     When the integration is activated successfully, the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.
   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

Instruct your API client to send log messages to the MID Server.

1. In the API client, configure a request with the following parameters:
   - HTTP Method: POST.
   - URL: The URL you copied in the **Set-up instruction** screen.
   - Authentication: The required authentication credentials. For example, Basic authentication (username and password).

     Note: The authentication method must be the same as the method configured on the MID Web Server.

   - Headers: Set the `Content-Type` header to match your payload format.
     - For JSON: `application/json`.
     - For raw text: `text/plain`.
   - Body: The logs payload in JSON or raw text.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Send the request.

   A successful response indicates that the MID Server has received the payload. When the MID Server has processed the log messages, the data input streams them to your ServiceNow instance using the REST protocol.

Set up a ServiceNow System Logs Retriever integration for Health Log Analytics

Set up an integration for streaming log data from your ServiceNow platform's System Log table to the HLA engine.

Before you begin

Note:

- This integration doesn't run on a MID Server.
- Only a single ServiceNow System Logs Retriever integration or data input can exist in the system.

- Verify that the Health Log Analytics application is installed and provisioned on your instance. For more information, see Install Health Log Analytics (HLA).
- Verify that a service instance is available.
- Verify that the HLA Engine is up and running.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `System Logs` in the search field.
5. Select the ServiceNow System logs tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. The **Provide details** form is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These fields are auto-populated, because only one ServiceNow System Logs Retriever integration or data input can exist in the system. For a description of the fields, see the **Provide details** table in ServiceNow System Logs Retriever integration configuration fields.

7. Select **Next**.
8. **Optional:** On the **Set data retrieval method** page, build conditions for filtering log data from the System Log table before it is streamed to the HLA engine.

   (Optional) This page helps you focus on the specific logs you want to monitor. For example, you might want to look at Discovery logs or exclude email logs. By default, all logs are included.

9. Do one of the following:
   - If you completed all the prerequisites before starting the configuration, select **Activate**.

     The integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

   - If you didn't complete all the prior requirements, select **Save draft**.

     The system saves the integration as a draft in the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the installation later. For more information, see Activate a draft integration in Health Log Analytics.

Result

Log data starts streaming from the ServiceNow System Log table to the Health Log Analytics AI engine, based on the configured filters. The dedicated HLA engine for your instance starts analyzing your system logs in real-time.

Note: Starting with Health Log Analytics version 37.0.15, you can use the ServiceNow System Logs Retriever integration to automatically detect errors and anomalies in your ServiceNow instance's system log. By combining HLA's anomaly detection with Now Assist's GenAI capabilities, you can identify and resolve platform issues more effectively for a better user experience. For more information, see Use Case: Proactive monitoring of your ServiceNow instance in Health Log Analytics.

What to do next

Use the information in the **Overview** tab to refine how HLA reads the log data by adjusting your integration configuration. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.

Note:

- The MID Server streaming status and the **Log streaming sources** table do not appear on the **Overview** tab for this integration, because it doesn't run on a MID Server.
- When the integration is first configured, it may take up to 24 hours for the first alerts to appear. Once the data is populated, you can refresh the screen to see real-time metrics.

Use the More menu to go directly from the **Overview** tab to the **Data Input Mapping**, **Source Type Structures**, and **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More menu also provides direct access to the **Log Viewer**, where you can see the raw logs that the integration ingests.

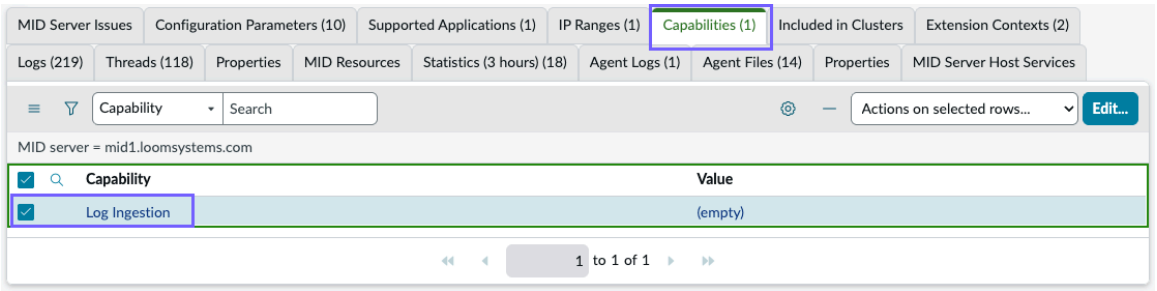
Set up a Splunk Poller integration for Health Log Analytics

Set up an integration that periodically pulls log data from Splunk to your ServiceNow instance for processing by Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.
- The MID Server must support basic authentication.

  Note: mTLS is not supported for log ingestion.

- No more than the default maximum of 10 integrations will stream logs to a single MID Server. You can modify the maximum number by adding the property `sn.occ.log_ingestion.max_datainputs_per_mid` to the MID Server and then changing the default value.

  To find out how many data inputs are streaming logs to the same MID Server, navigate to the **Streaming Sources** table and count the data inputs that stream to a specific MID Server.

- Consider whether to pull the log data to a single MID Server or to a MID Server cluster.

  In MID Server clusters, multiple MID Servers are grouped together for failover protection. The active integration runs on a single MID Server in the cluster. If that MID Server fails, the system moves its tasks to the next available MID Server in the cluster in a configured order.

  If you want to use a MID Server cluster, verify the following:

  - The MID Server cluster includes only MID Servers that support basic authentication.
  - Log ingestion is enabled for each MID Server in the cluster.

    Note: If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- No more than the default maximum of 10 integrations will stream logs to a single MID Server.

  A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 integrations running on it, even when that MID Server is down.

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Splunk Poller` in the search field.
5. Select the Splunk Poller integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Splunk Poller integration configuration fields.
7. Select **Next**.
8. On the **Set data retrieval method** form, fill in the fields.
   For a description of the fields, see the **Set data retrieval method** table in Splunk Poller integration configuration fields.
9. Select **Advanced settings** and fill in the advanced configuration fields.
   For a description of the fields, see Splunk Poller integration configuration fields.
10. **Optional:** Select **Test and save** to save the integration to the database and test connectivity.
11. Do one of the following:
    - If you completed all the prerequisites before starting the configuration, select **Activate**.

      In the pop-up window, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

      When the test is successful, the integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you didn't complete all the prior requirements, select **Save draft**.

  The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

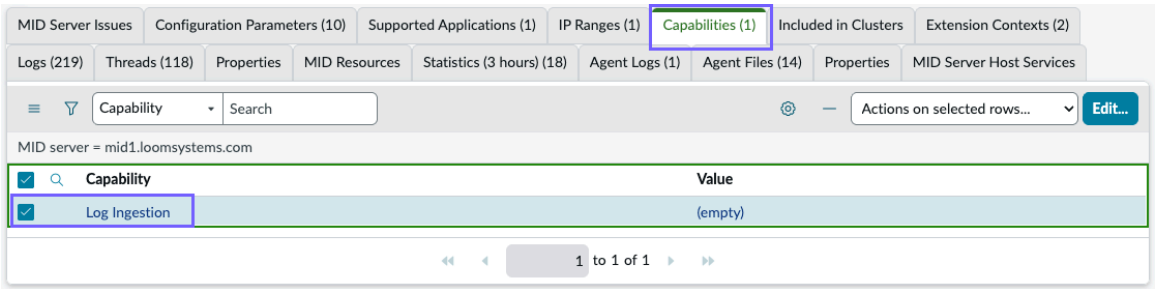
- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

Set up a Splunk TCP integration for Health Log Analytics

Set up an integration to stream log messages to your ServiceNow instance over the TCP transport protocol using a Splunk heavy forwarder. Health Log Analytics processes the ingested log data.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value.

Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter UDP in the search field.
5. Select the UDP integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in UDP integration configuration fields.
7. **Optional:** Select **Advanced Settings** to set advanced configuration fields.
   For a description of the fields, see the **Advanced Settings** table in UDP integration configuration fields.
8. Select **Next**.
9. In the **Setup instruction** screen, follow the instructions on the screen to install the integration in the third-party console.
10. Do one of the following:
    - If you completed all the prerequisites before starting the configuration, select **Activate**.

      When the integration is activated successfully, the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

    - If you didn't complete all the prior requirements, select **Save draft**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

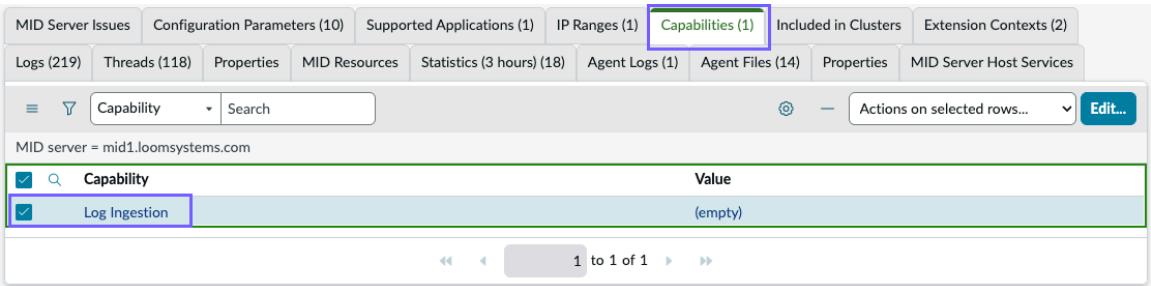
- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

Set up a Vector Agent integration for Health Log Analytics

Set up a Vector Agent integration to enable Health Log Analytics to process log messages that are streaming into your ServiceNow instance via a Vector Agent.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

- Verify that you have a `vector.yaml` file on your machine, or create one.

Role required: evt_mgmt_admin

About this task

If your organization uses Vector by Datadog to handle log data from multiple sources before sending it to Health Log Analytics, the log format HLA receives is distinct from other types. The Vector Agent integration enables HLA to detect and separate transport headers from inner log messages in this format. Only the inner messages are forwarded to the source type structure for processing.

You set up integrations through the Integrations Launchpad in Service Operations Workspace, which you access from the ITOM AIOps configuration center. The AIOps configuration center is a centralized workspace for configuring and managing AIOps features from a single place. The integrations setup process reduces implementation time compared to manual data input setup in the classic interface in Health Log Analytics. For more information, see Integrations Launchpad in Service Operations Workspace for ITOM.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Add integration**.
   The Integrations Launchpad appears.
4. In the **Browse integrations** tab, enter `Vector` in the search field.
5. Select the `Vector` integration tile.

   Note: If you start an integration setup before meeting all prerequisites, a message appears. You can cancel the setup and complete the prior requirements first. Alternatively, you can continue in draft mode and complete the requirements later. Note that you can't activate the integration until you have completed all the prerequisites.

6. On the **Provide details** form, fill in the fields.
   For a description of the fields, see the **Provide details** table in Vector Agent integration configuration fields.
7. Select **Next**.
8. In the **Set-up instruction** screen, follow the instructions on the screen to install the integration in your third-party console.
   Update the `vector.yaml` file as explained in the steps.
9. Do one of the following:
   - If you completed all the prerequisites before starting the configuration, select **Activate**.

     In the pop-up window, select **Test & Save** to save the integration to the database and test connectivity. If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.

     When the test is successful, the integration is activated and the **Overview** tab is displayed. On the Integrations Launchpad, the integration tile is available in the **Installed integrations** tab.

   - If you didn't complete all the prior requirements, select **Save draft**.

© 2026 ServiceNow, Inc. All rights reserved.

The system saves the integration as a draft in the Integrations Launchpad. It appears in the **Installed integrations** tab, under **Waiting for your action**. You can complete the prerequisites and activate the integration later. For more information, see Activate a draft integration in Health Log Analytics.

What to do next

On the **Overview** tab, do the following:

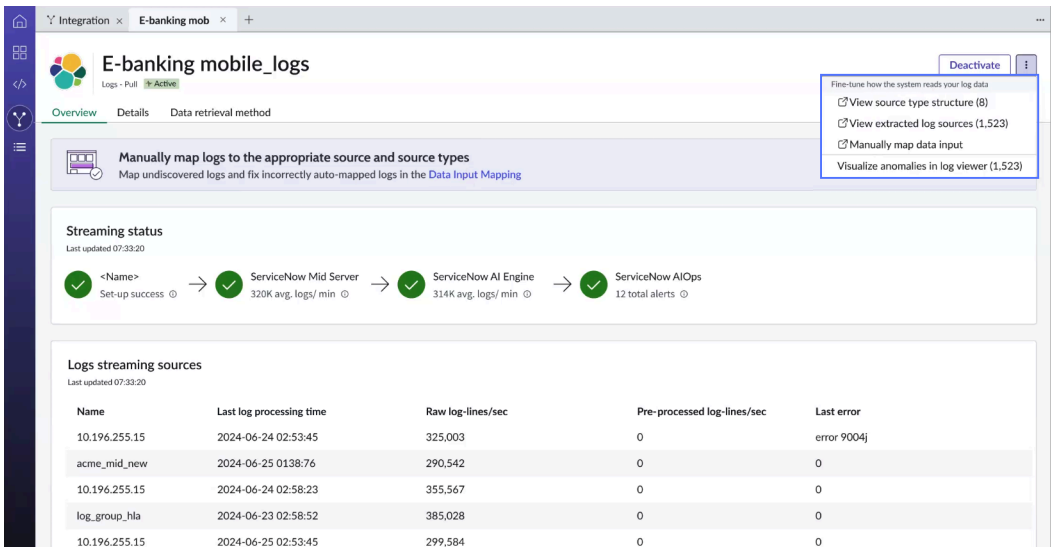
- Use the displayed information to refine how Health Log Analytics reads the log data. For more information, see Review log streaming data and adjust integration settings in Health Log Analytics.
- Use the More options menu (⋮) to open the **Data Input Mapping**, **Source Type Structures**, or **Log Sources** pages with context from the integration. If your log data is not properly mapped, structured, or sourced, go back and adjust the configuration. If the Service Operations Workspace Log Analytics application is installed, the More options menu also provides direct access to the **Log Viewer**. Use the **Log Viewer** to review raw log messages ingested by the integration. For more information, see:
  - Log data auto-mapping and mapping
  - Source type structure adjustment
  - Review logs on the Log Viewer

Monitoring log data flow and optimizing integration settings in Health Log Analytics

The Overview screen in Health Log Analytics provides a comprehensive view of the components in the log-processing pipeline of active integrations. From this screen, you can troubleshoot any streaming issues and adjust the integration's settings if needed.

The **Overview** screen shows the log data streaming status and streaming sources of an active integration. It provides direct access to the **Data Input Mapping**, **Source Type Structures**, and **Log Sources** pages, as well as the **Log Viewer**, all with context from the current integration.

Overview screen and View menu items



Streaming status

The **Streaming status** section on the **Overview** screen shows the status of data streaming between the log source and the MID Server and between the MID Server and the HLA engine.

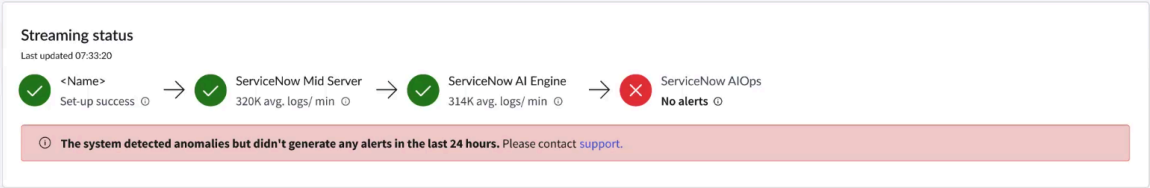
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

It displays the number of logs per minute passing through the MID Server and through the HLA engine.

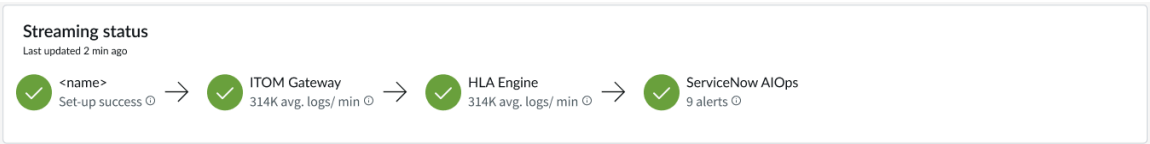
Note: For the ServiceNow System Logs Retriever integration, the **Overview** screen doesn't display the MID Server streaming status because that integration doesn't run on a MID Server.

The ServiceNow AIOps component shows the total number of alerts that the HLA engine has created. These statistics are updated when the **Overview** screen loads and are automatically refreshed every minute to show live data. You can change the default auto-refresh time interval through the system property *sn_itom_integ_app.overview_page_data_input_stats_auto_refresh_interval_second*

If data streaming fails, the integration is automatically deactivated and the **Streaming status** marks the component where the failure occurred. In addition, a banner explains the failure and either proposes steps to take to fix it or refers to ServiceNow support.



For MID-less or OpenTelemetry Protocol (OTLP) integrations, such as Amazon Data Firehose, the **Overview** screen displays the ITOM Gateway as a component in the log-processing pipeline. The MID Server component is not shown in the pipeline, because log data is sent directly from the source to the ITOM Gateway. The logs are then processed by the HLA engine to find anomalies.



For these integrations, the **Overview** screen shows the average rate of logs per minute over the last 15 minutes passing through the ITOM Gateway and the HLA engine, similar to the metrics shown for MID-based ingestion.

Note: The ITOM Gateway component is shown only if the MID Server property *mid.hla.itom_gateway_streaming.enabled* is set to true. For more information, see MID Server properties.

When the integration isn't streaming live data from the source, a warning message is displayed. There is a 4-hour interval between the last log source time and the current time before this message is generated. You can change the default time interval through the system property *sn_itom_integ_app.overview_page_log_source_time_threshold_hours*.

Note: The warning message is displayed only when the HLA engine is up and running.

Log streaming sources

Depending on your integration, the **Log streaming sources** table displays the following information about the integration's log streaming sources.

Note: This table isn't available for the ServiceNow System Logs Retriever integration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log streaming sources

Column	Description
Name	The name of the log data source.
Status	The streaming status: Active or Not active.
Data input	The integration streaming the data to your ServiceNow instance.
MID Server	The MID Server to which the log data is streaming.
Last event time	The time when the integration received the latest event.
Last log processing time	The time when the last log was received or processed.
Raw log lines/sec	The average number of raw log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value represents the number of raw log lines before preprocessing.
Pre-processed log lines/sec	The average number of preprocessed log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value can differ from the number of raw log lines per second. For example, the difference can be a result of logs having been dropped during preprocessing.

Example

As an admin, you use the integration **Overview** page to verify continuous data flow into the ServiceNow instance. If log streaming fails, HLA doesn't receive the real-time data needed to detect anomalies or generate alerts.

For example, the **Streaming Status** for an active Elasticsearch integration may show a red circle with a white X for the MID Server component in the log-processing pipeline. This indicates that logs are not reaching the MID Server.

The **Log Streaming Sources** table shows a state of Authentication Failed or Connection Error, with an error message indicating invalid credentials. This points to an issue with the Elasticsearch credentials. Fixing the credentials and either restarting the log service or waiting for the next polling cycle, restores the connection.

The **Log Streaming Sources** table now shows a connection state of Connected or Active with successful authentication. The **Streaming Status** displays a green circle with a white check mark for the MID Server component. With log streaming restored, HLA can resume processing data and generating anomaly alerts.

Review log streaming data and adjust integration settings in Health Log Analytics

Review log streaming data and adjust integration settings in Health Log Analytics

Review the log data streaming status and streaming sources of an active integration for Health Log Analytics on the integration's Overview screen. From this tab, you can investigate streaming issues and refine the integration settings. Leverage the displayed data to refine how HLA reads the log data by adjusting the integration's configuration.

Before you begin

Confirm that the integration has been activated on the Integrations Launchpad. For more information, see Set up integrations for Health Log Analytics from the Integrations Launchpad.

For MID-less or OpenTelemetry Protocol (OTLP) integrations, verify that the *mid.hla.itom_gateway_streaming.enabled* property is set to true in the MID Server properties to enable displaying the ITOM Gateway component on the Overview screen.

To access the Log Viewer from the Overview tab with context from the integration, you must have the ServiceNow Service Operations Workspace Log Analytics application installed.

Role required: evt_mgmt_admin

About this task

For more information about the data shown in the **Overview** screen, see Monitoring log data flow and optimizing integration settings in Health Log Analytics.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Manage installed integrations**.
   The Integrations Launchpad appears.
4. In the **Installed integrations** tab, search for an active integration and open it.
   The **Overview** screen displays, showing the integration's data streaming status and its log data sources data.

   Note: The ServiceNow System Logs Retriever integration doesn't run on a MID Server. Therefore, for this integration the **Overview** screen doesn't display the MID Server streaming status.

5. Analyze the provided data and investigate any data streaming issues.
6. **Optional:** Adjust the configuration of the integration, if needed.
   Use the options on the View menu (⋮) to navigate to the relevant table or the Log Viewer.

   Note: The View menu content changes dynamically depending on whether the referenced tables contain data.

View menu options

Option	Description
Data Input Mapping	Opens the **Data Input Mapping** page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	On this page, you can map sources manually if HLA didn't discover properties automatically. For more information, see Map raw log data in Health Log Analytics.
Source Type Structure	Opens the **Source Type Structures** page. In the Source Type Structure, log data is classified and organized based on its origin or type. You can adjust the structure and verify that the HLA AI engine extracts properties properly and classifies them correctly. For more information, see Source type structure adjustment in Health Log Analytics.
Log Sources	Opens the **Log Sources** table. This table enables you to verify that HLA has created all your log sources. If a log source is missing, you can add it manually. For more information, see Verify your log sources in Health Log Analytics.
Log Viewer	Opens the **Log Viewer**, which shows the frequency of anomalies in the log data during a specific time period. For more information, see Reviewing the logs that are connected with an alert on the Log Viewer in Health Log Analytics. **Note:** The Log Viewer option appears only if the Service Operations Workspace Log Analytics application is installed.

7. When you have resolved any data streaming issues and fixed the configuration, select **Test and save**.
   The system saves the updated configuration to the database and tests the configured port, returning either success or an error. If an error is returned, fix the configuration according to the suggestions on the screen and then select **Test and save** again. Once the test is successful, continue with the next step.
8. Reactivate the integration.

Mapping logs for contextual alerts in Health Log Analytics

Map your logs to service instances, components, and source types so that Health Log Analytics (HLA) can generate alerts in context. Contextualizing your log data is especially important when the integration processes logs from multiple service instances and components.

The AI agent suggests the optimal log field for mapping to service instances and components. When you use the AI-suggested field, or when that field is the default, an AI sparkle icon (✨) appears. You can select a different field if needed. If the AI agent cannot find an optimal match,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HLA uses the system default. The system default also applies if the selected field is not present in the sample log.

Example

A large financial institution might face performance issues with its e-banking application, which relies on various components like web, application, and database servers. Without log context mapping, logs from these components appear isolated, complicating issue correlation. An anomaly in a Tomcat server log might be detected, but without proper context, the operator struggles to assess its impact. Log context mapping enables defining rules to map logs to the e-banking application service instance and the Tomcat server component. This mapping provides a contextualized view for root cause analysis and resolution.

Map logs to service instances, components, and source types for contextual alerts in Health Log Analytics

Map your logs to service instances, components, and source types so that Health Log Analytics (HLA) can generate contextual alerts.

Before you begin

Configure and activate an integration before you perform this procedure. For more information, see Set up integrations for Health Log Analytics from the Integrations Launchpad.

Role required: evt_mgmt_admin

About this task

HLA uses the settings that you define in this procedure to identify service instances, components, and source types in log examples and map log data to them automatically. HLA links logs to the corresponding service instances, components, and source types for contextualized analysis. By default, automatic log context mapping is enabled.

AI suggests the optimal log field for mapping to service instances and components. When you use the AI-suggested field or if it's the default field, an AI sparkle icon (✦) appears. You can select a different field if needed. If AI can't find an optimal match or if your selected field is missing from the sample log, HLA uses the system default.

Important: If a manually defined mapping script exists in the **Data Input Mapping** page, automatic mapping overwrites it.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. Under Integrations, select **Manage installed integrations**.
   The Integrations Launchpad appears.
4. On the **Installed integrations** tab, search for an integration and open it.
   The **Overview** screen displays.
5. Under **Next steps**, on the **Log context mapping** card, select **View mapping**.
   The **Log context mapping** table displays.
6. Select the relevant integration.
   The integration's **Log context mapping** page displays.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

> **Note:** If the selected integration has features that are unsupported in Service Operations Workspace, you're referred to the **Data Input Mapping** page. For more information, see Map raw log data in Health Log Analytics.

7. **Optional:** Turn off automatic service instance and component mapping by using the toggle.
   If you turn off automatic mapping, you must define a mapping script manually in the **Data Input Mapping** page. For more information, see Map raw log data in Health Log Analytics.

   The remaining steps in this procedure are only relevant when automatic mapping is enabled.

   > **Note:** When you open the **Log context mapping** form for the first time, the system default values display in all fields.

8. Configure the log field by which HLA identifies a service instance from the **Raw log field** drop-down list.
   A service instance represents a complete business process.
9. Configure the log field by which HLA identifies a component from the **Raw log field** drop-down list.
   A component represents the smallest part of a service instance. A single service instance typically comprises multiple components.
10. **Optional:** Select **Preview** to view the service instances and components the system has identified based on your settings in the previous steps.
    The service instances and components are grouped by service.
11. In **Advanced settings**, review the fallback service and set the log field by which the system identifies a source type.

    a. In the **Selected fallback service** field, review the fallback service the system uses if it can't identify the service instance in the log data.
    The displayed fallback service is the default service instance that you selected when you configured the integration.

    > **Note:** For some integrations, such as Filebeat, this field shows `N/A` instead of a value. In these integrations, if HLA can't identify the service instance, it uses the system default value rather than the fallback service.

    b. Configure the log field by which HLA identifies a source type from the **Raw log field** drop-down list.

    c. **Optional:** Select **Preview** to view the log sources the system has identified based on your source type settings.

12. **Optional:** In the Simulator, review a log processing simulation based on your current mapping.
    The provided simulation helps you understand how the current mapping impacts HLA log processing. Use this information to fine-tune your settings:
    - The **Log fields** tab shows the default service, component, and source type and the raw log.
    - The **Extracted values** tab shows the service instance, component, and source type that the system has extracted from the raw log based on your current settings.
13. Select **Save mapping** to save your settings.

Activate a draft integration in Health Log Analytics

Activate an integration that was configured and saved as a draft in Health Log Analytics (HLA).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Configure an integration in draft mode through the Integrations Launchpad and save it.

Role required: evt_mgmt_admin

Procedure

1. Complete all the prior requirements for the integration.
2. In the Integrations Launchpad **Installed integrations** tab, under **Waiting for your action**, locate and select the integration tile.
3. On the configuration page, select **Activate**.
   - For Push integrations: The integration is activated and the **Overview** tab is displayed. The integration tile is available in the **Installed integrations** tab on the Integrations Launchpad.
   - For all other integrations: Continue with the following steps.
4. In the pop-up window, select **Test & Save** to save the integration to the database and test connectivity.
   If an error is returned, adjust the configuration as suggested in the error message and then try to activate the integration again.
5. When the test is successful, select the appropriate activation option.
   - **Activate**

     The integration is activated and the **Overview** tab is displayed.

     Note: If your integration supports activation with AI capabilities, you can select this option to activate the integration without enabling these capabilities.

   - **Activate with AI**

     Note: This option is only available if your integration supports activation with AI capabilities.

     The integration is activated with AI capabilities enabled and the **Overview** tab is displayed. Now Assist collects and analyzes log data, and an icon indicates that it auto-maps log data to service instances and components for contextual alert generation.

   The integration tile is available in the **Installed integrations** tab on the Integrations Launchpad

Edit an installed integration in Health Log Analytics

Edit an installed integration for streaming log data to Health Log Analytics on the Integrations Launchpad. For example, you can switch to a different service instance.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Manage installed integrations**.
   The Integrations Launchpad appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **Installed integrations** tab, search for and select the tile for the integration you want to edit.
5. Select a tab that you want to edit.
6. Select **Deactivate** to deactivate the integration.

   Note: You must deactivate the integration before you can edit it.

7. Select **Edit**.
8. Edit the integration per your requirements.
9. Select **Test and save**.
   Health Log Analytics tests the MID Server connectivity, returning either success or an error. If an error is returned, make adjustments to your configuration as suggested on the screen, and then select **Test and save** again. When the test is successful, you can reactivate the integration.
10. Select **Activate**.

Deactivate a log data integration in Health Log Analytics

Deactivate an integration for streaming log data to Health Log Analytics on the Integrations Launchpad. A deactivated integration stops streaming logs to your ServiceNow instance, but is still available.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. From the Integrate section, under Integrations, select **Manage installed integrations**.
   The Integrations Launchpad appears.
4. In the **Installed integrations** tab, search for and select the integration tile for the integration you want to deactivate.
5. In the **Overview** tab, select **Deactivate**.

Result

The integration is deactivated and stops streaming log data to the instance. The deactivated integration is still available on the Integrations Launchpad in the **Installed integrations** tab, under **Waiting for your action**.

Set up data inputs in Health Log Analytics using guided setup

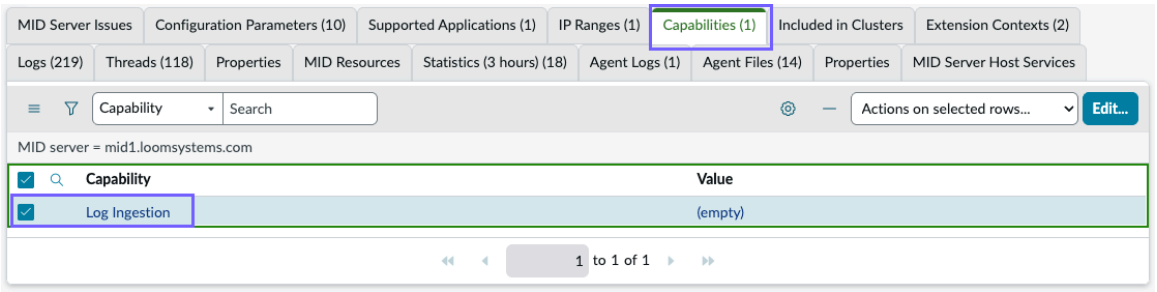
The Health Log Analytics guided setup provides a sequence of tasks to help you create data inputs on your ServiceNow instance. Data input configuration is an essential step in setting up the Health Log Analytics application. Using guided setup ensures that you have the minimum required setup for the data input process.

Before you begin

Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.
- For MID Server proxy requirements, see MID Server proxy preconditions for streaming logs to Health Log Analytics.

Role required: evt_mgmt_admin

About this task

For information about using the guided setup interface, see Using guided setup.

Procedure

1. Navigate to **All** > **Guided Setup** > **ITOM Guided Setup** > **Health Log Analytics**.
2. Follow the instructions to select and set up a data input.

What to do next

Once you've created the data input connector, proceed to map your raw log data.

- For MID Server proxy requirements, see MID Server proxy preconditions for streaming logs to Health Log Analytics.

Role required: evt_mgmt_admin. For the ServiceNow System Logs data input: admin.

Procedure

1. Setup a data input manually by performing the relevant procedure described in the product documentation.

Data Inputs

Data Input	Description
Rsyslog or Beats	The data input streams log data into your instance using Rsyslog or Beats.
Splunk	The data input streams log data into your instance using Splunk.
Splunk Polling	The data input periodically pulls log data from Splunk by using a query.

Data Input	Description
Elasticsearch	The data input pulls log data from Elasticsearch indexes into your instance.
TCP	The data input sends raw log messages to your instance directly over a TCP/SSL socket.
UDP	The data input streams raw log messages to your ServiceNow instance directly over a UDP socket.
GCP PubSub	The data input receives log messages that are published to a Google Cloud Pub/Sub topic and streams them to your ServiceNow instance.
MID Server	The data input collects MID Server log files and streams them to your instance.
Amazon CloudWatch	The data input streams log data from Amazon CloudWatch to your ServiceNow instance.
Amazon S3 Bucket	The data input streams log data from Amazon S3 (Simple Storage Service) buckets to your ServiceNow instance.
Microsoft Azure Log Analytics	The data input streams log data from Microsoft Azure Log Analytics to your ServiceNow instance.
Microsoft Azure Event Hubs	The data input streams events from Microsoft Azure Event Hubs to your ServiceNow instance.
Apache Kafka	The data input streams log data from Apache Kafka to your ServiceNow instance.
REST API	The data input streams log data to your ServiceNow instance in JSON format.
ServiceNow System Logs Retriever	The data input streams log data from the ServiceNow System Log table to the Health Log Analytics AI engine. **Note:** Only a single ServiceNow System Logs Retriever data input can exist in the system, and only users with the admin role can create and configure it. This data input doesn't run on a MID Server.
Cribl	The data input to enables Health Log Analytics to process Cribl log messages streaming into your ServiceNow instance.
Edge Delta	The data input enables Health Log Analytics to process Edge Delta log messages streaming into your ServiceNow instance.
Vector Agent	The data input enables Health Log Analytics to process log messages that are streaming

Data Input	Description
	into your ServiceNow instance via a Vector Agent.
Agent Client Collector	The data input streams log messages to your ServiceNow instance using the ServiceNow Agent Client Collector. This data input is supported for use with the Agent Client Collector Log Analytics application, available from the ServiceNow Store.

Note: Selecting **Test connection** at the end of the procedure ensures that your data input is configured correctly. You can only publish a data input configuration when the connection between the MID Server and the data repository has been established.

2. Identify and address streaming issues to ensure that the data input is streaming log data to the MID Server from all sources.
   For more information, see Identify and resolve a log streaming issue in Health Log Analytics.
3. **Optional:** Edit raw log data before Health Log Analytics maps and structures it.
   For more information, see Edit your raw log data before processing.
4. Determine how Health Log Analytics handles raw log data that is streaming into your instance. By default, every incoming log line is auto-mapped to the correct tag. If properties aren't discovered automatically, map the data input sources manually by defining a JavaScript function. For more information, see Map the raw data.
5. **Optional:** Tweak the source type structure to make sure that Health Log Analytics extracts and classifies all properties correctly.
   For more information, see Refine the source type structure in Health Log Analytics.
6. **Optional:** Perform additional data input setup tasks.
   For more information, see Additional data input setup tasks in Health Log Analytics.

Supported data inputs for Health Log Analytics

Configuring data inputs for Health Log Analytics manually

Configure the data input process manually in Health Log Analytics. Data input configuration is an essential step in setting up the Health Log Analytics application.

Configure an Amazon CloudWatch data input in Health Log Analytics manually

Set up a data input for streaming log data from Amazon CloudWatch to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled.
  For more information, see MID Server system requirements.

Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Amazon CloudWatch data input.
4. On the form, fill in the fields.
   For a description of the fields, see Amazon CloudWatch data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   For a description of the fields, see Amazon CloudWatch data input configuration fields. For information about configuring the advanced settings later, see Configure advanced settings for Amazon CloudWatch data inputs in Health Log Analytics manually.
6. On the **Query settings** tab, fill in the fields.
   For a description of the fields, see Amazon CloudWatch data input configuration fields.
7. On the **Transport** tab, fill in the fields.
   For a description of the fields, see Amazon CloudWatch data input configuration fields. These fields are required.
8. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
9. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

10. Select **Publish** to publish the data input to the MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data from Amazon CloudWatch to your ServiceNow instance.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

Result
The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data from Apache Kafka to your ServiceNow instance.

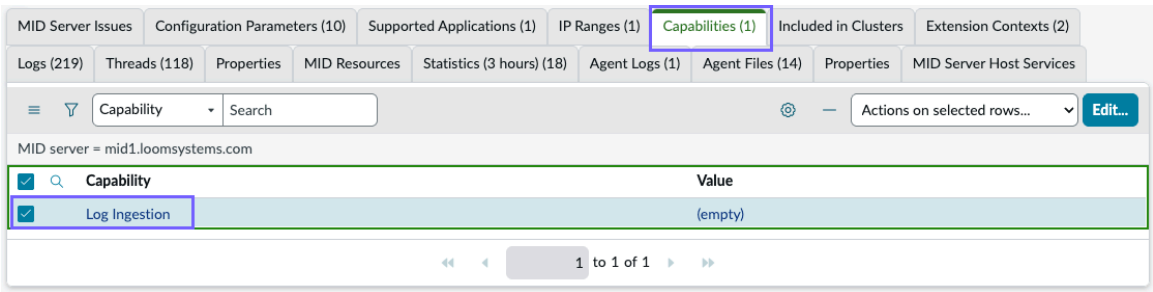
Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next
Make sure that the data input is streaming data.

Related topics
Configure advanced settings for Apache Kafka data inputs in Health Log Analytics manually

Configure a Cribl data input in Health Log Analytics manually
Set up a dedicated Cribl data input to enable Health Log Analytics to process Cribl log messages streaming into your ServiceNow instance.

Before you begin
- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task
If your organization uses Cribl for filtering and routing large volumes of log data from various sources, the log format Health Log Analytics receives is distinct from other types. The Cribl data input enables HLA to detect and separate transport headers from inner log messages in this format, forwarding only the inner message to the source type structure for processing.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Cribl data input.
4. On the **Getting Started** tab, fill in the form fields and then select **Next**.
   For a description of the fields, see Cribl data input configuration fields.
5. On the **Config** tab, fill in the form fields and then select **Next**.
   For a description of the fields, see Cribl data input configuration fields.
6. On the **Process** tab, select the required route and then select **Next**.

   For more information, see Cribl data input configuration fields.

   Note: For troubleshooting issues related to this step, see the Cribl - Setting up Cribl data input | Troubleshooting setup & data ingestion issues [KB0558611] article in the Now Support Knowledge Base.

   The **Finish** tab opens.
7. On the Cribl instance, verify that the configuration of the data input is correct.
   You can use the Cribl commands displayed on the **Finish** tab as needed.
8. When the configuration is correct, return to the data input configuration **Finish** tab and select **Publish** to publish the data input.

Result

The data input configuration process is complete. The data input starts streaming log data to your ServiceNow instance.

For resolving issues related to the ingestion of log data from Cribl, see the Cribl - Setting up Cribl data input | Troubleshooting setup & data ingestion issues [KB0558611] article in the Now Support Knowledge Base.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

Configure an Edge Delta data input in Health Log Analytics manually

Set up an Edge Delta data input to enable Health Log Analytics to process Edge Delta log messages streaming into your ServiceNow instance.

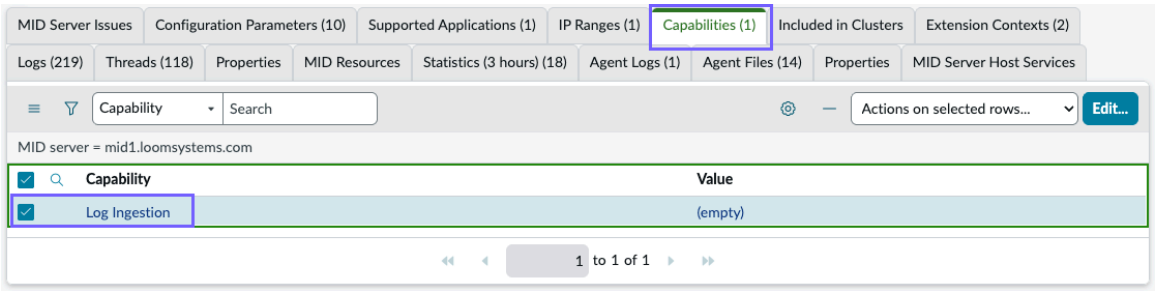
Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

About this task

If your organization uses Edge Delta to handle large volumes of log data from multiple sources before sending it to Health Log Analytics, the log format HLA receives is distinct from other types. The Edge Delta data input enables HLA to detect and separate transport headers from inner log messages in this format, forwarding only the inner message to the source type structure for processing.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Edge Delta data input.
4. On the form, fill in the fields.
   For a detailed description of the fields, see Edge Delta data input configuration fields.
5. Select **Save** to save your configuration.
6. Select **Publish** to publish the data input.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table. The data input starts streaming log data to your ServiceNow instance.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

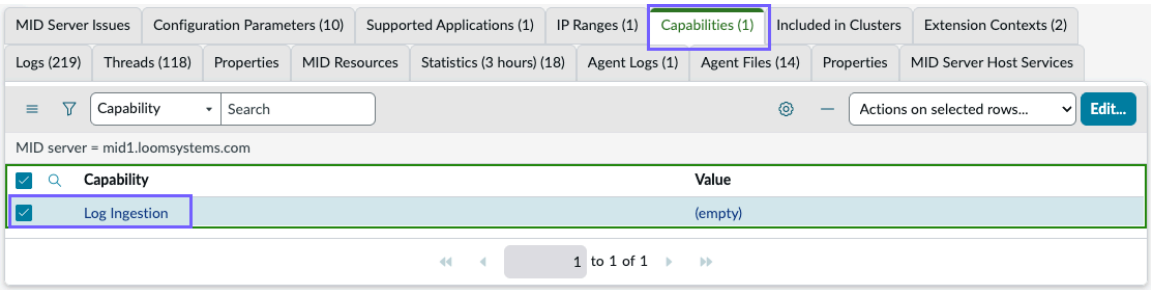
Make sure that the data input is streaming data.

Configure an Elasticsearch data input in Health Log Analytics manually

Set up a data input for streaming log data from Elasticsearch indices to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Health Log Analytics supports Elasticsearch versions above 7.10.2 and below 8.18.2.

Note: For advanced information about streaming log data from Elasticsearch indices to your instance, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support knowledge base.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Elasticsearch data input.
4. On the form, fill in the fields.
   For a description of the fields, see Elasticsearch data input configuration fields.
5. **Optional:** Select **Advanced** to set advanced configuration fields.
   For a description of the fields, see Elasticsearch data input configuration fields. For information about configuring the advanced settings later, see Configure advanced settings for Elasticsearch data inputs in Health Log Analytics manually.
6. On the **Transport** tab, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the fields, see Elasticsearch data input configuration fields.

7. On the **Query Settings** tab, fill in the fields.
   For a description of the fields, see Elasticsearch data input configuration fields.
8. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
9. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

     Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

10. Select **Publish** to publish the data input to the MID Server.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data from Elasticsearch indices to your ServiceNow instance.

For more information about streaming logs using the Elasticsearch data input, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support Knowledge Base.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

Note: If you experience permissions-related issues with streaming log data from Elasticsearch, refer to the Granting privileges for data streams from Elasticsearch [KB0967366] article in the Now Support Knowledge Base.

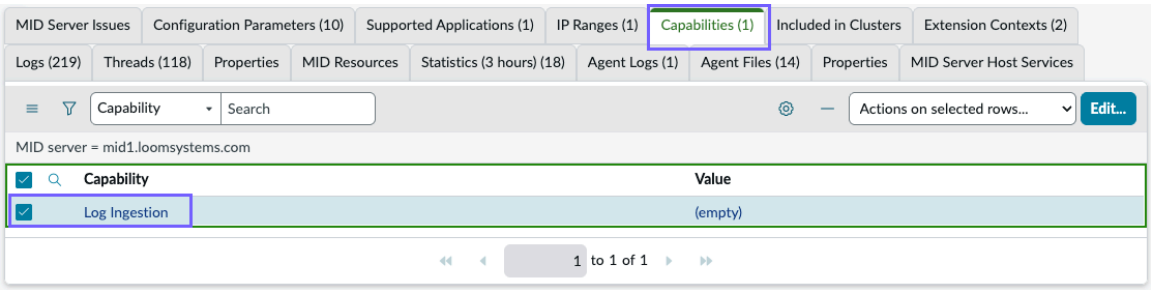
Configure a GCP PubSub data input in Health Log Analytics manually

Set up a data input for receiving log messages that were published to a Google Cloud Platform (GCP) Pub/Sub topic and streaming them to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the GCP PubSub data input type.

   Note: The selected data input type complements the passive data input (listener). For more information, see Supported data inputs for Health Log Analytics.

4. On the form, fill in the fields.
   For a description of the fields, see GCP PubSub data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   For a description of the fields, see GCP PubSub data input configuration fields.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
7. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

- If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
- If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you changed the configuration, and then select **Test connection** to test the connection again.

  Note: You can only publish the data input configuration when the connection is created successfully.

Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts to receive log messages from the Google Cloud Pub/Sub topic and streams them to your ServiceNow instance via the MID Server.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

Configure a Microsoft Azure Event Hubs data input in Health Log Analytics manually

Set up a data input for streaming events from Microsoft Azure Event Hubs to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

  Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Microsoft Azure Event Hubs data input.
4. On the form, fill in the fields.
   For a description of the fields, see Microsoft Azure Event Hubs data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   For a description of the fields, see Microsoft Azure Event Hubs data input configuration fields.
   For information about configuring the advanced settings later, see Configure advanced settings for Microsoft Azure Event Hubs data inputs in Health Log Analytics manually.
6. On the **Query settings** tab, fill in the fields.
   For a description of the fields, see Microsoft Azure Event Hubs data input configuration fields.
7. On the **Transport** tab, fill in the fields.
   For a description of the fields, see Microsoft Azure Event Hubs data input configuration fields.
8. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
9. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

10. Select **Publish** to publish the data input to the MID Server.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data from Microsoft Azure Event Hubs to your ServiceNow instance.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

Related topics

Configure advanced settings for Microsoft Azure Event Hubs data inputs in Health Log Analytics manually

Configure a Microsoft Azure Log Analytics data input in Health Log Analytics manually

Set up a data input for streaming log data from Microsoft Azure Log Analytics to your ServiceNow instance. The data input points the Health Log Analytics AI engine to a data source in your Microsoft Azure Log Analytics account.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.

> **Important:** Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Microsoft Azure Log Analytics data input.
4. On the form, fill in the fields.
   For a description of the fields, see Microsoft Azure Log Analytics data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   For a description of the fields, see Microsoft Azure Log Analytics data input configuration fields. For information about configuring the advanced settings later, see Configure advanced settings for Microsoft Azure Log Analytics data inputs in Health Log Analytics manually.
6. On the **Query settings** tab, fill in the fields.

   Health Log Analytics uses the values set in these fields to generate the query for receiving log data from Microsoft Azure Log Analytics.

   For example:

   ```
   {"query": "ContainerLog | where TimeGenerated > %s | take 500",
    "project": ["TimeGenerated", "LogEntry", "LogEntrySource"]}
   ```

   where:

   - `ContainerLog`: The data source name.
   - `TimeGenerated`: The event time property name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `500`: The maximum number of rows retrieved in each query.
- `["TimeGenerated", "LogEntry", "LogEntrySource"]`: The event time and the comma-separated list of column names to return.

Alternatively, you can configure a custom query in the **Log query** field. The value you set in this field overrides the values in all other fields on the **Query settings** tab except the **From** field. If the **Log query** field is empty, Health Log Analytics generates the query using the values set in the other fields on the tab.

For a description of the **Query settings** fields, see Microsoft Azure Log Analytics data input configuration fields.

7. On the **Transport** tab, fill in the fields.
   For a description of the fields, see Microsoft Azure Log Analytics data input configuration fields.
8. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
9. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

10. Select **Publish** to publish the data input to the MID Server.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data from Microsoft Azure Log Analytics to your ServiceNow instance.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

Related topics

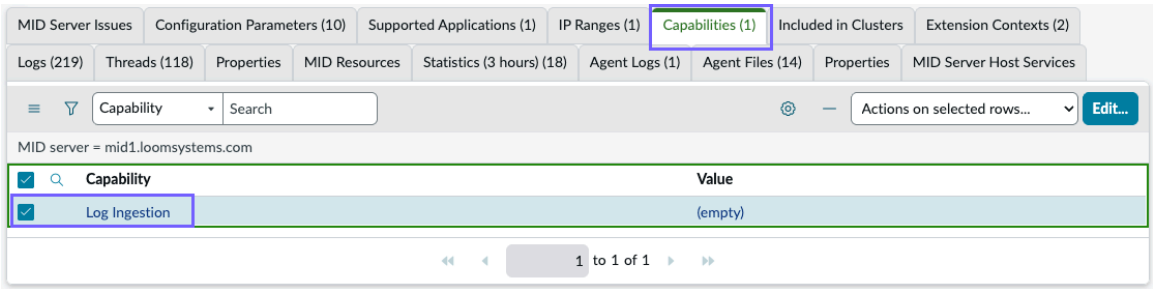
Configure advanced settings for Microsoft Azure Log Analytics data inputs in Health Log Analytics manually

Configure a MID Server data input in Health Log Analytics manually

Set up a data input for collecting and streaming MID Server log messages to your ServiceNow instance.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Role required: evt_mgmt_admin

About this task

This procedure describes how to create a MID Server data input from the Data Inputs page. To configure the MID Server data input automatically, click the related link on the MID Server form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- When you create a MID Server data input, all logs are automatically mapped to the predefined mid_server_log source type. This source type includes preconfigured mapping settings to maximize the value of monitoring your MID Server logs. To review the mapping script, navigate directly from the data input configuration form to the mapping form by selecting **Go to Mapping** under Related Links. Review the source type by navigating to Source Type Structures and select the mid_server_log source type.
- For optimal performance, debug MID Server log messages are not processed by default. If you want to send debug messages to Health Log Analytics for processing, add the following to your MID Server properties: mid.hla.mid_data_input.ignore_debug_level_logs = false.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the MID Server data input.
4. On the form, provide a description of the data input and the name of the MID Server from which the logs are streamed.
   For a description of the fields, see MID Server data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   On the form, fill in the fields. For a description of the fields, see MID Server data input configuration fields. For information about configuring the advanced settings later, see Configure advanced settings for MID Server data inputs in Health Log Analytics manually.
6. Select **Submit**.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts collecting and streaming MID Server log messages to your ServiceNow instance.

For a description of how this data input can help you detect and resolve emerging issues in your organization's ServiceNow instance, see Use Case: Proactive monitoring of your ServiceNow instance in Health Log Analytics.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

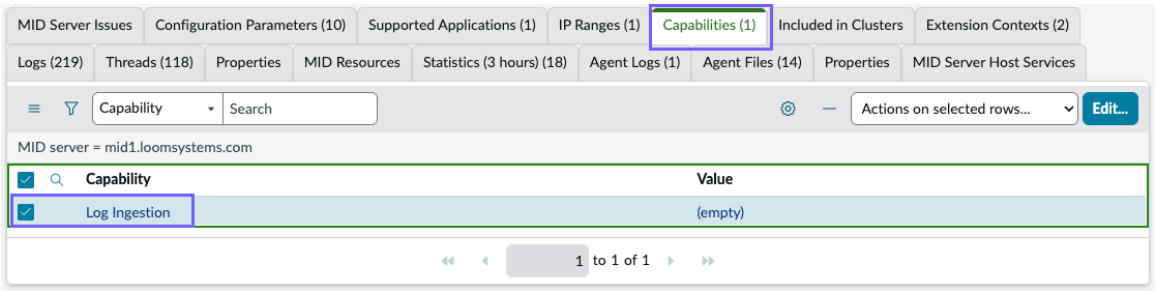
Configure a REST API data input in Health Log Analytics manually

Set up a REST API data input for streaming log data to your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

On the MID Web Server Context form, in the **Execute on** field, select *Specific MID Server* and not the cluster option. In the **MID Server** field, select the specific MID Server to which the log data is pulled.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the REST API data input.
4. On the form, fill in the fields.
   For a description of the fields, see REST API data input configuration fields.
5. Select **Save**.
   - Health Log Analytics adds the data input record to the **Data Inputs** table.
   - The system automatically generates the REST API data input URL for sending logs to the MID Server. The generated URL will be in this format: `http://(MID_SERVER_IP):(MID_WEB_SERVER_PORT)/ap1/mid/hla/raw`. HLA replaces `(MID_SERVER_IP)` and `(MID_WEB_SERVER_PORT)` with the values you configured.
6. Copy the generated URL.
7. Instruct your API client to send log messages to the MID Server.

   a. In the API client, configure a request with the following parameters:
      - HTTP Method: POST.
      - URL: The URL you copied in the previous step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Authentication: The required authentication credentials. For example, Basic authentication (username and password).

  Note: The authentication method must be the same as the method configured on the MID Web Server.

- Headers: Set the `Content-Type` header to match your payload format.
  - For JSON: `application/json`.
  - For raw text: `text/plain`.
- Body: The logs payload in JSON or raw text.

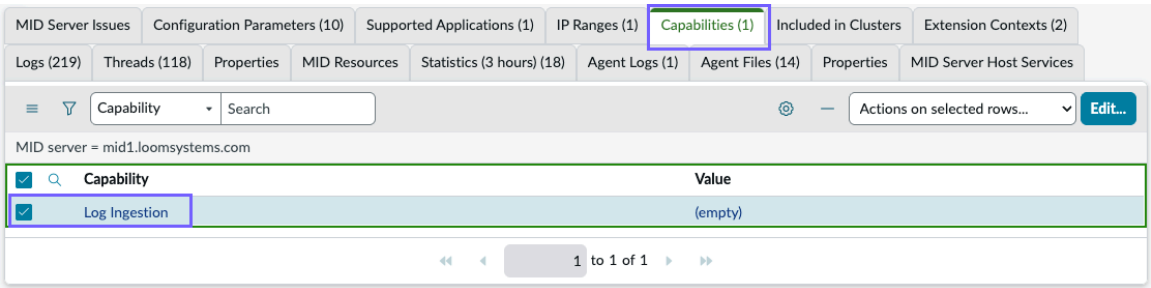
b. Send the request.
A successful response indicates that the MID Server has received the payload. When the MID Server has processed the log messages, the data input streams them to your ServiceNow instance using the REST protocol.

Configure a Rsyslog, Filebeat, or Winlogbeat data input in Health Log Analytics manually

Set up a data input for streaming log messages to your ServiceNow instance using an Rsyslog, Filebeat, or Winlogbeat agent.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the data input type to create from the available data input types described in the table.

   Note: The selected data input type complements the passive data input (listener). For more information, see Supported data inputs.

   Data input types

Type	Description
Rsyslog	Streams log messages from UNIX-based servers to the ServiceNow AI engine using the Rsyslog agent.
Linux using Filebeat	Streams system log messages and local files from Linux servers to the instance using the Filebeat agent.
Windows Application Logs using Filebeat	Streams local files from Microsoft Windows devices to the ServiceNow instance using the Filebeat agent.
Windows OS using Winlogbeat	Streams Windows event logs to the ServiceNow instance using the Winlogbeat agent.

4. On the **Getting Started** tab, fill in the form.

   For a description of the fields, see Rsyslog, Filebeat, or Winlogbeat data input configuration fields.

   Note: When creating a data input for Linux using Filebeat, you can select a content pack from the **Content pack** drop-down. The content pack contains default source types and mapping script templates that save you the time it takes to create them from scratch. For more information, see Health Log Analytics content packs for quicker time to value.

5. If the Rsyslog, Filebeat, or Winlogbeat agent has not already been installed, download and install it from the **Installation** tab.
   For installation instructions, refer to the product documentation of the respective agent.

   Note: Make sure that you're running the latest version of the agent. Earlier versions will work, but with limited functionality.

6. On the **Tagging and Binding** tab, assign logs to an service instance in the Configuration Management Database (CMDB) to enable the service to correlate the log data and enable the system to do root cause analysis.

   a. For each source, configure the path and service instance for the logs to be streamed.

   Note: By default, only the required fields **Path** and **Service instance** appear.

   For a description of the fields, see Rsyslog, Filebeat, or Winlogbeat data input configuration fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. If you want to ship multiline logs using Filebeat, configure the properties that control how Filebeat handles messages that span multiple lines of text.

Field	Description
Match	Specifies how Filebeat combines matching lines into an event.
Negate	Defines whether the pattern identified in the log lines is negated.
Regex	Specifies the regular expression to match.

Note: Health Log Analytics currently doesn't support multiline properties for Rsyslog.

c. Optional: Define additional log paths to enable the data input to stream log types from multiple paths.
Do the following for each additional log path:

i. Insert a new row.

ii. Configure the log path.

iii. Choose a service instance.

iv. (Optional) Choose a component and a source type.

Note: This option is not available or necessary when using Winlogbeat, because Health Log Analytics streams the Windows event logs.

7. On the **Finish** tab, complete the configuration for your data input type.

- Rsyslog:

  a. Download the configuration file and install it on the endpoint device, in the `/etc/rsyslog.d/rsyslog.conf` directory.

  Note: If you are using the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store, do the following instead:

  i. On the endpoint device, install the configuration file in the `/etc/rsyslog.d/` directory.

  ii. Create a spool directory by running the `sudo mkdir -p/var/spool/rsyslog` command.

  b. Validate the configuration by running the `rsyslogd -N1` command and verify the output.

  c. Restart Rsyslog by running the `sudo systemctl restart rsyslog` command.

  d. Verify the output. If it contains errors, check the `/var/log/messages` system log file for error messages and fix the errors.

- Linux using Filebeat:

  a. Download the configuration file and install it on the endpoint device, in the `/etc/filebeat/` directory.

  b. Start the agent service by running the `sudo service filebeat start` command.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The generated configuration ignores files that were last changed more than six hours ago. If needed, you can change this setting in the configuration.

c. Restart the agent service by running the appropriate command.

- Windows using Beats (Filebeat or Winlogbeat):

a. Download the configuration file and install it on the endpoint device, in the `C:\Program Files\` directory.

b. Start the agent service by running the appropriate command in PowerShell.

- Filebeat: `PS > Start-Service filebeat`
- Winlogbeat: `PS > Start-Service winlogbeat`

Note: The generated configuration ignores files that were last changed more than six hours ago. If needed, you can change this setting in the configuration.

c. Restart the agent service by running the appropriate command.

8. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
9. Verify that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

     Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

10. Select **Publish** to publish the data input to the MID Server.

Result
The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data to your ServiceNow instance.

Note: The configuration file Health Log Analytics generates for new Filebeat data inputs is compatible with Filebeat version 7.14 and above. The minimum Filebeat version that Elasticsearch currently supports is 7.17, which is nearing its end of life (EOL).

Existing Filebeat data input configuration files in HLA are compatible with Filebeat versions up to 8.x. For Filebeat version 9.0 and above, either migrate from log input to filestream input or generate a new configuration file. For more information on the migration process, refer to the Filebeat documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

Related topics

Configure advanced settings for Rsyslog, Splunk, or TCP data inputs in Health Log Analytics manually

Configure advanced settings for Beats data inputs in Health Log Analytics manually

Configure a ServiceNow Log Export data input in Health Log Analytics manually

Set up a data input for monitoring ServiceNow instance node logs from both Java code and JavaScript in Health Log Analytics (HLA). This data input provides a complete view of your instance status, including server context.

Before you begin

Note: Only a single ServiceNow Log Export data input can exist in the system. This data input doesn't run on a MID Server.

- Verify that the Log Export Service (LES) is installed on your ServiceNow instance. LES is a ServiceNow Platform tool under a different license than Health Log Analytics that enables you to export your system logs seamlessly into HLA. For more information, see Log Export Service (LES).
- Verify that the Hermes Messaging Service is up and running:
  1. Navigate to **All** > **Hermes Messaging Service** > **Diagnostics**.
  2. Ensure that the status icon is green, signifying that the service is active: .

     If it isn't, contact ServiceNow support.
- Create an instance-signed PKI Certificate:
  1. Navigate to **All** > **Certificate Generator** > **Instance PKI Certificate Generator**.
  2. In the **Certificate Password** field, set a password to use for your certificate.
  3. Select **Generate**.

     The system generates the certificate.
  4. Download the `keystore` and `truststore` files to your machine.
- Create a Basic Auth credential and attach it to a credential alias.
  1. Navigate to **All** > **IntegrationHub** > **IntegrationHub Usage** > **Connections & Credentials** > **Credentials**
  2. Select **New**.
  3. Select **Basic Auth Credentials**.
  4. In the **Password** field, enter the certificate password.
  5. In the **Credential alias** field, attach the new Basic Auth credential to a new credential alias.

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The ServiceNow Log Export data input streams system node logs from Java code and JavaScript into HLA, providing a complete view of your ServiceNow instance status with server context. This enhanced visibility facilitates improved monitoring and generates more meaningful alerts to help you identify instance issues, detect security threats, optimize performance, and maintain regulatory compliance.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose **ServiceNow Log Export Hermes Consumer**.
4. Select the **Manage Attachments** icon ( ) and attach the `keystore` and `truststore` files to the form.
5. On the form, fill in the fields.
   For a description of the fields, see ServiceNow Log Export data input configuration fields.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record.

Alerts generated by this data input have the `glide_node_log alerts` component alert tag in the **Express List Active alerts** page.

Configure a ServiceNow System Logs Retriever data input in Health Log Analytics manually

Set up a data input for streaming log data from the ServiceNow System Log table to the HLA engine (aka Occultus).

Before you begin

Note: Only a single ServiceNow System Logs Retriever data input can exist in the system. This data input doesn't run on a MID Server.

Role required: admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the ServiceNow System Logs Retriever data input.
4. On the form, fill in the fields.
   For a description of the fields, see ServiceNow System Logs Retriever data input configuration fields.
5. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The data input starts streaming ServiceNow log data from the System Log table to the Health Log Analytics AI engine, based on the configured filters. Admin users can set filters to query the System Log table. Operators can monitor the logs and view the alerts that Health Log Analytics generates from them.

For a description of how this data input can help you detect and resolve emerging issues in your organization's ServiceNow instance, see Use Case: Proactive monitoring of your ServiceNow instance in Health Log Analytics.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

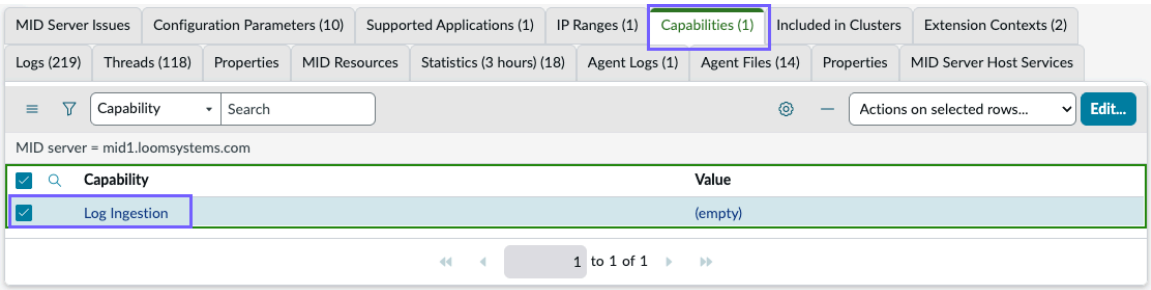
Make sure that the data input is streaming data.

Configure a Splunk data input in Health Log Analytics manually

Set up a data input for streaming log messages to your ServiceNow instance using a Splunk heavy forwarder.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.
- Configure Splunk to forward logs to your ServiceNow instance using Syslog.
- The configuration of this data input assumes the existence of an environment variable named $SPLUNK_HOME. In Unix-like environments, this variable typically points to `/opt/splunk`.

Note: The Windows environment uses the same directory structure, but with backslashes (\).

Role required: evt_mgmt_admin

About this task

This setup procedure is for streaming logs to your instance using a Splunk heavy forwarder. If you can't use a heavy forwarder, you can use a Splunk Universal Forwarder instead. For more information, see the Splunk Universal Forwarder as a Shipping method [KB0961378] article in the Now Support Knowledge Base.

Starting in the Yokohama family release, you can use new Splunk data inputs to ingest data in the preprocessed ("cooked") log-forwarding format that Splunk uses by default. In cooked mode, the Splunk forwarder embeds configuration details, such as host, source type, source, and other settings into the log data. Ingesting the data into HLA in this format verifies that each log line retains all the relevant contextual information. If you are using the cooked data option in HLA, there is no need to edit the `props.conf` and `transforms.conf` files during Splunk data input configuration.

Note: All Splunk configuration files are located in the `$SPLUNK_HOME/etc/system/local/` folder. If a configuration file that you need to modify doesn't exist, create it and save it to this folder.

Note: A MID Server that is down can cause a blockage in your Splunk pipeline. A full processing queue does not affect the pipeline.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Splunk data input for streaming logs via a Splunk heavy forwarder or universal forwarder.
4. On the **Getting Started** tab, fill in the form fields.
   For a description of the fields, see Splunk data input configuration fields.
5. On the **Outputs.conf** tab, add the following stanzas to the `outputs.conf` file to make the shipper forward log data over the selected transport protocol on the selected port, and then select **Next**.

   Note: If you have already configured outputs, merge these lines with your existing configuration.

   - Forwarding over TCP:

     Note: Use the first stanza only if you have not already configured a tcpout stanza. The second stanza is required for forwarding to Health Log Analytics over TCP.

     ```
     [tcpout]
     indexAndForward = 1
     defaultGroup = nothing

     [tcpout:health_log_analytics]
     server = ip-172-31-17-121.us-east-2.compute.internal:5000
     sendCookedData = false
     compressed = false
     ```

   - Forwarding over UDP:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Use the first stanza only if you have not already configured a syslog stanza. The second stanza is required for forwarding to Health Log Analytics over UDP.

```
[syslog]defaultGroup = nothing

[syslog:health_log_analytics]
server = ip-172-31-17-121.us-east-2.compute.internal:5000
```

6. On the **Props.conf** tab, edit the `props.conf` file, and then select **Next**.

Note: If you selected the **Use Cooked Data** option on the **Getting Started** tab, there is no need to edit the `props.conf` file.

a. Modify existing stanzas or add stanzas to mark source types, service instances, and hosts for forwarding to Health Log Analytics.

Note: For best results, mark only source types for forwarding.

When adding stanzas, use the following name formats:

- Source types: [<source type>]. For example: [syslog]
- Sources (not recommended): [source::<source>]. For example, [source::myApp]
- Hosts (not recommended): [host::<host>]. For example, [host::10.9.8.7]

b. Add the following line to the end of each stanza that you want to forward to Health Log Analytics over either TCP or UDP.

- Forwarding over TCP:

```
TRANSFORMS-cloned_data = clone_for_hla_store_sourcetype,
 clone_for_hla
```

- Forwarding over UDP:

```
TRANSFORMS-cloned_data = clone_for_hla_store_sourcetype,
 clone_for_hla_udp
```

This line applies the CLONE_SOURCETYPE transform on the data to prevent manipulation needed for Health Log Analytics processing from affecting your existing data pipeline. For example, to send all logs from the source type "syslog" to Health Log Analytics:

```
[syslog]
                                    #existing configuration
 goes here
                                    TRANSFORMS-cloned_data =
 clone_for_hla_store_sourcetype, clone_for_hla_udp
```

c. Add the following stanza to apply all the relevant transforms needed for Health Log Analytics processing.

Note: Splunk enables you to anonymize sensitive data on the cloned source type for the selected protocol. For more information, see the "Anonymize data" section in the Splunk documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Forwarding over TCP:

```
[send_to_hla_tcp]
TRANSFORMS-health_log_analytics =
 health_log_analytics_add_sourcetype,
 health_log_analytics_add_host,
 health_log_analytics_add_source,
 health_log_analytics_add_syslog5424,
 health_log_analytics_add_index,
 health_log_analytics_add_syslogHost,
 health_log_analytics_add_time
```

- Forwarding over UDP:

```
[send_to_hla_udp]
TRANSFORMS-health_log_analytics =
 health_log_analytics_add_sourcetype,
 health_log_analytics_add_host,
 health_log_analytics_add_source,
 health_log_analytics_add_syslog5424,
 health_log_analytics_add_index,
 health_log_analytics_add_syslogHost,
 health_log_analytics_add_time
```

7. On the **Transforms.conf** tab, add the following stanzas to the `transforms.conf` file, and then select **Next**.

Note: If you selected the **Use Cooked Data** option on the **Getting Started** tab, there is no need to edit the `transforms.conf` file.

The third stanza clones the logs for further manipulation without affecting your existing indexing. The remaining stanzas add the information needed to enable correct Health Log Analytics processing.

Note: You can obfuscate sensitive data by adding a transform here and then modifying the stanza of the cloned source type in the `props.conf` file.

```
[accepted_keys]
#Custom field for preserving sourcetype
hla_sourcetype_preservation=_hla_sourcetype

#Store sourcetype in a custom field, since CLONE_SOURCETYPE
 overwrites it
[clone_for_hla_store_sourcetype]

```

8. On the **Finish.conf** tab, restart Splunk by running the `$SPLUNK_HOME/bin/splunk restart splunkd` command.
9. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
10. Verify that the data input is configured correctly by selecting **Test connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health Log Analytics tries to connect the MID Server to the data repository.

- If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
- If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

  Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

  Note: You can only publish the data input configuration when the connection is created successfully.

Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

11. Select **Publish** to publish the data input to the MID Server.

Result

The data input configuration process is complete. Health Log Analytics adds the data input record to the **Data Inputs** table and attaches the configuration file to the data input record. The data input starts streaming log data to your ServiceNow instance using a Splunk shipper.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *mid.public_ip* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.
- For shipping your logs encrypted using SSL TLS, see the Streaming Data With Rsyslog & Filebeat Using SSL [KB0866319] article in the Now Support Knowledge Base.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose the Splunk Polling data input.
4. On the form, fill in the fields.
   For a description of the fields, see Splunk Polling data input configuration fields.
5. **Optional:** Select **Advanced** to set additional configuration fields.
   On the **Transport tab** and **Advanced tab**, fill in the fields. For a description of the fields, see Splunk Polling data input configuration fields.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
7. Verify that the data input is configured correctly by selecting **Test connection**.
   Health Log Analytics tries to connect the MID Server to the data repository. If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected.

   Note: You can only publish the data input configuration when the connection is created successfully.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

Configure a TCP data input in Health Log Analytics manually

Set up a data input for sending raw log messages to your ServiceNow instance directly over a TCP/SSL socket.

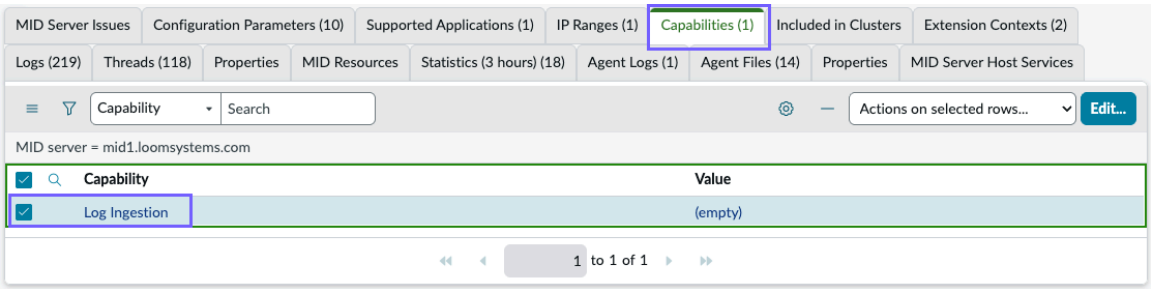
Configure a Vector Agent data input in Health Log Analytics manually

Set up a Vector Agent data input to enable Health Log Analytics to process log messages that are streaming into your ServiceNow instance via a Vector Agent.

Before you begin

- Verify that a MID Server is installed and configured with the Log Ingestion capability enabled. For more information, see MID Server system requirements.



Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- Unless the MID Server and external clients are on the same network, the MID Server must have a public IP address. This is required when its IP is exposed through network address translation (NAT), a load balancer, or a similar device. The public IP address enables external clients, such as Filebeat agents located outside its network, to reach the MID Server. Private IP addresses are not routable over the internet. Without a public IP, external clients cannot connect to the MID Server even if they are configured with its address. In the MID Server properties, add a property named *`mid.public_ip`* with the public IP address as the value. For more information, see Create a MID Server property. If the MID Server and external clients are on the same network, connections can be made using the private IP address.

- Verify that you have a `vector.yaml` file on your system, or create one.

Role required: evt_mgmt_admin

About this task

If your organization uses Vector by Datadog to handle log data from multiple sources before sending it to Health Log Analytics, the log format HLA receives is distinct from other types. The

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Vector Agent data input enables HLA to detect and separate transport headers from inner log messages in this format, forwarding only the inner message to the source type structure for processing.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. On the Data Inputs page, select **New**.
3. Choose **Vector - Stream logs from Vector Agent**.
4. On the **Getting Started** tab, fill in the form and then select **Next**.
   For a detailed description of the fields, see Vector Agent data input configuration fields.
5. On the **vector.yaml** tab, update the code with the relevant values as needed.
   For example, you can specify the sources or source file from which the logs will be streamed.

   Note: Code that you should not modify is preceded by a commented note.

   For more information, consult the Vector documentation.
6. Copy the updated code and paste it into the `vector.yaml` file on your system.
7. Select **Next**.
   The **Finish** tab displays a message confirming that the data input configuration process is complete.
8. Start streaming log data by running Vector with the configuration file.
   Run the following command:`vector --config /path/to/your/vector.yaml`, where `/path/to/your/` is the actual path to your YAML file.
9. **Optional:** Use the other commands displayed on the **Finish** tab as needed.
10. Select **Save** to save the data input.

Result

Health Log Analytics adds the data input record to the **Data Inputs** table. The data input starts streaming log data to your ServiceNow instance.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

What to do next

Make sure that the data input is streaming data.

Identify and resolve a log streaming issue in Health Log Analytics

Find and address log streaming issues to verify that your data inputs are streaming log data to your instance properly.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Streaming Sources**.
   The Streaming Sources page shows all data inputs and the MID Servers that are receiving logs from them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- When **Look up hostnames** is selected in the advanced data input configuration, the Streaming Sources page shows the hostname of devices that use an Rsyslog or a Filebeat shipper. For Elasticsearch indices, it displays the index name.
- Streaming Sources is also available as a related list on the data input form. The related list displays only the endpoint devices that are relevant to that data input.
- If the HLA engine is down and data has stopped streaming, a notification appears at the top of the Streaming Sources page. When this happens, contact ServiceNow support.

2. Select a data input record to view the streaming data of its sources and identify streaming issues and their possible cause.
   For example, if the last recorded event time for a data input's endpoint server is yesterday, that server might be down or configured incorrectly. A streaming issue might also be caused by the data input configuration file not being installed on the endpoint.

Filter	Description
Status	The status of the source. A red bullet indicates that this source has not streamed data in the last hour.
Last event time	The last recorded time an event arrived at the MID Server in the last one-minute interval. Health Log Analytics continuously updates the last event time. If the last event time is not up to date, data is not streaming.
Raw log lines/sec	The average number of raw log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value represents the number of raw log lines before preprocessing.
Preprocessed log lines/sec	The average number of preprocessed log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value can differ from the number of raw log lines per second. For example, the difference can be a result of logs having been dropped during preprocessing.

3. Investigate and resolve any data streaming issues.

Note: If you experience permissions-related issues with streaming log data from Elasticsearch, refer to the Granting privileges for data streams from Elasticsearch [KB0967366] article in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

When the logs are streaming properly, proceed to map your raw log data.

Note: You can choose to edit incoming raw log data before Health Log Analytics processes it. For example, preprocessing enables you to discard log portions or remove sensitive data from your logs. This task is optional.

Additional data input setup tasks in Health Log Analytics

After performing the initial data input setup and configuration in Health Log Analytics, continue with the remaining data input setup tasks.

Add a timestamp format in Health Log Analytics

Define any timestamp format that does not appear in the list of defined formats. Health Log Analytics must be able to read timestamps of any format contained in your log files.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Timestamp Formats**.
2. To determine whether your timestamp format matches a predefined format in the system, do the following:
   a. Select **Find format**.
   b. Enter a sample of your timestamp.
   c. Select **Find format**.
   If the sample matches an existing format, the system provides its ID.
3. If your timestamp sample doesn't match an existing format, then manually define your custom format and add it to the available timestamp formats.
   a. On the Timestamp Formats page, select **New**.
   b. On the form, fill in the fields.

Timestamp format form

Field	Description
ID	ID of the timestamp format. This value is selected automatically.
Format	Valid timestamp format. For example, dd-MMM-yyyy, HH:mm. **Note:** Health Log Analytics uses the Java 8 API for timestamp syntax.
Sample	Example of the timestamp format. For example, 03-May-2018, 10:20.
Description	Description of the timestamp format.

4. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The system validates the timestamp format and adds it to the list of available timestamps.

Add a source type manually in Health Log Analytics

Create a source type manually before you configure a data input if you want to stream log data to a specific source type rather than to the source type automatically extracted by Health Log Analytics during the mapping process.

Before you begin
This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

Role required: evt_mgmt_admin

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Source Types**.
2. On the Source Types page, select **New**.
3. On the form, fill in the fields.

Source type form

Field	Description
Name	The name of the source type. The name must be between 3-50 characters long. Acceptable characters are letters, numeric values, dashes, and underscores.
Examples	One or more raw input samples for this source type. Enter each sample on a new line. **Note:** This field must contain data.

The fields in the following table are read-only.

Field	Description
Created manually	Option for indicating that this source type was created manually. Default: true.
Auto-extraction enabled	Auto-extraction for this source type is disabled by default.
Learning mode	Option for indicating that Learning mode for the source type is ongoing. The AI engine must learn the format of log messages in each new log stream. In Learning mode, it learns the format of messages for this source type and extracts properties based on that knowledge.

4. Right-click the form header and select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Load examples** to load the raw input samples for this source type that you provided in the **Examples** field.
   When loading the log samples is completed successfully, the **Examples** field and the **Load examples** buttons no longer appear on the form.
6. **Optional:** Check how the AI engine has parsed the raw input samples by selecting the **Go to Source Type Structure** related link and modify the extracted properties if necessary.
7. Click **Submit**.

What to do next

Configure a data input and then map it to the new source type. For more information, see Set up data inputs in Health Log Analytics manually and Map raw log data in Health Log Analytics.

Related topics

Refine the source type structure in Health Log Analytics

Configure source type capabilities in Health Log Analytics

Health Log Analytics extracts source types automatically in the mapping process. You can add timestamp formats and specify, delete, or exclude keywords for individual source types.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Source Types**.
   The Source Types table lists all source types that were extracted automatically during raw data mapping.

Source Types

Field	Description
Auto extraction enabled	Auto-extraction for this source type is either enabled or disabled. This value is set on the Source Type Structure form. Default: true.
Learning mode	Learning mode for the source type is either ongoing or completed. The AI engine must learn the format of log messages in each new log stream. In Learning mode, it learns the format of messages for this source type and extracts properties based on that knowledge.
Stack trace detection enabled	Detection of active stack frames for this source type is either enabled or disabled. Typically, a stack trace enables tracking an error to the log in which it originated.

2. Open a record.
3. **Optional:** Add a timestamp format for this source type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the **Source Type Timestamps** tab, select **New**.

b. In the **Timestamp format** field, select a format from the list of available timestamp formats.

c. Select **Submit**.

4. **Optional:** Specify a keyword for this source type.

a. On the **Lexical Keywords** tab, select **New**.

> **Note:** The **Lexical Keywords** tab contains both global and specified keywords. Selecting **New** creates a specified keyword for this source type.

b. On the form, fill in the fields.

Field	Description
Name	Unique and descriptive name for the keyword.
Regular expression	The regular expression ("regex") that defines matches.
Exact match	Boolean value. If selected, Health Log Analytics matches the exact regex. For example, 'NullPointerException' in a message would not match the regex 'exception'. Default: True
Case-sensitive	Boolean value. If selected, Health Log Analytics looks for a case-sensitive match of the regex. Default: False

c. Select **Submit**.

5. **Optional:** Delete a keyword specified for this source type.

a. Select the row of the specified keyword that you want to delete.

b. From the **Actions on selected rows** list at the bottom of the page, select **Exclude keyword**.

c. Select **Continue** to delete the keyword.

6. **Optional:** Exclude a global keyword for this source type
When you exclude a keyword, Health Log Analytics no longer looks for it in the log data of this source type.

a. Select the row of the global keyword that you want to exclude.

b. From the **Actions on selected rows** list at the bottom of the page, select **Exclude keyword**.

> **Note:** You can delete global keywords from the Lexical Keywords page.

7. Select **Update**.

Verify your log sources in Health Log Analytics

Verify that all your log sources are present and active after Health Log Analytics tagging has assigned a log to a service instance and components, and has automatically mapped the log to a source.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Log Sources**.
   The Log Sources table provides information about the sources created when you mapped the streaming data. The table lists these sources by service instance.

Column	Description
Service instance	The service instance. Service instances represent large or complete business processes. A single service instance can consist of multiple components, whereas different service instances can include the same components.
Component	The components comprising the service instance. Components represent small technical parts or business processes. Typically, they represent Configuration Items (CIs). Several components are often clustered together in a single service instance.
Status	The status of the log source: Active or Inactive. The Active status indicates that logs streamed into the system from this source in the last hour.
Created	The creation date and time of this log source.
Last event time	The last time logs streamed into the system from this source.

2. Make sure that the system has created all your log sources.
3. Verify the creation, status, and log samples of a specific source in the source record.

   Note: Because auto-mapping can map log data to multiple sources, be sure to verify this information per source.

4. If a log source is missing, add it.

   a. Navigate to **Health Log Analytics** > **Data Input** > **Data Input Mapping**.

   b. Use the JavaScript function to manually map a log sample to the correct service instance, component, and source type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Map raw log data in Health Log Analytics.

c. Navigate back to the Log Sources page and verify that the status of the new log source is Active.

The system creates a log source.

5. Make sure that the status of all your log sources is Active.
If the status of a source is Inactive, double-click it and change it to Active manually.
6. Select **Update**.

Related topics

Delete a log source in Health Log Analytics

Stop extraction of unneeded log data in Health Log Analytics

Extract specific log data in Health Log Analytics

Delete a log source in Health Log Analytics

Delete a log source with or without its associated log data in Health Log Analytics.

Before you begin
Role required: evt_mgmt_admin

About this task
When you delete a log source, Health Log Analytics automatically deletes its related log data. You can also delete a source while keeping the log data. The associated data will then be deleted according to the log retention policy. For more information, see Storage space for log retention in Health Log Analytics.

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Log Sources**.
2. Open a source record.
3. Delete the log source in one of the following ways:
   - Delete the source and its related data by selecting **Delete**.
   - Delete the source without its related data by selecting the **Delete without logs** related link.

Review properties extracted from a source type in Health Log Analytics

Inspect the properties that were extracted from all the source types in a source type structure in a single table to identify any setup issues.

Before you begin
Role required: evt_mgmt_admin

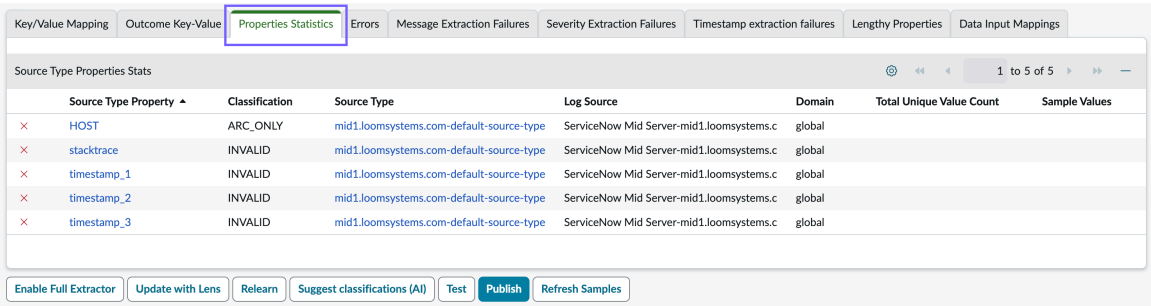
About this task
The Source Type Properties Stats table provides a comprehensive overview of the properties that were extracted from the source types. By reviewing the statistical distribution of their values, you can assess the classification of these properties and adjust your settings if needed.

The procedure in this section explains how to access the Source Type Properties Stats table via the Source Type Structure. From a source type record, you can navigate to the Source Type Structure by selecting the **Go to Source Type Structure** related link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Source Type Structures**.
2. Open a source type structure record.
3. Open the **Properties Statistics** related links tab.



The **Source Type Properties Stats** table shows the properties of all the source types that are part of this source type structure.

Source Type Properties Stats

Column	Description
Source Type Property	The property extracted from the source type.
Classification	The classification of the property. The available types are: METER, GAUGE, ARC, and INVALID. **Note:** A property classified as INVALID (the default classification) isn't tracked for anomaly detection or shown in the Meaningful Properties analysis.
Source Type	The source type from which the property was extracted.
Log Source	The list of Log Sources in which this property appeared.
Domain	The domain to which the log source belongs.
Total Unique Value Count	Only for properties classified as METER: The total number of distinct values contained in it. This field is inactive when the property is classified as ARC or GAUGE. **Note:** The Total Unique Value Count is updated once a day. Records older than 24 hours are deleted automatically.
Sample Values	Only for properties classified as METER: Sample unique values tracked by the system. Default is 30 samples.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	This field is inactive when the property is classified as ARC or GAUGE.

4. Review the properties and identify possible classification issues.
5. **Optional:** View statistics for individual source type properties classified as ARC_ONLY or GAUGE.
   a. Open a source type property classified as ARC_ONLY or GAUGE from the **Properties Statistics** related links tab.
   b. On the **Source Type Property** form, select **Source Type Properties Stats**.
   The following information displays in a pop-up:
   - For an ARC property: The percentage distribution of terms, based on the processed logs. For example, the percentage of Bad Request vs. Success.
   - For a GAUGE property: The average, minimum, and standard deviation from the expected numerical value.
6. **Optional:** Change classification settings on the **Key/Value Mapping** tab.
   For more information, see Refine the source type structure in Health Log Analytics.

Review patterns extracted from a source type in Health Log Analytics

Inspect all learned patterns extracted from a source type in a source type structure, together with the log sources in which these patterns appeared. Reviewing these patterns can provide valuable insights into the log message patterns that Health Log Analytics tracks for each source type and log source.

Before you begin
Role required: evt_mgmt_admin

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Source Type Structures**.
2. Select a source type in the **Source type name** column.
3. On the Source Type form, select the **Aggregated Log Patterns** related list.
   The tab shows the following data for each pattern that was extracted from this source type. The displayed data is updated every hour.

Aggregated Log Patterns

Column	Description
Pattern text	The content of the aggregated pattern.
Sources	The sources in which the pattern appeared.
Domain	The domain to which the pattern belongs.

Modify a data input configuration in Health Log Analytics

Change the configuration of a data input for Health Log Analytics by adding a new path to an existing data input configuration or modifying the data input's MID Server destination and port.

Before you begin
Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. Open a record from the Data Inputs table.
3. Modify the data input configuration.

Column	Description
Name	Name of the data input.
Description	Description of the data input.
Port	The port on the MID Server. **Note:** The port must not be occupied by another process. Make sure that your organization's security team opens the selected port.
MID	The MID Server to which the logs stream. **Note:** ○ You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. ○ The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties.

Settings

Column	Description
Path	The full path from which to stream logs. You can use a wildcard. **Note:** This column is not available on Windows systems using Winlogbeat.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.
Component	The device type or stack layer as context for the logs that is used for anomaly detection and correlation. For example, Tomcat. Components typically represent CIs in the CMDB. Several components are often

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	clustered together in a single service instance.
Source Type	The source type that defines how Health Log Analytics handles a specific application and parses the log data. For example: Tomcat Catalina. Each data input can have multiple source types depending on the diversity of its log formats. Service instances and components can have any number of source types.
For handling multiline messages on Linux / Windows systems using Filebeat only:	
Match	Specifies how Filebeat combines matching lines into an event, either **after** or **before**.
Negate	Boolean that defines whether the pattern identified in the log lines is negated. The default is **false**.
Regex	The regular expression to match.

Note: You can modify the Rsyslog configuration file to make the agent ship system logs in addition to application logs. For more information, see the Shipping system logs using Rsyslog [KB0954507] article in the Now Support Knowledge Base.

4. Select **Update**.
5. For data inputs that use Rsyslog or Beats agents only, rebuild the server-side configuration file and install it on the endpoint device.
   a. Select **Rebuild configuration file**.

      Health Log Analytics rebuilds the file and saves it in the Manage Attachments section. Depending on the agent used, the rebuilt file is saved as either `rsyslog.yml`, `filebeat.yml`, or `winlogbeat.yml`.

      The system automatically renames the previous configuration file by adding a suffix with the date and time the file was rebuilt to the file name.

   b. Install the rebuilt configuration file on the endpoint according to your data input type.

Data input type	Action
Rsyslog	i. Download the file and install it on the endpoint device in the `/etc/rsyslog.d/rsyslog.conf` directory. ii. Validate the configuration by running the `rsyslogd -N1` command. iii. Verify the output. If it contains errors, check the `/var/log/messages`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data input type	Action
	system log file for error messages and fix the errors. iv. Restart Rsyslog by running the `sudo systemctl restart rsyslog` command.
Linux	i. Download the file and install it on the endpoint device in the `/etc/filebeat/` directory. ii. Restart the agent service by running the `sudo service filebeat restart` command. **Note:** The generated configuration ignores files that were last changed more than six hours ago. If needed, you can change this setting in the configuration file.
Windows using Beats (Filebeat or Winlogbeat):	i. Download the file and install it on the endpoint device in the C:\Program Files\ directory. ii. Restart the agent service by running the appropriate command in PowerShell: ▪ Filebeat: `PS > Restart-Service filebeat` ▪ Winlogbeat: `PS > Restart-Service winlogbeat` **Note:** The generated configuration ignores files that were last changed more than six hours ago. If needed, you can change this setting in the configuration file.

Advanced data input configuration in Health Log Analytics

When you have configured a data input successfully, Health Log Analytics adds a record to the Data Inputs table and attaches the configuration file to it. You can configure advanced settings for your data input. Configuring advanced settings is optional.

Configure advanced settings for Amazon CloudWatch data inputs in Health Log Analytics manually

Configure advanced settings for data inputs used for streaming log data from Amazon CloudWatch to your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
You can set system parameters for reading log data that determine the actions that the system performs on log data arriving on the MID Server. For example, you can set the time zone to use if a log lacks a timestamp. If no advanced settings are configured, the system uses the default values.

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. Open an Amazon CloudWatch data input record from the Data Inputs table.

   Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

3. Select **Advanced** and then select the **Advanced** tab.
4. On the form, fill in the fields.
   For a description of the fields, see Amazon CloudWatch data input configuration fields.

   The **Character encoding** field is read-only. By default, the character encoding used for this data input is UTF-8.

5. **Optional:** In the Streaming Sources related list, verify that this data input is streaming log data from all relevant endpoint devices.
   For more information about streaming sources, see Identify and resolve a log streaming issue in Health Log Analytics.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
7. Ensure that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

© 2026 ServiceNow, Inc. All rights reserved.

   For more information about streaming sources, see Identify and resolve a log streaming issue in Health Log Analytics.
6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
7. Ensure that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

     Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

Related topics

Configure a Rsyslog, Filebeat, or Winlogbeat data input in Health Log Analytics manually

Configure advanced settings for Elasticsearch data inputs in Health Log Analytics manually

Configure advanced settings for data inputs used for streaming log data from Elasticsearch indices to your instance.

Before you begin

Role required: evt_mgmt_admin

About this task

You can set system parameters for reading log data that determine the actions that the system performs on log data arriving on the MID Server. For example, you can set the time zone to use if a log lacks a timestamp. If no advanced settings are configured, the system uses the default values.

For additional information about streaming logs using the Elasticsearch data input, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support Knowledge Base.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. Open an Elasticsearch data input record from the Data Inputs table.
   The data input configuration displays.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The number of log sources that the data input has created is shown in the **Sources count** field. For more information about data input sources, see Log data auto-mapping and mapping in Health Log Analytics.

Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the data input configuration page. When this happens, contact ServiceNow support.

3. Select **Advanced** and then select the **Advanced** tab.
4. On the form, fill in the fields.
   For a description of the fields, see Elasticsearch data input configuration fields.
5. **Optional:** In the Streaming Sources related list, verify that this data input is streaming log data from all relevant endpoint devices.
   For more information about streaming sources, see Identify and resolve a log streaming issue in Health Log Analytics.

   Note: If you experience permissions-related issues with streaming log data from Elasticsearch, refer to the Granting privileges for data streams from Elasticsearch [KB0967366] article in the Now Support Knowledge Base.

6. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
7. Ensure that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   If the data input is configured to run on a MID Server cluster, the system tries to connect all the MID Servers contained in the cluster to the repository. The cluster passes the test if at least one of its MID Servers gets connected. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

     Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

   Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

- If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
- If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

  Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

  Note: You can only publish the data input configuration when the connection is created successfully.

Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

8. Select **Publish** to publish the data input to the MID Server.

Stop or restart a data input in Health Log Analytics

You can stop using a data input for streaming log messages to your ServiceNow instance. Restart the data input if you want it to resume streaming data.

Before you begin

This functionality is available only when the data input configuration has been published.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Log Data Inputs**.
2. Open a data input record from the Data Inputs table.
3. Select **Stop Data Input**.
   The name of the button changes to **Start Data Input**.
4. To start using the data input again, select **Start Data Input**.

Edit raw log data before processing in Health Log Analytics

You can modify raw log data and drop or break up log messages before they are treated in the MID Server, and therefore before Health Log Analytics maps and structures them. For example, you could prevent sensitive data from reaching Health Log Analytics by replacing user names and passwords with an asterisk (*).

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input Preprocessor**.
2. Open a record.

Note: The first time the preprocessing form is displayed, Health Log Analytics fetches log samples automatically. In subsequent sessions, fetch fresh samples manually by selecting **Refresh Samples**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. **Optional:** Prevent showing log samples that are taken from your organization's raw logs by selecting **Disable raw log samples**.
   Select this option if you don't want to expose your logs to Health Log Analytics.
4. **Optional:** View how the current JavaScript function affects the log lines.
   a. Add a sample message in the **Test manual sample** field.
   b. Select **Go**.
   c. Note how the JavaScript function affects the log lines.
5. In the **Raw input samples** field, choose a log sample that will show the effect of your new JavaScript function on log lines when you test it.
6. Define a JavaScript function that modifies your raw log data before Health Log Analytics maps and structures it.

Note:

(ACC data inputs only) When the Agent Client Collector switches to a different MID Server to provide failover protection, it must switch to a different ACC data input. Therefore, all ACC data inputs must have the same JavaScript function. Health Log Analytics provides the latest published JavaScript function to all existing and future ACC data inputs, replacing the previous script. This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. For information about failover protection in Agent Client Collector Log Analytics (ACC-L), see Agent Client Collector Log Analytics.

a. In the JavaScript console, either change the provided default JavaScript function, modify an existing custom JavaScript function, or define a new one.

Note: In addition to the default JavaScript function for data preprocessing, Health Log Analytics provides a JavaScript function template named `Scrubbing`. This JavaScript function removes personally identifiable information such as email addresses, social security numbers, and passwords, from the raw log data. The template can act as a starting point for your custom script code. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

Note: (ACC data inputs only) Make sure that your JavaScript function can be used to handle data streamed by all ACC data inputs.

JavaScript functions for preprocessing raw log data use the following objects:

- Signature: function process(sample, metadata)

Object	Description
sample	The current log sample.
metadata	Object that contains the event stream. To access the event stream, call the `metadata.eventStream` function. Because event stream is an object, you can access each of its properties by calling the `metadata.eventStream.origin` or `metadata.eventStream.LocalPort` functions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Object	Description
	The list of available event stream properties is available in the **Event Stream: access via metadata** tab.

- Return type and structure

  Note: The JavaScript function returns a map of two entries. Do not change this return structure.

Object	Description
modifiedInput	The current log message after the JavaScript function has modified the original message. If null, the original log message is used.
splitEvents	Array of log messages after the JavaScript function has divided the original message.

- To discard a log message, call `return drop()`.

b. Test the JavaScript function by selecting **Test** and viewing the outcome on your log sample in related lists.

Tab	Description
Outcome	The result of running the JavaScript function on your log sample.
Event Stream: access via metadata	The key-value pairs that present the event stream metadata.
Failures	The log samples on which the JavaScript function failed to run successfully.

Note: If your new JavaScript function is not behaving as expected, you can revert to the last published one by selecting the **Revert JS Function** related link.

c. Optional: Make any necessary adjustments and then test the JavaScript function again.

7. Select the **Save template** option to save the JavaScript function.
You can either save the JavaScript function as a new template or overwrite the currently selected template.

- To save the JavaScript function as a new template, enter a new name in the **Template name** field.
- To overwrite the template currently selected in the **JS function templates** field, leave the **Template name** field empty.

8. Select **Publish** to save the JavaScript function to the database.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

When the JavaScript function is published, Health Log Analytics uses it to pre-process your raw log data before mapping and structuring it.

The new script is automatically added to the list of JS function templates from which you can choose. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

(ACC data inputs only) Health Log Analytics provides the published JavaScript function to all existing and future ACC data inputs. The new JavaScript function replaces the previous script.

What to do next

Proceed to the **Data Input Mapping** page by selecting the **Go to Mapping** related link. Map raw data that streams into your instance to determine how Health Log Analytics processes it.

Log data auto-mapping and mapping in Health Log Analytics

By default, the HLA Engine tries to auto-map every incoming log line to the correct tags. You can change automatic mapping results manually by defining a JavaScript function.

Auto-mapping incoming log lines

Health Log Analytics auto-mapping assigns log samples and metadata to three tags: service instance, component, and source type. The service instance assignment is based on the service instance specified in the data input setup. The remaining tags are assigned automatically.

For example, in the following example log line, Health Log Analytics uses the "source" field to find the component and source type.

```
{"beat":{"version":"6.8","name":"abc3.prd.acme.com","hostname":"
abc3.prd.acme.com"},"@timestamp":"2020-08-27T10:12:24.792Z","pro
spector":{"type":"log"},"message":"****
 User null is requesting the following page
 http://www.acme.com PROPS:{"subcategory1":"home
 pages","httpStatus":"200","loginLevel":"Anonymous","userAgent":
"Mozilla5.0",
 ("pageUrl":\"http://www.acme.com","host":"abc3.prd.acme.com","@
version":"1","source":"/opt/oracle/weblogic/abc/online_store3/lo
gs/online_store3.out","offset":3951550786}
```

In the example, Health Log Analytics extracts the string "online_store". It analyzes the following fields if they exist in the log line: source, path, channel, namespace_name, name, pod_name, source_name, and aws_lambda_name. When data is sent over Syslog, it also analyzes the syslog tag.

Stop extraction of unneeded data

If an extracted string is not descriptive enough or contains redundant text or information, you can stop extracting such expendable data. For more information, see Stop extraction of unneeded log data in Health Log Analytics.

Ensuring extraction of specific data

You can make sure that Health Log Analytics extracts specific desired terms. For more information, see Extract specific log data in Health Log Analytics.

Mapping data input sources

You can change automatic mapping results manually by defining a JavaScript function. Data input mapping enables you to organize your log data by service instance and by availability zone. A single service instance can include multiple components, and a component can

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

receive logs from many different source types. An service instance-component pair, however, is unique. Source types are based on a specific log structure and format. Service instances and components are defined more broadly and are therefore used mainly for logical mapping.

Activating **Test mode** avoids blowing up Elasticsearch storage with sample data that is used only for perfecting the log data mapping. When the data input is in Test mode, Health Log Analytics doesn't create the source types, sources, or any other objects it creates in the standard flow. It saves the streamed data in dedicated temporary Elasticsearch indices that appear as components in the Log viewer. When you publish the script and exit Test mode, these temporary indices are deleted to minimize storage space consumption.

When you're defining a JavaScript function, select **Test** to view the outcome of the script as it is currently specified. This functionality enables you to preview the created source types and sources. You can then refine the script until it achieves the desired outcome. For example, it can be useful to compare the test outcome of several versions of the JavaScript function.

Note: By default, the test processes 100 log data samples. You can customize this number in the system properties. For more information, see Configure global Health Log Analytics system properties.

During the data input setup, the system might create an excessive total number of data input sources. For example, this can be due to a faulty mapping script. You can configure limits for the number of sources created per data input in the system properties:

System property	Description	Default
log_source.sources_warning_limit	The warning limit for the number of sources created per data input.	500
log_source.sources_critical_limit	The critical limit for the number of sources created per data input.	600

The number of log sources that a specific data input has created displays in the **Sources count** field for that data input. When the total number of sources created during the data input setup reaches the warning limit, the system sends a warning notification by email. It also displays a message on the **Data Input mapping**, **Log sources**, and **Data input** pages. The notification and the message include the total number of sources created so far and the three data inputs that contributed the most sources to this total. If no action is taken, the system continues to create sources until the total number reaches the critical limit. When this happens, the data input setup and streaming from all data inputs stops automatically. You can't start data inputs again manually until the issue has been resolved. You can resolve this state by following the instructions in the How to handle too many sources in data inputs [KB0963067] article in the Now Support Knowledge Base.

Binding log data

Binding log data to Configuration Items (CIs) in the Configuration Management Database (CMDB) enables you to search the CMDB for endpoints that match a log. When you configure a data input, you bind log entries to a service instance that is bound to a CI in the CMDB. Binding log entries, service instances, and CIs enables the HLA Engine to correlate them for use in root cause analysis (RCA). For more information, see Configure a Rsyslog, Filebeat, or Winlogbeat data input in Health Log Analytics manually or Configure an Elasticsearch data input in Health Log Analytics manually.

Map raw log data in Health Log Analytics

Mapping raw log data that streams into your instance determines how the data is handled. Health Log Analytics automatically structures logs, creates metrics for anomaly detection, and presents alerts based on how your data is tagged.

Before you begin

Role required: evt_mgmt_admin

About this task

By default, Health Log Analytics tries to auto-map every incoming log line to the correct tag. If properties aren't discovered automatically, map the data input sources manually by defining a JavaScript function.

In the JavaScript function, you are required to map only the service instance (here called application service). Mapping the component and the source type is optional: Health Log Analytics tries to extract their values from the log data automatically. If the attempt fails, it assigns the default values. If you map the component but not the source type or vice versa, the system tries to extract the missing value from the log data. If it fails, it assigns the component value to the source type or vice versa, depending on which one you have mapped. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

Note:

(ACC data inputs only) When the Agent Client Collector switches to a different MID Server to provide failover protection, it must switch to a different ACC data input. Therefore, all ACC data inputs must have the same JavaScript function. Health Log Analytics provides the latest published JavaScript function to all existing and future ACC data inputs, replacing the previous script. This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. For information about failover protection in Agent Client Collector Log Analytics (ACC-L), see Agent Client Collector Log Analytics.

Note: You can manipulate raw log data before Health Log Analytics maps and structures it. For more information, see Edit raw log data before processing.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Mapping** > **Data Input Mapping**.
2. Open a record.

   Note: The first time the Data Input Mapping form is displayed, Health Log Analytics fetches log samples automatically. In subsequent sessions, fetch fresh samples by selecting **Refresh Samples**.

   Note: If the HLA engine is down and data has stopped streaming, a notification appears at the top of the Data Input Mapping page. When this happens, contact ServiceNow support.

3. **Optional:** To forward the complete raw log message, disable automatic header properties detection for this data input by selecting **Disable header detection**.
   For more information, see Header properties detection in Health Log Analytics.
4. **Optional:** Activate Test mode by setting the **Test mode** value to ON.
   In Test mode, Health Log Analytics doesn't create the source types, sources, or any other objects it creates in the standard flow to avoid blowing up Elasticsearch storage with sample data. For more information, see Log data auto-mapping and mapping in Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** View how the current JavaScript function affects log lines.
   a. Add a sample message in the **Test manual sample** field.
   b. Select **Go**.
   c. Note how the JavaScript function affects the log lines.
6. In the **Raw input sample** field, choose a log sample that will show the effect of your new JavaScript function on log lines when you test it.
7. **Optional:** Enable HLA to identify service instances and components from log fields and automatically map log data to them by selecting **Enable auto map from log field**.

   Note:
   - Automatic log context mapping can only be configured in the Service Operations Workspace. For more information about this feature, see Map logs to service instances, components, and source types for contextual alerts in Health Log Analytics.
   - If a manually-defined mapping script exists, automatic log context mapping overwrites it.
   - To be able to define a JavaScript function manually in the current form, the **Enable auto map from log field** check box must be clear.

8. Define a JavaScript function that maps your data input sources to the correct service instance (here called application service), component, and source type.

   Note: (ACC data inputs only) Make sure that your JavaScript function can be used to handle data streamed by all ACC data inputs.

   a. In the JavaScript console, either modify the provided default JavaScript function or a custom JavaScript function selected from the **JS functions templates** drop-down list, or define a new JavaScript function.
   The provided templates can act as a starting point for your custom script code. Available templates are:
   - Default Mapping Script
   - Glide Node Log Mapping Script
   - Glide Sys Log Mapping Script
   - Linux OS logs streamed with Syslog

     Note: Logs must have a syslog wrapper for this JavaScript function to work properly.

   - Mid Server Log Mapping Script
   - Windows - Winlogbeat logs streamed with Winlogbeat

   The JavaScript function for mapping raw log data uses the following objects:
   - Signature: function map(sample, metadata)

Object	Description
sample	The current log sample after preprocessing.
metadata	Object that contains:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Object	Description
	▪ Event Stream: Access via: <metadata value>. For example: `metadata.eventStream.origin` ▪ Transform header 1: Access via: <metadata value>. For example: `metadata.headers.i1.type` ▪ Transform header 2: Access via: <metadata value>. For example: metadata.headers.i2.type ▪ type Transform header 3: Access via: <metadata value>. For example: `metadata.headers.i3.type` ▪ Fallback Assignment: Access via: <metadata value>. For example: `metadata.fallBacks.host`

Note: You can create and associate multiple services per source type.

- Return type and structure

Note: The JavaScript function returns a map of two entries. Do not change this return structure.

Object	Description
applicationService	The existing application service (that is, the service instance) to which this sample will be assigned. **Note:** The service instance must be bound to anomaly alerts related to the log.
component	The component to which this sample will be assigned.
sourceType	The source type to which this sample will be assigned.

- To discard a log message, call `return drop()`.

b. Test the JavaScript function by selecting **Test**.

Testing the JavaScript function enables you to view the outcome of the script on the log sample. For a description of the displayed fields, see JavaScript function test outcome fields.

Note: If your new JavaScript function is not behaving as expected, you can revert to the last published one by selecting the **Revert JS Function** related link.

c. Optional: Make any necessary adjustments and then test the JavaScript function again.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. **Optional:** Compare the outcome of multiple tests.
Comparing the test results of several versions of the JavaScript function can help you refine the script until it achieves the desired outcome.

9. When you have finalized the JavaScript function, select **Save template** to save it.
You can either save the JavaScript function as a new template or overwrite the currently selected template.
   - To save the JavaScript function as a new template, enter a new name in the **Template name** field.
   - To overwrite the template currently selected in the **JS function templates** field, leave the **Template name** field empty.
10. Select **Publish** to save the JavaScript function to the database.

Result
When the JavaScript function is published, Health Log Analytics uses it to map data input sources.

The new script is automatically added to the list of JS function templates from which you can choose. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

(ACC data inputs only) Health Log Analytics provides the published JavaScript function to all existing and future ACC data inputs. The new JavaScript function replaces the previous script.

What to do next
- (Optional) Edit your raw log data before Health Log Analytics maps and structures it. If you want to perform this task immediately, click the **Go to Preprocessor** related link to proceed to the **Data Input Preprocessor** page.
- (Optional) Fine-tune how the system reads your log data by refining the Source Type structure. This step enables you to reclassify auto-classified properties and change auto-mapped labels.

Header properties detection in Health Log Analytics

Stop extraction of unneeded log data in Health Log Analytics

Extract specific log data in Health Log Analytics

View the relationships between source types and log sources in Health Log Analytics

Explore the many-to-many relationships between source types and log sources to help you optimize your data input mapping.

Before you begin
Role required: evt_mgmt_admin

About this task
Health Log Analytics uses source types to parse logs and utilizes log sources as the framework for detecting anomalies. Each source type provides logs that are analyzed by multiple log sources, and each log source receives logs that are parsed by multiple source types. Reviewing the associations between source types and log sources can help you improve your data input mapping for better performance and outcomes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Mapping** > **Data Input Mapping**.
2. Ensure that log data is streaming into your instance, and then open a data input mapping record.
3. View the associations between the log sources and the source types.
   - View the log sources that are associated with a source type:
     a. Open the **Source Types** tab to view the generated source type structures.
     b. Open a source type structure record.
     c. Select a source type.
     d. Under **Sources**, view all the log sources that receive data from this source type.
   - View the source types that are associated with a log source:
     a. Open the **Sources** tab to view the generated log sources.
     b. Select a log source record.
     c. On the **Source Types** tab, view all the source types that feed data into this log source.

Note: The displayed results are updated once a day. Results that are older than 24 hours are deleted automatically.

Header properties detection in Health Log Analytics

In Health Log Analytics, automatic header properties detection separates the transport header from the inner log message and forwards only the inner log message to the source type structure. The inner message contains the actual log data without including shipping information.

The Health Log Analytics application supports header properties detection for Fluentd, Beats, and Syslog (RFC 3164, RFC 5424).

Starting with Version 33.0.27 - August 2024, the system also supports header properties detection for logs that follow the OpenTelemetry logs data model and semantic conventions. For more information, see the OpenTelemetry Logs Data Model documentation.

Disabling header properties detection

When you disable header properties detection for a data input, the Health Log Analytics AI Engine stops extracting properties from the header. Forwarding the complete raw message can be useful in the following situations:

- The inner log message lacks information for parsing, such as timestamp and severity.
- The data input contains information that can be used for structuring.
- The data input forwards the logs fully parsed.

For the procedure to disable header properties detection, see Map raw log data in Health Log Analytics.

Extract specific log data in Health Log Analytics

Set Health Log Analytics to extract specified terms from logs and map them to specific components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Mapping** > **Extracted values**.
2. Select **New**.
3. In the **Value to extract** field, enter the term that you want Health Log Analytics to extract from your logs.
4. In the **Map to component** field, enter the component that you want the value mapped to.
5. In the **Property** field, choose a property from the list.
6. **Optional:** Further specify the value to extract by selecting additional options:
   - Exact match
   - Case sensitive
7. **Optional:** In the **Description** field, add a description of the value.
8. Select **Submit**.

Stop extraction of unneeded log data in Health Log Analytics

If an extracted string of data is not descriptive enough or contains redundant text or information, you can set Health Log Analytics to stop extracting such data from your logs.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Mapping** > **Excluded values**.
2. Select **New**.
3. In the **Value to exclude** field, enter the string that you want Health Log Analytics to stop extracting.
4. **Optional:** Further specify the values to stop extracting by selecting additional options:
   - Starts with
   - Ends with
   - Contains
   - Case sensitive
5. **Optional:** In the **Description** field, add a description of the value.
6. Select **Submit**.

Source type structure adjustment in Health Log Analytics

Health Log Analytics enables you to reclassify auto-classified properties and change auto-mapped labels. These adjustments help Health Log Analytics machine learning to better understand your priorities.

What HLA does automatically

HLA automatically separates the transport header from the inner log message and sends only the inner log message to the source type structure. The system extracts properties from incoming log messages and auto-maps labels to source type fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Classification determines how the HLA engine analyzes and processes each field. Available classifications are: METER, GAUGE, ARC_ONLY, HISTOGRAM, INVALID.
- Labels tell HLA what role a field plays in the log structure. Available labels are: MESSAGE, HOST, TIMESTAMP, SEVERITY, EVENT-ID.

Reviewing and, if necessary, modifying automatically mapped labels and auto-classified properties in the source type structure verifies the HLA engine interprets log fields correctly.

Note: Because a single data input can contain multiple source types, HLA structures log data by source type rather than by data input.

AI-powered classification and labeling suggestions

Simplify classification and labeling of parsed log properties with AI-powered automatic classification and labeling suggestions. You can access the AI agent from the **Source Type Structure** page to receive AI-suggested classifications and labels based on dynamic analysis of your log samples. AI-suggested classifications include METER, GAUGE, ARC_ONLY, and INVALID. AI-suggested labels include MESSAGE, HOST, TIMESTAMP, and SEVERITY. After reviewing the suggestions, select your preferred classifications and labels.

Example

The following example shows how to modify values of extracted properties in the source type structure with JavaScript.

Consider the following log:

```
{
  "TenantId": "abc-01-02-03-04-05050708091011121314",
  "@timestamp": "2020-08-28T08:29:23.967Z",
  "Computer": "john Doe_computer",
  "EventType_s": "LogMessage",
  "Job_s": "johnDoe_cell",
  "IP_s": "1.00.00.00",
  "message": "This is the extracted message. This part of the
 message includes superfluous content and values",
  "MessageType_s": "OUT",
  "Timestamp_d": 1598603359017850000,
  "Type": "my_LogMessage_is",
  "_ResourceId": ""
}
```

The sample code contains `"key":"value"` pairs: The key is the property name. The value is the property value.

The key "message" in the sample has the following value: `"This is the extracted message. This part of the message includes superfluous content and values"`.

If you wanted your logs to contain only the meaningful part of that message, you would add JavaScript code instructing the system to extract only that part:

```
//Added JavaScript to extract only the first sentence in the
 message! if (output['message'] != null){ output['message'] =
 output['message'].slice(0, output['message'].indexOf("\.")); }
 (edited)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You could use the same logic to reclassify a value. For example, if the key "Computer" is insignificant, you could set its value to "Invalid."

For more information about the source type structure, see the Source Type Structure – Labels & Classifications [KB0863562] article in the Now Support Knowledge Base.

Note: You can reactivate the learning mode for a source type structure to use the HLA engine's learning functionality again after the initial learning period becomes outdated. On the **Source Type Structure** form, select **Relearn** to reset parsing, extraction, classification, and labeling for the source type structure and restart the learning process.

Related topics

Refine the source type structure in Health Log Analytics

Refine the source type structure in Health Log Analytics

Fine-tune how Health Log Analytics reads your inner log messages and detects anomalies by customizing the extracted properties in the source type structure.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Inputs** > **Source Type Structure**.
2. Open a record.

   Note:

   - Health Log Analytics automatically separates the transport header from the inner log message when **Auto extraction** is selected (default).
   - Health Log Analytics fetches log samples automatically the first time the **Source Type Structure** form displays. In subsequent sessions, fetch the latest samples by selecting **Refresh Samples**.

3. **Optional:** Get AI-powered classification and labeling suggestions.

   AI can classify parsed log properties and suggest appropriate labels.

   a. Select **Suggest classifications (AI)** from the **Source Type Structure** page.

      On the **Key/Value Mapping** tab, AI-suggested classifications and labels appear in the **AI-suggested classification** and **AI-suggested label** columns.

   b. Review the suggestions.

   c. In the **Classification** and **Labels to assign** columns, select your preferred classifications and labels from the lists.

4. **Optional:** View how the current JavaScript function affects the log lines.

   a. Add a sample message in the **Test manual sample** field.

   b. Select **Go**.

   c. In the **Key/Value Mapping** tab, note how the JavaScript function affects the log lines.

5. In the **Raw input sample** field, choose a log message.

   When you test your JavaScript function, Health Log Analytics uses this sample message to show the joint effect of automatic extraction and the JavaScript function on the log lines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following fields are read only:

Field	Description
Duration (ms)	The processing time of all samples, in milliseconds.
Dropped	The total number of logs dropped in all the samples.
Errors	The total number of errors that occurred in all the samples.
Timestamp extraction failures	The number of timestamp extraction failures that occurred in all the samples.
Severity extraction failures	The total number of severity extraction failures that occurred in all the samples.
Message extraction failures	The total number of message extraction failures that occurred in all the samples.
Lengthy properties	The total number of lengthy properties in all the samples. Lengthy properties are properties with more than 256 characters. **Note:** Because Health Log Analytics doesn't extract such properties, they aren't indexed as keywords in Elasticsearch.

6. Define a JavaScript function that customizes automatically extracted properties or adds properties to the source type structure.

   a. In the JavaScript console, either change the provided default JavaScript function, modify an existing custom JavaScript function, or define a new one.

   Note: In addition to the default JavaScript function, Health Log Analytics provides several JS function templates for refining the source type structure. The templates can act as a starting point for your custom script code. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

JS function templates	Description
Extract Key_Values Using Regex	Script used for parsing logs into a series of key:value pairs by using regular expressions to identify specific regex patterns. Depending on the log data being sent to the source type, it parses either the inner message or the full log line. You can view how the data appears in the samples that are loaded into the source type structure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JS function templates	Description
	This process is iterative. It ’s repeated until all key:value pairs are found.
Extract Key_Values Using split-regex	Script used for parsing logs into a series of key:value pairs by using regular expressions to identify specific regex patterns. This process captures the values in a LIST form first, then uses the Java split function to create the key:value pairs. Depending on how the data appears in the raw input, this function might be more efficient than `Extract Key_Values Using Regex`. The raw input is either the inner message that header detection passes on, or the full raw log. If header detection is turned off or doesn't work on that particular log, the full raw log is used.
JSON Parse - flatten	Script used for extracting JSON information that is part of another text string from the raw input. For example, the information could be a JSON request written as part of a longer inner message. Inner JSON sections are difficult to split. In such cases, this script can be used to "flatten" or parse out the key:value pairs.
Extract a new field from raw input	Script that extracts a new field from the raw input, using a regular expression with capture groups to identify the new field's pattern.
Parse XML format	Script used for extracting key:value pairs from the XML by using a regular expression to identify the XML format. This process is iterative. It's repeated until all key:value pairs are found.
Set numerical severity level as textual values	Script used for converting numerical severity values to their corresponding textual severity values. **Note:** To enable the system to identify the severity level of a log correctly, severity must be given in text format. No numerical severity values should remain.
Trim function	Script used for removing the double quotes that surround the string from VALUE.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JS function templates	Description
	You can adapt this function to remove any other characters that surround the output VALUE of a key:value pair.

The JavaScript function for refining the source type structure uses the following objects:

Signature - function construct (sample, output)

Object	Description
sample	The inner message extracted from the sample message.
output	Object that contains the key-value pair map.

b. Test the JavaScript function by selecting **Test**.

c. View the outcome of the JavaScript function in the related lists and modify if needed.

- The **Key/Value Mapping** tab shows the effect of your JavaScript function combined with the system's automatic extraction on your raw input sample.

  Modify keys where appropriate.

  - The **Classification** field enables you to reset the classification of a property. The available types are:

Classification

Type	Description	Example
Meter	A property with this classification detects anomalies in the number of times the property appears in each log message. It presents changes in the quantity of this value as part of Automatic Root Cause analysis. **Note:** Properties classified as Meter consume resources.	Status codes, response codes, actions, or patterns
Gauge	A property with this classification detects anomalies in a numerical value that is reported continuously.	CPU, memory, or response time

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type	Description	Example
	Note: Properties with a classification of Gauge consume resources.	
Timeless Gauge	A property with this classification detects anomalies in a numerical value that is not reported continuously. The system notifies about an anomaly in this value regardless when the anomaly occurred. **Note:** This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.	
Automatic Root Cause (ARC Only)	A property with this classification reports the property as part of the Automatic Root Cause analysis of another anomaly and not as an anomaly by itself.	User name, IP addresses, application components, or datacenter
Invalid	A property with this classification isn't calculated or shown in the Automatic Root Cause analysis. **Note:** Properties classified as Invalid save resources.	

- The **Labels to assign** field enables you to set a property on a label.

Labels to assign

Label	Description
Timestamp	The property that holds the timestamp of the event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Description
	Note: If automatic header properties detection is enabled and the source type lacks a timestamp, the system extracts the timestamp from the transport header. If header detection is turned off or doesn't work for the relevant log lines in the data input, all log lines must have proper timestamps.
Severity	The property that represents the severity level of the log.
Message	The log message. The system uses this property to identify textual patterns in the data.
Host	The property that represents the host from which the event was sent. **Note:** If automatic header properties detection is enabled and the source type lacks a host, the system extracts the host from the transport header. If header detection is turned off or doesn't work for the relevant log lines in the data input, all log lines must have a host.
External ID	The property that serves as a unique identifier for this event type. For example, Event ID in Windows event log.

    - The **Rename key** field enables you to rename the key.
- The **Outcome Key-Value** tab shows how your JavaScript function processed the data.
- The **Data Input Mappings** tab shows the data input mappings for the current source type.

  The **Last event time** column on this tab shows the last date and time that the AI engine processed a log for the data input mapping. The system refreshes this information every five minutes. Knowing when the last log was processed for this data input mapping makes it easier to verify that log data is streaming.

- The remaining tabs show errors, message extraction failures, severity extraction failures, timestamp extraction failures, and lengthy properties.

Note: If your new JavaScript function isn't behaving as expected, you can revert to the last published one by selecting the **Revert JS Function** related link.

d. Optional: Make any necessary adjustments and then test the JavaScript function again.

7. Select the **Save template** option to save the JavaScript function.
   You can either save the JavaScript function as a new template or overwrite the currently selected template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To save the JavaScript function as a new template, enter a new name in the **Template name** field.
- To overwrite the template currently selected in the **JS function templates** field, leave the **Template name** field empty.

8. Select **Publish** to save the JavaScript function to the database.

Result

When the JavaScript function is published, Health Log Analytics uses it to fine-tune how it reads your inner log messages and detects anomalies.

The new script is automatically added to the list of JS function templates from which you can choose. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.

What to do next

Continue with the remaining data input setup tasks: Verify that all your log sources are present and active, and add timestamp formats if necessary.

Health Log Analytics content packs for quicker time to value

Shorten onboarding time for the Health Log Analytics application by installing content packs. The packs contain default source types and mapping script templates that save you the time it takes to create them from scratch.

After installing a content pack, Health Log Analytics begins to stream and parse your log data immediately. The application recognizes and analyzes the data, generates more relevant alerts, and reduces noise from the moment of the integration. You can still customize the mapping configuration later on, if needed.

You can integrate content packs in two different ways:

- Select a content pack when you're configuring a data input. Health Log Analytics activates the selected pack automatically and uses its mapping script for mapping the data input sources.
- Activate a content pack before you configure a data input. When you have configured the data input and you're mapping the raw log data, select the content pack's mapping script from the **Data Input Mapping** form.

Currently, a content pack is available for streaming logs from Linux using Filebeat.

Note: All configurations in content packs exist in the global domain. If you're using domain separation, the content pack content is only available for logs in the global domain.

This feature is supported in the Health Log Analytics application, Version 25.0.17 - November 2022 and later, available from the ServiceNow Store.

Activate a content pack in Health Log Analytics

You can activate a content pack before configuring a data input.

Before you begin

For an overview of this feature, see Health Log Analytics content packs for quicker time to value.

Role required: evt_mgmt_admin

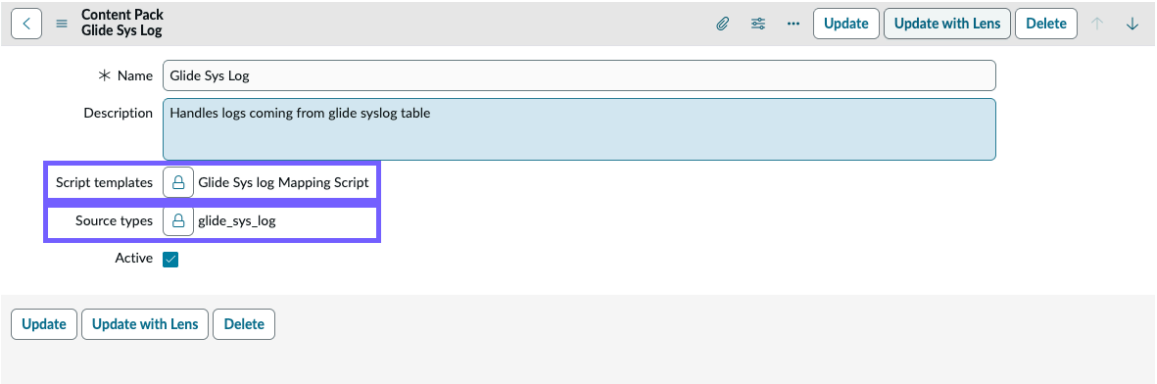
Procedure

1. Navigate to **All** > **Health Log Analytics** > **Content Packs**.
2. Open the appropriate content pack for your data input.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

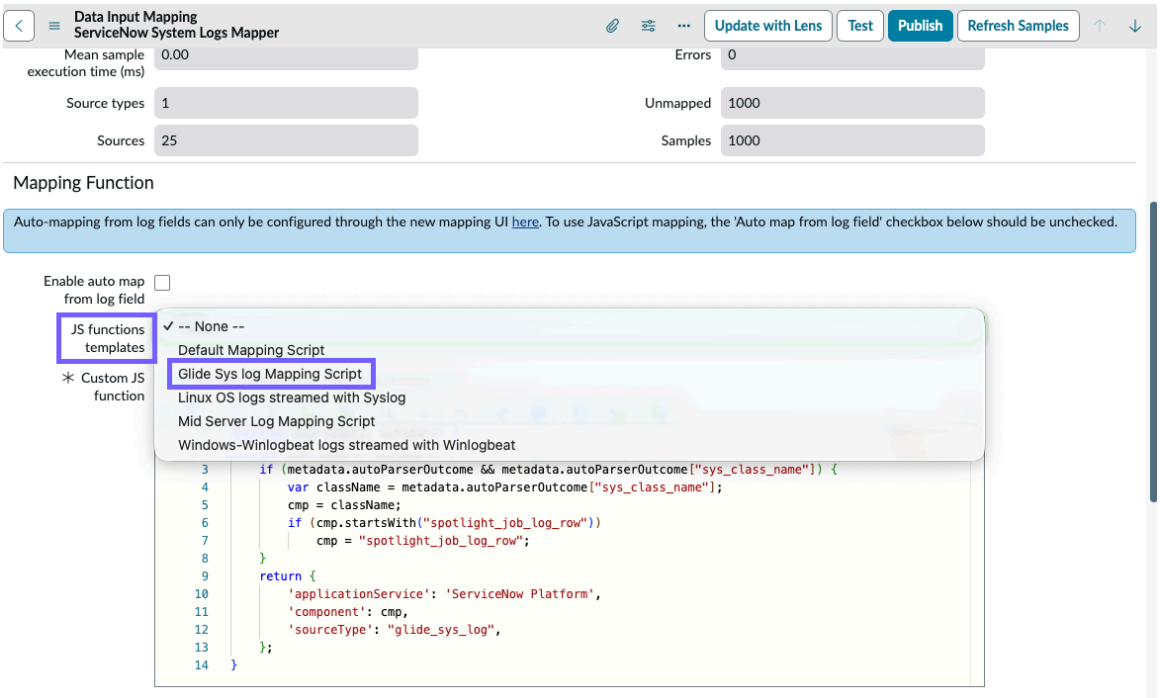
Note: Currently, a content pack is available for streaming logs from Linux using Filebeat.

3. On the **Content Pack** form, select **Activate**.
   The **Active** check-box appears selected. The activated content pack displays the script templates and source types that are associated with it.



Note: The source types included in the content pack may already exist on your ServiceNow instance. In this case, Health Log Analytics automatically renames the content pack source types by adding a content pack suffix to their name. If you want to use the content pack source types and their mapping, delete or rename the original source types and then remove the suffix from the content pack source types. Otherwise, Health Log Analytics uses the original source types.

On the **Data Input Mapping** form, the mapping script is listed as a JavaScript functions template option.



What to do next

When you have configured the data input and you're mapping your raw log data, you can select the content pack's mapping script from the **JS functions templates** drop-down.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Migrating a Health Log Analytics data input configuration between instances

Export a Health Log Analytics data input and source types configuration as an update set and import it to a different ServiceNow instance. In the target environment, you can use the migrated data input for streaming and processing log data. This functionality saves time and reduces possible errors by avoiding the need to configure the settings again on the target instance.

The migrated configuration includes mapping and all other relevant settings, except credentials. Depending on the data input that you're exporting, you may need to configure credentials in the target environment. For example, when exporting Amazon CloudWatch or Amazon S3 data inputs, you must configure Amazon Web Services (AWS) credentials.

This feature is supported in the Health Log Analytics application, Version 25.0.17 - November 2022 and later, available from the ServiceNow Store.

Starting with Health Log Analytics Version - December 2025, you can also export all source types related to one or more selected log sources to the update set together. For more information, see

For general information about update sets in the ServiceNow AI Platform, see System update sets.

Export a Health Log Analytics data input configuration

Export the configuration of a Health Log Analytics data input with or without the related source types to an update set. You can then import the update set to the target environment.

Before you begin

For an overview of this feature, see Migrating a Health Log Analytics data input configuration between instances.

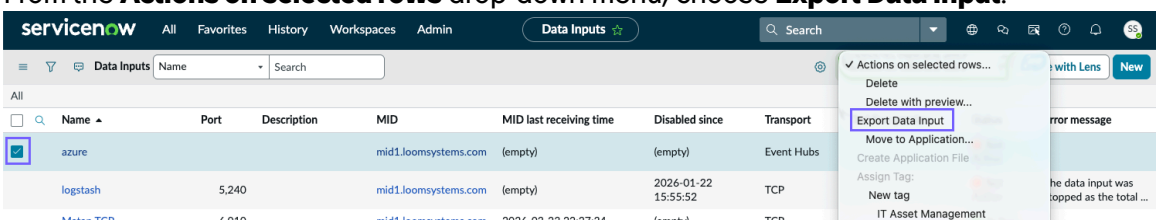
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Data Inputs**.
2. In the Data Inputs list, select the data input that you want to export.
3. Export the data input to an update set.

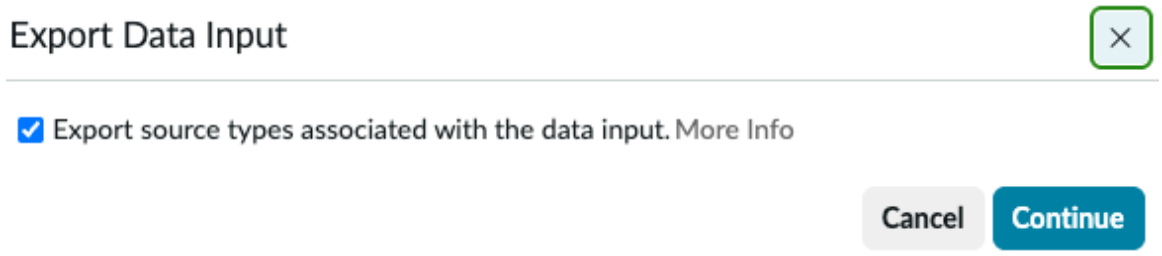
> **Note:** The exported configuration doesn't include the service instance configured for the data input.

a. From the **Actions on selected rows** drop-down menu, choose **Export Data Input**.



b. In the **Export Data Input** dialog, do one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Leave the check box selected to include the source types that are associated with the data input in the update set.

  When the box is selected, the update set will include the following source type-related tables:

  - sn_occ_source_type
  - sn_occ_source_type_structure
  - sn_occ_sources
  - sn_occ_timestamp_formats
  - sn_occ_lexical_keywords
  - sn_occ_log_correlator
  - sn_occ_log_source_retention
  - sn_occ_quick_replacements
  - sn_occ_reconstructors
  - sn_occ_replacements
- Clear the box to export the data input without the associated source types. For example, if you want to reuse the data input configuration, but configure the source types from scratch.

  When the box is clear, the update set will not include the source type-related tables.

  Note: You can export source types separately. For more information, see Export source types to an update set in Health Log Analytics.

c. Select **Continue**.

The data input, with or without the source types, is exported to an update set.

Note: An update set can act as the parent for multiple child update sets.

4. Select **Download update set** to download the update set to the instance.
The update set is downloaded as an XML file.

What to do next

Import the update set to the required ServiceNow instance. For more information, see Import a Health Log Analytics data input to a target instance.

Import a Health Log Analytics data input to a target instance

Import a data input configuration that you've exported from another instance as an update set.

Before you begin

For an overview of this feature, see Migrating a Health Log Analytics data input configuration between instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before performing this procedure, export the data input to an update set. For more information, see Export a Health Log Analytics data input configuration.

Role required: admin

Procedure

1. On the target instance, import the update set that contains the data input configuration.
   a. Navigate to **All** > **System Update Sets** > **Retrieved Update Sets**.
   b. In the Related Links, select **Import Update Set from XML**.
   c. Select **Choose file** and open the update set XML file from the Downloads folder.
   d. Select **Upload**.
   The update set is uploaded to the instance and appears in the **Retrieved Update Sets** list in the Loaded state.
2. Identify and address errors in the update set.
   a. In the **Retrieved Update Sets** list, open the update set record.
   b. Select **Preview Update Set Batch** to detect errors.
   The **Batch Update Set Preview** dialog indicates failure, which is expected behavior.
   c. Close the dialog and resolve the errors in the **Update Set Preview Problems** related list.

      For more information, see Preview a remote update set.

      You can ignore errors that start with 'Could not find a record in [table]' for the following tables:

      - aws_credentials
      - azure_sas_credentials
      - azure_service_principal
      - basic_auth_credentials
      - cmdb_ci_service_auto - Service instance
      - ecc_agent - MID
      - ecc_agent_cluster - MID Server Cluster
      - kafka_ssl_credentials
      - sn_occ_data_input_preprocess_example
      - sn_occ_data_input_preprocess_example_row
      - sn_occ_gcp_credentials
      - sn_occ_mapper_example
      - sn_occ_source_type_examples
      - sn_occ_source_type_structure_data
   d. Select the errors that you ignored and then select the **Select All** check box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. From the **Actions on selected rows...** drop-down menu, choose **Accept remote update**.

f. In the **Preview Problems for Batch** related list, select all remaining errors and accept the remote update as explained in the earlier steps.

3. When all errors in the update set have been resolved, select **Commit Update Set Batch**.
   The imported data input appears on the Data Inputs list. The import includes mapping settings and all other relevant configuration.
4. In the imported data input, configure the following.
   - The MID Server to which the logs stream.
   - Credentials.

     Note: Whether you need to configure credentials depends on the data input that you've imported. For example, you must configure Amazon Web Services (AWS) credentials for Amazon CloudWatch and Amazon S3 data inputs.

   - (Optional) The service instance to which to bind the log data.

   For more information, see the configuration documentation for the relevant data input: Set up data inputs in Health Log Analytics manually.

Result
You can begin using the data input for streaming and processing log data.

Export source types to an update set in Health Log Analytics

Export source types to an update set separate from the Health Log Analytics data input configuration. You can then import the update set to the target environment.

Before you begin
For an overview of this feature, see Migrating a Health Log Analytics data input configuration between instances.

Role required: evt_mgmt_admin

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Source Types**.
2. In the Source Types list, select one or more source types that you want to export.
3. From the **Actions on selected rows** drop-down menu, choose **Export Source Types**.
   The source types are exported to an update set.

   Note: An update set can act as the parent for multiple child update sets.

4. Select **Download update set** to download the update set to the instance.
   The update set is downloaded as an XML file.

What to do next
Import the update set to the required ServiceNow instance. For more information, see Import Health Log Analytics source types to a target instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Export source types to an update set by log source in Health Log Analytics

Export all source types related to one or more selected log sources to an update set together. You can then import the update set to the target environment.

Before you begin

For an overview of this feature, see Migrating a Health Log Analytics data input configuration between instances.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Log Sources**.
2. In the Log Sources list, select one or more log sources for which you want to export the related source types.
3. From the **Actions on selected rows** drop-down menu, choose **Export Related Source Types**. The source types are exported to an update set.

   Note: An update set can act as the parent for multiple child update sets.

4. In the **Related Source Type Exporter** screen, select **Download update set** to download the update set to the instance.
   The update set is downloaded as an XML file.

What to do next

Import the update set to the required ServiceNow instance. For more information, see Import Health Log Analytics source types to a target instance.

Note: Only the related source types and tables for the selected log sources will be imported, not the data inputs.

Import Health Log Analytics source types to a target instance

Import source types that you've exported separate from the Health Log Analytics data input configuration.

Before you begin

For an overview of this feature, see Migrating a Health Log Analytics data input configuration between instances.

Before performing this procedure, export the source types to an update set. For more information, see Export source types to an update set in Health Log Analytics.

Role required: admin

Procedure

1. On the target instance, import the update set that contains the source types.

   a. Navigate to **All** > **System Update Sets** > **Retrieved Update Sets**.

   b. In the Related Links, select **Import Update Set from XML**.

   c. Select **Choose file** and open the update set XML file from the Downloads folder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select **Upload**.
The update set is uploaded to the instance and appears in the **Retrieved Update Sets** list in the Loaded state.

2. Identify and address any errors in the update set.

a. In the **Retrieved Update Sets** list, open the update set record.

b. Select **Preview Update Set Batch** to detect errors in the update set.
The **Batch Update Set Preview** dialog indicates failure, which is expected behavior.

c. Close the dialog and resolve the errors in the **Update Set Preview Problems** related list.
You can ignore errors that start with 'Could not find a record in [table]' for the following tables:

d. Select the errors that you ignored and then select the **Select All** check box.

e. From the **Actions on selected rows...** drop-down menu, choose **Accept remote update**.

f. In the **Preview Problems for Batch** related list, select all remaining errors and accept the remote update as explained in the earlier steps.

3. When all errors in the update set have been resolved, select **Commit Update Set Batch**.

Result
The imported source types appear in the Source Types list.

Check gRPC and network connectivity for Health Log Analytics on the MID Server

Verify that Health Log Analytics can function properly by performing diagnostic tests on the MID Server to check gRPC and network connectivity.

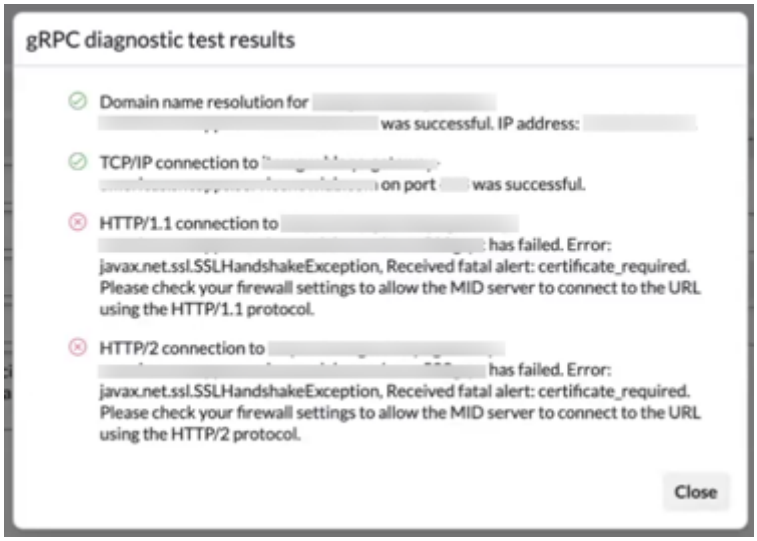
Before you begin
Role required: evt_mgmt_admin

About this task
Your organization's network and security configuration may be keeping Health Log Analytics from functioning properly. For example, complex configurations with proxy and firewall settings might block outbound connections. To avoid operational issues, you can test gRPC and network connectivity on the MID Server.

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
2. Open the relevant MID Server record.
3. Under Related Links, select **Test gRPC connection**.
The system performs gRPC connectivity tests, such as domain name resolution, TCP/IP, and HTTP connection. When the testing is complete, the test results are displayed. Successful tests are preceded by a green check-mark, while failed tests are preceded by a red x mark.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Fix the issues that caused any tests to fail by following the instructions on the **gRPC diagnostic test results** screen.
5. Select **Test gRPC connection** again and confirm that all the tests are completed successfully.

Administering Health Log Analytics

This section covers tasks involved in Health Log Analytics administration. It provides you with information needed to keep Health Log Analytics running efficiently.

Configure Health Log Analytics system properties for a single log source

Configure system properties for a specific log source if you need to alter the default values, which should not usually be necessary.

Before you begin

Role required: evt_mgmt_admin

About this task

Changing Health Log Analytics system properties affects back-end processes and can produce unexpected results. Therefore, if you need to make changes to these properties, keep a record of your adjustments. For example, note the value before and after a modification and the time of the change.

Note: To modify a Health Log Analytics system property whose **Requires restart** value is **true**, contact ServiceNow support to modify it for you.

For a complete description of all the Health Log Analytics system properties, see the HLA System Properties [KB0869842] article in the Now Support Knowledge Base.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Data Input** > **Log Sources**.
2. On the **Source properties** tab, right-click a property.
3. Select **Override property value** from the pop-up menu.
4. In the **Value** field, enter the appropriate value.
5. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The new value overrides the previous setting for the selected log source.

Related topics
Configure global Health Log Analytics system properties

Configure global Health Log Analytics system properties

Configure global Health Log Analytics system properties if you need to alter the default values, which should not usually be necessary.

Before you begin
Role required: evt_mgmt_admin

About this task
Changing Health Log Analytics system properties affects back-end processes and can produce unexpected results. Therefore, if you need to make changes to these properties, keep a record of your adjustments. For example, note the value before and after a modification and the time of the change.

Note: To modify a Health Log Analytics system property whose **Requires restart** value is **true**, contact ServiceNow support to modify it for you.

For a complete description of all the Health Log Analytics system properties, see the HLA System Properties [KB0869842] article in the Now Support Knowledge Base.

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Health Log Analytics Administration** > **System Properties**.
2. Select a property with the scope Source.
3. In the **Value** field, enter the appropriate value.
4. Select **Update**.
   The setting will apply to log sources created from this point forward.
5. Determine the scope of application of the new setting.
   - To apply the setting only to log sources created from this point forward, select **Update**.
   - To override values for this property in all existing log sources and apply the modified setting to all new log sources, select **Override source property**.

Related topics
Configure Health Log Analytics system properties for a single log source

Enable or disable Health Log Analytics system features

Customize the basic configuration of Health Log Analytics by enabling or disabling system features.

Before you begin
Role required: evt_mgmt_admin

Procedure
1. Navigate to **All** > **Health Log Analytics** > **Health Log Analytics Administration** > **Features**.
   By default, the table shows the system features that administrators modify most commonly. To view the complete list of features, use the filtering options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select a feature record from the table.
   The record contains the following information:
   - The name of the feature
   - A description of the feature's purpose
   - The default state of the feature
   - The current state of the feature
3. Set the state of a system feature to ON to enable the feature or to OFF to disable it.
4. Select **Update**.

View log anomaly metrics in Health Log Analytics

View and query all metrics that Health Log Analytics tracks from a single location.

Before you begin
Role required: evt_mgmt_admin

About this task
The Metric Data table provides a centralized view of every metric that HLA collects and monitors. It includes pattern metrics, custom metrics, and raw metrics. Use the table for the following tasks:

- Query metrics by log source, integration, source type, and metric type to narrow down which metrics HLA is tracking for a data input or environment.
- Review anomaly detection statistics to see how often HLA detects anomalies for a given metric.
- View metric baselines to understand what HLA records as normal behavior.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Log Anomaly Detection** > **All Metrics**.
   The **Metric Data** table displays a record for each metric that HLA is collecting. For a description of the columns in the table, see Metric Data table columns in Health Log Analytics.
2. **Optional:** Filter the table by log source, integration, source type, or metric type.
   Filtering enables you to narrow the results to the metrics relevant to a specific data input or environment.
3. Select a metric record to view its details.

Health Log Analytics alert notification in Slack or Microsoft Teams channels

Health Log Analytics sends notifications for new anomaly alerts in real time to Slack or Microsoft Teams channels. This built-in functionality frees you from having to continuously monitor logs to prevent incidents.

The notifications include the number of the alert, its description, severity, configuration item, state, and priority group. You can filter the alerts for which notifications are sent to your channel. For example, you may only want to receive alerts of a Major severity or a High priority group. By default, no notifications are sent on secondary alerts.

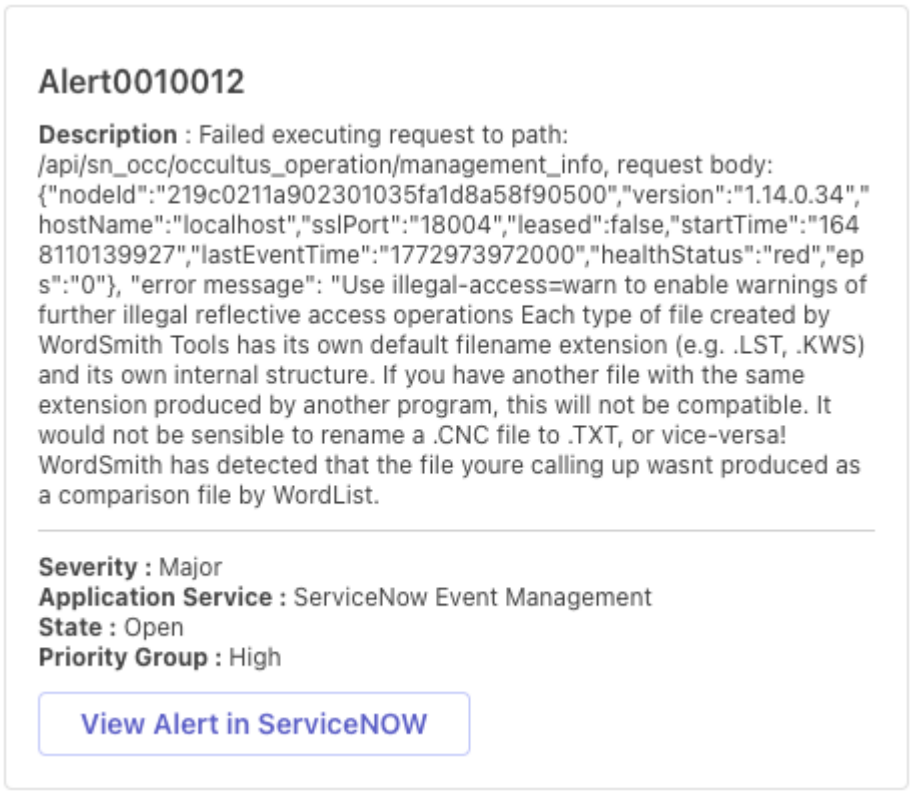
To support channel notification, the channel must be configured to receive Health Log Analytics notifications.

Starting with Version 33.0.27 - August 2024, Health Log Analytics uses the Microsoft Teams Graph spoke application to send notifications on new anomaly alerts. The application replaces the Microsoft Teams spoke plugin, which will be deprecated. If you're using an HLA version earlier than 33.0.27, follow the setup procedure in Set up Health Log Analytics alert notifications

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

in channels. Otherwise, see Set up Health Log Analytics alert notifications in a Microsoft Teams channel.

Sample HLA alert notification in Microsoft Teams



Set up Health Log Analytics alert notifications in channels

Set up notifications for new Health Log Analytics anomaly alerts in either a Slack or Microsoft Teams channel.

Before you begin

Starting with Version 33.0.27 - August 2024, Health Log Analytics uses the Microsoft Teams Graph spoke application to send notifications for new anomaly alerts. The new application replaces the Microsoft Teams spoke plugin, which will be deprecated. If you're using an HLA version earlier than 33.0.27, follow the setup procedure below. Otherwise, refer to Set up Health Log Analytics alert notifications in a Microsoft Teams channel.

Note: If you upgrade from an earlier version to Version 33.0.27 - August 2024 or later, redo the setup using the procedure in Set up Health Log Analytics alert notifications in a Microsoft Teams channel.

For alert notifications in Slack channels, verify that the plugin Slack Webhooks Spoke for ServiceNow Integration Hub (com.sn.slack.ah) is installed:

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.

Role required: evt_mgmt_operator or evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a Webhook URL for a channel in Slack or Microsoft Teams.

   Health Log Analytics uses the Webhook to notify about the alerts in the channel.

   Perform the appropriate procedure:

   - Create a Webhook URL for a channel in Slack
   - Create a Webhook URL for a channel in Microsoft Teams

2. Map the Webhook URL for the channel to the service instance associated with the alert.

   a. Navigate to **Health Log Analytics Administration** > **Webhook Notification**.

   b. Select **New**.

   c. On the form, fill in the fields.

   Alert Notification Webhook form

Field	Description
Webhook	The Webhook URL that you created for the channel.
Active	Select to activate the Webhook.
Configuration item	The service instance associated with the alert. If this field is empty, the system uses the default property for the channel: default.slack.webhook.url for Slack or default.teams.webhook.url for Microsoft Teams.

   d. Select **Submit**.

3. Activate the Health Log Analytics Alert Management rule for submitting alerts to the appropriate channel.

   a. Navigate to **Event Management** > **Rules** > **Alert Management Rules**.

   b. Locate the appropriate rule:

   - For Slack: Submit HLA alerts to slack.
   - For Microsoft Teams: Submit HLA alerts to teams.

   c. In the **Active** column for the rule, set the value to `true`.

4. **Optional:** Filter the alerts on which notifications will be sent to the channel.

   a. In the Alert Management Rules table, select the rule for your channel.

   b. Select **Alert Filter**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. On the form, set the conditions that must be met for sending a notification on the alert to the channel.

d. Select **Update**.

Set up Health Log Analytics alert notifications in a Microsoft Teams channel

Set up notifications for new Health Log Analytics anomaly alerts in a Microsoft Teams channel.

Before you begin

Starting with Version 33.0.27 - August 2024, Health Log Analytics uses the Microsoft Teams Graph spoke application to send notifications on new anomaly alerts. For more information, see Microsoft Teams Graph Spoke. If you're using an HLA version earlier than 33.0.27, refer to the setup procedure in Set up Health Log Analytics alert notifications in channels.

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Install the latest version of the Microsoft Teams Graph spoke from the ServiceNow Store.
2. Set up the Microsoft Teams Graph spoke.
   For instructions, see: Set up the.
3. Activate the Health Log Analytics Alert Management rule for submitting alerts to the Microsoft Teams channel.
   a. Navigate to **Event Management** > **Rules** > **Alert Management Rules**.
   b. Locate the appropriate rule: Submit HLA alerts to teams.
   c. In the **Active** column for the rule, set the value to `true`.
4. Map the service instance to the Microsoft Teams channel.
   a. In the **All** navigation menu, type `sn_occ_teams_alert_notification_config` and then press Enter.
   b. Select **New**.
   c. On the form, fill in the fields.

      Note:

      - You can obtain the Teams ID and Channel ID from the Microsoft Teams channel.
      - The **Configuration Item** field must correspond to the Service instance. If no CI is needed, leave this field empty. In this case, the record is used for alerts when there's no record that matches their CI.

   d. Select **Submit**.
   e. **Optional:** Repeat steps 1 to 4 to add additional configurations.

Storage space for log retention in Health Log Analytics

The Health Log Analytics base system typically provides 1,000 GB storage space for log source retention, although the storage capacity may vary depending on your license. The default retention time for logs is three days, but you can modify that period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. To activate it, contact your ServiceNow account manager or ServiceNow Support.

When the storage space used by all log sources exceeds 80 percent of the total, you receive an email notification. You can change the default threshold percentage by modifying the *sn_occ.elastic_storage.utilization_limit.percent* system property in the System Properties table.

Automatic reduction of log retention days

By default, logs are retained for three days. You can adjust this period to 3, 7, 14, or 30 days. For more information, see Modify the log source retention period in Health Log Analytics.

If the storage space used by all log sources reaches 100 percent, the number of retention days allocated per source is automatically lowered by one level and you receive an email notification with the specifics. The automatic reduction process starts with the sources that were allocated the highest number of retention days. For example, for a source with 30 retention days, the number is reduced to 14. If the source has 14 retention days, the number is reduced to 7, and so on.

You can change the threshold percentage for the automatic reduction of log retention days by modifying the *sn_occ.log_retention.automatic_reduction_utilization_percent* system property in the System Properties table.

Related topics

Modify the log source retention period in Health Log Analytics

Modify the log source retention period in Health Log Analytics

Modify the period that Health Log Analytics retains logs from a specific source. You can calculate the impact of your intended change on storage to help you make an informed decision.

Before you begin

This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. To activate it, contact your ServiceNow account manager or ServiceNow Support.

To display **Log source retention** in the filter navigator:

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Enter the property name *sn_occ.activate_log_source_retention* in the Search box.
3. Ensure that the property value is set to **true**.

Role required: evt_mgmt_admin

About this task

By default, the log retention duration per source is set to three days. You can change this number to 7, 14, or 30 days. For more information, see Storage space for log retention in Health Log Analytics. Note that longer log retention results in higher storage usage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Log source retention**.
2. **Optional:** Calculate how changing the retention period for logs from a particular source affects storage.
   a. Open a log source record.
   b. In the Related Links section, select **Calculate how retention impacts storage**.
   c. From the New retention list, select the proposed number of retention days for logs from this source.
   d. Select **Calculate**.
   The **Projected storage usage (GB)** field displays the amount of storage space in GB that the source would use if the new policy were implemented.

   Note: Health Log Analytics bases its calculation of projected storage usage on the volume of log data that was streamed in the past. The estimate could change as the volume of streamed log data varies.

   e. Compare the projected usage to the amount of storage needed for the current policy that is shown in the **Current storage usage (GB)** field.
   f. Select **Cancel** to close the dialog box.
3. Update the log retention policy per source or for several sources together.
   - To update log retention for a single source:
     a. Open a log source record.
     b. From the Retention days list, select the required number of retention days for logs from this source.
     c. Select **Update**.
   - To update log retention for multiple sources:
     a. Select several log source records.
     b. From the Actions on selected rows choice list, select **Update multiple source retentions**.
     c. From the New retention policy list, select the required number of retention days for logs from the selected sources.
     d. Select **Update**.

   The updated policy takes effect in up to 15 minutes.
4. **Optional:** Restore the default log retention policy per source or for all log sources.
   - To restore the default policy for a single source:
     a. Open a log source record from the table.
     b. In the Related Links section of the record, select **Restore default**.

     The log retention policy for this log source reverts to the default value of three days.
   - To restore the default policy for all sources:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Related Links section, select **Restore defaults**.

b. In the confirmation dialog, select **Continue**.

The log retention policy for all log sources reverts to the default value of three days.

Scaling Health Log Analytics to stream logs at a higher rate

Stream log data to Health Log Analytics in a scalable, more stable way using the advanced ServiceNow infrastructure.

The new ServiceNow architecture leverages queuing technology in IT Operations Management Cloud Services for authentication and log ingestion. The Health Log Analytics AI engine has been enhanced to scale dynamically in response to increased log ingestion by your organization. Health Log Analytics can be scaled to support more than 50,000 events per second (EPS) or more than 10,000 subscription units (SUs).

You can switch to the advanced ServiceNow infrastructure by submitting a scaling request through your ServiceNow account manager. When your scaling request is approved, ServiceNow provisions the number of Elasticsearch and AI Engine nodes required to support your subscription units.

Enhancing the CMDB with host data Health Log Analytics found in logs

When Health Log Analytics streams logs, it extracts host data from the log events. If host data is discovered that doesn't match the information in the Configuration Management Database (CMDB), the system creates a configuration item (CI) candidate for you to review based on the data it found in the logs.

After reviewing a CI candidate, you can choose to either add it to the CMDB or dismiss it as irrelevant. The **Log-Based CI Candidates** table lists all CI candidates that Health Log Analytics has created, sorted by system update time. The **Operation** column shows the suggested action to take on each CI candidate. You are automatically notified when there are new CI candidates for your consideration. For more information, see Add log-based CIs to the CMDB in Health Log Analytics.

For a description of the related system properties, see the "logsourceinfo (CMDB)" section in the HLA System Properties [KB0869842] article in the Now Support Knowledge Base.

This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. You can use it on the ServiceNow AI Platform using the Rome Patch 6 release (scheduled to be released on January 27, 2022) or later.

Add log-based CIs to the CMDB in Health Log Analytics

Keep the Configuration Management Database (CMDB) updated with host data Health Log Analytics discovered in your logs by adding log-based configuration items (CIs) to the database.

Before you begin

This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. You can use it on the ServiceNow AI Platform using the Rome Patch 6 release (scheduled to be released on January 27, 2022) or later.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Health Log Analytics Administration** > **Log-Based CI Candidates**.
2. Handle a single CI candidate or multiple CI candidates together.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Procedure
Take action on a single CI candidate	**a.** Select a CI candidate record and review the information on the form. For field descriptions, see Log-based CI candidates fields in Health Log Analytics. **b.** Add the CI candidate to the CMDB or delete it. ▪ If the CI candidate is appropriate, either add it to the CMDB as is or include more information in it before adding it to the CMDB. ▪ To add the CI candidate to the CMDB as is, select **Add to CMDB** and then se lect **Continue**. ▪ To add more information, select **Edit ad ditional CI fields**. Enter data that was not extracted from the logs, such as the name of the company associated with the CI, and then select **Submit**. The CI is added to the CMDB. In the CMDB table for the relevant class type, the discovery source for the new CI is Health Log Analytics. The CI candidate record is automatically deleted from the Log-based CI candidates table. ▪ If the CI candidate is irrelevant, delete it by selecting **Delete**.
Take action on multiple CI candidates at the same time	**Note:** This option does not enable you to add extra information to the selected CIs. ○ Add multiple CIs to the CMDB. **a.** In the Log-based CI candidates table, se lect the CI candidates you want to add to the CMDB. **b.** From the Actions on selected rows list at the bottom of the page, select **Add to CMDB**. The selected CIs are added to the CMDB. The CI candidate records are automatical ly deleted from the Log-based CI candi dates table. ○ Delete multiple CI candidates.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Procedure
	a. In the Log-based CI candidates table, select the CI candidates you want to delete. **b.** From the Actions on selected rows list at the bottom of the page, select **Delete**.

Analyzing and resolving Log Analytics alerts

Analyze and resolve Log Analytics alerts by investigating log data and taking action to resolve the underlying issue.

Overview of analyzing and resolving a Log Analytics alert

As an Operator, you are responsible for analyzing and resolving the alerts that Health Log Analytics generates. When HLA creates an alert, you review the alert's severity, the affected Configuration Item (CI), the log data associated with the anomaly, and the impacted services. You try to identify the root cause by investigating the logs that surround the anomaly.

In the Express List, review alert details and use Now Assist to get an in-depth analysis of the alert and potential resolutions in straightforward, human-readable language. By drilling down into the alert, you can quickly identify the issue and proceed to resolve it before it affects your users.

Using the Log Viewer, you can browse the alert logs by timestamp or range for further investigation. You can visualize the frequency of anomalous log lines in a chart.

- Start remediation of a Log Analytics alert from the Overview tab

  Begin the remediation process of a Log Analytics alert from the alert **Overview** tab. This tab provides information on the alert, log data associated with the anomalous behavior, CIs associated with the alert, and services impacted by it.

- Analyze the logs that surround the anomaly

  Review the log lines surrounding the anomaly for clues about the state of faulting systems. This information can help you narrow down the root cause of the alert.

- Use log correlators to identify relationships in log data

  Identify relationships between alerts to help you determine whether an alert is part of a larger issue.

- Navigate to the Express List and select an alert from the Alerts list.

  Use Now Assist to get an in-depth analysis of the alert and potential resolutions. By drilling down into the alert, you can quickly identify the issue and proceed to resolve it.

- Review the logs for an alert on the Log viewer

  For further investigation you can navigate to the **Log Viewer** to browse the alert logs by timestamp or time range, and visualize anomaly frequency within a time period for a comprehensive view of log data over a specified time range.

- Add a KB article to a Log Analytics alert

  When you have resolved an alert that Health Log Analytics generated, you can add a knowledge base (KB) article to it. For example, provide information that might help others resolve similar issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use cases

Use Case: Proactive monitoring of your ServiceNow instance in Health Log Analytics - Use Health Log Analytics to detect and resolve emerging issues in your organization's ServiceNow instance before they affect platform users.

Start remediation of a Log Analytics alert from the Overview tab

Begin the remediation process of a Log Analytics alert from the alert **Overview** tab. This tab provides information on the alert, the log data associated with the anomalous behavior, CIs associated with the alert, and services impacted by it.

Before you begin

Important: From the Vancouver release onward, the **Operator Workspace** is deprecated and replaced with Service Operations Workspace.

Role required: evt_mgmt_operator, or evt_mgmt_user, or evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the Service Operations Workspace, select the lists icon ( ).
3. Select the appropriate list in the Alerts sub-list and navigate to the relevant alert or group.

   All Health Log Analytics alerts have the value **Log Analytics** in the **Source** column. The value in the **Group** column identifies the type of Log Analytics alert. See Types of Health Log Analytics alerts for a more detailed description of each type of alert or group.

   Tip: To preview an alert in the list, click its info icon ( ).

4. Select the alert number.

   The **Overview** tab displays.

5. View the section of the **Overview** tab that provides the information that you need.

   For a description of the sections and cards, see Sections and cards on the alert Overview tab in Health Log Analytics.

   Note: Because some sections on the **Overview** tab show only a portion of the information, many sections include a link that displays different or more complete information.

6. **Optional:** Run predefined remediation tasks to resolve alert issues.
   a. Select **Launch playbook**.
   b. Select the **Playbook** tab.

      The **Run remediation** card displays the available remediation actions.

   c. Select the tile corresponding to the action you want to run.
   When the action is complete, it appears in the **Completed** card.

Analyzing the logs around an anomaly to help find the alert's root cause

When Health Log Analytics identifies an anomaly, viewing the logs that surround the anomaly provides clues about the state of faulting systems. This information can help you narrow down the root cause of an alert.

While viewing a Log Analytics alert, the **Surrounding logs** tab lists the log lines that were generated one minute before and one second after the anomaly occurred. The log lines are related to the metric or pattern that triggered the alert. The list is filtered to the relevant component.

Logs generated immediately before the anomaly might point to warning signs or conditions that led to the issue. By reviewing these logs, you can trace the sequence of events that led to the anomaly, helping you understand what went wrong. Logs created right after the anomaly can help you evaluate the impact of the event by analyzing how the system responded and whether other components were affected. The timeline of the logs around the anomaly can help clarify what might have caused the issue, for example a configuration change or a software update.

You can modify the time range of the displayed log lines, for example to investigate logs from more than one minute before the anomaly, or more than a second afterward.

Note: Logs that surround the anomaly are retained and available for 30 days after the creation of the alert. The system does not delete these logs when the global retention period of logs expires. When the retention period expires, the surrounding logs are available only on the **Surrounding logs** tab and not in the Log viewer.

Health Log Analytics enables you to view the anomalous log data graphically on the Log viewer, accessed from the Service Operations Workspace. The Log viewer displays a chart of the frequency of anomalous log lines during one minute before and one minute after the Log Analytics alert and lists the associated log lines. It automatically shows the query that relates to the anomaly, the selected component, and the appropriate time filter. For more information, see Reviewing the logs that are connected with an alert on the Log Viewer in Health Log Analytics.

For the new procedure, see the corresponding topic in the Service Operations Workspace for ITOM documentation: Analyze log lines that surround an anomaly in Health Log Analytics.

Identifying related alerts in log data by using log correlators

Log correlators are keys or values in log data that detect correlations between alerts to help you determine whether an alert is part of a larger issue. For example, a log correlator could detect when the interface ID of a particular network device occurs simultaneously in multiple warnings across different service instances.

You can identify related alerts in your log data by using log correlators. The base system includes several log correlators, and you can define custom correlators for a specific log source, all log sources, or only log sources created after the correlator is activated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Most log lines include a metadata portion plus a message portion. Some log lines, however, include only message text with metadata included in the text. The two types of log correlators, free text correlators and log property correlators, analyze the different portions of each log to identify relationships between log data from multiple log sources.

Free text correlators

Free text correlators analyze the text within the log message portion of log lines that are associated with an anomaly. The system uses free text correlators to identify correlations between alerts. You use free text correlators to add a term that you expect to appear within log messages. A good choice is a term that is not structured and would not otherwise be extracted as a log property. For example, “policy-id” or “ thread-id”.

You also typically add free text correlators for the names of systems, applications, and services that are unique to your environment. Because such a value can be referred to by multiple sources, layers, middleware, or databases, the free text correlator can be an effective detector of correlated alerts. For example, if your organization's service is called TeaTime, then you might add "teatime" as a free text correlator. The correlator would identify alerts that are related because they were generated for resources that support the TeaTime service, such as a database lock or a connection failure between TeaTime components.

Log property correlators

Log property correlators analyze the metadata portion of log lines. For example, the correlator can analyze the name of a service instance, the interface ID of a network device, or the request ID of a web-facing component. A log property correlator could flag a correlation when the interface ID of a network device simultaneously occurs in multiple warnings in different log sources. Log property correlators are specific to the business context of your environment.

You can specify the set of log sources whose log data are analyzed by a log correlator. Choices are as follows:

- **Only new sources**: The system applies the log correlator only to log lines from log sources that were created after this log correlator is activated.
- **All sources**: The system applies the log correlator to log lines from all log sources.
- **Specified source**: For a log correlator, the system analyzes only log lines from the log source that you specify.

Add a log correlator to identify relationships between alerts in log data

Detect related alerts in log data by adding log correlators. The base system includes several log correlators and you can define custom log correlators.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

About this task

For information about the types and functions of log correlators, see Identifying related alerts in log data by using log correlators.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Use one of the following methods to add a log correlator.

Option	Procedure
Add a log correlator for a specific log source	**a.** Navigate to **Health Log Analytics** > **Log Anomaly Detection** > **Log Correlators**. The list of existing log correlators opens. **b.** Click the name of a log correlator. The names appear in the **Correlation indicator** column. **c.** Click **New**.
Add a log correlator that applies either to all log sources or to only those log sources that become active after you define this log correlator	**a.** Navigate to **Health Log Analytics** > **Data Input** > **Log Sources**. **b.** Click the name of the log source. The Log correlators related list displays the list of existing log correlators that analyze log data from the selected log source. **c.** On the **Log correlators** tab, click **New**.

2. Fill in the Log correlator form.
   For a description of the fields, see Log correlators form fields.
3. Select **Active** and then click **Submit**.

Exclude a source from a log correlator

Prevent the system from analyzing log lines from a specific source by excluding that source from the log correlator.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Navigate to **Health Log Analytics** > **Data Input** > **Log Sources**.
2. Open the relevant source on the Log Sources form.
3. On the **Log Correlators** tab, select the option for the log correlator.
4. In the Actions on selected items list, select **Exclude from this source**.

Reviewing the logs that are connected with an alert on the Log Viewer in Health Log Analytics

The **Log Viewer** tab lets you browse the logs for an alert by timestamp or time range, and visualize anomaly frequency within a specific time period. Customizing the displayed data and adjusting time filters enables you to better understand the framework in which the anomaly occurred, helping you find the root cause faster.

The Log Viewer presents all data connected with the Log Analytics alert. It shows the query that relates to the anomaly, the selected component, and the appropriate time filter. You can personalize the displayed data, and manually adjust the time range without affecting the other settings. The applied filters appear in the **Filters** pane. You can add or remove filters as needed to show only the data you want to view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Log Viewer** displays a chart of the frequency of anomalous log lines during one minute before and one minute after the Log Analytics alert and lists the associated log data. This information helps you identify trends leading up to and following the event, providing context for root cause analysis.

As you analyze the logs for an alert on the **Log Viewer**, you can modify the query to fine-tune the search, save useful searches, and share them with others. For a description of the information displayed in the **Log Viewer** table, see Log Viewer table fields.

You can perform the following tasks on the **Log Viewer**:

- View log data for an alert in Health Log Analytics

  View a chart of the frequency of anomalous log lines and the associated log data.

- Define, save, and share a search of log data in Health Log Analytics

  Fine-tune the search query to help determine the causes of the issue, and save and share useful searches.

- Use or modify a saved log data search in Health Log Analytics

  Use a saved search. As the owner of a saved search, you can modify the search values and save your changes.

- Filter search results on the Log Viewer in Health Log Analytics

  Apply filters to show only the data you want to view.

- Customize the Log Viewer table in Health Log Analytics

  Add or remove columns in the table to show only the data you want to view.

If you discover an important metric in the log data, you can use it to define a new Log Analytics alert rule. For more information, see Define a custom Log Analytics alert rule in Health Log Analytics.

Use Case: Proactive monitoring of your ServiceNow instance in Health Log Analytics

Use Health Log Analytics to detect and resolve emerging issues in your organization's ServiceNow instance before they negatively impact users.

Using the ServiceNow System Logs Retriever integration to detect platform issues automatically

Starting with version 35.0.26 of Health Log Analytics, you can use the ServiceNow System Logs Retriever integration to automatically detect errors and anomalies in your ServiceNow instance's system logs. As an operator you can view, manage, and respond to the generated alerts in the Express List. Filter the list to show only alerts for the impacted service. Then, use Now Assist to get an in-depth analysis of the alert and potential resolutions in straightforward, human-readable language. This AI-driven tool demonstrates a deep understanding of the Glide system and offers actionable insights.

Combining HLA's anomaly detection with Now Assist's GenAI capabilities provides a comprehensive toolkit for identifying and resolving platform system issues more effectively. This collaboration enables Health Log Analytics to help prevent system issues from impacting your platform users.

Using the MID Server and System Logs Retriever data inputs together to monitor your instance

You can also stay ahead of disruptions to your ServiceNow environment by using the MID Server data input and the ServiceNow System Logs Retriever data input together.

As an admin, you select a MID Server from the MID Servers list. Under Related Links, choose **Create MID Server Data Input using HLA** to create a data input specific to the selected MID Server. Then activate the System Logs Retriever data input and configure it to collect your ServiceNow instance's system logs.

As an operator, you navigate to the Express List and select an alert from the Alerts list. Review the alert details, including duration and impacted services, and analyze the logs that surround the anomaly. Use Now Assist to get an in-depth analysis of the alert and potential resolutions in straightforward, human-readable language. If needed, for further investigation, you can navigate to the Log Viewer for a visual presentation of the system logs. Select System Logs Retriever from the components drop-down list to view all the errors that have occurred in the ServiceNow instance. You can customize the visualization by using filters.

By drilling down into the alert and MID Server logs, you can quickly identify the issue and resolve it before it affects your platform users.

Controlling Health Log Analytics alert generation, prioritization, and anomaly detection

Influence how Health Log Analytics generates and prioritizes alerts and identifies anomalies. Use alert filters to reduce noise from unimportant issues.

Overview of impacting alert generation, prioritization, and anomaly detection

Explore how to influence alert generation and anomaly detection in Health Log Analytics. You can create and modify rules to generate alerts for specific metrics, ensuring that you are informed of important issues. You can also assign different levels of significance to alerts, helping Health Log Analytics prioritize them based on their relevance. In addition, you can influence anomaly detection by managing the keywords that Health Log Analytics looks for in your log data, and use advanced log alert filters to reduce noise.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Using alert rules to control when Health Log Analytics generates alerts

  Manage alert rules to generate Log Analytics alerts for specified metrics.

- Assign higher or lower significance to an alert in Health Log Analytics

  Assign higher or lower significance to an alert to help prioritize the alerts that Health Log Analytics generates.

- Influence anomaly detection in Health Log Analytics with lexical keywords

  Influence how Health Log Analytics finds anomalies by managing keywords it looks for in your log data.

- Reducing noise by adding advanced log alert filters in Health Log Analytics

  Use advanced log alert filters to reduce noise by making Health Log Analytics drop alerts that don't indicate a significant issue.

Using alert rules to control when Health Log Analytics generates alerts

Alert rules enable you to set conditions that determine when Health Log Analytics (HLA) triggers an alert.

HLA detects anomalies automatically by learning from your log data. However, some log types need custom alert rules to generate alerts reliably. For more information, see Alert rules in Health Log Analytics.

You can define, change, or delete custom alert rules:

- Define a custom Log Analytics alert rule in Health Log Analytics

  Define a Log Analytics alert rule for log data that is not generating alerts automatically.

- Change a custom Log Analytics alert rule in Health Log Analytics

  Edit a Log Analytics alert rule that you have defined.

- Delete a custom Log Analytics alert rule in Health Log Analytics

  Delete a Log Analytics alert rule that you have defined if it’s no longer needed.

Alert rules in Health Log Analytics

Health Log Analytics (HLA) detects anomalies automatically by learning from your log data. However, some log types require a custom alert rule to generate alerts reliably.

You can use custom alert rules to specify the metric, threshold, and alert properties for generating alerts that HLA might not detect automatically.

Anomaly detection logic by log pattern

HLA classifies incoming logs into three patterns before applying anomaly detection. This classification determines which detection logic is used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log patterns

Pattern	Description
Lively	Logs arrive frequently and consistently: at least once in 20 seconds. For example, an application writes hundreds of log entries per hour. The ML Engine has enough volume to build a reliable baseline, so it applies standard anomaly scoring to detect deviations.
Sparse	Logs arrive infrequently or irregularly: less than once in 1 minute (60 seconds). For example, a batch job runs every night and writes a small number of log entries. Standard anomaly scoring would produce unreliable results here, so the ML Engine applies probability distribution analysis instead. Sparse logs might not generate alerts if the volume is too low to establish a baseline.
Stopped	Logs have not arrived for more than the configured period. Default is 5 minutes (300 seconds). To modify the default value, update the HLA system property `detective.resolution.signal_dead`. For a log stream to be alerted as stopped or dead it must first be considered alive by running continuously for a minimum period of time. You can set this time in the HLA system property `detective.alive_period_seconds_for_signal_d` For information about setting and changing HLA system properties, see Configure global Health Log Analytics system properties.

When to create custom alert rules

- For high-frequency logs with a lively log pattern, there is no need for a custom rule. However, you can add a rule to generate alerts under specific conditions.
- For low-frequency logs with a sparse log pattern, the system might not generate alerts automatically. If these logs should still generate alerts, define a custom alert rule.
- For known critical conditions that HLA might not flag automatically, define a custom rule. For example, if a specific log message indicates that a critical service has failed, define a rule that generates an alert every time that message appears.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using custom alert rules

Scenario	ML detection	Custom rule
High-frequency logs with a lively log pattern	Likely sufficient	Optional
Low-frequency or periodic logs	Unreliable	Suggested
Known critical conditions	Insufficient	Required

Related topics

Define a custom Log Analytics alert rule in Health Log Analytics

Change a custom Log Analytics alert rule in Health Log Analytics

Delete a custom Log Analytics alert rule in Health Log Analytics

Define a custom Log Analytics alert rule in Health Log Analytics

Define a custom Log Analytics alert rule for log data that might not generate alerts automatically. A custom rule enables you to specify the metric, threshold, and alert properties directly.

Before you begin

For background information, see Alert rules in Health Log Analytics.

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Define and run a search.
   For more information, see Define, save, and share a search of log data in Health Log Analytics.
3. When a search returns log data that should generate an alert, select **Save** or **Save as** to save the search.

   Note: If you're using Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store , you don't have to perform this step.

4. Access the form for creating an alert rule by selecting **Define alert** at the top right of the **Log viewer** tab.
5. On the form, provide the name and description for the alert rule.
   The name appears on the Anomaly card for generated alerts.
6. Determine whether the rule generates alerts when the threshold conditions are met in the log data by setting the **State** field.
   To activate the rule, select **Enabled**.
7. If you have installed the Health Log Analytics application, Version 20.0.11 - July 2021 , set the Severity value for the alert generated by this alert rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Low**: Attention is required even though the resource is still functional.
- **Medium**: Either performance has degraded or a partial, non-critical loss of functionality has occurred.
- **High**: Major functionality is severely impaired or performance has degraded.
- **Critical**: Immediate action is required. Either the resource is not functional or critical problems are imminent.

8. If you have installed the Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, fill in the details for the query.

Query details

Field	Description
Your query	The query to search for in the log data. By default, this is the query that was defined on the Log viewer. You can modify the query by adding search requirements to it. To search for all queries, specify an asterisk (*).
Active filters	The filters defined for the query on the Log viewer. You can delete the filters.
Component	The component to which this alert rule applies. By default, this is the component that was defined on the Log viewer. You can choose a different component by selecting the search icon ( ) in the Component row and then selecting the required component from the list.

9. Fill in the fields related to the threshold that will trigger the alert rule.

Threshold

Field	Description
Operator	Mathematical comparison operator that qualifies how the hit count triggers an alert of this kind. This field is automatically set to Bigger Than.
Hit count	Number of matching log entries that serve as the trigger for an alert of this kind.
Time period	Period of time over which the hit count is measured. The period is measured in the units specified by the **Time unit** value.
Time unit	Units of the time period. This field is automatically set to minutes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Persistence	Time period over which the specified hit count per unit time must persist to trigger an alert of this kind. The field is automatically set to 1 minute.

10. Select **Save**.

1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Open a defined alert.
   a. Select the selection icon ( ) at the top right of the **Log viewer** tab, and then choose **Manage my defined alerts** from the drop-down list.
   b. From the **Defined alerts** table, select the alert that you want to delete.
3. Select **Delete**.

Assign higher or lower significance to an alert in Health Log Analytics

Label an alert in Health Log Analytics as meaningful or insignificant, or restore normal importance to the metric involved in generating it.

Assigning higher or lower significance to an alert helps you prioritize the alerts Health Log Analytics generates. Here are some common use cases for adjusting the importance of an alert:

- Labeling alerts as meaningful: You can make a significant alert more likely to be included in a Log Analytics group when its associated metric behaves anomalously. This ensures that important alerts receive appropriate attention.
- Muting distracting alerts: You can mute alerts for insignificant issues to reduce noise and avoid being overwhelmed by alerts for minor problems. This enables you to focus on more critical alerts. You can view a list of muted metrics to ensure you are aware of metrics that are no longer generating alerts.
- Reducing sensitivity to certain anomalies: You can lower the sensitivity of anomaly detection to a specific anomaly. This can help you focus on more significant anomalies.
- Restoring normal significance: If you previously marked an alert as significant, muted it, or if you lowered sensitivity to certain anomalies, you can return the associated metric to its normal significance. This is useful when you no longer want to treat the alert specially.

You can do the following to adjust the importance of an alert or reduce sensitivity to specific anomalies:

- Mark an alert as significant in Health Log Analytics

  Make an alert more likely to be included in a Log Analytics group when the associated metric behaves anomalously by labeling the alert as meaningful.

- Mute an unimportant alert in Health Log Analytics

  Eliminate distracting new alerts for insignificant issues by muting them. View the list of metrics that were muted and no longer generate alerts.

- Decrease sensitivity to similar anomalies in Health Log Analytics

  Make Health Log Analytics anomaly detection less sensitive to anomalies like the one that triggered the current Log Analytics alert.

- Restore normal importance to an alert metric in Health Log Analytics

  Return normal significance to the metric involved in generating a Log Analytics alert.

For detailed information about alert metrics, see How Health Log Analytics generates alerts.

Mark an alert as significant in Health Log Analytics

Make an alert more likely to be included in a Log Analytics group when the associated metric behaves anomalously by labeling the alert as meaningful.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Important: From the Vancouver release onward, the **Operator Workspace** is deprecated and replaced with Service Operations Workspace. For the new procedure, see the corresponding topic in the Service Operations Workspace for ITOM documentation: Mark an alert as significant in Health Log Analytics.

Mute an unimportant alert in Health Log Analytics

Eliminate distracting new alerts for insignificant issues by muting them.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Important: From the Vancouver release onward, the **Operator Workspace** is deprecated and replaced with Service Operations Workspace. For the new procedure, see the corresponding topic in the Service Operations Workspace for ITOM documentation: Mute an unimportant alert in Health Log Analytics.

View the list of muted metrics in Health Log Analytics

View the list of metrics that were muted so that they no longer generate alerts.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

Navigate to **All** > **Health Log Analytics** > **Log Anomaly Detection** > **Muted Metrics**.

Muted Metrics

Field	Description
Service instance	Service instance where the muted alert with which the metric is associated appears.
Component	Logical component of the service instance that generated the event. Multiple CIs can sometimes perform the same function.
Pattern text	Text for the metric that is associated with the muted alert.
Metric	Log text or key that represents a meter or gauge value in the data. For example, patterns, raw metrics, keyword, severity, all events metrics.
Created	Date and time when the metric was added to the list.

Restore normal importance to an alert metric in Health Log Analytics

Restore normal importance to an alert metric in Health Log Analytics

If you no longer want a muted alert or an alert that was marked as significant to be treated specially, you can restore normal importance to the metric involved in generating it.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

Important: From the Vancouver release onward, the **Operator Workspace** is deprecated and replaced with Service Operations Workspace. For the new procedure, see the corresponding topic in the Service Operations Workspace for ITOM documentation: Restore normal importance to an alert metric in Health Log Analytics.

Influence anomaly detection in Health Log Analytics with lexical keywords

Influence how Health Log Analytics finds anomalies by managing keywords it looks for in your log data. When text in log data for a source matches a lexical keyword that exceeds a specified count threshold, the system identifies an anomaly and generates an alert.

Health Log Analytics scans your logs for words that can indicate important issues. Lexical keywords such as 'crashed' or 'failed' signal conditions that may require attention. The application sets a threshold for each lexical keyword based on its normal occurrence pattern and frequency in your logs.

When Health Log Analytics scans your logs, it identifies all occurrences of the keyword. If the frequency of a lexical keyword in the log data for a source exceeds the specified threshold, the system identifies an anomaly and generates an alert.

Health Log Analytics comes with many default global keywords. You can add, edit, and delete these global keywords or phrases, which apply to all source types.

Note: To add a specified keyword associated with a specific source type, see Configure source type capabilities in Health Log Analytics.

You can manage lexical keywords as follows:

- Add, edit, or delete lexical keywords in Health Log Analytics

  Add, edit, and delete global keywords or phrases.

- View the lexical keywords that generate alerts in Health Log Analytics

  View the list of lexical keywords that can indicate important issues in log entries. By default, the table lists only global keywords.

Add, edit, or delete lexical keywords in Health Log Analytics

Manage the keywords that Health Log Analytics looks for in your log data.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

About this task

In log data, terms like "crash" or "failed" are called lexical keywords because they indicate issues that can merit attention. When text in log data for a source matches a lexical keyword that exceeds a specified count threshold, the system identifies an anomaly and generates an alert.

Important: A lexical keyword differs from a key in a `key : value` pair in a log line. For example, *`Hostname`* is a key that takes on a value: the name or IP address of the host. In contrast, a keyword like *`Failed`* is important by itself and does not take on a value.

The application comes with many default global keywords. You can add, edit, and delete global keywords or phrases. These keywords apply to all source types.

Note: To add a specified keyword that is associated with a specific source type, see Configure source type capabilities in Health Log Analytics.

Procedure

1. Navigate to **All** > **Health Log Analytics** > **Log Anomaly Detection** > **Lexical Keywords**.
   By default, the Lexical Keywords table lists only global keywords.
2. **Optional:** Add a global keyword.
   a. Select **New**.
   b. On the form, fill in the fields.

Lexical keyword form

Field	Description
Name	Unique and descriptive name for the keyword.
Regular expression	Regular expression (regex) that defines matches.
Exact match	Option to make Health Log Analytics match the exact regex. For example, 'NullPointerException' in a message would not match the regex 'exception'. This field is automatically set to **True**.
Case-sensitive	Option to make Health Log Analytics look for a case-sensitive match of the regex. This field is automatically set to **False**.
Range of analysis	Range of sources types where Health Log Analytics looks for the keyword in the log data. Choices are as follows: ▪ **All source types** ▪ **Specified source type**
Excluded source types	Source types that are not associated with the keyword. Health Log Analytics does not

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	look for the keyword in the log data of these source types.

c. Select **Submit**.

3. **Optional:** Edit a global keyword.
   a. Click the keyword that you want to edit in the list.
   b. On the form, edit the relevant fields.
   c. Select **Update**.
4. **Optional:** Delete one or more global keywords.
   a. Select the rows of the keywords that you want to delete.
   b. From the Actions on selected rows list at the bottom of the page, select **Delete**.
   c. Select **OK**.

View the list of lexical keywords that can indicate important issues in log entries.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

Navigate to **All** > **Health Log Analytics** > **Log Anomaly Detection** > **Lexical Keywords**.
The Lexical Keywords table appears. By default, the table lists only global keywords.

For information about adding, editing, or deleting global keywords, see Add, edit, or delete lexical keywords in Health Log Analytics.

To add a specified keyword that is associated with a specific source type, see Configure source type capabilities in Health Log Analytics.

Reducing noise by adding advanced log alert filters in Health Log Analytics

Use advanced log alert filters to determine whether to allow an alert or to drop it. These filters reduce noise by dropping alerts that don't indicate a significant issue.

You can add advanced log alert filters to scan alerts for your defined conditions. For example, you can define a filter that drops alerts coming from specific log sources, or alerts for anomalies that do not cross the specified threshold.

Some examples of the actions that advanced filters can enable:

- Alert only on anomalies that are shared across multiple hosts.
- Do not alert on anomalies that happen outside of working hours.
- Do not alert if the anomaly does not cross the specified threshold.
- Alert only on anomalies that are part of a correlation.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can manage advanced log alert filters as follows:

- Create advanced log alert filters

  Add advanced log alert filters to scan alerts for conditions that you specify. The filters reduce noise by dropping alerts that do not indicate a significant issue. While developing a filter, you can test, update, publish, or activate the filter at any time.

- Continue modifying the filter by reopening the filter record from the filters list. You can then edit, test, publish, and activate the filter.

For more technical information on log alert filters, see the Advanced Log Alert Filtering [KB0863538] article in the Now Support Knowledge Base.

Create advanced log alert filters

Add advanced log alert filters to scan alerts for conditions that you specify. The filters reduce noise by dropping alerts that do not indicate a significant issue. While developing a filter, you can test, update, publish, or activate the filter at any time.

Before you begin

The Disable Alert Rule Engine feature and the Disable Detection Rule Engine feature must be in the OFF state. You set the values by navigating to **Health Log Analytics** > **Health Predictive AI Ops Administration** > **Features**.

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Navigate to **Health Log Analytics** > **Log Anomaly Detection** > **Advanced Log Alert Filter**.
2. Select **New**.
3. Enter a unique and descriptive name for the filter.
4. **Optional:** Enter a description of the operation of the filter.
5. In the **Script template** field, select the script that most closely matches your intended logic.
   The template can act as a starting point for your custom script code.
   After you select a template, the Custom JS function text box is populated with the appropriate JavaScript function. The JavaScript function applies the filter to the alert payload data and either allows or drops the alert. The alert payload is the text and metadata for the kind of alert that the filter will analyze.
6. Save the record by selecting **Submit**.
   To continue modifying the filter, you must reopen the record from the filters list. You can then edit, test, publish, and activate the filter.
7. Edit the default **Alert payload** text in preparation for testing your intended logic.

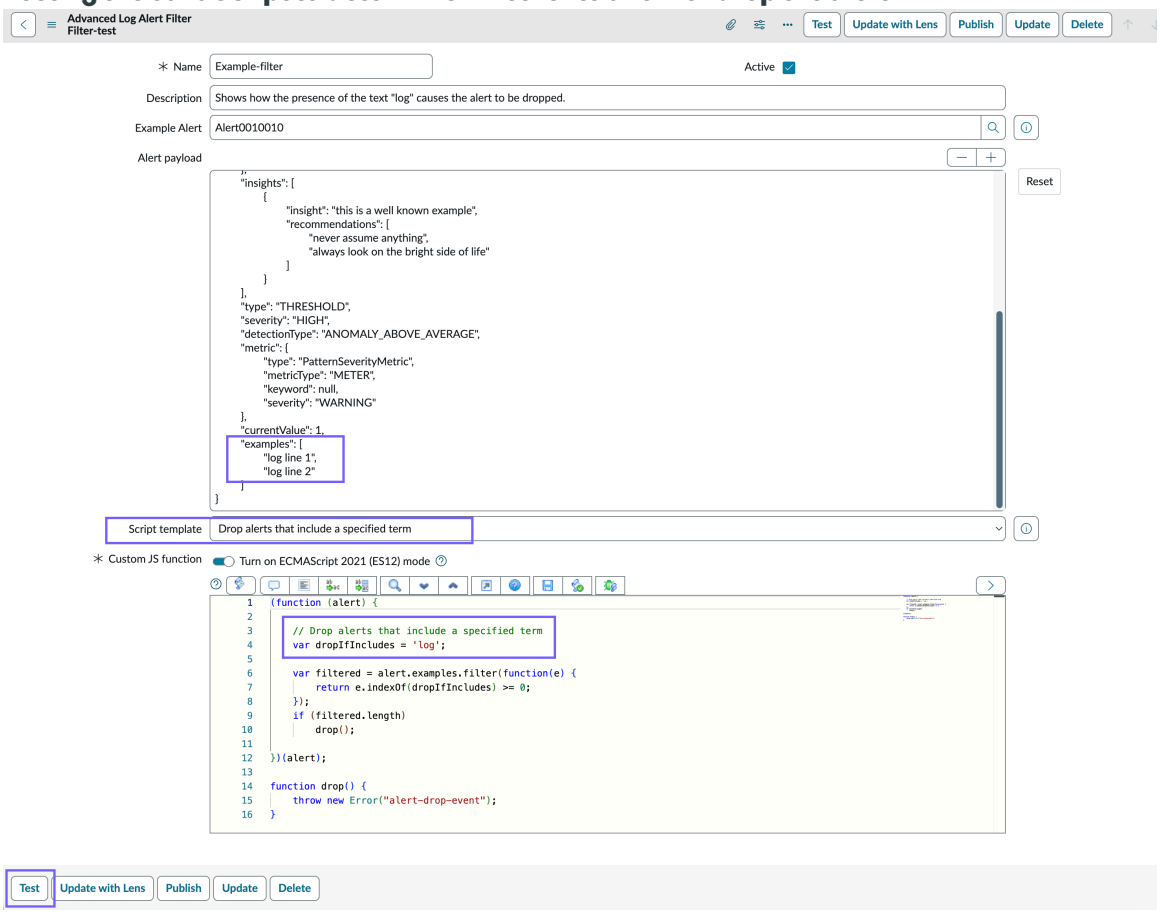
   To remove your changes and revert to the default text for the Alert payload text box, click **Reset**.

   For your convenience, Health Log Analytics provides sample alerts with preconfigured payloads. Select a sample alert in the **Example alert** field to display its payload in the Alert payload text box.
8. **Optional:** Save the current values of the filter without testing by selecting **Update**.
9. When your content for the alert payload and your JavaScript function are complete, select **Test**.
   To simulate the alert operation, the system saves the filter values, applies the filter to the **Alert payload** text, and then displays one of the following results:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Alert will be dropped.
- Alert will be allowed.

Testing the JavaScript to determine whether to allow or drop the alert



Note: If your new JavaScript function is not behaving as expected, you can revert to the last published one by selecting the **Revert JS Function** related link.

10. Repeat the process of updating the alert payload and testing the JavaScript function as often as needed.
11. When you are satisfied with the filter, save its values and determine whether to apply it to the log stream.
    - To save the values and apply the filter to the log stream, make sure the **Active** check box is selected and select **Publish**.
    - To save the filter without applying it to the log stream, clear the **Active** check box and select **Publish.**

Note: If you modify a published filter, you must publish the modified filter to apply it to the log stream.

Result

The values of the active filter are saved. If you selected the Active option, the filter is applied to the log stream.

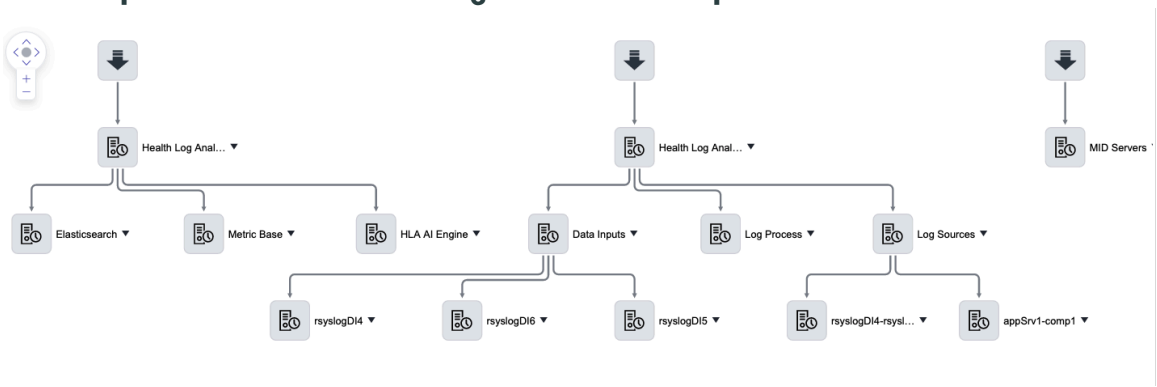
Viewing Health Log Analytics system health alerts on the service map

The ServiceNow Event Management service map includes a model of the Health Log Analytics core components and the system health alerts that affect them.

Health Log Analytics and the Event Management application form a single service. Viewing the configuration items (CIs) that comprise Health Log Analytics and their relationships helps you visualize the impact of HLA system health issues on the service.

HLA components on the Event Management service map



Health Log Analytics uses self-health checks to monitor the health of its components. When it discovers a system health issue, a notification triggers an alert. System health alerts display on the affected CIs on the service map. A colored bar on an affected CI indicates the criticality level of the alert: A red bar signifies a critical alert, an orange bar a major alert, and a yellow bar a minor alert.

For example, the red bar indicates a critical alert on this CI:

If the alert impacts the parent object, the parent object has a bar of the same color. For more information, see View an alert impact on CIs in a service map.

You can drill down into an alert to view details about the issue and then address it by performing the action proposed in the notification. For more information, see Health Log Analytics self-health checks, notifications, and proposed actions.

Monitored components

Component	What is monitored
Health Log Analytics core	• Elasticsearch • Metric Base • HLA AI Engine
Health Log Analytics	• Data inputs • Log sources

Monitored components (continued)

Component	What is monitored
	Note: New data inputs and log sources are automatically added to the service map.
Log ingestion process	All elements that affect the log ingestion process.

Related topics

Identify Health Log Analytics system health issues on the service map

Identify Health Log Analytics system health issues on the service map

View Health Log Analytics (HLA) system health issues on the ServiceNow Event Management service map.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

About this task

Viewing the configuration items (CIs) that comprise Health Log Analytics and their relationships helps you visualize the impact of HLA system health issues on the service. For more information, see Viewing Health Log Analytics system health alerts on the service map.

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Application Services**.
2. On the **Mapped Application Services** page, locate ServiceNow Event Management and select **View Service**.

   The Event Management service map shows the Health Log Analytics core components and the system health alerts that affect them.
3. On the service map, identify Health Log Analytics system health issues.
4. Drill down into an alert to view details about the issue.

What to do next

Address the alert by performing the action proposed in the notification. For more information, see Health Log Analytics self-health checks, notifications, and proposed actions.

Analytics and Reporting in Health Log Analytics

Gain valuable insights into the number of IT issues predicted before your users were affected and the money it saved your organization by using Analytics and Reporting in Health Log Analytics.

Platform Analytics Solutions for Health Log Analytics

Platform Analytics Solutions contain prepackaged Performance Analytics and Reporting content for use with other ServiceNow AI Platform products. This Platform Analytics Solution provides valuable insights into the number of IT issues Health Log Analytics predicted before your users were affected, and the money it saved your organization by preventing critical outages.

Required roles

The following roles and tasks are associated with this solution:

- ServiceNow AI Platform administrator (admin): Install and activate this solution and make any necessary changes to system properties.
- Performance Analytics administrator (pa_admin): Review the indicators, breakdowns, widgets, and dashboards. Set up and start data collection. Share the dashboards with appropriate stakeholders.

Activate the Platform Analytics Solution for Health Log Analytics

Activate the content pack ServiceNow Store application for the Platform Analytics Solution.

Before you begin

Activate the full, subscription version of Performance Analytics on the instance where you are activating this Platform Analytics Solution. You can activate Performance Analytics on a non-production instance without purchasing a subscription. For more information, see Activate your Performance Analytics subscription.

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Applications** > **ServiceNow Store**.
2. Browse for Health Log Analytics and verify that you have the necessary valid entitlements.

   You need a HI account and permission to request applications for the instances under consideration. The HI account and the instance need to be part of the same company. For more information, see Install a ServiceNow Product on the ServiceNow Store.
3. Search for `Health Log Analytics (sn.occ)`.
4. Install the application.

   When you install this application, you also activate the Performance Analytics - Premium (com.snc.pa.premium) plugin.

   Note: This plugin requires an additional fee.

Configure the Platform Analytics Solution for Health Log Analytics

Run diagnostics, review and customize components, and start collecting data.

Before you begin

A ServiceNow AI Platform administrator must have installed the content pack plugins or ServiceNow Store application for this Platform Analytics Solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: pa_admin

Procedure

1. Run diagnostics on all records.

   These diagnostics can catch many mismatches between the configuration of your Platform Analytics Solutions and your tables.

2. Navigate to **All** > **Performance Analytics** > **Administration Console**.
3. Verify the name of the dashboard that has been installed with this Platform Analytics Solution: Health Log Analytics Overview dashboard.
4. Open the **Indicator Sources** tab.
5. For each dashboard included in this Platform Analytics Solution:

   a. Filter the indicator sources on the dashboard name.

   b. Review the facts table, conditions, and frequency of the indicator sources compared to the data structure on your own instance.

   > **Important:** Pay particular attention to time stamp fields such as Resolved or Created that are referenced in the **Conditions** field. You may need to use different time stamp fields.

   c. If necessary, open an indicator source and make corrections.

   d. If you are editing an indicator source record, go to the Indicators related list and review the Conditions field for each indicator.
   Changing the indicator source can also affect the additional conditions on the individual indicators.

6. If you changed the time field stamps in any indicator sources, then change any related Performance Analytics scripts.
7. Open the **Breakdown Sources** tab.
8. For each dashboard included in this Platform Analytics Solution:
   a. Filter the breakdown sources on the dashboard name.
   b. Review the conditions on the breakdown source as described in Review the breakdown sources.
9. Navigate to **All** > **Performance Analytics** > **Jobs**.
10. Set up and run the historical job for this Platform Analytics Solution, *`[PA HLA] Historic Data Collection`*.
11. Edit and activate the scheduled data collection job for this Platform Analytics Solution, *`[PA HLA] Historic Data Collection`*.

Health Log Analytics Overview dashboard

The Health Log Analytics Overview dashboard uses Performance Analytics to provide a trend of historical data as well as regular reports.

From the Xanadu release onward, the Health Log Analytics Overview dashboard has been deprecated and replaced with the HLA Operational dashboard. The HLA Operational dashboard uses Performance Analytics to enable you to monitor log data, alerts, and error rate information

in Service Operations Workspace and address issues as they occur in the system. For more information, see HLA Operational dashboard.

Health Log Analytics reference

Reference topics provide additional information about the Health Log Analytics application.

Components installed with Health Log Analytics

Activating the Health Log Analytics, Health Log Analytics Viewer and Health Log Analytics Core plugins adds several components.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Plugins

Plugin	Description
Health Log Analytics	Health Log Analytics is an AI-powered log analysis solution capable of preventing IT incidents before users are affected. It automatically identifies your environment and logs, predicts IT incidents, generates alerts, and provides expert suggestions for fixing issues. Health Log Analytics is a ServiceNow Store app. Once installed, the module is available, but you can choose not to interact with it. Dependency: • Health Log Analytics Core • The ServiceNow® Event Management application
Health Log Analytics Viewer	Event Management operators use the Health Log Analytics Viewer plugin to browse logs by timestamp or time range. Health Log Analytics Viewer enables Event Management operators to search for a specific log text and visualize the frequency of hits in a particular time period. Dependency: The ServiceNow® Event Management application.
Health Log Analytics Core	This plugin contains essential components for Health Log Analytics, such as the AI Engine and Elasticsearch. Health Log Analytics Core is a ServiceNow Store app. Once installed, the module is available, but you can choose not to interact with it.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugin	Description
	Dependency: The ServiceNow® Event Management application.

Roles

Health Log Analytics uses the following roles.

Role title [name]	Description
Event Management Administrator [evt_mgmt_admin]	Has read and write access to all Event Management features to configure Health Log Analytics.
Event Management Operator [evt_mgmt_operator]	Has read access to all Event Management features. Has write access to alerts to manage the alert life cycle. Has the itil role to manage incidents created from alerts. Can also activate operations on alerts, such as to acknowledge, close, and open an incident and run remediation.

Lists

Health Log Analytics adds the following lists.

Table [name]	Description
Advanced Log Alert Filtering [sn_occ_advanced_alert_filtering]	Controls processing of alert metrics with feedback options. Enables providing more complex feedback to the AI engine. Beginning with the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store, this representation no longer displays.
Advanced Log Alert Filter [sn_occ_advanced_alert_filter]	Controls processing of alert metrics with feedback options. Enables providing more complex feedback to the AI engine. **Note:** This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, available from the ServiceNow Store.
Data Inputs [sn_occ_base_data_input_config]	Enables setting up data input connectors to stream log data into the instance.
Data Input Mapping [sn_occ_event_mapper]	Enables mapping raw log data that streams into the instance to determine how Health Log Analytics processes it.
Data Input Preprocessor [sn_occ_data_input_preprocess_screen]	Enables editing raw log data before the system maps and structures it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table [name]	Description
Define Alert [sn_occ_custom_alert]	Enables creating custom alerts based on a predefined set of rules.
Excluded Values [sn_occ_auto_service_normalizer]	Enables configuring Health Log Analytics to stop extracting specific log data that is not descriptive enough or contains redundant text or information.
Extracted Values [sn_occ_auto_service_mapper]	Enables configuring Health Log Analytics to extract a specific term found in a field and map it to a specified component.
Features [sn_occ_features]	Lists all Health Log Analytics features. The features can be activated and deactivated.
Lexical Keywords [sn_occ_lexical_keywords]	Shows all default lexical keywords that Health Log Analytics looks for in log data.
Log Correlator [sn_occ_log_correlator]	Shows all correlators that determine whether to correlate different alerts to the same group. Enables adding correlators to Health Log Analytics.
Log Sources [sn_occ_sources]	Provides a view of all data input sources when the log data has been mapped. Enables controlling properties and correlators for these sources.
Muted Metrics [sn_occ_metric_state]	Shows all muted alert metrics together with the muted components. Enables reactivating the muted alert metrics.
Source Type [sn_occ_source_type]	Contains the source types extracted in the mapping process.
Source Type Structure [sn_occ_source_type_structure]	Enables fine-tuning the source type structure. Provides a view of all source types when the log data has been mapped. Source types define how Health Log Analytics treats specific sources and how it parses the logs.
Streaming Sources [sn_occ_log_streaming_source_stats]	Enables monitoring all entities that stream log data to the instance.
System Health – Notifications [sn_occ_health_check]	Shows all system health notifications together and enables updating their status.
System Properties [sn_occ_system_settings]	Displays system properties and enables customizing their values.
Timestamp Formats [sn_occ_timestamp_formats]	Displays predefined timestamp formats. Enables defining and adding timestamp formats.
Time Zones [sn_occ_time_zones]	Enables deleting records in sn_occ_time_zones for users with the evt_mgmt_admin role.

Forms

Health Log Analytics adds the following forms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table [name]	Description
Beats Data Input [sn_occ_data_input_config_filebeat]	Enables configuring advanced settings for Beats data input connectors.
Beats Linux (Filebeat) [sn_occ_data_input_connector_filebeat]	Enables configuring Filebeat data input connectors.
Elasticsearch Data Input [sn_occ_data_input_config_elastic]	Enables configuring an Elasticsearch data input.
MID Server Data Input [sn_occ_data_input_config_midserver]	Enables configuring a MID Server data input.
Rsyslog [sn_occ_data_input_connector_rsyslog]	Enables configuring Rsyslog data input connectors.
Rsyslog Data Input [sn_occ_data_input_config_rsyslog]	Enables configuring advanced settings for Rsyslog data input connectors.
TCP Data Input Configuration [sn_occ_data_input_config_tcp]	Enables configuring advanced settings for TCP data input connectors.
Windows Beats [sn_occ_data_input_connector_winbeat]	Enables configuring Windows Beats data input connectors.
WinLog Beats [sn_occ_data_input_connector_winlogbeat]	Enables configuring WinLog Beats data input connectors.

Supported data inputs for Health Log Analytics

Health Log Analytics (HLA) enables you to connect your ServiceNow instance to several types of data input.

HLA supports the following data input types:

- Passive data inputs (listeners), which wait for log data to be pushed to them. These data inputs require a network port to be open on the MID Server:
  - Rsyslog
  - Beats
  - Splunk
  - TCP
  - UDP
  - MID Server
  - GCP PubSub
  - REST API

  The Agent Client Collector data input is supported for use with the Agent Client Collector Log Analytics application, available from the ServiceNow Store.
- Active data inputs (pullers), which pull data from repositories:
  - Elasticsearch
  - Splunk Polling
  - Amazon CloudWatch

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Amazon S3
- Microsoft Azure Log Analytics
- Microsoft Azure Event Hubs
- Apache Kafka

For all active data inputs, Health Log Analytics supports MID Server clusters for failover protection. The active data input runs on a single MID Server in the cluster. If that MID Server fails, the system moves its tasks to the next available MID Server in the cluster in a configured order.

The Elasticsearch data input fetches data from a data repository or database using credentials. If your data is in Elasticsearch, Health Log Analytics must have the following:

- Permissions to query Elasticsearch

  One of the following types of credentials:

  - Basic authentication (user and password)
  - AWS, for Elasticsearch on Amazon AWS Cloud
- Network connectivity to the relevant Elasticsearch cluster

Note: Health Log Analytics must be pointed to the correct index to start pulling the data.

In addition, Health Log Analytics supports Crible, Edge Delta, and Vector Agent data inputs. These data inputs enable HLA to process log messages that are streaming from these tools into your instance.

Native ServiceNow data inputs

Streaming logs from Cloud Observability to Health Log Analytics

Health Log Analytics can process log data it ingests from the ServiceNow® Cloud Observability application, formerly#Lightstep. HLA automatically sets up the configuration needed to enable log streaming from Cloud Observability as part of its native integration. Setting up the connection from Cloud Observability to HLA must be done in the Cloud Observability application. In HLA, you handle log records from Cloud Observability in the same way as any other Data Input Mapping and Source Type Structure records, as explained in Log data auto-mapping and mapping in Health Log Analytics and Source type structure adjustment in Health Log Analytics. For more information about Cloud Observability, see Explore Cloud Observability documentation.

		logs to a flat file and use the ACC agent to stream them to Health Log Analytics. • Dynatrace: Set up the Dynatrace integration to stream data directly from Dynatrace to Health Log Analytics. • Nagios: Use the Nagios plugin to stream events directly to Health Log Analytics. Export logs to a flat file and use the ACC agent to stream them to Health Log Analytics. • Datadog: Use the Vector Agent data input to stream data from Datadog to Health Log Analytics.

MID Server proxy preconditions for streaming logs to Health Log Analytics

Requirements for using a MID Server proxy to stream log data to Health Log Analytics.

- Use a Squid MID Server proxy to enable streaming log data to Health Log Analytics. For more information, see Proxy server configuration for MID Servers used for Cloud Discovery and Cloud Provisioning and Governance.
- Install and configure the MID Server proxy with the log ingestion capability enabled.

  In addition, configure the following properties:

  - mid.proxy.use_proxy = true
  - mid.proxy.host = <proxy_ip>
  - mid.proxy.port = <proxy_port>

Health Log Analytics configuration preferences

Commonly used settings for Health Log Analytics properties and general configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Server settings

- The MID Server log ingestion capability must be enabled.

  Note: Enabling **All capabilities** on the MID Server includes enabling the log ingestion capability.

- Use dedicated MID Servers for log ingestion whenever possible.
- To enable MID Servers to run multiple products, Health Log Analytics must have at least the Java Virtual Machine (JVM) memory setting for the standard product for each MID Server thread configuration.

The preferred MID Server settings for Health Log Analytics are:

- ○ CPUs: 8
  - RAM: 32 GB
  - Network Bandwidth: Up to 10 Gbps
  - EBS Bandwidth: Up to 4,750 Mbps
  - Maximum Java heap size for MID Server: 8,192 MB

  With the above specifications, the expected log ingestion throughput on a Washington DC instance is as follows:

  - For a log message of 300 bytes: 20,000
  - For a log message of 1.1 KB: 12,300
  - For a log message of 2 KB: 7,970

  The minimum requirements for streaming logs to Health Log Analytics are:

  - CPUs: 4
  - RAM: 16 GB
  - Java heap size for MID Server: 8 GB

  For general information, see: MID Server system requirements.

- To increase log ingestion throughput, you can either increase the ulimit or the network bandwidth, or decrease the size of the logs being streamed. The ulimit setting can be configured on an individual MID Server. However, the correlation between the ulimit and the throughput can't be modified.

  The following table lists the ulimit settings for open files relating to network throughput on the MID Server. It shows the size of the logs being streamed from the MID Server to the agent, and the gRPC streaming rate equivalent to the throughput.

Ulimit settings in relation to throughput

Queue Type	Log line size	gRPC rate
In Memory Queue	300 bytes	18,000
In Memory Queue	1.1 KB	13,000
In Memory Queue	2 KB	10,000
Disk-based Queue	300 bytes	11,000

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Queue Type	Log line size	gRPC rate
Disk-based Queue	1.1 KB	5,000
Disk-based Queue	2 KB	3,000

Starting from the August 2024 release, you can enhance MID Server communication with the ServiceNow instance by using the Lightning gRPC client, which can increase log streaming speeds to Health Log Analytics by up to six times. The Lightning gRPC client requires manual configuration to activate. For more information, see the Lightning gRPC client - Enabling the new MID gRPC streaming architecture [KB1648419] article in the Now Support Knowledge Base.

- By default, the number of data inputs per MID Server is limited to 10. You can configure this limitation for an individual MID Server or for all MID Servers.
- Both in FIPS and non-FIPS mode, MID Servers with Health Log Analytics capability must run on the Java Runtime Environment (JRE) 11 or above.

Note: To support BC-FIPS version 2.0, Health Log Analytics requires an upgrade to version 34.0.37, December 2024.

Log source retention settings

By default, log retention per source is set to three days. This setting can't be modified.

When using Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store , you can modify the log retention policy per source or for multiple sources together. For more information, see Modify the log source retention period in Health Log Analytics.

Health Log Analytics system health notifications

Health Log Analytics system health notifications help to ensure that you're aware of potentially dangerous conditions. You can manually adjust the status of a notification as the issue is being addressed.

Health Log Analytics uses self-health checks to monitor the health of its components. When it discovers a system health issue, a notification is created and an email sent to all subscribers. The Health Log Analytics Administration **System Health - Notifications** list displays all HLA system health notifications, including those about internal errors. You can ask your admin to subscribe you to the system health notifications.

Health Log Analytics System Health - Notifications

Field	Description
Name	Notification header.
Description	Description of the notification.
Created	Date when the notification was created.
State	State of the notification. • **New**: The notification was newly added. • **Acknowledged**: The notification record was read.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health Log Analytics System Health - Notifications (continued)

Field	Description
	• **Work in progress**: The issue described in the notification is being addressed. Adjust the value manually. • **Closed**: The issue is no longer active. Adjust the value manually. **Note:** Changing the state of a notification does not affect the state of the issue described in it. A notification in the Closed state will still display in the table. The notification is automatically filtered out of the table only when the issue is detected as fixed (that is, when the Healthy status is **True**).
Healthy	Field that indicates the status of the issue mentioned in the notification. The table shows only notifications with a Healthy value of **False**. When the issue is detected as fixed, the value is automatically changed to **True** and the notification is filtered out of the table.

Health Log Analytics self-health checks, notifications, and proposed actions

Health Log Analytics provides self-health checks, notifications, and proposed problem-solving steps.

Health Log Analytics system health notifications

Self-health check	Notification	Proposed action
Maximum AI engine queue size exceeded	The AI engine is running at overcapacity (size=%s, threshold=%s, duration=%s). As a result, the accuracy of anomaly detection might deteriorate.	Contact ServiceNow support.
High rate of unclassified errors in %s %s	"%s %s has a high rate of unclassified errors and is failing frequently.	Contact ServiceNow support.
Errors invoking glide API	Errors invoking '%s' for %s.	Contact ServiceNow support.
Log size limitation was exceeded	Log messages from %s: %s are being dropped because the log size limitation was exceeded.	If the difference is minor, increase the log size limitation by adjusting the property *mid.data_inputs.max_length_bytes* on the MID Server Properties form. If the logs are too long or multi-line, you can also modify

Health Log Analytics language support

Health Log Analytics provides international language support. The default language is US English.

Language support coverage

The current available languages for Health Log Analytics are as follows: US English, UK English, French, German, Italian, Japanese, and Spanish.

Note: To receive keyword-based alerts for languages other than English, keywords in the relevant language must be added to the system before you start streaming. Contact ServiceNow Support for assistance.

Domain separation and Health Log Analytics

Domain separation is supported for Health Log Analytics. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Domain separation and Health Log Analytics overview

Domain separation is present in all aspects of the Health Log Analytics application. Users belonging to a specific domain see only the data existing in their own domain.

How domain separation works in Health Log Analytics

When data is domain separated using a single Health Log Analytics server, each Managed Service Provider (MSP) can see the log data only in its own domain or the child domains below it . Users can view alerts that Health Log Analytics generates only in their own domain. Actions to remediate the alerts apply only for the scope of that domain. By default, all users and records are set to the parent domain unless the admin assigns them to a specific domain.

The Health Log Analytics Domain Separation plugin must be installed before you configure your data inputs in the Health Log Analytics application. There is no setup procedure for the plugin. Install the plugin with the Health Log Analytics application Version 21.0.1 - September 2021, and then activate it. Make sure that you map your data into logical silos and configure rules and entities.

You define the domain-separated environment when you configure your data inputs. Users can use data inputs that are only available in their own domain. Health Log Analytics creates alerts only for logs that arrive in those data inputs. All relevant records and all data processing in the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health Log Analytics program flow reside in the same domain as the data input. A data input's domain name is shown in the **Domain** column displayed in the tables in your instance.

Using domain separation in your instance is transparent to Health Log Analytics. The application manages all aspects of the data, such as system settings and custom operations, separately. When a property is changed, the new value affects new sources only in the specific domain. System properties affecting the server are common to all domains because all domains use the Health Log Analytics server.

Note: Health Log Analytics supports up to 60 kilobytes events per second (EPS) across all domains, without the ability to provide a service level agreement (SLA) to a specific domain and without fairness. If a domain streams a large amount of data, the Health Log Analytics server processes it. Other domains might suffer latency, drops, or other issues as a result, even if they stream a low number of logs. On the MID Server side, 10 kilobytes EPS is expected.

Use cases

- An MSP wants to provide the Health Log Analytics application to multiple customers in a similar environment with a single instance.
- An organization with many tenants wants to isolate its sensitive data, such as security logs.
- An administrator of a tenant organization wants to define a data input only for their own domain.
- An operator in a tenant organization wants to view logs only in their own domain.
- An operator in a tenant organization wants to provide feedback for alerts only in their own domain.
- An MSP Admin wants to view log data from all of their organization's tenant domains.

Domain separation for service providers

JavaScript function test outcome fields

Description of the JavaScript function test outcome fields.

The following fields are read-only:

Field	Description
Duration (ms)	The processing time of all samples, in milliseconds.
Source types	The number of source types predicted or created for this data input.
Sources	The number of sources predicted or created for this data input.
Errors	The number of JavaScript errors that occurred in all the samples.
Unmapped	The number of log lines that could not be mapped. These log lines are mapped to default tags.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Samples	The number of log samples on which the test is run. The default value is 1,000. **Note:** You can increase the number of log samples up to a maximum of 5,000 samples in the system property data_input_mapping.max_examples. For more information, see Configure global Health Log Analytics system properties.

In the related lists, view the predicted or created source types and sources.

List/Tab	Description
Outcome Key Value Mapping	The results of running the JavaScript function on the log samples.
Source Types (from samples)	The predicted or created source types. **Note:** You can open source types that have already been created by selecting the appropriate link.
Sources (from samples)	The predicted or created sources. **Note:** You can open sources that have already been created by selecting the appropriate link.
Test Outcome	The log samples used for testing your JavaScript function, ordered by sources and source types. The **Test Outcome** list displays the number of log samples for each source-source type combination, and is updated when the log samples are refreshed and you start testing your script. The list links to samples in the **Mapping Samples** table, which shows the outcome of the JavaScript function for each sample. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.
Source Type Structures	The source type structures for this data input. Reviewing the source type structures can help you gain a better understanding of the data flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List/Tab	Description
	The **Last event time** column on this tab shows the last date and time the AI engine processed a log for the source type structure. The system refreshes this information every 5 minutes. Knowing when the last log was processed for this source type structure makes it easier to verify that log data is streaming.

Health Log Analytics severity mapping

Health Log Analytics (HLA) uses common severity values to identify severity labels in the Source Type Structure.

The **Log severity mapping** table illustrates how HLA identifies severity words from raw logs (shown in the left column), maps them to its own severity values (middle column), and then presents them in Event Management alerts (right column).

Log severity mapping

Raw log severity	HLA log severity	Event Management alert severity
TRACE	TRACE	Keywords-based
VERBOSE	TRACE	Keywords-based
FINE	TRACE	Keywords-based
FINER	TRACE	Keywords-based
FINEST	TRACE	Keywords-based
DEBUG	DEBUG	Keywords-based
DBG	DEBUG	Keywords-based
CONFIG	DEBUG	Keywords-based
INFORMATIONAL	INFORMATIONAL	Keywords-based
INFORMATION	INFORMATIONAL	Keywords-based
INF	INFORMATIONAL	Keywords-based
INFO	INFORMATIONAL	Keywords-based
UNKNOWN	UNKNOWN	Keywords-based
NOTICE	NOTICE	LOW
NOTIFICATION	NOTICE	LOW
WARNING	WARNING	MEDIUM
WARN	WARNING	MEDIUM
ERROR	ERROR	HIGH
ERR	ERROR	HIGH
CRITICAL	CRITICAL	CRITICAL
CRIT	CRITICAL	CRITICAL
FAT	CRITICAL	CRITICAL

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log severity mapping (continued)

Raw log severity	HLA log severity	Event Management alert severity
FATAL	CRITICAL	CRITICAL
SEVERE	CRITICAL	CRITICAL
ALERT	ALERT	CRITICAL
EMERGENCY	EMERGENCY	CRITICAL
EMER	EMERGENCY	CRITICAL

Note: If your raw log contains numerical severities or unrecognized words, map these values to the HLA Log Severity column by creating a conditional statement using the JS function in the Source Type Structure. For more information, see Source type structure adjustment in Health Log Analytics.

Integration configuration field descriptions

This section provides descriptions of the fields on the integration configuration forms for Health Log Analytics.

Amazon CloudWatch integration configuration fields

Description of the fields on the Amazon CloudWatch integration configuration forms for Health Log Analytics.

For the Amazon CloudWatch integration setup procedure, see Set up an Amazon CloudWatch integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My CloudWatch integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID server name	(Only when the **Execute on** field is set to Specific MID Server) The MID Server to which log data from Amazon CloudWatch is pulled. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of integrations streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: CloudWatch. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set data retrieval method

Field	Description
How to extract data from AWS CloudWatch?	
Authentication method	The AWS credentials needed to access resources in AWS service accounts. This field is required. Choose AWS credentials from the list, or add new AWS credentials to the list by selecting **Manage Credentials** and then defining new credentials on the **AWS Credentials** page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method (continued)

Field	Description
Group Name(s)	The log group(s) to fetch log data from in Amazon CloudWatch. This field is required. If you want the integration to search multiple log groups, specify the relevant groups in a comma-separated list. To fetch log data from all groups, use an asterisk (*) as a wildcard character.
AWS Region	The AWS region where the Amazon CloudWatch cluster is hosted. For example: us-west-1. This field is required. For a list of AWS regions, see https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-regions-availability-zones.html#concepts-regions
Which data to send to ServiceNow?	
Filter pattern	The pattern by which to filter incoming events. Various types of filter patterns are supported. For example: • A pattern for fetching log events that contain a single term. • A pattern for fetching log events that contain multiple terms. • A pattern for fetching log events that include a term and exclude another. **Note:** Filter patterns are case sensitive. For more information, see https://docs.aws.amazon.com/AmazonCloudWatch/latest/logs/FilterAndPatternSyntax.html
Prefix	Option to define a name prefix for Amazon CloudWatch log streams to read from. The integration reads only from log streams with this name prefix. **Note:** Only a single log stream prefix per data item is supported. For multiple prefixes, create multiple integrations.

© 2026 ServiceNow, Inc. All rights reserved.

Advanced settings

Field	Description
Connection timeout (ms)	The number of milliseconds to wait before timing out the AWS connection attempt.
Socket timeout (ms)	The number of milliseconds to wait before timing out a data transfer over an established connection.
Sub sample drop ratio	The number of logs to batch together, out of which one will be dropped. The default value is -1: No logs are dropped. This setting is used to reduce the number of fetched logs. For example, if you want one log out of every five to be dropped, change the value to 5.
Polling interval	The interval, in seconds, to wait before polling for new logs.
Character encoding	The character encoding used for this integration: UTF-8.
Batch size	The maximum number of logs retrieved per query.
Max length in bytes	The maximum length of log messages, in bytes.
Sub sample receive ratio	The number of logs to batch together, out of which one log will be received and the remaining ones dropped. The default value is -1: No logs are received. This setting is used to reduce the number of received logs. For example, if you want to receive one log out of every five, change the value to 5.
Sleep interval (seconds)	The interval, in seconds, to wait before querying again after a query has returned no logs.
Default timezone	The default timezone if the log date and time doesn't include timezone information.
Drop if queue is full	Option to select discarding logs if there is a load on the MID Server.

Amazon S3 integration configuration fields

Description of the fields on the Amazon S3 integration configuration forms for Health Log Analytics.

For the Amazon S3 integration setup procedure, see Set up an Amazon S3 integration for Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My S3 integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID server name	(Only when the **Execute on** field is set to Specific MID Server) The MID Server to which log data from Amazon S3 is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: S3. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set data retrieval method

Field	Description
Bucket name	The Amazon S3 bucket to stream. This field is required.
Region	The AWS region where the Amazon CloudWatch cluster is hosted. For example: us-east-2. This field is required. For a list of AWS regions, see https://docs.aws.amazon.com/AWSEC2/latest/

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method (continued)

Field	Description
	UserGuide/using-regions-availability-zones.html#concepts-regions
Authentication method	The AWS credentials needed to access resources in AWS service accounts. This field is required. Choose AWS credentials from the drop-down list, or add new AWS credentials to the list by selecting **Manage Credentials** and then defining new credentials on the **AWS Credentials** page.

Advanced settings

Field	Description
Include	The file or object to include when the system performs pattern matching.
Exclude	The file or object to exclude when the system performs pattern matching.
Bucket prefix	The prefix for the objects to be fetched. The integration fetches only objects with this prefix. **Note:** This field is typically used to fetch only specific folders within a bucket.
Buffer size	The size of the download buffer, in bytes.
Threadpool size	The number of concurrent threads that are downloading files from the bucket.
Anonymous	Option to force accessing the bucket without credentials, while ignoring default credentials if they exist.
Traverse	Option to access each directory in the bucket.
Sorting object by last modified time	Option to fetch objects if the objects in the bucket are sorted by time.
Sub sample drop ratio	The number of logs to batch together, out of which one will be dropped. The default value is -1: No logs are dropped. This setting is used to reduce the number of fetched logs. For example, if you want one log out of every five to be dropped, change the value to 5.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Sleep interval (seconds)	The interval, in seconds, to wait before querying again after a query has returned no events.
Max length in bytes	The maximum length, in bytes, of events.
Connection timeout (ms)	The number of milliseconds to wait before timing out the attempt to establish a connection to AWS.
Max retry per file	The maximum number of times to retry file processing in case of failure.
Socket timeout (ms)	The number of milliseconds to wait before timing out data transfer over an established connection.
Default timezone	The default timezone if the log doesn't include timezone information.
Sub sample receive ratio	The number of logs to batch together, out of which one log will be received and the remaining ones dropped. The default value is -1: No logs are received. This setting is used to reduce the number of received logs. For example, if you want to receive one log out of every five, change the value to 5.
Polling interval	The interval, in seconds, to wait before polling for new events.
Character encoding	The character encoding used for this integration: UTF-8
Drop if queue is full	Option to select discarding logs if there is a load on the MID Server.

Apache Kafka integration configuration fields

Description of the fields on the Apache Kafka integration configuration forms for Health Log Analytics.

For the Apache Kafka integration setup procedure, see Set up an Apache Kafka integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Kafka integration. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID server name	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Apache Kafka is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify the maximum number by adding the property `sn.occ.log_ingestion.max_datainputs_per` to the MID Server and then changing the default value. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: Kafka. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set data retrieval method

Field	Description
Kafka node names	A comma-separated list in the format HOST:PORT,HOST:PORT. This field is required. The list does not have to include all the Apache Kafka Cluster servers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method (continued)

Field	Description
Topics	A comma-separated list of topics to which the data input must subscribe. This field is required.
Kafka credentials	The Apache Kafka credentials. You can select existing Kafka SSL credentials, or create new ones by selecting **Create Kafka credentials** from the drop-down list. For a description of the fields on the Kafka SSL credentials form, see Kafka SSL credentials fields.
Group ID	The name of the Apache Kafka Consumer Group.

Advanced settings

Field	Description	Default value
Timeout	The time, in milliseconds, spent waiting in the poll if data is not available in the topics.	500
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.	GMT
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Character encoding	The character encoding for this data input. This field is read-only.	UTF-8
Node discovery timeout	The time, in milliseconds, before node discovery times out.	30
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description	Default value
Max length in bytes	The maximum length, in bytes, of events.	32766
Drop if queue is full	Option to discard logs if there is a load on the MID Server.	False

Amazon Data Firehose integration configuration fields

Description of the fields on the Amazon Data Firehose integration configuration forms for Health Log Analytics.

For the Amazon Data Firehose integration setup procedure, see Set up an Amazon Data Firehose (MID-less) integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Firehose integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Transport	The protocol used for streaming log messages to your instance: Amazon CloudWatch Logs. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Cribl integration configuration fields

Description of the fields on the Cribl integration configuration forms for Health Log Analytics.

For the Cribl integration setup procedure, see Set up a Cribl integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Cribl integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service Instance	The service instance (formerly the application service) to which to bind the log data. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
MID Server name	The MID Server to which the Cribl logs are streamed. This field is required.
Port	The port on the MID Server. This field is required. Choose a port within the range 6000-6200 from the array. The port must not be occupied by another process. Make sure that your organization's security team opens the selected port on the MID Server.
Description	Option to add a brief description of the integration to help identify it.
Transport (for push integrations)	The protocol used for streaming log messages to your ServiceNow instance: TCP. This field is read-only.
Source (for pull integrations)	The source of the log data that the integration pulls to your ServiceNow instance: Cribl. This field is read-only.

Set up connection

Field	Description
Cribl URL	The URL of the Cribl instance. This field is required. HLA uses this URL to establish the connection with the Cribl instance and make the necessary API calls. For example: • On-Prem: https://my-cribl.company.com:9000 • Cloud: https://myorg-12345abcde.cribl.cloud • Sandbox: https://sandbox-xyz789.sandbox.cribl.io
Authentication method	The authentication method used by the Cribl integration. This field is required. The Cribl integration supports: • Token-based authentication: Required for Cribl Cloud and also supported for self-hosted (On-Prem) Cribl instances. • Basic authentication: Preferred for self-hosted (On-Prem) Cribl instances. Both of these authentication methods use the default credential alias: Cribl_Credential_Alias. For information about setting up credentials for the authentication method used by the Cribl integration, see Set up authentication credentials for the Cribl integration in Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up connection (continued)

Field	Description
	Important: Verify that only one active credential record of each credentials type exists under the credential alias.
Worker Group	The Cribl Worker Group from which to stream log data to the instance. This field is required. The drop-down list displays Worker Groups based on the provided Cribl cloud instance URL and authentication method. For example: • default • dev-workers • prod-workers • staging-workers
Cribl route	The Cribl route that directs log data to a specific destination. This field is auto-populated with a drop-down list of all available routes, each configured with a default destination. Select the desired route from the list. This field is required. For example: • default • demo-route
Cribl destination	The Cribl destination to which the log data is directed. This field is auto-populated and read-only. When HLA populates this field, it provides a link to the destination on the Cribl server. For example: sn_hla_cribl_tcp_json_abcdef

Edge Delta REST integration configuration fields

Description of the fields on the Edge Delta REST integration configuration form for Health Log Analytics.

For the Edge Delta REST integration setup procedure, see Set up an Edge Delta REST integration for Health Log Analytics.

Provide details

Field	Description
Integration name	Unique name of this integration. For example: My Edge Delta REST integration. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID web server	The MID Web Server to use. This field is required.
Service instance	The service instance to which to bind the log data. This field is required.
Port	The port for the MID Server. This field is read-only. It is auto-populated when the MID Web Server is chosen.
Transport	The transport method used for streaming log messages to your ServiceNow instance: REST. This field is read-only.
MID server name	The MID Server to which the log data is pushed. This field is auto-populated when the MID Web Server is chosen. It is read-only.
Description	Option to add a brief description of the integration to help identify it.

Edge Delta TCP integration configuration fields

Description of the fields on the Edge Delta TCP integration configuration forms for Health Log Analytics.

For the Edge Delta TCP integration setup procedure, see Set up an Edge Delta TCP integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Edge Delta TCP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	MID Server to which the Edge Delta logs are streamed. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
Port	The port on the MID Server used for listening on logs. This field is required. Choose a port within the suggested range from the array. The port must not be occupied by another process. Ensure that your organization's security team opens the selected port.
Service instance	The service instance to which to bind the log data. This field is required.
Transport	The protocol used for streaming log messages to your ServiceNow instance: TCP. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Advanced settings

Field	Description
Lookup hostnames	Option to perform DNS lookup to resolve IPs to hostnames. The default value is false.
Sub sample drop ratio	The ratio of logs to drop. The default value is -1: no logs are dropped. For example: If you want one out of every five logs to be dropped, change the value to 5.
Sub sample receive ratio	The ratio of logs to receive. The default value is -1: no logs are received. For example: If you want one out of every five logs to be received, change the value to 5.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Max length in bytes	The maximum length of log messages in bytes. The default value is 32766.
Character encoding	The character encoding for this data input. Default is UTF-8.
Line breaker delimiters	The line break character separating the raw log lines. Splitting values must be separated by a comma followed by a space: ", ". For example: "\r, \n, , splitHere, #".
Boss thread count	The number of threads that manage connections.
Worker thread count	The number of threads that handle incoming data.
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.
Default timezone	The time zone of events that the system uses if a log does not specify the time zone. By default, the system uses GMT, but you can specify a different time zone.
Drop if queue is full	Option to discard logs if there is a load on the MID Server.

Elasticsearch integration configuration fields

Description of the fields on the Elasticsearch integration configuration forms for Health Log Analytics.

For the Elasticsearch integration setup procedure, see Set up an Elasticsearch integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Elasticsearch integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Execute on	Option to determine whether to use a specific MID Server or a specific MID Server cluster.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
MID server name	(Only when **Execute on** is set to Specific MID Server) The MID Server to which log data from Elasticsearch indices is pulled. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server Cluster) The MID Server cluster to which the log data is pulled. This field is required. When you select a cluster, the MID Servers in the selected cluster and their status are displayed. The integration runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the integration tasks to the next available MID Server in the cluster according to the configured order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the integration form, the MID Server Clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • If Elasticsearch uses client certificate or CA certificate authentication, all MID Servers in the cluster must have the appropriate certificates. • The default maximum number of integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 integrations running on it, even when that MID Server is down.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: Elastic. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Data retrieval method

Field	Description
Server URL	The URL used to access the cluster. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data retrieval method (continued)

Field	Description
Authentication method	The authentication method used to authenticate the integration to Elasticsearch. Default is none. When you select the authentication method, the corresponding credentials fields display on the form. **Note:** As an admin, you can create an authentication method by navigating to **All** > **Health Log Analytics** > **Authentication Methods** and selecting **New**.
Index prefix	Prefix prepended to the names of the Elasticsearch indices from which you want to read data. The integration only reads data from indices that match the configured prefix. For example: network-logs-* matches indices such as network-logs-2024.01.01. This field is required. This setting ensures that HLA only ingests data from the relevant indices. For example: only-read-these-indices-*
Document timestamp field	Timestamp field in documents stored in the read indices. This field is required.
Timestamp field format	Format of the timestamp field in the documents. If no format is specified, the default Unix epoch time format is used, in milliseconds. For example: 1684168407 (May 15, 2023 4:33:27 PM)
Term filters	JSON map of the terms to filter. **Note:** Avoid using the term query for text fields. If the target field is mapped as both text and keyword, reference the keyword by using fieldname.keyword. For example: {"severity": ["error", "warning"]}

Advanced settings

Field	Description
Max connections per route	The maximum number of connections to be opened per node.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Max scroll slices	The number of shards configured for the relevant index in Elasticsearch. This number tells Elastic how many parallel queries to execute in each polling request.
Proxy host	Host name of the HTTP proxy through which requests are sent.
Proxy port	Port of the HTTP proxy through which requests are sent.
Use MID certificate policy check	Option to enable the MID certificate policy check. Select this option if you want to ship your logs encrypted using SSL TLS. Then navigate to **All** > **MID Server** > **MID Security Policy** and add the MID certificate policy check to the table. For more information, see MID Server certificate check policies.
Use cross-cluster search	Option to search for data across Elasticsearch clusters. When this check box is selected, the **Clusters to search** field displays. **Note:** Your settings in the **Use minimal privileges** check box and the **Delay in reading current timestamp (seconds)** field on the **Advanced configuration** form affect how data is collected across multiple clusters.
Clusters to search	The Elasticsearch clusters to search.This field displays only when the **Use cross-cluster search** check box is selected. Do one of the following: • Leave this field empty or enter "*" to search all the remote clusters defined in Elasticsearch. • Specify the clusters to search in a comma-separated list. **Note:** To also search the local cluster, add a comma at the beginning or end, or add two commas in succession to the list. For example: "east,,west" or ",east,west" or "*,"

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Use minimal privileges	Option to read log data directly from the Elasticsearch indices with the configured prefix. • When selected, the integration reads the log data directly from the Elasticsearch indices with the configured prefix. To perform this task, it needs only read privileges. **Note:** When this check box is selected and you're using cross-cluster search, data is collected from all the clusters simultaneously. • When clear, the integration fetches all indices with the prefix, filters them, and reads the log data from the filtered indices. Performing this task requires additional privileges. **Note:** Leaving this check box clear when using cross-cluster search affects how data is collected from the clusters. For more information, see the Enabling and Using Cross-Cluster Search for Elasticsearch Data Inputs in Health Log Analytics [KB1556079] article in the Now Support Knowledge Base. For additional information about streaming logs using the Elasticsearch integration, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support Knowledge Base.
Max documents per query	Maximum number of documents fetched in a single query.
Sliced-scrolling tie breaker	Value used to slice the data. Each slice is scrolled in parallel. Default: _id
Search-after tie breaker	Unique value per document to use as tiebreaker when sorting log entries by timestamp.
Use search-after API	Option to toggle between using sliced-scrolling and search-after APIs. **Note:** Sliced-scrolling APIs are preferable when reading historical data, while search-after APIs are better for reading real-time data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Index time-suffix format	Format of the time suffix when using time-based index names, such as [logstash-]YYYY.MM.DD. When using aliases, leave this field empty. For example: uuuu.MM.dd
Data reading timeout (milliseconds)	The duration of time, in milliseconds, before a request to the Elasticsearch cluster times out.
Index discovery interval (seconds)	The number of seconds between intermittent MID Server requests to the Elasticsearch cluster for new indices from which to read data.
Scroll context time (milliseconds)	The lifetime of the created scroll when using the scroll API to read data from Elasticsearch. For more information, see the Elasticsearch scroll API documentation.
Event processor workers	The maximum number of CPU cores used in parallel to process events fetched from Elasticsearch. A higher setting increases the data input throughput at the cost of higher CPU usage.
Worker queue size	The maximum number of batches to queue for processing. A higher setting increases throughput, at the cost of higher RAM usage.
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.
Character encoding	The character encoding for this data input.
Sleep interval (seconds)	The interval, in seconds, to wait before querying again after a query has returned no data.
Max length in bytes	The maximum length, in bytes, of log messages.
Delay in reading current timestamp (seconds)	The number of seconds before current time to query to include delayed data.The configured

Advanced settings (continued)

Field	Description
	number of seconds is subtracted from the current time for reading the last timestamp. **Note:** If this value is 0 and data is collected from multiple clusters simultaneously, the query may not include data that was sent with a delay on one of the clusters,
Polling interval	How frequently the system polls for new log data.

GCP PubSub integration configuration fields

Description of the fields on the GCP PubSub integration configuration forms for Health Log Analytics.

For the GCP PubSub integration setup procedure, see Set up a GCP PubSub integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My GCP PubSub integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service Instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID Server name	(Only when **Execute on** is set to Specific MID Server.) The MID Server to which the logs are streamed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • You can only select a MID Server with log ingestion capability that supports basic authentication. MID Servers that support mTLS are not listed. • If log ingestion is not enabled on the selected MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
MID Server cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Source	The source of the log data that the integration pulls to your ServiceNow instance: PubSub. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set up connection

Field	Description
Project ID	The project ID of the Google Cloud project. For example, my-project-id. This field is required. You can obtain the project ID from your Google Cloud homepage by selecting My Project. The project ID will be displayed.
Authentication method	The credential alias ServiceNow® uses to access Google Cloud. The default value is sn_occ.HLA_Credential_Alias. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up connection (continued)

Field	Description
	Note: You can add more credential aliases to the list of available aliases to choose from by selecting **Manage credential aliases** from the list and adding a credential alias.
Topic name	The Google Cloud Pub/Sub topic to which to subscribe Health Log Analytics. For example, my_topic. This field is required. You can obtain the topic name from your Google Cloud homepage by searching for Pub/Sub. All topic names will be displayed.
Subscription name	The subscription Health Log Analytics uses to receive log data that is published on the Google Cloud Pub/Sub topic. If you leave this field blank, Health Log Analytics uses ServiceNow-Subscription.

Advanced Settings

Field	Description	Default value
Subscriber thread pool size	The number of concurrent threads that are downloading files from the Google Cloud Pub/Sub topic.	1
Sub sample receive ratio	The ratio of logs to receive. This setting determines the number of logs to group together, out of which one is received. It reduces the number of logs you receive. The default value is -1, meaning no logs are received. For example, if you want to receive one log out of every five, change the value to 5.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32,766
Character encoding	The character encoding for this data input. This field is read-only.	UTF-8
Sub sample drop ratio	The ratio of logs to discard. This setting determines the number of logs to group	-1

Advanced Settings (continued)

Field	Description	Default value
	together, out of which one is dropped. It reduces the number of fetched logs. The default value is -1: no logs are discarded. For example, if you want one log out of every five to be dropped, change the value to 5.	
Rate limit	The maximum number of events per second that this data input processes.	-1
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Drop if queue is full	Option to discard logs if many processes are waiting in the queue to access the MID Server.	Clear

Microsoft Azure Event Hubs integration configuration fields

Description of the fields on the Microsoft Azure Event Hubs integration configuration forms for Health Log Analytics.

For the Microsoft Azure Event Hubs integration setup procedure, see Set up a Microsoft Azure Event Hubs integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Event Hubs integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service Instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Source	The source of the log data that the integration pulls to your ServiceNow instance: PubSub. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.

Set data retrieval method

Event Hubs namespace	The scoping container for the event hub or hubs. This field is required.
Event Hub name	The event hub from which to fetch log data. This field is required.
Consumer Group name	The Consumer Group to use. This field is required. Enter an existing Consumer group or create one in the event hub. The default value is $Default.
Event Hub Credentials	The Event Hub credentials to use. This field is required. Select existing Azure Shared Access Signature (SAS) credentials or create the Azure SAS credentials to use. If you create new Azure

Set data retrieval method (continued)

	SAS credentials, you must provide the SAS policy name and key.

Advanced settings

Field	Description
Restore point rate	The number of logs the integration can read before a restore point is saved.
Processor threads count	The total number of processor threads.
Sub sample drop ratio	The ratio of logs to discard. This setting determines the number of logs to group together, out of which one is dropped. It reduces the number of fetched logs. The default value is -1: no logs are discarded. For example, if you want one log out of every five to be dropped, change the value to 5.
Sub sample receive ratio	The ratio of logs to receive. This setting determines the number of logs to group together, out of which one is received. It reduces the number of logs you receive. The default value is -1, meaning no logs are received. For example, if you want to receive one log out of every five, change the value to 5.
Operation timeout (seconds)	The number of seconds to wait before timing out event hubs operations.
Receive idle timeout (seconds)	The number of seconds to wait before timing out receive operations.
Max length in bytes	The maximum length, in bytes, of log messages. The default value is 32766.
Prefetch count	The number of logs received in advance of event hubs operations.
Max batch size	The maximum number of events passed to a single process call. The default value is 100.
Default timezone	The default time zone of logs. The system uses this default when the log does not specify a time zone. The default value is GMT.
Character encoding	The character encoding for this integration. The default value is UTF-8.
Drop if queue is full	Option to select discarding logs if there is a load on the MID Server.

Microsoft Azure Log Analytics integration configuration fields

Description of the fields on the Microsoft Azure Log Analytics integration configuration forms for Health Log Analytics.

For the Microsoft Azure Log Analytics integration setup procedure, see Set up a Microsoft Azure Log Analytics integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Azure Log Analytics integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID server name	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Microsoft Azure Log Analytics is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of integrations streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
MID MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to

Field	Description
	the next available MID Server in the cluster according to the configured order. **Note:** • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: Azure Log Analytics. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set data retrieval method

Field	Description
Redirect url	The redirect URL of the access log application. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method (continued)

Field	Description
	The URL refers to the Microsoft Azure redirect_uri authorization property. For more information, see the Authorization code URL (GET request) section in the Microsoft Azure documentation.
Authentication method	The credentials used to access Microsoft Azure resources. This field is required. If no credentials exist, select **Create new Azure Service Principal credential**. Create a credential by filling in the fields and then selecting **Submit**. For information on the **Tenant ID**, **Client ID**, and **Secret key** fields, refer to the Microsoft Azure documentation. When you have created a credential, you can select it from the drop-down list.
Workspace ID	The Customer ID used to call the Microsoft Azure Log Analytics REST API. This field is required.
Table name	The name of the table in Microsoft Azure Log Analytics where the data input fetches the log data. For more information, see the View table information section in the Microsoft Azure documentation. This field is required.
Event time property name	The Microsoft Azure Log Analytics field in which to detect the event time. This field is required.

Advanced settings

Field	Description
Event Processor workers	The number of concurrent event processing workers, where each worker processes a batch of events independently.
Workers queue size	The queue size of the Event Processor workers.
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.
Max documents per query	The highest number of rows retrieved in each query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Columns to select	Comma-separated list of column names to return. **Note:** This field is ignored when you provide a custom query.
Character encoding	The character encoding for this data input.
Sleep interval (seconds)	The interval, in seconds, to wait before querying again after a query has returned no events.
Polling interval	The interval, in seconds, to wait before polling for new events.
Drop if queue is full	Option to discard logs if there is a load on the MID Server.

Log Query	Option to define your own Log Analytics query. This field overrides the values configured in the other query settings fields.
	
	Note: If this field is empty, Health Log Analytics generates the query using the values set in the other fields.
	
	For your custom query, use the following JSON format:
	
	`{"query": "query | where TimeGenerated > %s | take 500"}`
	
	For example:
	
	`{ "query":"ContainerLog | where LogEntry contains 'cartservice' | where TimeGenerated > %s | take 500", "workspaces": ["defaultworkspace-3ab145ff-f9cd-433f-8533-d1b1ee24aee6-eus"], "project": ["TimeGenerated", "LogEntry", "LogEntrySource"] }`

MID Server integration configuration fields

Description of the fields on the MID Server integration configuration forms for Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For the MID Server integration setup procedure, see Set up a MID Server integration for Health Log Analytics.

Provide details

Field	Description
MID server name	The name of the MID Server from which the integration collects log messages and streams them to the instance. **Note:** You can only create one MID Server integration per available MID Server. If an existing MID Server integration or data input uses the same MID Server, you can't create an additional one for this MID Server. This field is required.
Integration Name	The name of the integration. When you select the MID Server name, this field is auto-populated with the selected MID Server. This field is read-only.
Service instance	The service instance to which to bind the log data. This field is required. By default, it is set to ServiceNow MID Server. **Note:** This field is only available for MID Server integrations created in version 36.0.17 or later versions.
Description	Option to add a brief description of the integration to help identify it.

Advanced settings

Field	Description
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Sub sample drop ratio	The ratio of events to drop. The default value is -1.
Sub sample receive ratio	The ratio of events to receive. The default value is -1.
Max length in bytes	The maximum length of log messages, in bytes. The default value is 32,766.
Character encoding	The character encoding for this data input. The default value is UTF-8.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Drop if queue is full	Option to discard logs if many processes are waiting in the queue to access the MID Server.

REST API integration configuration fields

Description of the fields on the REST API integration configuration forms for Health Log Analytics.

For the REST API integration setup procedure, see Set up a REST API integration for Health Log Analytics.

Note: REST API integrations support only UTF-8 encoding for incoming data.

Provide details tab

Field	Description
Integration Name	Unique name of this integration. For example: My REST API integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID web server	The MID Web Server to use. This field is required.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create a service instance and add CIs (Configuration Items) to it. Set the status of the new service instance to Operational.
Transport	The protocol used for streaming log messages to your ServiceNow instance: REST. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.
MID server name	The MID Server to which the log data is pushed. This field is auto-populated when the MID Web Server is chosen. It is read-only.
Port	The port for the MID Server. This field is read-only. It is auto-populated when the MID Web Server is chosen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow System Logs Retriever integration configuration fields

Description of the fields on the ServiceNow System Logs Retriever integration configuration form for Health Log Analytics.

For the ServiceNow System Logs Retriever integration setup procedure, see Set up a ServiceNow System Logs Retriever integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My System Logs integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required. The default service instance for this integration is ServiceNow System Logs.
Description	Option to add a brief description of the integration to help identify it.

Splunk Poller integration configuration fields

Description of the fields on the Splunk Poller integration configuration forms for Health Log Analytics.

For the Splunk Poller integration setup procedure, see Set up a Splunk Poller integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID server name	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Splunk is pulled. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Data source	The source of the log data that the integration pulls to your ServiceNow instance: Splunk. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Set data retrieval method

Field	Description
REST API Server URL	The URL used to access the Splunk REST API. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set data retrieval method (continued)

Field	Description
	Note: • By default, the Splunk REST API endpoint is available on port 8089. Therefore, the default endpoint for the Splunk REST API is: `http://<splunk-server>:8089`. • The REST API endpoint is different from the front-end endpoint.
Authentication method	The credential alias to be used. This field is required. The Splunk integration uses credential aliases instead of direct references to credentials for authentication. The credential aliases are listed by type: aliases that contain basic auth credentials, and those that contain token auth credentials. If an alias holds both credential types, it appears in both categories. You can select **Manage credential aliases** to manage your credential aliases and create new ones in the **Connection & Credential Aliases** list.
Query	The query Splunk uses to search your data. This field is required. For example, the query `sourcetype="adc_access_log"` instructs the Splunk Poller integration to retrieve all logs with the source type adc_access_log.

Advanced settings

Field	Description
Max documents per query	The maximum number of documents retrieved each time log data is fetched from Splunk. Default: 10,000.
Splunk Request Timeout (seconds)	The maximum time, in seconds, allowed for data retrieval before the request times out.

Splunk TCP integration configuration fields

Description of the fields on the Splunk TCP integration configuration forms for Health Log Analytics.

For the Splunk TCP integration setup procedure, see Set up a Splunk TCP integration for Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Splunk TCP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	MID Server to which log data from Splunk is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.
Port	The port for the MID Server. This field is required. Make sure that your organization's security team opens the selected port on the MID Server.
Description	Option to add a brief description of the integration to help identify it.
Transport	The protocol used for streaming log messages to your ServiceNow instance: TCP. This field is read-only.
Use Cooked Data	Option to ingest log data from Splunk in the preprocessed ("cooked") format that Splunk uses on the forwarder. Ingesting data into HLA in this format ensures that each log line retains the relevant contextual information that Splunk embeds into it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings

Field	Description
Use SSL/TLS	Option to use SSL/TLS, for enhanced data security and protection. **Note:** SSL/TLS must be enabled if you want to send logs in a compressed format.
Lookup hostnames	Option to perform DNS lookup to resolve IPs to hostnames. The default value is false.
Use Forwarder TimeZone	Option to pass information about the time zone in which the forwarder is located. The MID Server uses this information to adjust for the time zone from which the logs arrive. This option is displayed when **Use Cooked Data** is selected. It is relevant when using Splunk Universal Forwarders.
Enable Compression	Option to send logs in compressed format. Sending logs in a compressed format minimizes the size of the data being transferred, which is important when dealing with large volumes of log data. This option is displayed when **Use Cooked Data** and **Use SSL/TLS** are selected. It is relevant when using Splunk Universal Forwarders.
Sub sample drop ratio	The ratio of logs to drop. The default value is -1: no logs are dropped. For example: If you want one out of every five logs to be dropped, change the value to 5.
Sub sample receive ratio	The ratio of logs to receive. The default value is -1: no logs are received. For example: If you want one out of every five logs to be received, change the value to 5.
Max length in bytes	The maximum length of log messages in bytes. The default value is 32766.
Character encoding	The character encoding for this data input. Default is UTF-8.
Boss thread count	The number of threads that manage connections.
Worker thread count	The number of threads that handle incoming data.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced settings (continued)

Field	Description
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Drop if queue is full	Option to discard logs if there is a load on the MID Server.

Splunk UDP integration configuration fields

Description of the fields on the Splunk UDP integration configuration forms for Health Log Analytics.

For the Splunk UDP integration setup procedure, see Set up a Splunk UDP integration for Health Log Analytics.

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Splunk UDP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	MID Server to which log data from Splunk is pulled. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details (continued)

Field	Description
Port	The port for the MID Server. This field is required. **Note:** Make sure that your organization's security team opens the selected port on the MID Server.
Description	Option to add a brief description of the integration to help identify it.
Transport	The protocol used for streaming log messages to your ServiceNow instance: UDP. This field is read-only.

Advanced settings

Field	Description
Lookup hostnames	Option to perform DNS lookup to resolve IPs to hostnames. The default value is false.
Sub sample receive ratio	The ratio of logs to receive. The default value is -1: no logs are received. For example: If you want one out of every five logs to be received, change the value to 5.
Character encoding	The character encoding for this data input. The default value is UTF-8. This field is read-only.
Drop if queue is full	Option to discard logs if there is a load on the MID Server.
Sub sample drop ratio	The ratio of logs to drop. The default value is -1: no logs are dropped. For example: If you want one out of every five logs to be dropped, change the value to 5.
Max length in bytes	The maximum length of log messages in bytes. The default value is 32766.
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.

TCP integration configuration fields

Description of the fields on the TCP integration configuration forms for Health Log Analytics.

For the TCP integration setup procedure, see Set up a TCP integration for Health Log Analytics.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provide details tab

Field	Description
Integration Name	Unique name of this integration. For example: My TCP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	The MID Server to which the logs are streamed. This field is required. • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties.
Port	The port for the MID Server. This field is required. Select a unique port from the array. The placeholder shows the range of ports from which to choose. Make sure that your organization's security team opens the selected port.
Service instance	The service instance to which to bind the log data. This field is required.
Transport	The protocol used for streaming log messages to your ServiceNow instance: TCP. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Advanced settings

Field	Description
Use SSL/TLS	Option to use SSL/TLS.
Lookup hostnames	Option to perform DNS lookup to resolve IPs to hostnames.
Boss thread count	The number of threads that manage connections.
Worker thread count	The number of threads that handle incoming data.

Advanced settings (continued)

Field	Description
Read timeout seconds	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.
Sub sample drop ratio	The ratio of events to drop.
Sub sample receive ratio	The ratio of events to receive.
Max length in bytes	The maximum length of log messages in bytes.
Character encoding	The character encoding for this data input.
Drop if queue is full	Option to discard logs if there is a load on the MID Server.
Line breaker delimiters	The line break character separating the raw log lines. Splitting values must be separated by a comma followed by a space: ", ". For example: "\r, \n, , splitHere, #".

UDP integration configuration fields

Description of the fields on the UDP integration configuration forms for Health Log Analytics.

For the UDP integration setup procedure, see Set up a UDP integration for Health Log Analytics.

Provide details tab

Field	Description
Integration Name	Unique name of this integration. For example: My UDP integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	The MID Server to which the logs are streamed. This field is required.

Field	Description
	Note: • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties.
Service instance	The service instance (formerly the application service) to which to bind the log data. This field is required.
Port	The port for the MID Server. This field is required. The port must be within the range 6000-6200. Make sure that your organization's security team opens the selected port on the MID Server.
Transport	The protocol used for streaming log messages to your ServiceNow instance: UDP. This field is read-only.
Description	Option to add a brief description of the integration to help identify it.

Advanced

Field	Description
Default timezone	The time zone of events that the system will use if a log does not specify the time zone. By default, the system uses GMT in such cases, but you can specify a different time zone.
Sub sample drop ratio	The ratio of events to drop. The default value is -1.
Sub sample receive ratio	The ratio of events to receive. The default value is -1.
Rate limit	Limitation on the number of events per second that the data input processes. The default value is -1.
Max length in bytes	The maximum length of log messages, in bytes. The default value is 32,766.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced (continued)

Field	Description
Character encoding	The character encoding for this data input. The default value is UTF-8. This field is read-only.
Drop if queue is full	Option to discard logs if many processes are waiting in the queue to access the MID Server.

Vector Agent integration configuration fields

Description of the fields on the Vector Agent integration configuration forms for Health Log Analytics.

For the Vector Agent integration setup procedure, see Set up a Vector Agent integration for Health Log Analytics .

Provide details

Field	Description
Integration Name	Unique name of this integration. For example: My Vector Agent integration. This field is required. **Note:** When you fill in this field, the generic name displayed on the form adjusts automatically to match the name you entered.
MID server name	The MID Server to which the Vector Agent logs are streamed. This field is required. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of integrations streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. • If the MID Server is down or the connection is lost, the Vector pipeline may get blocked.
Port	The port on the MID Server. This field is required. Choose a port within the range 6000-6200 from the array. The port must not be occupied

© 2026 ServiceNow, Inc. All rights reserved.

Provide details (continued)

Field	Description
	by another process. Make sure that your organization's security team opens the selected port on the MID Server.
Transport	The protocol used for streaming log messages to your ServiceNow instance: TCP.
Description	Option to add a brief description of the integration to help identify it.

Data input configuration field descriptions

This section provides descriptions of the fields on the Health Log Analytics data input configuration forms.

Amazon CloudWatch data input configuration fields

Description of the fields on the Amazon CloudWatch data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Amazon CloudWatch is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order. **Note:** • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses Amazon CloudWatch to stream log data to your instance.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query settings tab

Field	Description	Example
From	The date and time to start reading the data. Data older than this date and time is not read. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. This field is required.	Now -1 week
Group Name(s)	The log groups to search. If multiple log groups must be searched, specify the groups in a comma-separated list. To fetch log data from all groups, use an asterisk (*) as a wildcard character. This field is required.	hla-cw-loggroup1,hla-cw-loggroup2
Prefix	Name prefix for the Amazon CloudWatch log streams to read from. The data input reads only from log streams with this name prefix.	hla-cw

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query settings tab (continued)

Field	Description	Example
	Note: Only a single log stream prefix per data item is supported. For multiple prefixes, create multiple data inputs.	
Filter pattern	Pattern by which to filter incoming events. Various types of filter patterns are supported. For example: • A pattern for fetching log events that contain a single term. • A pattern for fetching log events that contain multiple terms. • A pattern for fetching log events that include a term and exclude another. **Note:** Filter patterns are case sensitive. For more information, see https://docs.aws.amazon.com/AmazonCloudWatch/latest/logs/FilterAndPatternSyntax.html	• Pattern for fetching log events that contain a single term, "STATUS_CODE": "STATUS_CODE" • Pattern for fetching log events that contain multiple terms, “STATUS_CODE” and “200”: “STATUS_CODE 200” • Pattern for fetching log events that include a term, “STATUS_CODE,” and exclude another term, “200”: “STATUS_CODE” – “200”

Transport tab

Field	Description
AWS credentials	Field that refers to the AWS Credentials list (aws_credentials.list). The list contains the AWS access and secret access keys.
AWS region	The AWS region where the Amazon CloudWatch cluster runs, for example, us-west-1. For a list of AWS regions, see https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-regions-availability-zones.html#concepts-regions This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Connection timeout	The number of milliseconds to wait before timing out the AWS connection attempt.	1000
Batch size	The maximum number of logs retrieved per query.	2500
Socket timeout	The number of milliseconds to wait before timing out a data transfer over an established connection.	10000
Default timezone	The default timezone if the log date and time doesn't include timezone information.	GMT
Sub sample drop ratio	The number of logs to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched logs.	-1
Sub sample receive ratio	The number of logs to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received logs.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32766
Sleep interval	The interval, in seconds, to wait before querying again after a query has returned no logs.	60
Polling interval	The interval, in seconds, to wait before polling for new logs.	0
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	False

Amazon S3 data input configuration fields

Description of the fields on the Amazon S3 data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Amazon S3 is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses Amazon S3 to stream log data to your instance.
Sources count	The number of log sources this data input has created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Disabled since	Time when the data input stopped or failed.
Last log time	Time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query settings tab

Field	Description	Example
From/To	Starting and ending dates and time for reading the data. • From: Data older than this date and time is not read. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. • To: Data newer than this date and time is not read. For live data, set this date far into the future. This field is required.	From: Now -1 week To: 2300-01-01 15:59:59
Bucket name	The Amazon S3 bucket to stream. This field is required.	my-s3-bucket
Prefix	Prefix for the objects to be fetched. The data input fetches only objects that begin with this prefix. This field is typically used to fetch only specific folders in a bucket.	/only/this/folder/
Include	File or object to include when the system performs pattern matching.	.*include-me.*
Exclude	File or object to exclude when the system performs pattern matching.	.*skip-me.*

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transport tab

Field	Description
AWS credentials	Field that refers to the AWS Credentials list (aws_credentials.list). The list contains the AWS access and secret access keys.
AWS region	The AWS region where the Amazon S3 bucket is located, for example, us-west-1. For a list of AWS regions, see https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/using-regions-availability-zones.html#concepts-regions This field is required.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Anonymous	Option to force accessing the Amazon S3 bucket without credentials, while ignoring default credentials if they exist.	False
Traverse	Option to access each directory in the bucket.	False
Object sorted by Last Modified Time	Option to fetch objects if the objects in the bucket are sorted by time.	False
Connection timeout	The number of milliseconds to wait before timing out the attempt to establish a connection to AWS.	100
Threadpool size	The number of concurrent threads that are downloading files from the bucket.	1
Buffer size	Size of the download buffer, in bytes.	100MB
Socket timeout	The number of milliseconds to wait before timing out data transfer over an established connection.	10000
Max retry for file	The maximum number of times to retry file processing in case of failure.	10

Advanced configuration form (continued)

Field	Description	Default value
Default timezone	The default timezone if the log doesn't include timezone information.	UTC
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Rate limit	The maximum number of events per second that this data input processes.	-1
Max length in bytes	The maximum length, in bytes, of events.	32766
Character encoding	The character encoding for this data input.	UTF-8
Sleep interval	The interval, in seconds, to wait before querying again after a query has returned no events.	60
Polling interval	The interval, in seconds, to wait before polling for new events.	0
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	False

Apache Kafka data input configuration fields

Description of the fields on the Apache Kafka data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Apache Kafka is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses Apache Kafka to stream log data to your instance.
Sources count	The number of log sources this data input has created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query Settings tab

Field	Description	Example
From	Starting date and time for reading the data. Data older than this date and time is not read. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. This field is required.	Now -1 week

Transport tab

Field	Description	Example
Kafka node names	A comma-separated list in the format HOST:PORT,HOST:PORT. The list does not have to include all the Apache Kafka Cluster servers.	123.4.5.6:9092,123.3.4.5:9093
Topics	A comma-separated list of topics to which the data input must subscribe. This field is required.	FirstTopic,SecondTopic,ThirdTopic
Kafka credentials	Reference to the Apache Kafka credentials. You can display the Kafka SSL credentials form by selecting the Search icon ( ) and opening a record. The form enables you to choose the	None

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transport tab (continued)

Field	Description	Example
	security protocol used for authenticating with Apache Kafka from the following options: • **SSL** - SSL channel. • **SASL_SSL** - SASL authenticated, SSL channel. • **SASL_PLAINTEXT** - SASL authenticated, non-encrypted channel. For a description of the fields on the Kafka SSL credentials form, see Kafka SSL credentials fields.	
Group Id	The name of the Apache Kafka Consumer Group.	logs

Advanced configuration

Advanced configuration form

Field	Description	Default value
Timeout	The time, in milliseconds, spent waiting in the poll if data is not available in the topics.	500
Node discovery timeout	The time, in milliseconds, before node discovery times out.	30
Default timezone	The default timezone if the log doesn't include timezone information.	GMT
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Max length in bytes	The maximum length, in bytes, of events.	32766

Advanced configuration form (continued)

Field	Description	Default value
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	False

Kafka SSL credentials fields

Description of the fields on the Kafka SSL credentials form.

SSL security protocol

Field	Description
SSL keystore	The content of an actual server.keystore.jks file, encoded as a Base64 string.
SSL keystore type	Format of the SSL keystore file. Default: Java KeyStore (JKS).
SSL keystore password	Password to the keystore, identical to the value of the ssl.keystore.password property in Apache Kafka.
SSL key password	Password, identical to the ssl.key.password property value in Apache Kafka.
SSL truststore	The content of an actual client.truststore.jks file, encoded as a Base64 string.
SSL truststore type	Format of the truststore file. Default: Java KeyStore (JKS).
SSL truststore password	Password to the truststore, identical to the value of the ssl.truststore.password property in Apache Kafka.
SSL provider	Name of the security provider used for SSL connections.
Disable hostname verification	Option to disable verification of the hostname.
Additional Kafka consumer properties	Semicolon-separated string of additional Kafka consumer properties. For example: ssl.protocol=TLSv1.2;ssl.enabled.protocols=TLSv1.2,TLSv1.1

SASL_SSL security protocol

Field	Description
SSL truststore	The content of an actual client.truststore.jks file, encoded as a Base64 string.
SSL truststore type	Format of the SSL truststore file. Default: Java KeyStore (JKS).

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SASL_SSL security protocol (continued)

Field	Description
SSL truststore password	Password to the truststore, identical to the value of the ssl.truststore.password property in Apache Kafka.
SSL provider	Name of the security provider used for SSL connections.
Disable hostname verification	Option to disable verification of the hostname.
User name	The user name, if any, associated with this credential. **Note:** The specified user name is used for SASL authentication using JAAS. The following JAAS configuration is passed to the Kafka Server: `org.apache.kafka.common.security.plain.P required username=<user_name> password=<password>`
Password	The password associated with this credential. **Note:** • The specified password is used for SASL authentication using JAAS. The following JAAS configuration is passed to the Kafka Server: `org.apache.kafka.common.security.plain. required username=<user_name> password=<password>` • The password you specify is invisible. It is stored in the database in encrypted form.
Additional Kafka consumer properties	Semicolon-separated string of additional Kafka consumer properties. For example: ssl.protocol=TLSv1.2;ssl.enabled.protocols=TLSv1.2,TLSv1.1

SASL_PLAINTEXT security protocol

User name	The user name, if any, associated with this credential.

SASL_PLAINTEXT security protocol (continued)

	Note: The specified user name is used for SASL authentication using JAAS. The following JAAS configuration is passed to the Kafka Server: `org.apache.kafka.common.security.plain.P required username=<user_name> password=<password>`
Password	The password associated with this credential. **Note:** • The specified password is used for SASL authentication using JAAS. The following JAAS configuration is passed to the Kafka Server: `org.apache.kafka.common.security.plain. required username=<user_name> password=<password>` • The password you specify is invisible. It is stored in the database in encrypted form.
Additional Kafka consumer properties	Semicolon-separated string of additional Kafka consumer properties. For example: ssl.protocol=TLSv1.2;ssl.enabled.protocols=TLSv1.2,TLSv1.1

Cribl data input configuration fields

Description of the fields on the Cribl data input configuration form.

Getting Started

Field	Description
Data input name	Name of the new data input. This field is required.
Description	Description of the data input.
MID server	The MID Server to which the Cribl logs are streamed. This field is required.
Port	The port on the MID Server. Choose a port within the suggested range from the array. The port must not be occupied by another process. Make sure that your organization's security team opens the selected port.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started (continued)

Field	Description
	This field is required.

Config

Field	Description
Cribl instance URL	The URL of the Cribl instance. HLA uses this URL to establish the connection with the Cribl instance.
Cribl API token	The Cribl API token HLA uses to authenticate with Cribl and make API calls.

Process

Field	Description
Cribl route	The Cribl route that directs log data to a specific destination. This field is auto-populated with a drop-down list of all available routes, each configured with a default destination. You must select the desired route from this list. This field is required.
Cribl destination	The created Cribl destination. The Cribl destination points to the MID Server host and port configured in the data input. This field is read-only.

Edge Delta data input configuration fields

Description of the fields on the Edge Delta data input configuration form.

Edge Delta data input configuration form

Field	Description
Data input name	Name of the new data input. This field is required.
Description	Description of the data input.
Transport	The Edge Delta destination used for streaming log messages to the ServiceNow instance. The options are: • TCP - Frequently used for handling large volumes of log data. If you select TCP, you must provide the MID Server and port. When choosing the TCP transport option, create a TCP destination in Edge Delta to send log data to the instance from any source,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edge Delta data input configuration form (continued)

Field	Description
	using the same MID Server host and port you have configured for the Edge Delta data input. **Note:** For TCP, TLS/SSL is not supported. • HTTP: Frequently used for sending smaller logs via RESTful APIs, HTTP, or HTTPS for secure transmission. **Note:** For the HTTP protocol, authentication is used. If you select HTTP, you must provide the MID Web Server that is running on the MID Server. The system then populates the MID Server and port fields automatically, based on the provided MID Web Server. Depending on the MID Web Server configuration, you can send logs using either HTTP or HTTPS. If the **Secure Connection** check box on the MID Web Server extension form is clear, use HTTP. If it is selected, use HTTPS. For more information, see Event Management MID Web Server extension form. In addition, if the **Authentication Type** on the MID Web Server extension form is Basic, provide Basic authentication details in the Authorization header. If the **Authentication Type** is API Key, provide the key as “Key Api_Key". When choosing the HTTP transport option, create an HTTP destination in Edge Delta and enter the Endpoint URL in the following format: http://{MID_SERVER_IP}:{MID_WEB_SERVER_PORT}/api/mid/hla/raw. In Advanced Settings, create two headers to be attached to the HTTP request: ○ An Authorization header with the MID Web Server API key value or basic credentials as MID Web Server configured. ○ A Content-Type header named with the application/json value.
MID web server	The MID Web Server to which the log data is streamed.
MID server	The MID Server to which the Edge Delta logs are streamed. This field is required. If you selected HTTP in the **Transport** field, this field is populated automatically based on the selected MID Web Server.
Port	The port on the MID Server used for listening to logs. Choose a port within the suggested range from the array. In the case of TCP transport, the port must not be occupied by another process. Make sure that your organization’s security team opens the selected port. This field is required. If you selected HTTP in the **Transport** field, this field is populated automatically based on the selected MID Web Server.
Service instance	The service instance to which to bind the log data. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edge Delta data input configuration form (continued)

Field	Description
	Choosing the service instance enables HLA to correlate CIs and service instances in the CMDB for root cause analysis. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

Elasticsearch data input configuration fields

Description of the fields on the Elasticsearch data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to determine whether to use a specific MID Server or a MID Server cluster. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store.
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Elasticsearch indices is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when the **Execute on** field is set to Specific MID Server Cluster)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	The MID Server cluster to which the log data is pulled. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order. This feature is supported in the Health Log Analytics application, Version 26.0.17 - February 2023 and later, available from the ServiceNow Store. **Note:** • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input form, the MID Server Clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • If Elasticsearch uses client certificate or CA certificate authentication, all MID Servers in the cluster must have the appropriate certificates. • The default maximum number of data inputs streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster. This field is required.
Service instance	The service instance to which to bind the log data. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses Elastic to stream log data to your instance.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

Transport tab

Field	Description
Server URL	URL used to access the cluster. This field is required.
Max connections per route	Maximum number of connections to be opened per node. Default: 2.
Max scroll slices	The number of shards configured for the relevant index in Elasticsearch. This number tells Elastic how many parallel queries to execute in each polling request.
Proxy host	Host name of the HTTP proxy through which requests are sent.
Proxy port	Port of the HTTP proxy through which requests are sent.
Authentication method	The authentication method used to authenticate the data input to Elasticsearch. The options are: Basic auth, apiKey, or client certificate. **Note:** When you select the required authentication method, the corresponding credentials fields display on the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transport tab (continued)

Field	Description
Basic auth credentials	User name and password used to connect to the Elasticsearch search engine. **Note:** Fill in either this field or the **AWS credentials** field.
AWS credentials	AWS credentials to use to connect to the AWS-hosted Elasticsearch search engine. **Note:** Fill in either this field or the **Basic auth credentials** field.
AWS region	AWS region where the Elasticsearch cluster runs.
API key credentials	The API key used to connect to the Elasticsearch search engine.
Client certificate	The client certificate used to connect to the Elasticsearch search engine.
Use MID certificate policy check	Option to enable the MID certificate policy check. Select this option if you want to ship your logs encrypted using SSL TLS. Then navigate to **All** > **MID Server** > **MID Security Policy** and add the MID certificate policy check to the table. For more information, see MID Server certificate check policies.

Query Settings tab

Field	Description	Example
From/To	From and to dates and time for reading the data. • From: Don't read data older than this date. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. • To: Don't read data newer than this date. For live data, set this date far into the future.	From: 1970-01-01 15:59:59 To: 2300-01-01 15:59:59
Use cross-cluster search	Option for searching for data across Elasticsearch clusters.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query Settings tab (continued)

Field	Description	Example
	When this check box is selected, the **Clusters to search** field displays. **Note:** Your settings in the **Use minimal privileges** check box and the **Delay in reading current timestamp (seconds)** field on the **Advanced configuration** form affect how data is collected across multiple clusters.	
Clusters to search	The Elasticsearch clusters to search. This field displays only when the **Use cross-cluster search** check box is selected. Do one of the following: • Leave this field empty or enter "*" to search all the remote clusters defined in Elasticsearch. • Specify the clusters to search in a comma-separated list. **Note:** To also search the local cluster, add a comma at the beginning or end, or add two commas in succession to the list. For example: "east,,west" or ",east,west" or "*,"	east,west,south
Index prefix	Prefix for the Elasticsearch indices to read from. The data input reads only from indices with this prefix. This field is required.	only-read-these-indices-*
Use minimal privileges	Option for reading log data directly from the Elasticsearch indices with the configured prefix. • When selected, the data input reads the log data directly from the Elasticsearch indices with the configured prefix. To perform this task, it needs only read privileges. **Note:** When this check box is selected and you're using cross-cluster search, data is collected from all the clusters simultaneously. • When clear, the data input fetches all indices with the prefix, filters them,

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query Settings tab (continued)

Field	Description	Example
	and reads the log data from the filtered indices. Performing this task requires additional privileges. **Note:** Leaving this check box clear when using cross-cluster search affects how data is collected from the clusters. For more information, see the Enabling and Using Cross-Cluster Search for Elasticsearch Data Inputs in Health Log Analytics [KB1556079] article in the Now Support Knowledge Base. For additional information about streaming logs using the Elasticsearch data input, see the Stream logs using Elasticsearch data input - Advanced guide [KB1080162] article in the Now Support Knowledge Base.	
Document timestamp field	Timestamp field in documents stored in the read indices. This field is required.	
Timestamp field format	Format of the timestamp field in the documents. If no format is specified, the default Unix epoch time format is used, in milliseconds. For example: 1684168407 (May 15, 2023 4:33:27 PM)	yyyy-MM-dd'T'HH:mm:ss.SSSSSSS'Z'
Term filters	JSON map of the terms to filter. **Note:** Avoid using the term query for text fields. If the target field is mapped as both text and keyword, reference the keyword by using fieldname.keyword.	{"severity": ["error", "warning"]}
Max documents per query	Maximum number of documents fetched in a single query.	
Sliced-scrolling tiebreaker	Value used to slice the data. Each slice is scrolled in parallel. Default: _id	
Search-after tiebreaker	Unique value per document to use as tiebreaker when sorting log entries by timestamp.	
Use search-after API	Option for toggling between using sliced-scrolling and search-after APIs.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query Settings tab (continued)

Field	Description	Example
	Note: Sliced-scrolling APIs are preferable when reading historical data, while search-after APIs are better for reading real-time data.	
Index time-suffix format	Format of the time suffix when using time-based index names, such as [logstash-]YYYY.MM.DD. When using aliases, leave this field empty.	uuuu.MM.dd

Advanced configuration

Advanced configuration form

Field	Description
Data reading timeout (milliseconds)	The duration of time, in milliseconds, before a request to the Elasticsearch cluster times out.
Index discovery interval (seconds)	The number of seconds between intermittent MID Server requests to the Elasticsearch cluster for new indices from which to read data.
Scroll context time (milliseconds)	The lifetime of the created scroll when using the scroll API to read data from Elasticsearch. For more information, see the Elasticsearch scroll API documentation.
Event processor workers	The maximum number of CPU cores used in parallel to process events fetched from Elasticsearch. A higher setting increases the data input throughput at the cost of higher CPU usage.
Worker queue size	The maximum number of batches to queue for processing. A higher setting increases throughput, at the cost of higher RAM usage.
Default timezone	The default timezone if the event date and time doesn't include timezone information.
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.
Character encoding	The character encoding for this data input.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration form (continued)

Field	Description
Sleep interval (seconds)	The interval, in seconds, to wait before querying again after a query has returned no data.
Max length in bytes	The maximum length, in bytes, of log messages.
Delay in reading current timestamp (seconds)	The number of seconds before current time to query to include delayed data. The configured number of seconds is subtracted from the current time for reading the last timestamp. **Note:** If this value is 0 and data is collected from multiple clusters simultaneously, the query may not include data that was sent with a delay on one of the clusters,

GCP PubSub data input configuration fields

Description of the fields on the GCP PubSub data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Port	The port for the MID Server. Select a unique port from the array. The placeholder shows the range of ports from which to choose. Make sure that your organization's security team opens the selected port. This field is required.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID	(Only when the **Execute on** field is set to Specific MID Server) The MID Server to which the logs are streamed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

The fields in the following table show read-only information.

Field	Description
Transport	Protocol used to send the log data: PubSub.
Sources count	The number of log sources this data input has created.
Status	Status of the data input.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transport tab

Field	Description
Project ID	The project ID of the Google Cloud project. For example, my-project-id.
Topic Name	The Google Cloud Pub/Sub topic to which to subscribe Health Log Analytics. For example, my_topic.
GCP Credential Alias	The credential alias to be used. Specify one GCP credential alias by selecting the magnifying glass icon and then either selecting an existing credential alias from the **Connection & Credential Aliases** list, or selecting **New** to create a new record. The default is sn_occ.HLA_Credential_Alias. For information about creating a credential alias, see Credential aliases for Discovery.
Subscription Name	The subscription Health Log Analytics uses to receive log data that is published on the Google Cloud Pub/Sub topic. If you leave this field blank, Health Log Analytics uses ServiceNow-Subscription.

Advanced configuration

Advanced tab

Field	Description	Default value
Subscriber Thread Pool Size	The number of concurrent threads that are downloading files from the Google Cloud Pub/Sub topic.	1
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Max length in bytes	The maximum length of log messages, in bytes.	32,766
Character encoding	(Read-only) The character encoding for this data input.	UTF-8
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Rate limit	The maximum number of events per second that this data input processes.	-1

Field	Description
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query settings tab

Field	Description	Example
From	Starting date and time for reading the data. Data older than this date and time is not read. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. This field is required.	Now -1 week
Max batch size	The maximum number of events passed to a single process call.	100

Transport tab

Field	Description
Event Hubs namespace	The scoping container for the event hub or hubs. This field is required.
Event Hub name	The event hub from which to fetch log data. This field is required.
Event Hub credentials	Shared access authorization policy with which to authenticate to the event hub. This field is required.
Consumer Group name	The Consumer Group to use. This field is required.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Restore point rate	The number of events the data input can read before a restore point is saved.	100
Processor threads count	The total number of processor threads.	2
Operation timeout	The number of seconds to wait before timing out event hubs operations.	120
Receive idle timeout	The number of seconds to wait before timing out receive operations.	60
Prefetch count	The number of events received in advance of event hubs operations.	500
Default timezone	The default timezone if the log doesn't include timezone information.	GMT
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Max length in bytes	The maximum length, in bytes, of events.	32766
Character encoding	The character encoding for this data input.	UTF-8
Sleep interval	The interval, in seconds, to wait before querying again after a query has returned no events.	60
Polling interval	The interval, in seconds, to wait before polling for new events.	0
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	False

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Azure Log Analytics data input configuration fields

Description of the fields on the Microsoft Azure Log Analytics data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID	(Only when the **Execute on** field is set to Specific MID Server) MID Server to which log data from Microsoft Azure Log Analytics is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. • If log ingestion is not enabled for the selected MID Server, Health Log Analytics enables it automatically. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses Microsoft Azure Log Analytics to stream log data to your instance.
Disabled since	The time when the data input stopped or failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Sources count	The number of log sources this data input has created.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Query settings tab

Health Log Analytics uses the values set in these fields to generate the query for receiving log data from Microsoft Azure Log Analytics. The Log query field enables you to configure a custom query

Field	Description	Example
From	Starting date and time for reading the data. Data older than this date and time is not read. **Note:** Setting this value to a past date might require the system to read large amounts of data, causing congestion. This field is required.	Now -1 week
Data source name	The name of the table in Microsoft Azure Log Analytics where the data input fetches the log data. For more information, see the View table information section in the Microsoft Azure documentation. This field is required.	ContainerLog
Event time property name	The Microsoft Azure Log Analytics field in which to detect the event time. This field is required.	TimeGenerated
Max documents per query	The highest number of rows retrieved in each query.	500

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query settings tab

Health Log Analytics uses the values set in these fields to generate the query for receiving log data from Microsoft Azure Log Analytics. The Log query field enables you to configure a custom query

(continued)

Field	Description	Example
Columns to select	Comma-separated list of column names to return. **Note:** This field is ignored when you provide a custom query.	LogEntry,LogEntrySource
Log query	A custom query for receiving log data from Microsoft Azure Log Analytics. The settings in this field override those in all other fields on the **Query settings** tab except the **From** field. If the **Log query** field is empty, Health Log Analytics generates the query using the values set in the other fields. For the custom query, use the following JSON format: `{"query": "query | where TimeGenerated > %s | take 500"}`	`{ "query":"ContainerLog | where LogEntry contains 'cartservice' | where TimeGenerated > %s | take 500", "workspaces": ["defaultworkspace-3ab145ff-f9cd-433f-8533-d1b1ee24aee6-eus"], "project": ["TimeGenerated", "LogEntry", "LogEntrySource"] }`

Transport tab

Field	Description
Redirect Url	The redirect URL of the access log application. The URL refers to the Microsoft Azure redirect_uri authorization property. For more information, see the Authorization code URL (GET request) section in the Microsoft Azure documentation. This field is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transport tab (continued)

Field	Description
Azure service principal credentials	The credentials used to access Microsoft Azure resources. Choose **Client Secret** from the drop-down list. **Note:** You do not need Azure Enterprise Agreement (EA) credentials. This field is required.
Workspace Id	The Customer ID used to call the Microsoft Azure Log Analytics REST API.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Event Processor workers	The number of concurrent event processing workers, where each worker processes a batch of events independently.	4
Workers Queue Size	The queue size of the Event Processor workers.	5
Sub sample drop ratio	The number of events to batch together, out of which one will be discarded. This setting is used to reduce the number of fetched events.	-1
Sub sample receive ratio	The number of events to batch together, out of which all but one will be discarded. This setting is used to decrease the number of received events.	-1
Character encoding	The character encoding for this data input.	UTF-8
Sleep interval	The interval, in seconds, to wait before querying again after a query has returned no events.	60
Polling interval	The interval, in seconds, to wait before polling for new events.	0

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration form (continued)

Field	Description	Default value
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	False

MID Server data input configuration fields

Description of the fields on the MID Server data input configuration form.

Basic configuration

Field	Description
Description	Description of the data input.
MID	The name of the MID Server from which the logs are streamed.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data. This data input uses the MID Server to stream log data to your instance.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

Advanced configuration

Field	Description	Default value
Default timezone	The default time zone of events. The system uses this default when the log does not specify a timezone.	GMT
Sub sample drop ratio	The ratio of events to discard.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32766

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description	Default value
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for discarding logs if there is a load on the MID Server.	

REST API data input configuration fields

Description of the fields on the REST API data input configuration form.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
MID Web Server	MID Server to which the log data is pulled. **Note:** • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. When you select the MID Server, the **MID** and **Port** fields are completed automatically. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Service instance	The service instance to which to bind the log data. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational. This field is required.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to stream the log data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This data input uses REST to stream log data to your instance.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

Rsyslog, Filebeat, or Winlogbeat data input configuration fields

Description of the fields on the Rsyslog, Filebeat, and Winlogbeat data input configuration forms.

Basic configuration

Getting Started tab

Field	Description
Data input name	Name of the new data input. This field is required.
Description	Description of the data input.
MID Server	The MID Server to which the logs stream. **Note:** • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Port	The port on the MID Server. Choose a port within the suggested range from the array. The port must not be occupied by another process. Make sure that your organization's security team opens the selected port. This field is required.
Content pack	(Linux using Filebeat only) The content pack to use. Content packs contain default source types and mapping script templates. Health Log Analytics activates the selected pack

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started tab (continued)

Field	Description
	automatically and uses its mapping script for mapping the data input sources. For more information, see Health Log Analytics content packs for quicker time to value.

Tagging and Binding tab

Field	Description
Path	The full path from which to stream logs. You can use a wildcard. This field is required.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.
Component	The device type or stack layer as context for the logs that is used for anomaly detection and correlation. For example: Tomcat. Components typically represent CIs in the CMDB. Several components are often clustered together in a single service instance.
Source Type	The source type, which defines how Health Log Analytics handles a specific application and parses the log data. For example: Tomcat Catalina. Each data input can have multiple source types, based on the diversity of its log formats. Service instances and components can have any number of source types.

Advanced configuration

For Rsyslog data inputs:

Rsyslog advanced configuration form

Field	Description	Default values
Use SSL/TLS	Option for selecting to use SSL/TLS.	
Look up hostnames	Option for selecting to perform DNS lookup to resolve IPs to hostnames.	false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rsyslog advanced configuration form (continued)

Field	Description	Default values
Boss thread count	The number of threads that manage connections.	1
Worker thread count	The number of threads that handle incoming data.	4
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.	30
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages in bytes.	32766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	

For data inputs that use Beats agents:

Beats advanced configuration form

Field	Description	Default value
Client inactivity timeout (sec)	The timeout, in seconds, to close an inactive channel.	15
Worker thread count	The number of threads that handle incoming data.	4
Default time zone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32766
Character encoding	The character encoding for this data input.	UTF-8

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Beats advanced configuration form (continued)

Field	Description	Default value
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	false

ServiceNow Log Export data input configuration fields

Description of the fields on the ServiceNow Log Export data input configuration form.

ServiceNow Log Export data input configuration fields

Field	Description
Name	Name of the new data input. This field is required.
Service instance	The service instance to which to bind the log data. **Important:** The service instance field is pre-populated with a value. Changing this value is necessary only if there is a compelling reason to do so. Consider the implications carefully before making any changes.
Certificate password alias	The credential alias you created in **Basic Auth Credentials**. This field is required. For more information, see the Before you begin section in Configure a ServiceNow Log Export data input in Health Log Analytics manually.
Description	Option to add a brief description of the data input to help identify it.
Log level	The log level indicating the severity of the log messages. The available log levels are: • INFO: Information messages representing service actions. This is the default log level. • ERROR: Non-fatal error messages. • WARN: Warning messages indicating potential issues.
Status	Status of the data input: Active or Not Active. This field is read-only.
Disabled since	The time when the data input stopped or failed. This field is read-only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow System Logs Retriever data input configuration fields

Description of the fields on the ServiceNow System Logs Retriever data input configuration form.

ServiceNow System Logs Retriever data input form fields

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Service instance	The service instance to which to bind the log data. The default value is ServiceNow Glide Sys Log. This field is required. **Note:** Health Log Analytics comes with the source type glide_sys_log for log traffic from the ServiceNow Glide Sys Log service instance.
From	From date and time for reading the data. The data input doesn't read data older than this date and time. This field is required.
Status	Status of the data input.
Disabled since	The time when the data input stopped or failed.
Syslog table filter	The criteria used to filter log data from the System Log table before streaming it to the AI engine.

Splunk data input configuration fields

Description of the fields on the Splunk data input configuration form.

Basic configuration

Getting Started tab

Field	Description
Data input name	Name of the new data input. This field is required.
Description	Description of the data input.
MID Server	The MID Server to which the logs stream.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started tab (continued)

Field	Description
	Note: • You can select only MID Servers that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Port	The port for the MID Server. Make sure that your organization's security team opens the selected port in the MID Server. This field is required.
Transport Protocol	The protocol used for streaming log messages to your ServiceNow instance. • TCP - When using the Transmission Control Protocol (TCP) protocol, all logs will reach the instance. However, the Splunk pipeline might be blocked if the MID Server is down or the connection to it is lost. TCP is the default transport protocol. • UDP - When using the User Datagram Protocol (UDP) protocol, the Splunk pipeline will never be blocked. However, some logs might be dropped before they reach the instance. For more information about streaming log data using the TCP or UCP transport protocol, see the Streaming Splunk data using Heavy Forwarder: Selecting TCP or UDP [KB0998928] article in the Now Support Knowledge Base.
Use Cooked Data	Option to ingest log data from Splunk in the preprocessed ("cooked") format that Splunk uses on the forwarder. Ingesting data into HLA in this format ensures that each log line retains the relevant contextual information that Splunk embeds into it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started tab (continued)

Field	Description
	Note: If you select this option, there is no need to edit the `props.conf` and `transforms.conf` files during Splunk data input configuration.
Use Forwarder TimeZone	Option to pass information about the time zone in which the forwarder is located. The MID Server uses this information to adjust for the time zone from which the logs arrive. This option is relevant when using Splunk Universal Forwarders.
Enable Compression	Option to send logs in compressed format. Sending logs in a compressed format minimizes the size of the data being transferred, which is important when dealing with large volumes of log data. This option is relevant when using Splunk Universal Forwarders and can only be used when SSL/TLS is enabled.

Advanced configuration

Advanced configuration form

Field	Description	Default values
Use SSL/TLS	Option for selecting to use SSL/TLS. **Note:** To send logs in a compressed format, SSL/TLS must be enabled.	
Look up hostnames	Option for selecting to perform DNS lookup to resolve IPs to hostnames.	false
Boss thread count	The number of threads that manage connections.	1
Worker thread count	The number of threads that handle incoming data.	4
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.	30
Default timezone	The default time zone of events. The system uses this	GMT

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration form (continued)

Field	Description	Default values
	default when the log does not specify a time zone.	
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages in bytes.	32766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	

Splunk Polling data input configuration fields

Description of the fields on the Splunk Polling data input configuration form.

Basic configuration

Getting Started tab

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Execute on	Option to select whether to use a specific MID Server or a MID Server cluster. This field is required.
MID	(Only when the **Execute on** field is set to Specific MID Server.) The MID Server to which the logs are streamed. This field is required.
MID Server Cluster	(Only when **Execute on** is set to Specific MID Server cluster.) The MID Server cluster to which the log data is pulled. This field is required. The data input runs on a single MID Server in the cluster until that MID Server fails. The system then moves all the data input tasks to the next available MID Server in the cluster according to the configured order.

Getting Started tab (continued)

Field	Description
	Note: • Health Log Analytics supports only failover MID Server clusters. In these clusters, multiple MID Servers are grouped together for failover protection. When selecting a cluster from the data input or integration form, the MID Server clusters list displays only failover clusters. • The MID Server cluster must include only MID Servers that support basic authentication. mTLS is not supported for log ingestion. • Log ingestion must be enabled for each MID Server in the cluster. If log ingestion is not enabled for the active MID Server, Health Log Analytics enables it automatically. • The default maximum number of data inputs or integrations streaming logs to a single MID Server is 10. A cluster passes capacity validation if it contains at least one MID Server with fewer than 10 data inputs or integrations running on it, even when that MID Server is down. For more information about MID Server clusters, see Configure a MID Server cluster.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, create a service instance and add CIs to it. Set the status of the new service instance to Operational.
Transport	The protocol used for streaming log messages to your ServiceNow instance.
Sources count	The number of log sources this data input has created.
Status	Status of the data input.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration

Transport tab

Field	Description
Server URL	The URL used to access the Splunk REST API.
Query	The query Splunk uses to search your data.
Authentication Type	The authentication type. • Basic authentication: Sends a username and password with each HTTP request. Basic authentication is simpler than token-based authentication, but less secure. • Token authentication: The client obtains a token from an authentication server and uses that token to authenticate against Splunk.
Splunk Poll Credential Alias	The credential alias to be used. Specify a Splunk Poll credential alias by selecting the magnifying glass icon and then either selecting an existing credential alias from the **Connection & Credential Aliases** list, or selecting **New** to create a new record. The selected credential alias can hold one Basic Auth credential and one Token Auth credential. For information about creating a credential alias, see Credential aliases for Discovery.
From	The date and time from which Splunk searches the data.
To	The date and time until which Splunk searches the data.

Advanced tab

Field	Description
Max documents per query	The maximum number of documents retrieved each time log data is fetched from Splunk. Default: 10,000.
Splunk request timeout (seconds)	The maximum time, in seconds, allowed for data retrieval before the request times out.

TCP data input configuration fields

Description of the fields on the TCP data input configuration form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic configuration

Field	Description
Name	Name of the new data input. This field is required.
Description	Description of the data input.
Port	The port for the MID Server. Select a unique port from the array. The placeholder shows the range of ports from which to choose. Make sure that your organization's security team opens the selected port. This field is required.
MID	The MID Server to which the logs are streamed. **Note:** • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

The following fields show read-only information:

Field	Description
Status	Status of the data input.
Transport	Protocol used to send the log data. Rsyslog and Splunk send data using the TCP protocol.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

Advanced configuration

Advanced configuration form

Field	Description	Default value
Use SSL/TLS	Option for selecting to use SSL/TLS.	
Look up hostnames	Option for selecting to perform DNS lookup to resolve IPs to hostnames.	false
Boss thread count	The number of threads that manage connections.	1
Worker thread count	The number of threads that handle incoming data.	4
Read timeout seconds	The timeout in seconds since the last read. When the timeout expires, the system closes the channel.	30
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages in bytes.	32766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for selecting to discard logs if there is a load on the MID Server.	
Line breaker delimiters	The line break character separating the raw log lines. Splitting values must be separated by a comma followed by a space: ", ". For example: "\r, \n, , splitHere, #".	

UDP data input configuration fields

Description of the fields on the UDP data input configuration form.

Name	Name of the new data input. This field is required.
Port	The port for the MID Server. Select a unique port from the array. The placeholder shows the range of ports from which to choose. Make sure that your organization's security team opens the selected port. This field is required.
MID	The MID Server to which the logs are streamed. **Note:** • You can select only MID Servers with log ingestion capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. This field is required.
Service instance	The service instance to which to bind the log data. This field is required. **Note:** If no relevant service instance exists, Create an service instance and add CIs to it. Set the status of the new service instance to Operational.

The fields in the following table show read-only information.

Field	Description
Status	Status of the data input.
Transport	Protocol used to send the log data: UDP.
Sources count	The number of log sources this data input has created.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field is populated automatically. It displays only when a streaming error has occurred.

Advanced configuration

Field	Description	Default value
Default timezone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Rate limit	Limitation on the number of events per second that the data input processes.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32,766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for selecting to discard logs if many processes are waiting in the queue to access the MID Server.	false

Vector Agent data input configuration fields

Description of the fields on the Vector Agent data input configuration form.

Getting Started tab

Field	Description
Data input name	Name of the new data input. This field is required.
Description	Description of the data input.
MID Server	The MID Server to which the Vector Agent logs are streamed. This field is required. **Note:** If the MID Server is down or the connection is lost, the Vector pipeline may get blocked.
Port	The port on the MID Server used for listening to logs. This field is required. Choose a port within the range of 6000-6200.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Getting Started tab (continued)

Field	Description
Transport	The protocol used for streaming log messages to your ServiceNow instance. Currently, only TCP is available.
Status	Status of the data input.

Sections and cards on the alert Overview tab in Health Log Analytics

The **Overview** tab helps you understand component-based alerts, Log Analytics alerts, and Log Analytics alert groups.

Information on the Overview tab for a Component-based alert

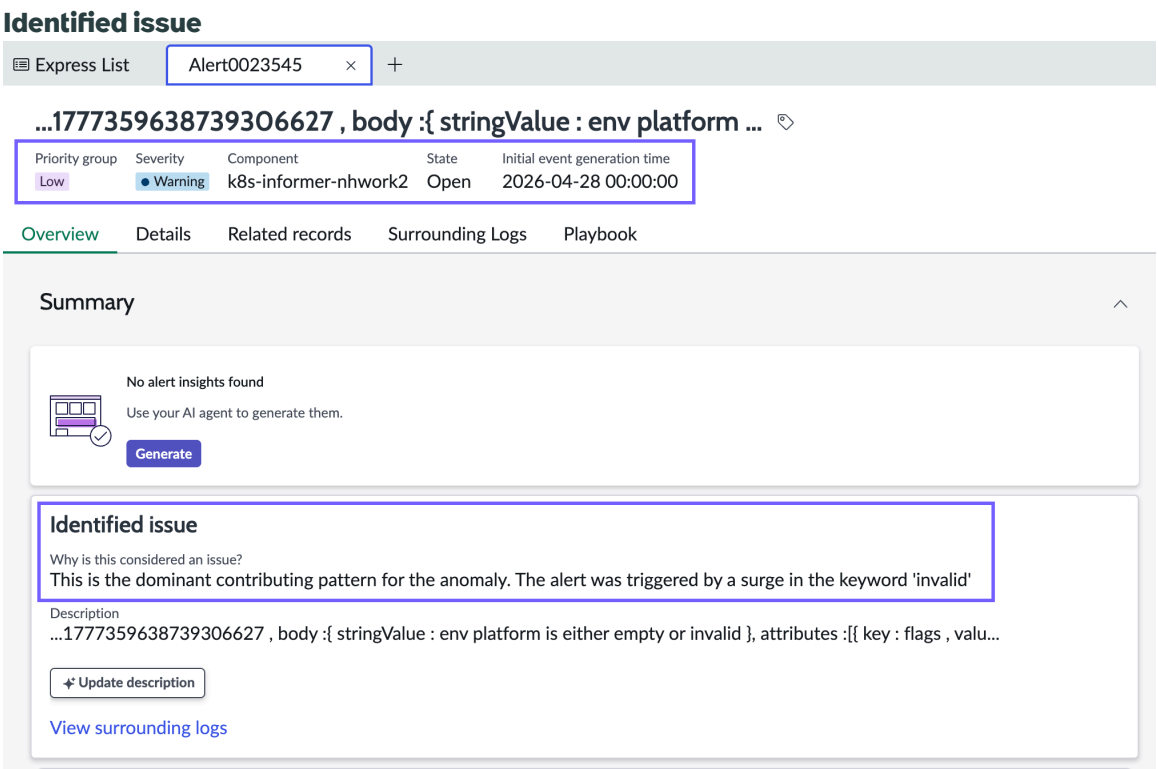
The alert **Overview** tab in Health Log Analytics helps you understand Component-based alerts.

Sections on the Overview tab for a Component-based alert

For a detailed description of Component-based alerts, see Types of Health Log Analytics alerts.

Identified issue

The "identified issue" led to the alert. The issue appears in the title for the alert and on a card on the tab. Information about the alert appears in the banner.



- Click the information icon ( ) to see how the issue was identified.
- Click **View surrounding logs** to view the log lines that were generated one minute before and one minute after the alert. See Analyze log lines around the anomaly to help find the root cause.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration Items

To view more detailed information on the CIs that are associated with the alert, click the **Configuration Items** tab or click **View more** in the Configuration Items section. See Operator phase 1: Analyze and acknowledge an alert.

Impacted services

To view detailed information on the services that are impacted by the alerts, click the **Impacted services** tab. See Operator phase 1: Analyze and acknowledge an alert.

Anomaly

The Anomaly card illustrates the anomalous activity that led to the alert.

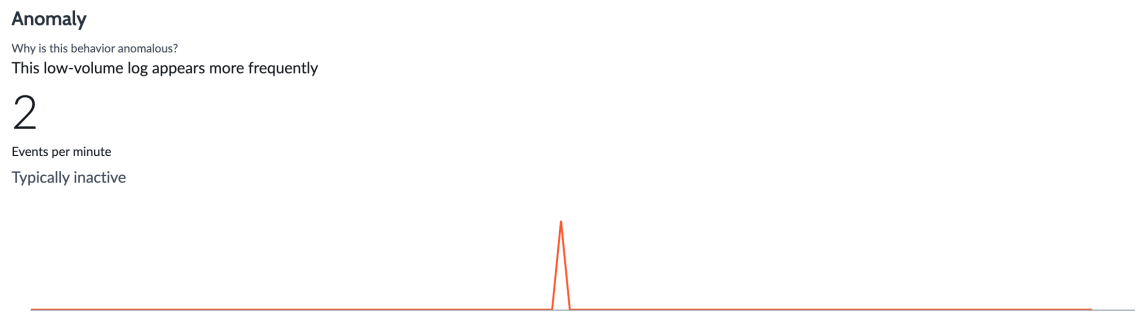
- The blue line shows the recent anomalous activity.
- On some charts, the lightly shaded area indicates the expected (learned baseline) behavior.

  A peach-shaded area represents the baseline values for the same hour one day earlier. A pink-shaded area shows the values for the same period in the previous week.

- Click the information icon to see how the anomaly was identified: ⓘ.

In this example, the peach-shaded area shows the same data for the same hour one day earlier. The spike in the metric value (events per minute) is clearly visible.

Anomaly card



In this example, the pink-shaded area represents the baseline values for the same hour in the previous week.

Anomaly card with baseline values one week earlier

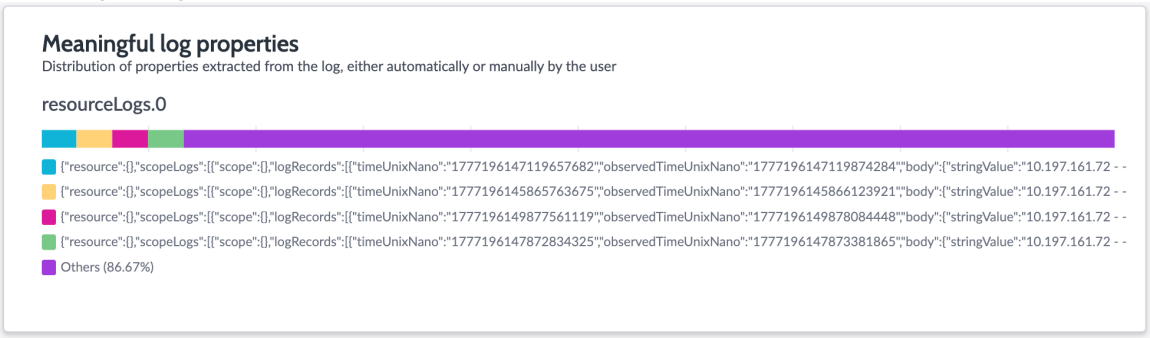
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on the kinds of anomalies that you might encounter, see Types of anomalous behavior in Health Log Analytics.

Meaningful log properties

On the Meaningful log properties card, each bar chart shows the distribution of values for a single log property that contributed to the anomaly. Each property value is associated with a color. The length of a color bar correlates to the percentage that the property value holds in comparison with all other values for the property. For the *p_a5* property in the example, the value *EUR* appeared in 56.12% of log lines, *GBP* in 13.67%, and so on.

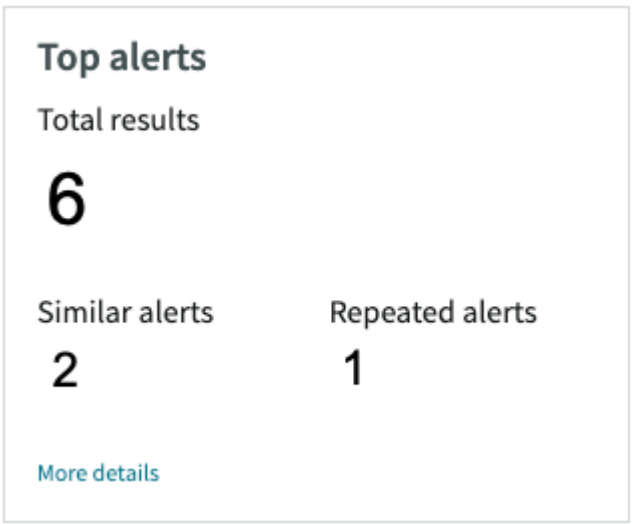
Meaningful log properties



Top alerts

The Top alerts card displays summaries of data from the **Similar alerts** and **Repeated alerts** tabs. The Total results value is the sum of the two values. Click **More details** to open the **Alert Insight Similar Alerts** tab. For details, see Information on the Alert Insight Similar Alerts tab.

Top alerts



Top incidents

The Top incidents card displays summaries of data from the **Incidents on CI** and **Incidents on related CIs** tabs. The Total results value is the sum of the two values. Click **More details** to open the **Incidents on CI** tab.

Top incidents

Information on the Overview tab for a Log Analytics group

The alert **Overview** tab in Health Log Analytics helps you understand Log Analytics groups.

Sections on the Overview tab for Log Analytics groups

For a detailed description of Log Analytics groups, see Types of Health Log Analytics alerts.

Correlations banner

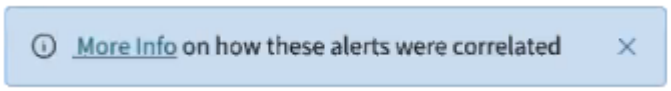
During initial analysis, alerts are scored. Each correlation in the alert's log data with another alert contributes to the score. The higher the score, the more likely the alert is to be included as a Log Analytics alert in a Log Analytics alert.

The following kinds of data are considered when determining whether alerts are correlated:

- Time: The events all occurred within a configured time interval.
- Metadata: The alerts have matching values in log-line metadata. For example, all alerts involve the same host.
- Message text: The message text in the log data is similar or identical between alerts.
- Trend: The alerts show a similar tendency in values or rates. For example, a particular metric value is increasing in all alerts.

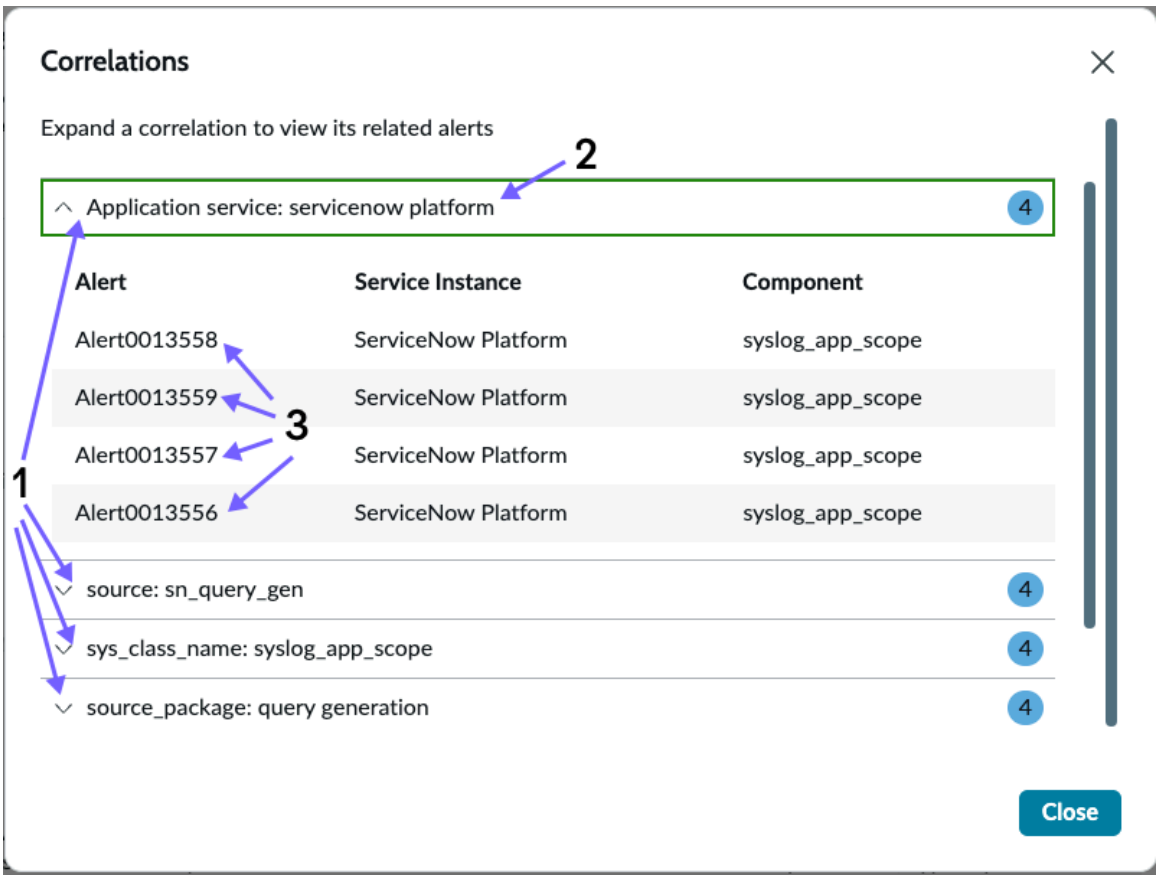
Click the **More info** link on the Correlations banner to view the list of correlations that relate the Log Analytics alerts.

Correlations banner



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Correlations



1. List of correlations: The first correlation in the list is expanded to show the individual Log Analytics alerts that are correlated and the log correlator that the alerts share. The number in parentheses is the number of alerts in the correlation.
2. An individual log correlator: The identifier for a group of correlated Log Analytics alerts. The alerts are grouped by the log-line data or metadata that is common to the alerts (for example, IP address, host name, or user name). The number in parentheses indicates the number of correlated alerts.
3. Log Analytics alerts that are correlated.

Alerts in group

For a Log Analytics alert (Alert0010166 in the example), the Alerts in group section shows the Log Analytics alerts that are grouped under the Log Analytics alert.

Click a Log Analytics alert to view its details. To view the full list of Log Analytics alerts, click **View more** or click the **Alerts in group** tab.

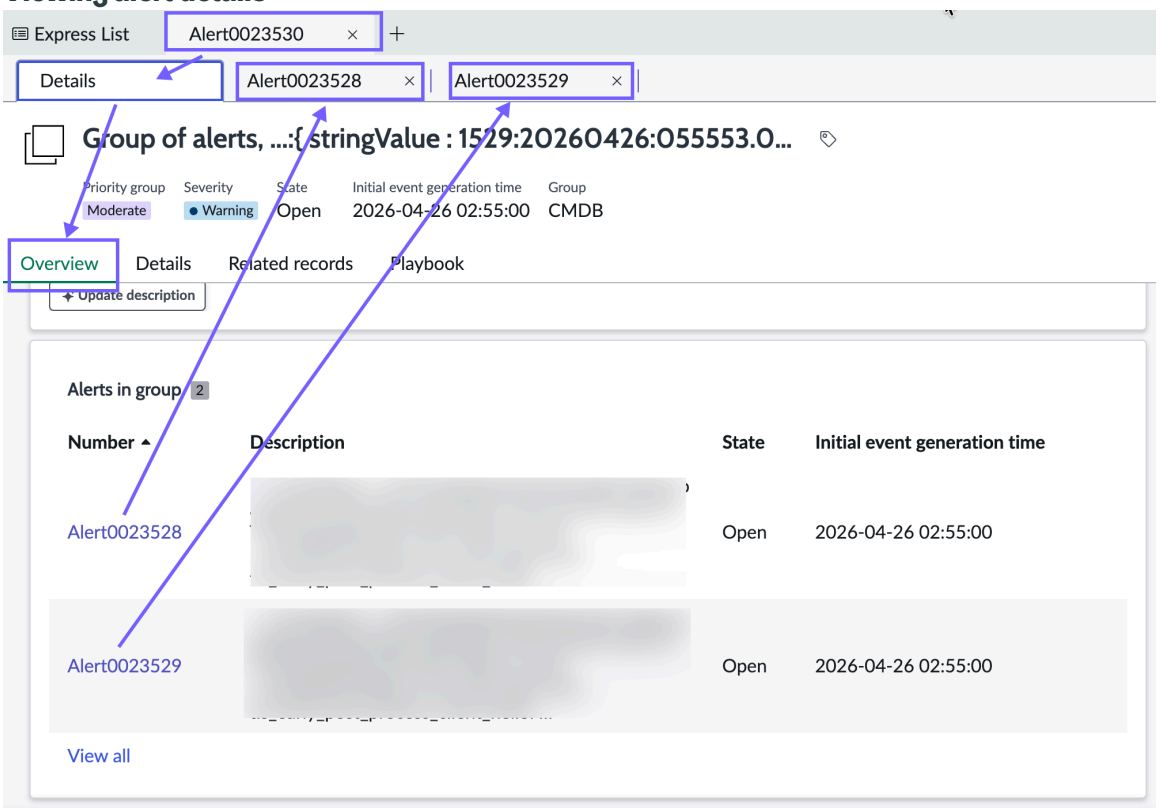
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Viewing alert details



Configuration Items

To view more detailed information on the CIs that are associated with the alerts, click the **Configuration Items** tab or click **View more** in the Configuration Items section. See Operator phase 1: Analyze and acknowledge an alert.

Impacted services

To view detailed information on the services that are impacted by the alerts, click the **Impacted services** tab. See Operator phase 1: Analyze and acknowledge an alert.

Log Analytics alerts on the Alerts in group tab

The table describes the Log Analytics alerts in a Log Analytics group on the **Alerts in group** tab.

Alerts in group tab

Column	Description
Number	The number of the alert that appears in the list of alerts on the Operator Workspace dashboard. To view detailed information for an alert on the **Details** tab, click the alert number. This field is automatically set.
Group	Type of group that the alert belongs to: a standalone Log Analytics alert or a Component-based alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alerts in group tab (continued)

Column	Description
Description	Anomalous pattern or metric that caused the alert to be generated.
Severity	Severity value for the alert. The available values are: • **Critical**: Immediate action is required. Either the resource is not functional or critical problems are imminent. • **Major**: Major functionality is severely impaired or performance has degraded. • **Minor**: Either performance has degraded or there is a partial, non-critical loss of functionality. • **Warning**: Attention is required even though the resource is still functional. • **Info**: An informational message. An alert is created, but the resource is still functional. • **Clear or Resolved**: No action is required. An alert is not created from this event. Existing alerts are closed.
Priority group	Priority group that indicates the order in which to resolve alerts. Choices are as follows: • **Urgent** • **High** • **Moderate** • **Low** The priority group value is more important than severity alone. For example, a high priority and low severity alert should be addressed before a low priority and high severity alert. For information on how priority is calculated, see Alert priority.
State	Processing state of the alert. A newly generated alert is in the **Open** state. Other states are as follows: • **Reopen**: A previously closed alert is open again, and it requires your attention. • **Flapping**: The alert is receiving identical events from the same source at high frequency. This state can cause an alert to re-open from the Closed state, resulting in a

Alerts in group tab (continued)

Column	Description
	high frequency of changes between Open and Closed states. • **Closed**: The alert is closed and does not require any further action. You close an alert when it is remediated.
Configuration item	CI in the CMDB. The CI is applied to by the alert.
Node	Node field that is received in the log message. The event described in the log message occurred on this node. Often, the node is the name of the CI that is associated with the alert. For example, a computer name, IP address, FQDN, or MAC address.
Source	All Log Analytics alerts have the value **Log Analytics** in the **Source** column to indicate that Health Log Analytics generated the alert.
Metric name	Name of the metric whose anomalous behavior led to the alert. For example, the *I/O request* in the case that the I/O request took longer than 15000 ms to complete.
Updated	Most recent time when the alert information or state was updated.

Information on the Overview tab for a Log Analytics alert

The alert **Overview** tab in Health Log Analytics helps you understand Log Analytics alerts.

Sections and cards on the Overview tab for Log Analytics alerts

For a detailed description of Log Analytics alerts , see Types of Health Log Analytics alerts.

Identified issue

The "identified issue" led to the alert. The issue appears in the title for the alert and on a card on the tab. Information about the alert appears in the banner.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Insight feature helps you to determine the root cause and recommends a solution. Using smart launch in context, you can perform any of the following actions:

- Launch an application
- Open a browser at a specified URL
- Perform remediation (based on orchestration)
- Launch a subflow (workflow based on flow designer).

Surrounding logs tab fields

This section describes the information displayed on the **Surrounding logs** tab.

Surrounding logs tab

Column	Description
Time	Timestamp of the log line in the format that the source uses. If no value appears, then check the source type structure of the raw data.
Application service	Service instance in which the metric was found.
Component	Logical component of the service instance that generated the event. Multiple CIs can sometimes perform the same function.
Message	Inner message of the raw log line that contains the text of the system-generated log message regarding the nature of the occurrence.
Level	Type of event. The available values, in order of importance, are: • **Emergency** • **Alert** • **Critical** • **Error** • **Warning** • **Notice** • **Informational** • **Debug**
Host	Host identifier from the log line that consists of the hostname or IP address of the endpoint.
Log message	The raw log message without the header.

Log Viewer table fields

This section describes the information displayed in the **Log Viewer** table.

Log Viewer table fields

Column	Description
Time	Timestamp of the log line in the format that the source uses. If no value appears, then check the source type structure of the raw data.
Service instance	Service instance in which the metric was found.
Component	Logical component of the service instance that generated the event. Multiple CIs can sometimes perform the same function.
Message	Inner message of the raw log line that contains the text of the system-generated log message regarding the nature of the occurrence.
Level	Type of event. The available values, in order of importance, are: • **Emergency** • **Alert** • **Critical** • **Error** • **Warning** • **Notice** • **Informational** • **Debug**
Host	Host identifier from the log line that consists of the hostname or IP address of the endpoint.
Log message	The raw log message without the header.

Note: The Raw message column does not appear in the Log Viewer table by default. You can display this column by selecting it from the **Filters** pane. For more information, see Customize the Log Viewer table in Health Log Analytics.

Log correlators form fields

This section describes the fields on the Log correlators form.

Log correlators form

Field	Description
Type	Type of log correlator. Choices are as follows. • **Free text correlator**: The log correlator analyzes text in the log message. • **Log-key correlator**: The log correlator analyzes log metadata. For example, the name of a service instance in your

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log correlators form (continued)

Field	Description
	infrastructure. Log property correlators are specific to the business context of your environment. For more information, see Identifying related alerts in log data by using log correlators.
Free text term or Identifier	Text that the log correlator isolates when parsing log lines. The label for this field is **Free text term** for free text log correlators and **Identifier** for log property correlators. **Note:** The value of this field can be the text for either type of log correlator. As a result, the label for this column in the resulting list of log correlators is **Correlation indicator**.
Active	Option to apply the log correlator. When you select this field, the system applies the log correlator to the log stream.
Range of analysis	Set of sources whose log data are analyzed by this log correlator. Choices are as follows: • **All sources**: The log correlator is applied to log lines from all sources in the data stream. • **Only new sources**: The log correlator is applied to log lines from all sources created after this log correlator is activated. • **Specified source**: The log correlator is applied only to the log lines from the source that you specify on this form.
Excluded sources	Sources that are excluded from the log correlator. The system does not analyze log lines from sources that are listed in this field. **Note:** This field applies only when the **Range of analysis** field is set **All sources** or **Only new sources**. For information about excluding a source from a log correlator, see Exclude a source from a log correlator.
Source	Source of the log correlator. The log correlator analyzes the data of this log source. This field appears only when you are adding the log correlator from the Log Sources form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log correlators form (continued)

Field	Description
	The field is automatically set to the log source that you are working on.

Log-based CI candidates fields in Health Log Analytics

Field descriptions for the Log-based CI candidates table, the Log-based CI candidate form, and the Add CI candidate to CMDB form.

Log-based CI candidates table

Field	Description
Host name	The host name that Health Log Analytics discovered in the log data.
CI class type	The CI class type discovered in the log data. The CI class type is determined by the data input type: • Rsyslogs – CI class type: Linux Server • Linux Filebeat - CI class type: Linux Server • Windows Filebeat - CI class type: Windows Server • Winlogbeat - CI class type: Windows Server
Last log time	(Read only) The last time this host was found in the log data.
Operation	(Read only) The suggested action to take: Add - Add the CI to the CMDB.
Status	(Read only) The status of the suggested action. • Pending - No action has been taken. • If the taken action failed, this field contains an error message.

Log-based CI candidate form

Field	Description
CI class type	The CI class type discovered in the log data. The CI class type is determined by the data input type: • Rsyslogs – CI class type: Linux Server • Linux Filebeat - CI class type: Linux Server

Log-based CI candidate form (continued)

Field	Description
	• Windows Filebeat - CI class type: Windows Server • Winlogbeat - CI class type: Windows Server
CI name	The host name that Health Log Analytics discovered in the log data.
Operation	(Read only) The suggested action to take: Add - Add the CI to the CMDB.
Last log time	(Read only) The last time this host was found in the log data.
Status	(Read only) The status of the suggested action: • Pending - No action has been taken. • If the taken action failed, this field contains an error message.

Add CI candidate to CMDB form (Linux Server)

Field	Description
Name	The name of the CI.
Asset tag	Alphanumeric information to help track the asset associated with the CI.
Manufacturer	The device manufacturer.
Asset	(Read-only) The asset associated with the CI.
Class	The asset group. For example, Linux Server.
Comments	Information about the asset.
Company	The company associated with the CI. This field is required.
Serial number	The serial number associated with the CI.
Model ID	The device model ID.
Assigned to	The person using or primarily responsible for this item.
Host name	The host name of the CI.
OS Domain	The OS domain of the CI.
Operating System	The OS running on the CI.
OS Version	The version of the OS running on the CI.
OS Service Pack	The service pack installed on the OS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add CI candidate to CMDB form (Linux Server) (continued)

Field	Description
DNS Domain	The DNS domain of the CI.
IP Address	The IP address of the CI.
Disk space (GB)	The amount of disk space, in GB.
Description	Textual description of the CI.
RAM (MB)	The amount of RAM on the computer, in MB.
CPU manufacturer	The CPU manufacturer.
CPU type	The CPU type.
CPU speed (MHz)	The speed of the CPU, in MHz.
CPU count	The number of CPUs.
CPU core count	The number of cores per CPU.
IsVirtual	Option for indicating whether the device is running on a virtual machine instance.

Metric Data table columns in Health Log Analytics

The Metric Data table lists all metrics that Health Log Analytics collects. Use the table to query metrics by log source, integration, source type, and metric type, review anomaly detection statistics, and view metric baselines.

For more information about using the Metric Data table, see View log anomaly metrics in Health Log Analytics.

Column descriptions

Each row in the Metric Data table represents one metric that HLA collects.

Metric Data columns

Column	Description
Metric Name	Unique identifier of the metric being tracked.
Service	Service instance associated with the metric.
Source	Log source from which the metric originates.
Component	Component within the log source that generates the metric.
Metric Type	Type of measurement, such as meter or gauge.
Dimension	AI Engine metric identifier associated with this record.
Subject	Subject identifier that groups related metrics.
Class	Metric classification, such as Keyword Metric, Pattern ID Metric, Raw Metric, or All Events Metric.

Service Reliability Management

Service Reliability Management (SRM) helps your organization respond, collaborate, track, and self-remediate when working on alerts and incidents. SRM is available when you have both ITSM Standard and ITOM Operator Professional subscriptions.

Overview of Service Reliability Management

Get started

Explore

Learn about SRM concepts and features.

Configure

Install and configure SRM.

Use

Work with services, teams, and reliability tasks in SRM.

Reference

Get details about SRM components, such as fields, tables, and properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Install from the Store

Install SRM from the ServiceNow Store. Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Note: When installing from the store, first confirm that you have all the dependencies needed by selecting the Dependencies tab. For more information, see Install Service Reliability Management from Admin Center or ServiceNow Store.

Troubleshoot and get help

- Visit our community
- Search the Known Error Portal for known error articles
- Contact Customer Service and Support

Exploring Service Reliability Management

Service Reliability Management (SRM) provides a self-serve, guided experience for teams to manage service health. The experience is built using the Service Operations Workspace application and combines ITOM and ITSM capabilities into a single workflow.

SRM overview

Optimize service health with site reliability engineering (SRE) practices. SRM is a single operations workspace that empowers teams to improve the reliability of digital services with SRE.

- Use on-call escalations to respond to issues in a timely manner.
- Reduce setup friction with guided self-service to onboard distributed teams with separated data, empowered access, and minimal governance from central IT.

When SRM is installed, several plugins and applications are also activated. For more information, see Plugins or applications installed with ITOM AIOps.

SRM users

Users

Users	Description	Contains Roles
admin	ServiceNow administrators manage, configure, and maintain the ServiceNow platform. In SRM, they can access and work in the Service Operations Workspace Admin Center. Only administrators can do the following: • Install SRM. • Add and manage SRM administrators. • Create and manage integration users.	All

Users (continued)

Users	Description	Contains Roles
SRM administrator [srm_admin] **Note:** This role differs from the ServiceNow admin role.	SRM administrators can manage account settings, configurations, and users. Administrators can perform the following actions: • Access, create, edit, or delete all SRM configurations. • Add or manage integrations. • Create integrations with Application Performance Monitoring (APM) tools. • Set up and maintain reliability metrics. • Set up and maintain error budget policies.	• Manager • Responder
SRM manager [srm_manager]	Managers oversee a team of SREs. Managers assign SREs to the team on-call schedule, monitor their performance, and create procedures to handle incidents and develop solutions. Managers promote resilience across all the systems and the DevOps workflows. Managers can perform the following actions within the context of their teams: • Define and set up teams, on-call schedules, and services. • Add and delete users such as responders and managers for the teams they're a part of. • Add or manage integrations. • Create Integrations with Application Performance Monitoring (APM) tools. • Set up and maintain reliability metrics. • Set up and maintain error budget policies.	Responder
SRM responder [srm_responder]	A Service Reliability Engineer (SRE) that uses SRM to perform everyday tasks. Responders are the individuals	Inherits 17 roles including the following:

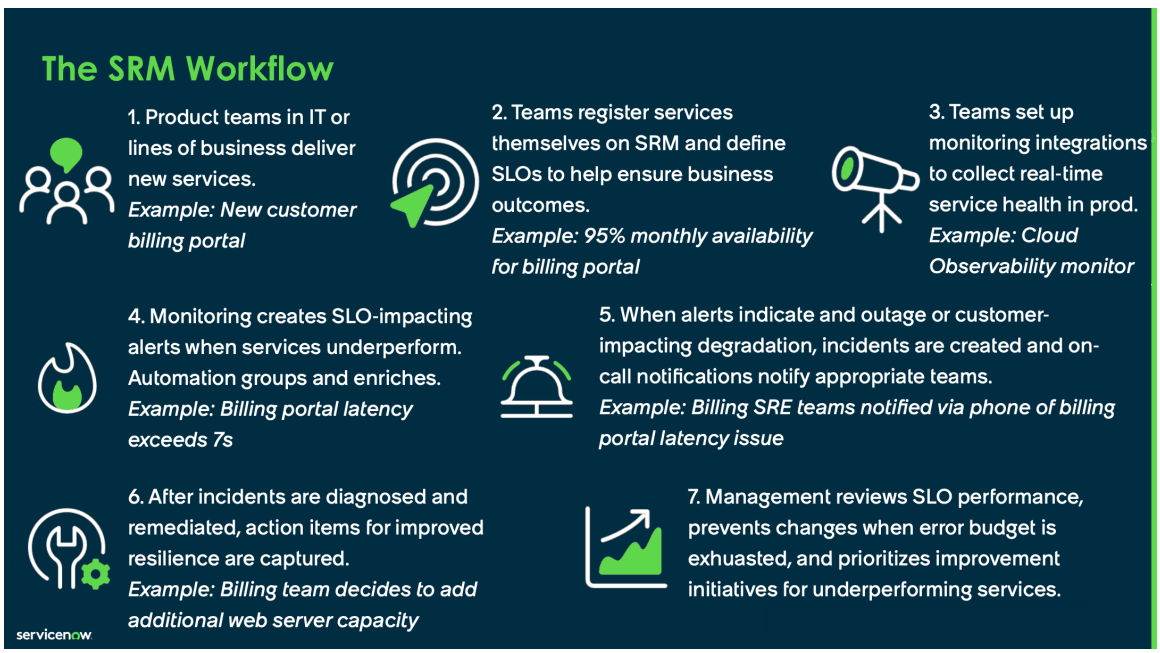
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users (continued)

Users	Description	Contains Roles
	who are on call and diagnose and remediate incidents. Responders can only access configurations that they're a part of. They can only access the alerts or incidents for which they have permissions. SREs can perform the following actions, within the context of their teams: • Set up services, teams, and integrations. • Confirm their on-call schedules. • Manage incident and alert records. • Update teams that they've created. • Add other responders. • Create integrations with Application Performance Monitoring (APM) tools. • Set up and maintain reliability metrics. • Set up and maintain error budget actions.	• cmdb_read • sn_sow.sow_user • sn_sow_srm.srm_responder • workspace_user • slo_operator

For more information, see SRM roles and responsibilities.

SRM workflow



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Product teams in IT or Lines of Business continuously deliver new service instances and technology management services. Example: New customer billing portal.
2. Along with SLO Management, teams can register services and define service level objectives (SLOs), helping them reach business outcomes. Example: 95% monthly availability for the billing portal.
3. Monitoring integrations are set up by the teams to collect the real-time health of these services. Example: Cloud Observability.
4. Monitoring creates service level indicators (SLIs) impacting alerts when services are underperforming. Automation groups and enriches. Example: Billing portal latency is exceeding 7 s.
5. When the alerts indicate an outage or customer-impacting degradation, incidents are created and on-call notifications notify appropriate team resources. Example: A Billing SRE team is notified via phone of a latency issue on the billing portal.
6. After teams collaboratively diagnose and remediate incidents, they identify action items for improving the system's resilience. Example: The Billing team decides to add additional web server capacity.
7. Management continually reviews SLO performance, helps to prevent changes when the error budget is exhausted, and prioritizes improvement initiatives for underperforming services.

SRM benefits

Benefit	Feature	Users
Team-based experience	Working with SRM teams	SRM administrators, managers, and responders
Service registration	Working with SRM services	SRM administrators, managers, and responders
Prebuilt integrations	Working with integrations in SRM	SRM administrators, managers, and responders
Measure service health	Working with reliability metrics	SRM administrators, managers, and responders
On-call coverage	Create an SRM on-call schedule	SRM administrators, managers, and responders
Remediate high severity alerts and incidents	Working with SRM reliability tasks	SRM administrators, managers, and responders

What to explore next

To learn more about configuring and using SRM, see:

- Configuring Service Reliability Management
- Using Service Reliability Management
- Service Reliability Management reference

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get started with Service Reliability Management

Service Reliability Management (SRM) accelerates your path to viewing service health in the context of service level objectives and incident resolution. Helps IT Operations and DevOps teams deliver on the promise of agility, performance, and uptime.

Get started with SRM to understand the different sections in the SRM interface.

For more information on roles, see SRM roles and responsibilities.

Basic SRM tasks

Step	Description	Reference
Set up teams and services	Setup guides for the Home, Services, and Teams pages show how to add a team or service to SRM.	Add an SRM team
Visit and learn about your Home page	The Home page is where you find the things most important to you. For example, the services with critical alerts and incidents and work assigned to you and your team.	SRM Home page
Learn how to navigate SRM	Get familiar with the different sections and elements of the SRM interface. The sections and elements are used throughout the documentation.	SRM interface

SRM helps you when you must create and administer teams, services, and integrations.

SRM tasks

Step	Description	See this
Manage a service instance or technology management service in SRM	Define the basic tasks and parameters that make up your service and how it should behave.	Add a service to SRM
Set up an SRM team	Set up a team. Teams are responsible for the issues that occur in their associated services.	Add an SRM team
Set up on-call schedules and escalation policies	Create an on-call schedule for your team to make sure they're available to resolve issues. You can set up an escalation policy to make sure at least one team member is engaged in incident response.	Create an SRM on-call schedule
Configure service relationships	Use a map canvas to add, configure, and arrange services. You can add child services that depend on parent services.	View impact of child service on parent service
Integrate services with third-party monitoring tools	Set up a third-party integration, such as Datadog or ServiceNow Cloud	Working with integrations in SRM

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SRM tasks (continued)

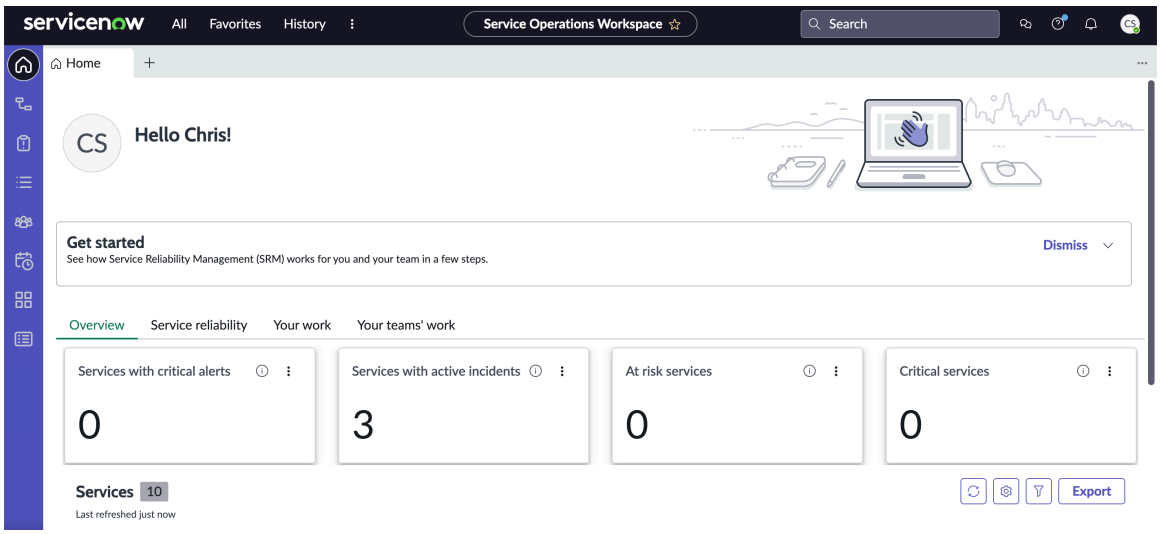
Step	Description	See this
	Observability, with SRM so that alerts are available to your teams within SRM.	
Establish SLOs, SLIs & error budgets for services	Establish goals for how well your service should operate. Also, specify the maximum amount of time that a technical system can fail without contractual consequences.	Service Level Objective Management
Set up alert automations **Note:** This functionality is only available if you have installed the Alert automations application.	Alert automations enable you to define alert conditions. Set up alert rules for each APM tool to define the conditions when the APM tool should send notifications to SRM.	The Alert automation application is available from the ServiceNow Store.

SRM Home page

The Service Reliability Management (SRM) Home page provides relevant information about your work, services, schedules, maintenance reminders, and teams. View the Home page by navigating to **Service Reliability Management**.

Service Reliability Management Home page sections

In the workspace, select **Home** ( ) to view the Home page.



When you're on-call, your schedule is listed.

Home page sections

Get started	Contains setup tasks and their progress for teams and services. For more information on completing setup, see Add a service to SRM and Edit service details in SRM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Home page sections (continued)

	Note: You can skip any section and come back to it later. Progress is marked in percentages by the actions that you take. As long as a step remains incomplete, the tiles are available. You can minimize them, at any point, by selecting the Up icon . Use **Dismiss** to remove it from your page. The checklist states are as follows: • **None**: No action has been taken. • **Done**: All required fields have been added. • **Pending**: Some fields or approvals still must be added or granted.
Overview	Contains an overview of all service alerts, incidents, and at-risk and critical services. **Services with critical alerts** are the default list view. Select a card to see the list view for that area.
Service reliability	Displays a dashboard for monitoring and managing service performance. The dashboard offers multiple visualizations to help you track error budgets, monitor service level objectives, and identify issues across services.
Your work	Contains incidents and alerts assigned to you. Select a card to see the list view for that area.
Your teams' work	Contains incidents and alerts assigned to your team. Select a card to see the list view for that area.

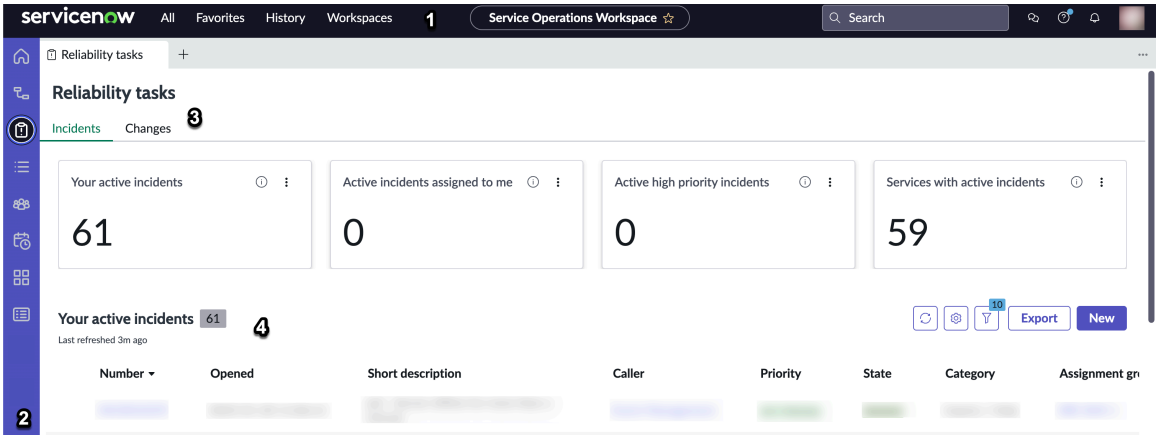
SRM interface

The different components on the Service Reliability Management (SRM) interface provide easy access to different functions. The features and functions that appear depend on your role and permissions.

The SRM interface has the following different sections:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Interface sections



Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics. Depending on your role, you may see other icons in the primary navigation.

If you see the SOW Home page, select an SRM icon to view SRM-specific information.

Sections	Description
1 - Header	A home for your organization logo and system-level utilities present everywhere in the interface. • All • Favorites • History • Workspaces • Current workspace • Search • Sidebar discussions • Help • Notifications • Profile icon: Represents your profile
2 - Primary navigation	Easy access to specific pages in SRM. The primary navigation uses icons, including icons for Services, Reliability tasks, Teams, and Schedules. Use tooltips to identify them.
3 - Content headers	Tabs, cards, or buttons that provide the means to accomplish product-level tasks. The elements in the content header differ from one page to another.
4 - Content area	Canvas or the main area where you can gather information, read metrics, and perform tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sections	Description
	Note: If you want to minimize the side panel on forms, by default, navigate to **Preferences** > **Workspace** and disable the **Show sidebar** option. That action disables it across the Service Operations Workspace, not just SRM.

Search, filters, lists, forms, and guides

An overview of the additional elements in the Service Reliability Management (SRM) interface that help you find items, view available forms and lists, and follow setup processes.

Table List view

View services and incidents as a list.

- Search using the header text box.
- Order items using the list columns.
- Filter list results using the list columns.

Note: View the active filters using the filter icon in the list view header.

Each view contains its own unique items. See those pages for details.

Form view

When you open any of the table records from the list view, you see the details of the record as a form.

Each view contains its own unique items. See those pages for details.

Note: Grayed out fields can't be changed.

The Attachments panel is often visible by default, to hide it select the Attachment icon .

Setup checklists

Use the setup checklists to visualize the process that you go through to reach your goals. Each step is highlighted as you complete it.

Export list information to a file

You can export live information to a file in Service Reliability Management (SRM).

Before you begin

Note: Bulk selection doesn't impact exports. The export includes all records that match the current filter criteria. It doesn't consider the selections you make in the list view.

Role required: srm_admin, srm_manager, or srm_responder

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. Select the list view in any landing page section in SRM with an **Export button**.

3. Determine which filters you want to use and select them from the Filters or More actions menu in the list columns.

   Note:

   The Export button only becomes available if there are records in the list view.

   The export contains all list data that matches your filtered/grouped lists.

4. Select **Export**.
   In the pop-up window select:
   - File Type:
     - Excel
     - CSV
     - JSON
     - PDF
   - Delivery type:
     - Download
     - Email: Provide an email address

   For **Email**: Once the export is complete, a success message appears with your email address at the top of the screen. It's useful for larger files because, depending on the size of the file, exporting might take some time. Email runs in the background, so you're free to do something else while waiting.

   For **Download**: The pop-up begins exporting and the file appears in your Download directory. Depending on the size of the file, it might take some time. You can open it in any application that supports the file format.

Manually create SRM tags

Add tags to classify, categorize, and add context to data. Service Reliability Management (SRM) imports tags and attaches them to services, alerts, and incidents. You can also manually create tags.

Before you begin

Role required: srm_admin, srm_manager, or srm_responder

About this task

There are two ways that tags can enter the system and attach to an alert or incident. The first is automated but the last one is manual.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Imported from a third-party integration such as Datadog.
- Using the tag icon in the header of a service, alert, or incident.
- Added using the **Modify field values** action in an automation rule.

This task describes how to add tags to services and incidents in SRM. For information about managing alerts, see Alerts in Service Operations Workspace.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Services** or **Reliability tasks**.
3. Open a service or incident.
4. In the header, select the **Tag** icon to add tags.
5. Enter your tag in the pop-up window.
   Your tag is saved and appears below the Add Tag box alongside any existing tags.
6. Select anywhere in the form to close the pop-up.

Note:

Tags are also shown under the description in the incident list view.

SRM incidents

Track and collaborate on incidents in the Incidents tab, helping you and your teams resolve issues efficiently.

The Incidents tab appears in the Service Reliability Management (SRM) Reliability tasks page. Its top header shows description information, tags, priority information, state, service, and assignment group.

Note: Tags are imported from third-party integrations and attached to incidents. However, you can also create tags to categorize data and drive system logic using the Tag icon . For more information on creating and viewing tags, see Manually create SRM tags.

When selecting an incident, you're taken to an overview. This section contains three content panels: Summary, Activity, and Recommended actions.

Note: When an editable field is updated, notifications are sent based on user notification preferences.

In the Impact Summary, you find the following information:

Affected CIs

Field	Description
Configuration item	Name of and link to the configuration item associated with this incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impacted Services

Field	Description
Configuration item	Name of and link to the configuration item associated with this incident.
Managed by	Team responsible for the incident.
Owned by	Incident owner.
Approval group	Team responsible for approvals.
Location	Geographical location of the incident if defined.
Operational status	Status of the incident.
Manually added.	Whether this incident was manually added or the result of an error budget policy.

Details

Contains incident details and related alerts

Field	Description
Short description	Brief description of the incident.
Description	Detailed description of the incident.
Number	Incident identifier.
Impact	Impact is a measure of the effect of an incident on business processes. Choices are: • 1 - High • 2 - Medium • 3 - Low
Assignment group	Team assigned to the incident.
Priority	Priority is based on **Impact** and **Urgency**, and it identifies how quickly the incident should be addressed. Choices are: • High Impact = Critical Priority • Medium Impact = High Priority • Low Impact = Moderate **Note:** See Priority Data Lookup rules below.
Category	Category of the incident. Choices are: • Inquiry/Help • Software • Hardware

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Details

Contains incident details and related alerts

(continued)

Field	Description
	• Network • Database
Urgency	Urgency is a measure of how long the resolution can be delayed until an incident has a significant business impact.
Service	Affected service associated with the incident. You can edit this field from a list menu. **Note:** When you set a service, and that service has an assigned team, the assigned team of that service is automatically assigned to the incident.
Severity	Imported severity on the incident. Values P1–P5.
Configuration item	Asset associated with the incident.
Assigned to	Individual responsible for resolving the incident.
State	State of the incident. The state moves and tracks incidents through several stages of resolution. Choices are: • New • In Progress • Ob Hold • Resolved • Canceled
Watch list	Individuals interested in the incident. Subscribes them to notifications according to their preferences.
Resolution code	Code associated with the resolution. Choices are: • None (default) • Duplicate • Known error • No resolution provided • Resolved by caller • Resolved by change • Resolved by problem • Resolved by request • Solution provided
Resolution notes	Detailed information on the resolution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Details

Contains incident details and related alerts

(continued)

Field	Description
	Resolution notes are posted to the **Activity** timeline.

Note: Priority is calculated according to the following sample data lookup rules:

Priority Data lookup rules

Impact	Urgency	Priority
1 - High	1 - High	1 - Critical
1 - High	2 - Medium	2 - High
1 - High	3 - Low	3 - Moderate
2 - Medium	1 - High	2 - High
2 - Medium	2 - Medium	3 - Moderate
2 - Medium	3 - Low	4 - Low
3 - Low	1 - High	3 - Moderate
3 - Low	2 - Medium	4 - Low
3 - Low	3 - Low	5 - Planning

When a service is deleted, its integrations, alerts, incidents, and automations are removed. Deleting a service isn't a recoverable action so consider deactivating the service instead.

The Related Records tab contains any alerts associated with this incident.

Note: All field values are imported from the related records and aren't editable from SRM.

Child Incidents

Field	Description
Number	Identifier for the related incident.
Short description	Brief description of the related incident.
Priority	Priority of the related incident.
State	State of the related incident.
Assigned to	Team member assigned to the related incident.
Assignment group	Team assigned to the related incident.
Service	Service associated with the related incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alerts

Field	Description
Number	Identifier for the related alert.
Severity	Severity of the related alert.
Short description	Brief description of the related alert.
Acknowledged	Whether the related alert has been acknowledged or not.
Assigned to	Team member assigned to the related alert.
Configuration item	Asset associated with the related alert.
Parent	Primary alert associated with the related alert.

Recent Impactful Changes

Field	Description
Number	Identifier for the related changes associated with this incident.
Short description	Brief description of the related changes associated with this incident.
Type	Type of the recent changes associated with this incident.
State	State of the recent changes associated with this incident.
Planned start date	Date and time to begin changes associated with this incident.
Planned end date	Date and time to begin changes associated with this incident.
Assigned to	Team member responsible for the change request associated with this incident.

Change Requests

Field	Description
Short description	Brief description of the change request associated with this incident.
Type	Type of the change request associated with this incident.
State	State of the change request associated with this incident.
Planned start date	Date and time to begin change request work associated with this incident.
Planned end date	Date and time change request work associated with this incident ended.
Assigned to	Team member responsible for the change request associated with this incident.

Postmortem tab

About Postmortem owner:

- If a Scribe has already been chosen in the Collaboration panel Responders list, they're automatically made the owner.
- If there's more than one scribe, the first one assigned is chosen. Otherwise, you can select an owner from the list menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If a new scribe is added or an existing user persona is changed to Scribe, that user is made the owner.
- If you manually remove an owner, no new owner is automatically selected.

Use the drag-and-drop feature to edit postmortem sections. You can exclude sections from PDFs, delete sections, or reorder sections.

To add new sections, select the **Add** icon .
Compose panel

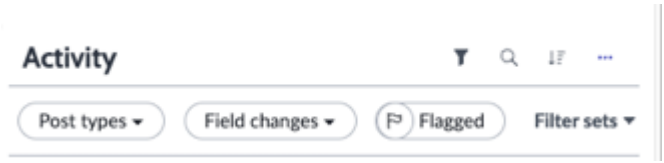
Work notes are added to the Activity timeline automatically. Visible to responders and above. Add comments using the **Compose** text box.

Comments are added to the Activity timeline automatically. Visible to everyone in SRM.

Activity section

Stream that contains all the system activity, and resolution notes. You can filter, sort, expand or collapse all posts using the header icons.

Note: The filter option includes **Post types**, **Field changes**, and **Filter sets**. All choices are selected by default. Flagged entries are either all or none.



Actions panel

Note:

The **Notifications**, **Agent assist**, **Expert on-call**, and **Email templates** panels aren't currently supported in SRM.

Attachments section

Open the **Attachments** section using the Attachment icon .

On the **Attachments** section, you can initially **Browse** your local hard drive for files.

Once you have added attachments, you can:

- Search for an attachment based on its name or extension

  Note: You must have two or more attachments to search.

- Upload a new attachment using the ( ) icon.
- Download, remove, or rename existing attachments using the More actions icon ( ).

Template section

Open the **Template** panel using the Template icon .

Note: Existing templates are displayed, but creating templates isn't available in SRM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Collaboration panel

Displays the available Zoom meetings, Microsoft Teams, or Slack channels to start or join.

To start or join a Zoom meeting:

Note: The Zoom integration and recognized IDs must be active in your instance. If Start Channel is unavailable, contact your administrator.

1. Select **Start Zoom**.
   - A meeting pop-up appears.
   - Add participants.
   - Select **Create Meeting**.
   - The meeting is created, invitations are sent, and you join the meeting.

     Note: Any issues found when starting a meeting are shown in a banner message.
2. Select **Join Meeting**
   - **Sign in** to your Zoom account.
   - You join the Zoom meeting.

1. Select **Start Channel**.
   - Sign in to your Microsoft Teams account.
   - Select **Create**. You are redirected to the Microsoft Teams application.
   - Back in the Collaboration column, the **Join Channel** button is activated.

     Note: Any issues found when joining a channel are shown in a banner message.
2. Select **Join Channel** in the Collaboration panel in SRM.
3. Sign into your Microsoft Teams account.

   You are taken to the channel in Microsoft Teams.

Start or join a Slack channel:

Note: The Slack integration and recognized IDs must be active in your instance. If Start Channel is unavailable, contact your administrator.

1. Select **Start Slack**.
   - Add participants in the Create a Slack channel pop-up.
   - Select **Create**. You are redirected to the Slack application.
   - Back in the Collaboration column, the **Join Slack** button is activated.

     Note: Any issues found when starting a channel are shown in a banner message.
2. Select **Join Channel** in the Slack application window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Sign into you Slack account.

   You are taken to the Slack channel.

Service Operations Workspace setup for SRM

Install and configure Service Reliability Management (SRM) within the Service Operations Workspace Admin Center so that SRM admins, managers and responders can provide service reliability efficiently.

You can Install Service Reliability Management from Admin Center or ServiceNow Store from the Service Operations Workspace Admin Center.

Note: The Data visualizations app v24.1.8 is also required. See Data visualizations in the ServiceNow Store to install the app.

Once installed, configuring SRM within the Service Operations Workspace Admin Center sets up the SRM workspace with options and actions.

Using the Service Reliability Management menus in the Service Operations Workspace Admin Center, you can:

- Assign an administrator to Service Reliability Management.
- Activate teams and services in SRM
- Customize service approval settings in SRM.
- Customize team approval settings in SRM
- Access and publish the request catalog item for users.
- Configure error budget actions for breached SRM SLOs.

Alert automations are conditional triggers that execute response actions automatically, based on the contents of the alert. This functionality is available to SRM upon request, from the Alert automations application in the ServiceNow Store.

Configuring Service Reliability Management

Configuring Service Reliability Management (SRM) involves installing it from the ServiceNow Store or Service Operations Workspace Admin Center. You can also assign administrators and import services and teams.

Using guided setup for SRM

The guided setup provides a sequence of tasks to help you configure SRM on your instance. To open the guided setup, navigate to **All** > *Service Operations Workspace* **Admin Center** > **Overview**. Next, find the Service Reliability Management tile and select **Configure**.

SRM configuration documentation

Visit the following pages to set up and configure SRM. The content is primarily for srm_admin or admin users.

Install Service Reliability Management from Admin Center or ServiceNow Store

Install the Service Reliability Management (SRM) application from the Admin Center or ServiceNow Store.

Before you begin
Subscriptions required: ITSM Standard and ITOM Operator Professional subscriptions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The data visualizations store app v24.1.8 is also required. See Data visualizations in the ServiceNow Store to install the app.

To create and manage alert automations, install the Alert automation application available on request in the ServiceNow Store.

Role required: admin

About this task
Roles and demo data are installed with SRM. The demo data includes templates that help accelerate implementation and SRM use.

Procedure
1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Overview**.
2. Locate the *Service Reliability Management* card and select **Install**.
3. In the pop-up window, select **Start Install**.
   You're taken to the ServiceNow Store portal.
4. Complete the necessary steps.

   Note: If any dependencies are red on the app store listing, select the row to open the dependent app and install it. If the dependent app is already installed but still appears in red, you can get or reopt it as needed.

   Demo data comprises the sample records that describe application features for the common use cases. Demo data is loaded when you first install the application on a development or test instance.

   Following installation, the *Service Reliability Management* card can be used to configure SRM.

Assign an administrator to Service Reliability Management

Add people from your ServiceNow instance to administer Service Reliability Management (SRM) and your service operations.

Before you begin
Role required: admin

About this task
The SRM admin can add and create teams. They can also manage data across all SRM teams.

Procedure
1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Overview**.
2. In the *Service Reliability Management* tile, select **Configure**.
3. Navigate to **Assign admins** > **Service reliability management admins**.
4. Enter user names in the field.
5. Select **Save**.

Activate teams and services in SRM

Activate teams and services to be managed in the Service Reliability Management (SRM) application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: srm_admin or admin

Procedure
1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Configurations**.
2. Select *Service Reliability Management* > **Activate** > **Teams and services**.
3. Select **Activate teams and services** to begin importing or adding teams.
4. Use the condition builder to filter the teams shown in the Assignment groups list.

   Note:

   Filters on the same field use AND logic, and filters on different fields use OR logic. For example, filtering for multiple `Business Criticality` levels and `State = Open`, evaluates as `(Criticality = 1 OR 2 OR 3 OR 4) AND (State = Open)`.

   List view filters are saved automatically and persist when you navigate away and return.

5. In the Assignment groups list, select the teams you want to add and then select **Activate**.
   You reach the **Activate services** option to add services.
6. From the **Select a service class** list, select a service.
   The following service types are available:
   - Application Services
   - Mapped Application Services
   - Calculated Application Services
   - Dynamic CI Group
   - Technical Services
   - Tag-based Services
7. Use the condition builder to add new services to the list view.
8. Select the services that you want to add and then select **Activate**.
   The **Activate Services** pop-up opens.
9. From the **Support Group** drop-down, select the relevant support group and select **Confirm**.

Result
On the **Activate teams and services** page, the following options appear:

- Existing teams
- Existing services

You can select the options to view the teams or services.

Customize service approval settings in SRM

Add an approval process to your services for governance.

Before you begin
Role required: srm_admin or admin

About this task
Require approval when Service Reliability Management (SRM) admins, managers, or responders request to create or add a service in SRM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Configurations**.
2. Select *Service Reliability Management* > **Governance and autonomy** > **Service governance**.
3. Choose one or both processes by selecting the relevant check box.

   Approval requirement types:

   - Approval required when creating a new service:

     Requires approval when creating a service in SRM, and assigns it to the team responsible for new services.

   - Approval required when associating an existing Configuration Management Database (CMDB) service:

     Requires approval to add an existing service to SRM, and assigns it to the team responsible for existing services.

4. Enter or select the team responsible for approvals.
5. Select **Save**.
   This action initiates the approval process and assigns approval to the team responsible for approving the new service.

   Note: Approvals take two steps. First, the request is approved, which appears in the **Stage** field of the request record. Next, the request remains **Pending** until the request item is approved in the **Request** record.

Customize team approval settings in SRM

Customize how team approvals work when non-admin users create or add a team in Service Reliability Management (SRM). This feature, also known as team governance, helps you control access and align with internal policies.

Before you begin

Role required: srm_admin or admin

About this task

By default, team governance is active in SRM. When non-admin users request a team, SRM creates two records: a parent request and a requested item. The approval team is notified, and any member can approve the request from My approvals. Once approved, the team is created or added, the parent request is set to `Approved`, and the requested item is set to `Closed Complete`.

You can customize team governance by turning off approvals or changing the approval team.

Note: Non-admin users are SRM managers and SRM responders. When team governance is active, admins and SRM admins can still create and add teams without approval.

Procedure

1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Configurations**.
2. Under **Service Reliability Management**, select **Governance and autonomy** and then select **Team governance**.
3. Review or update the approval options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Approval required when creating a new team	Clear this option to let non-admin users cre ate teams in SRM without approval.
Approval required when associating an ex isting team	Clear this option to let non-admin users add existing teams to SRM without approval.

4. Review or update the approval team for one or both options.
   By default, the approval team is set to `SRM Team approvers`. You can view its members in `sys_user_group.list`.

   Note: Any member of the approval team can approve requests, but they need the `sn_request_read` role to view request details. Without that role, they only see the approval task.

5. Select **Save** to update your team governance settings.

Configure error budget actions for breached SRM SLOs

Configure the actions that the team can select when the error budget of a service level objective (SLO) is breached.

Before you begin

Role required: srm_admin or admin

Procedure

1. Navigate to **All** > *`Service Operations Workspace`* **Admin Center** > **Configurations**.
2. Select *`Service Reliability Management`* > **Governance and autonomy** > **Error budgets**.
3. Select **Configure error budget actions** to edit the Process Error Budget Policy Threshold subflow in Workflow Studio.

   Note: Working in Workflow Studio requires advanced ServiceNow expertise. For more detailed information on editing workflows or creating custom workflows, see Flow Designer.

Approve a change request for SRM

Approve a service change request in Service Reliability Management (SRM) to allow the requested action to proceed.

Before you begin

Only open change requests are available on the **Reliability tasks** page.

Role required: SRM approval team or admin

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the **Changes** tab.
4. Select a change request and then select the **Details** tab.
5. On the **State** field, select the list and select **Approved**.
6. Select **Save**.
   The change request state updates from `Assess` to `Approved`.

   On approval, the new service is created and added to the SRM team. The owner is set to the person shown in the Assigned to field. And the Managed by group is set to the SRM team associated with the assignee.

Configure fields for escalation triggers

Configure additional fields for on-call escalation triggers in Service Reliability Management (SRM).

Before you begin

Role required: admin

About this task

Configure additional fields that teams can use when setting up escalation triggers. By default, escalation triggers run only when the Assignment group field changes. Completing the following procedure makes other fields available, giving teams more flexibility and helping them respond to issues quickly.

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **Administration** > **Trigger Rule Table Config**.
2. Select **em_alert** or **incident** to configure additional trigger fields for alerts or incidents.
3. In **Trigger condition fields**, add fields from the following table.

Note: Selecting fields not listed in the table might cause performance issues.

Table	Supported fields
em_alert	○ Assigned to ○ Flap count ○ Flap last state ○ Initial event generation time ○ Last event generation time ○ Number of Work Notes ○ Overall Event Count
incident	○ Assigned to ○ Category ○ Escalation ○ Impact ○ Reopen count

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Supported fields
	○ State ○ Urgency

4. Select **Update** to save your changes.
   The selected fields now appear as options for teams configuring escalation triggers.

What to do next
To set up an escalation trigger, see Create an escalation trigger for an SRM team.

Configure Twilio to send notifications in SRM

Connect your Service Reliability Management (SRM) instance and Twilio account to send notifications to teams.

Before you begin
Before you begin, you must have a String Identifier (SID) and an authentication token for an active Twilio account.

Note: Performing this action requires ServiceNow expertise.

Role required: srm_admin or admin

About this task
You can adjust what gets sent from Twilio by editing the on-call workflow in the system.

Procedure
1. Navigate to **All** > *Service Operations Workspace* **Admin Center** > **Configurations**.
2. Select *Service Reliability Management* > **Integrations** > **Twilio API Key**.
3. Select **Twilio Config**.
4. In the new window, select **here** to edit the record.
5. Enter the **Account SID** value.
6. **Optional:** Enter a **Validity Period** value.
7. Select **Connect** to activate the key or **Save** to save your changes without activating.

Install the Alert Automation application

Install the **Alert Automation** application and any supporting applications.

Before you begin
Role required: admin

Subscriptions required: ITSM Professional or ITOM Operator Professional subscriptions.

About this task
Before creating management rules, you must install and configure the Service Reliability Management (SRM) application, available in the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. To access the ServiceNow Store and download the application onto your SRM instance, select the link in the email you received.
2. In your ServiceNow AI Platform instance, navigate to **All** > **System Applications** > **All Available Applications** > **All**.
3. Locate the *Service Operations Workspace* **Alert Automation** application and select **Install**.
   Alert automation rules are ready to use in SRM.

Using Service Reliability Management

Service Reliability Management (SRM) enables you to register services, monitor service health, respond to service degradations with on-call shifts and escalation policies and triggers, and onboard distributed teams with minimal governance from central IT.

Basic Tasks in SRM

Working with SRM services

A service represents a functional outcome like networking, payments, or HR services, that is owned by a team. To deliver that outcome, a service can contain one or more technical components like a user authentication service, or a piece of shared infrastructure like a database.

Service Reliability Management (SRM) works with integrations to prioritize and route alerts to the relevant responders. It follows up with escalations until the alert is acknowledged and someone responds. When you create or add a service in SRM, it must reflect a service in your SRM infrastructure.

Note: You might want multiple tool integrations to monitor each technology management service and receive events from those tools. See Working with integrations in SRM for more information.

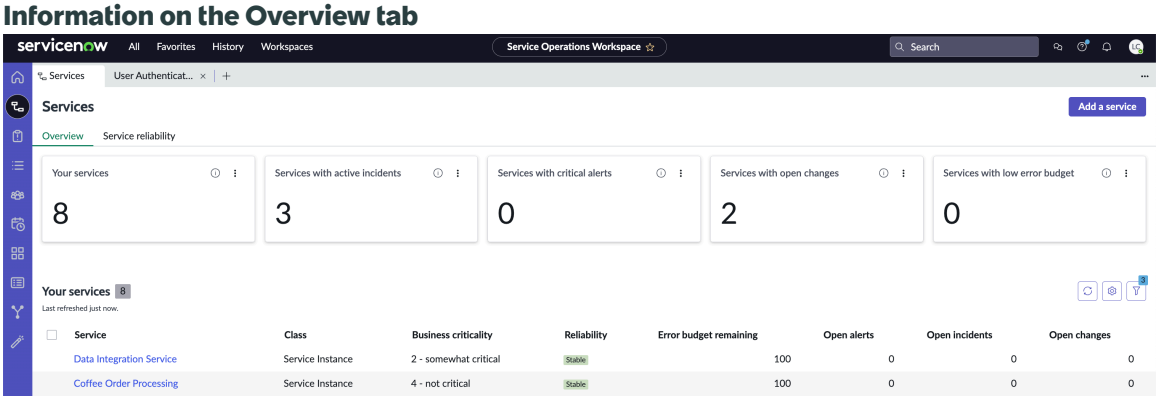
In addition, you can create reliability metrics for the service. See Working with reliability metrics.

Tying a team and policies to that service makes it easier to divide responsibilities and track technical outcomes. It also makes it easier to automate response routines and focus on who you notify and when.

The state of an exiting service is inherited. The state of a created service in SRM is **None**.

Services Overview

Information on the Overview tab



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The cards on the Overview tab display the following metrics. By default, the list view shows information related to the Your services card. Select a different card to view different information in the list view.

- **Your services**: Count of all the services you or your team manages and monitors for reliability.
- **Services with active incidents**: Services with open incidents sorted in the following order:
  - Business criticality - most critical first.
  - Number of active incidents - highest first.
  - Percentage of error budget remaining - lowest first.
- **Services with critical alerts**: Services with open alerts sorted in the following order:
  - Business criticality - most critical first.
  - Number of alerts - highest first.
  - Percentage of error budget remaining - lowest first.
- **Services with open changes**: All the services your team manages and monitors.
- **Services with low error budget**: Services with less than 25% error budget remaining.

  The error budget metric is represented as the amount of service level objective (SLO) that you can spend over a specified time. It can be used to manage release velocity.

Note: To refresh the card and list values, select Refresh .

You can interact with the list in the following ways:

- Group or filter columns to customize the view.
- Edit, sort, or export the list as needed. See Export list information to a file.

For more information about individual service details, see Edit service details form.

Services list view definitions

The columns include the following details:

- **Service**: Name of the service.
- **Class**: Service instance or technology management service.
- **Business criticality**: Importance of the service to the business.
- **Open alerts**: Number of open alerts assigned to the service.
- **Open incidents**: Number of open incidents assigned to the service.
- **Error budget remaining**: Percentage of error budget remaining for the service.

Service reliability

The Service reliability tab is a customizable dashboard showing high-level service performance. For more information about the dashboard, see Visualizations in the Service reliability dashboard.

Add a service to SRM

Add services to Service Reliability Management (SRM) to help your teams manage service health.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

If you're adding a technology management service to SRM, make sure it doesn't have a support group. You assign the support group when you add the service to SRM.

Role required: srm_manager, srm_responder, or srm_admin

About this task

Add a service to SRM to assign it to your teams and let them access its incidents and alerts. You can either create a service or import an existing one. SRM supports both service instances and technology management services:

- Service instances - Business-facing services, such as an HR portal. Service instances often have multiple infrastructure components.
- Technology management services - IT-focused services that support a business service or service instance. For example, an authentication service or database service.

When you add a technology management service to SRM, you also add its offerings. Offerings are specific components within a parent technology management service. For example, Spam filtering is an offering within the Email technology management service. In SRM, you can assign a parent technology management service and its offerings to different teams.

Note: When you import an existing technology management service, its offerings don't inherit its support group. Offerings either keep their existing support group or, if they don't have one, you must assign it before setting up Service Level Objectives (SLOs).

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. Select the Services icon and then select **Add**.
3. In the Add services for your teams modal, you can either create a service or add existing services.

Option	Steps
Create a new service	**a.** Select **Create a new service**. **b.** Fill in the fields. For field descriptions, see Add service form. **c.** Select **Next**.
Select existing services	**a.** Select **Select existing services**. **b.** Search for and select your service. You can add more than one. **c.** Select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
	Tip: Select the search box to view up to 25 services not yet in SRM, ordered by creation time. After you enter three characters, it shows up to 25 matching results. Both lists can include services with or without a support group. If a ser vice has one, the support group can be an SRM team or a group outside SRM.

4. In the Assign a team step, assign your service to an existing or new support group.
   In SRM, support groups are also known as teams.

Option	Steps
Select an existing team	Enter your team's name in the search box.
Create a team	Select **Create a team**. For more information about creating teams, see Add an SRM team.

5. Select **Add service**.
   If approvals aren't enabled, your service appears in the service list. If approvals are enabled, your request is sent for approval. After it's approved, the service appears in the services list.

   Note: If you added a technology management service, its offerings appear in the Offerings tab on the parent technology management service's page. Offerings also appear in the services list. To view an offering without an assigned support group, remove all filters from the services list.

What to do next

If an offering doesn't have a support group, assign it to a support group before setting up SLOs. For how to assign support groups, see Edit service details in SRM.

You can also add integrations to your service to start monitoring its health.

Edit service details in SRM

Edit an existing service owned by your team. For each service that you support in SRM provide general information about the service and the SRM team that supports it.

Before you begin

Role required: srm_admin, srm_manager, or srm_responder

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select the **Services** icon ( ).
3. From your services list, select the service that you want to edit or update.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To view and select a technology management service offering without an assigned support group, remove all filters from the services list.

4. On the Overview page, select the **Details** tab.
5. Fill in or edit the fields.
   For more information on the field descriptions, see Edit service details form.
6. To save the updated service details after editing, select **Save**.

Remove a service from SRM

Remove a service from Service Reliability Management (SRM) when you no longer need to track or monitor its reliability.

Before you begin

SRM administrators can remove any service from SRM. SRM managers can remove only the services assigned to their teams.

Note: Administrators and SRM administrators have a delete option on service pages. That option deletes the service from both SRM and the Configuration Management Database (CMDB). The remove option, described below, only removes the service from SRM.

Role required: srm_manager or srm_admin

About this task

Remove one or more services from SRM when you no longer need to track their reliability. Removing a service from SRM does the following:

- Removes the service from SRM views, including the Service page and Service reliability dashboard.
- Deletes all draft service level objectives (SLOs) associated with the service. Those SLOs aren't recoverable.
- Retires all active SLOs associated with the service. Those SLOs are no longer active but remain visible in SRM.

Removing a service from SRM doesn't affect the service reliability tasks, such as alerts, change tasks, or incidents. The service also remains in the CMDB, and you can add it back to SRM at any time.

Note: The following procedure shows how to remove services from SRM using the Services page. You can also remove services using the Teams page by selecting a team and then the **Services managed** tab.

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
2. In the primary navigation, select **Services**.
3. Point to a service you want to remove, and then select its check box.
   You can select one or more services.
4. Select **Remove**.
5. In the dialog, review the details about the affected SLOs and then select **Remove service**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The page displays `<service-name> removed from` SRM. The service no longer appears in the SRM application, but it remains in the CMDB. You can add it back to SRM at any time.

Note: If you receive an error when removing a service, see Troubleshoot SRM.

What to do next

To learn how to monitor and manage services that remain in SRM, see Working with SRM services. To add a service that you want to monitor or that was removed by mistake, see Add a service to SRM.

Working with integrations in SRM

Connect your services to monitoring tools using the Integrations Launchpad . Integrations send information to Service Reliability Management (SRM), helping you track alerts, manage incidents, and maintain service health.

Access the Integrations Launchpad

As an SRM admin, manager, or responder, you can access the Integrations Launchpad in the following ways:

- From the primary navigation, select the ITOM Admin Experience icon, and then select either **Add integration** or **Manage installed integrations**.
- From the Services page ( ), select a service, select the **Integrations** tab, and then select **Add an integration**.
- From the Services page ( ), select a service, expand **Complete setup**, and then select **Add integrations**.

Integration details specific to SRM

Be aware of the following when using the Integrations Launchpad for SRM:

Connector type support

SRM supports custom, pull, and push connectors. Pull connectors retrieve data from external sources, and push connectors send data from external sources to your instance.

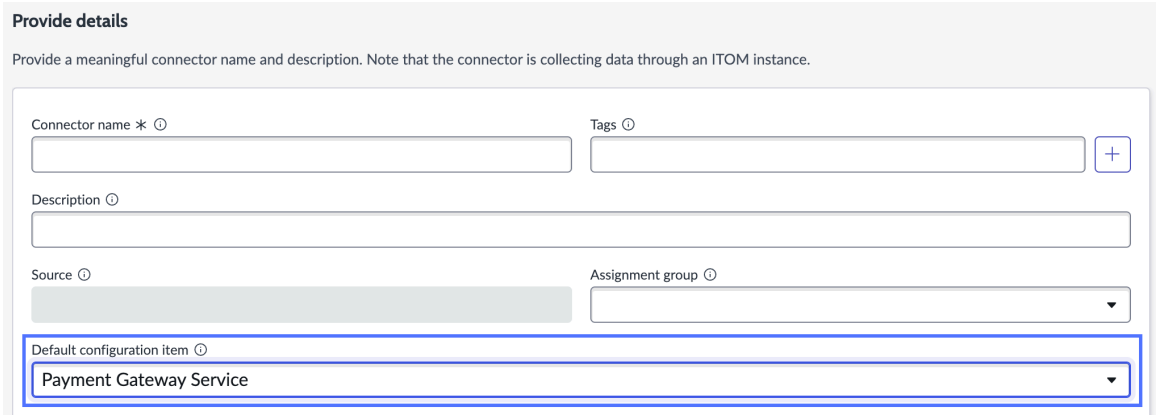
Note: For information about setting up connectors, see Integrations Launchpad in Service Operations Workspace for ITOM.

Configuration item field

When you set up an integration for SRM, the Provide details step has an additional field called Default configuration item.

Set this field to the service your integration monitors. If an incoming alert doesn't include service details, SRM uses this field to connect the alert to the relevant service. This field helps make sure that your teams receive alerts for the services they support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Learn more

Visit the following links to set up and manage integrations with the Integrations Launchpad. The pages are in a different section because the Integrations Launchpad is part of the broader Service Operations Workspace.

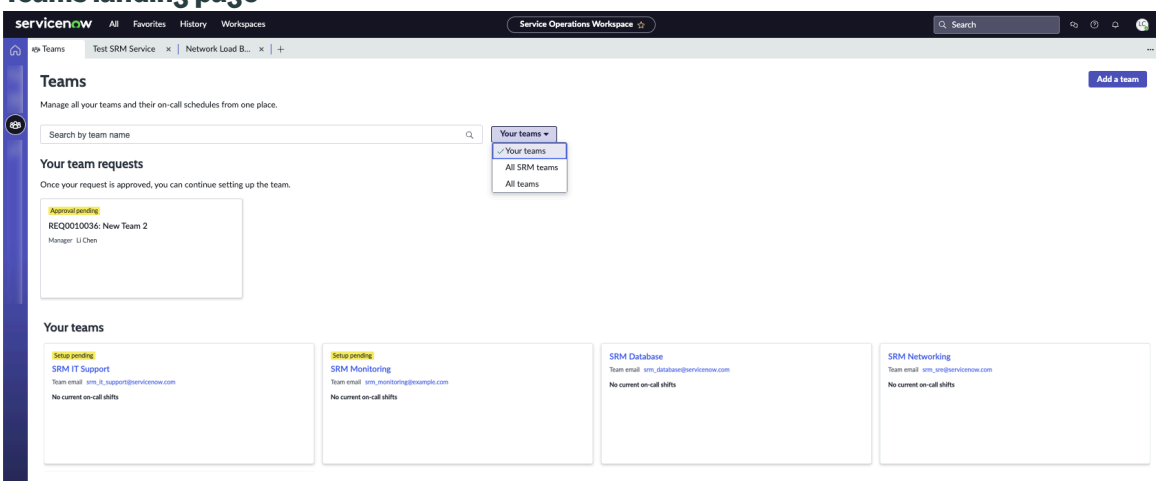
- Activate integration
- Configure an event custom connector
- Configure an event pull connector
- Configure an event push connector
- Deactivate integration
- Delete integration

Working with SRM teams

Manage schedules and define escalation policies for your team. That way, your team sees who is on call and accountable and can have the confidence that critical alerts or incidents are acknowledged in a timely manner.

On the Teams landing page, view and manage your teams and team requests.

Teams landing page



Search by team name among teams you belong to, all SRM teams, or all teams in your organization.

Your selection determines the cards that you're shown on the Teams landing page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Choices are:

- **Your teams** (default)
- **All SRM teams**: All the SRM teams.

  Note: Your ability to take actions in each team depends on permissions for that team.

- **All teams**: All teams you have access to in your organization.

  Note: Your ability to take actions in each team depends on permissions for that team.

The Your team requests section contains team cards for any pending requests, if there are any.

The Your teams section contains cards that provide information about a specific team, such as the status of the team, name of the team, manager, team email, current shift name and duration, and primary responder. See Manage your SRM team details for more information.

Add an SRM team

Request to create a team to start monitoring your services. Teams are responsible for the issues that occur in the associated services.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

About this task

If you have the srm_admin or admin role, you can set up teams using a different process. See Activate teams and services in SRM for more information.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. Select **Teams** ( ), select **Add a team**.
3. Create a new team or add an existing one.

Option	Steps
Add a new team	**a.** In the **New or existing** field, select **I am creating a new team**. **b.** On the form, fill in the fields. For more information on the field descriptions, see Create team form. **c.** Select **Add team**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
Register an existing team	**a.** In the **New or existing** field, select **I want to give a group access to SRM app**. **b.** Select an existing team from the **Select team** list. **c.** Select **Add team**.

Result
When the request is approved, the team is created. Your team appears in the Teams landing page under **Your teams**.

What to do next
- Manage your SRM team details
- Set up escalation policies for your team in SRM
- Create an SRM on-call schedule
- Add team members to SRM
- Manage or add a service to your SRM team

Manage your SRM team details

Add or edit team members, description, contact information of you team.

Before you begin
Role required: srm_manager, srm_responder, or srm_admin

Procedure
1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Teams** ( ).
3. Select the team card whose details you want to update.
4. On the form in the **Details** tab, update the details as required.

Field	Description
Name	Unique name of the team.
Manager	Person who manages the team.
Group email	Email contact for the team that includes all team members.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Description of the team that helps others to understand its responsibilities, purpose, or location.

5. Select **Save**.

Add team members to SRM

Add new team members to your team as required to plan, manage, resolve issues, and increase the efficiency of your business operations.

Before you begin
Role required: srm_manager or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Teams** ( ).
3. Select the team card to open.
4. Select **Teams members** tab.
5. Select **Add**.
6. In the pop-up window select members to add from the list menu.

   Note: Member details are imported from user records and not editable.

7. Select **Add**.

Manage or add a service to your SRM team

Add a service to an incident to increase the amount of data for the incident.

Before you begin
Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Teams** ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select a team card to open any team you want to view or add a service to.
4. From the team page, select the **Services managed** tab.
   You can export the list of services. See Export list information to a file for more information.
5. **Optional:** Add a service to your team by selecting **Add**.
6. Add a new service or register an existing one.

Option	Steps
Add a new service	**a.** In the **New or existing** field, select **Create a new service in Service Reliability Management**. **b.** On the form, fill in the fields. For more information on the field descriptions, see Add service form. **c.** Select **Next**.
Register an existing service	**a.** In the **New or existing** field, select **Associate existing CMDB services to Service Reliability Management**. **b.** Select one or more services. **c.** Select **Next**.

7. In the Assign a team step, fill in the fields.
   - In the **Service owner** field, select the user who will own the services.
   - In the **Support Group** field, select a team that will monitor services.

   The service record has been added.
8. Finish setting up your service or do it later.

Option	Steps
Finish setting up your service	**a.** Select **Continue to setup**. **b.** Select **Add integrations** and connect your service to a data source to monitor events. **c.** Select **Add SLO & SLI** and create a service level objective and measure your service health with a service level indicator.
Do it later	Select **Do it later**.

See Edit service details in SRM and Edit service details formfor information on the service and completion steps for setup.

Create an SRM on-call schedule

Set up an on-call schedule to make sure that someone is available to respond to incidents and critical alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Before creating an on-call schedule, a team must exist in Service Reliability Management (SRM). The Alert table [em_alert] must also be added to the Trigger Rule Table Config list. See Add an SRM team and Add alert table to enable on-call scheduling for Service Operations Workspace for ITOM for more information.

Role required: srm_manager, srm_responder, or srm_admin

About this task

Shifts in SRM let you define variable time periods for your shift-based workforce. Create shifts for particular dates and times when you need coverage, and assign them to team members.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** > **Teams (** **)**.
2. On the Teams page, select your team.
3. Select the **Schedule** tab and then select **Create shift**.
4. In the Create new dialog, select either **Create new** or **Use template**.
   Your system admin can create predefined templates for you to use to create shifts.
5. Fill in the fields.
   For more information on the field descriptions, see Create a shift form in Service Reliability Management.
6. Select **Create shift**.

Set on-call team preferences in SRM

Set on-call preferences for team members to increase the efficiency of your business operations.

Before you begin

Role required: srm_manager or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Teams** ( ).
3. Select the team card to open.
4. Select the **On-call team preferences** button.
5. On the form, fill in the fields.

Field	Description
On-call shift managers	Team managers for the on-call shift.
PTO requests	Requests for Paid Time Off (PTO) made by team members. Choices are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ System default (Not allowed) ○ With approval ○ Without approval ○ Not allowed
First day of the week	First day of your work week. **Note:** This option is available for Washington DC and later releases only.
Allow shift schedule overlap	Option to allow schedules to overlap
Escalation rule on shift overlap	Choices are: ○ System default (Escalate to all shifts) ○ Escalate to outgoing shift ○ Escalate to incoming shift ○ Escalate to all shifts

6. Select **Save**.

Set up escalation policies for your team in SRM

Set up an escalation policy for your team to ensure that alerts or incidents are resolved in a timely manner by the appropriate team member.

Before you begin

Before creating an escalation policy, you must create an on-call shift for your team.

Note: Only the responder who created the team or the manager of the team can set up an escalation policy for that team.

Role required: srm_manager, srm_responder, or srm_admin

About this task

An escalation policy is a set of guidelines that outlines how and when incidents should be elevated to higher levels of authority. It delineates clear procedures and responsibilities for escalation to help responders promptly address problems. It defines the order in which notifications should be escalated if an alert or incident isn't acknowledged or resolved within a defined amount of time. If no one responds, the escalation is based on your defined policies until someone responds. After a team member responds, the escalation policy stops escalating and no further notifications are sent.

Note: Escalation workflow is triggered only if there's an active shift.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. From the primary navigation, select **Teams** ( ).
3. Select the **Escalation triggers and policies** tab.
4. Under **Escalation policies** in the left panel, select **Create policy**.
5. On the Escalation policy form, fill in the fields.
   For more information, see Set up escalation policies form in SRM
6. **Optional:** Select **Add escalation step** to define the additional steps for escalation and escalation path.
   For more information on the Add escalation step form, see Set up escalation policies form in SRM.
7. Select **Save changes**.
8. **Optional:** Add another escalation policy to the team for another category of alert or incident by selecting **Add a policy**.

Create an escalation trigger for an SRM team

To address issues promptly, define the conditions that trigger a team's escalation policy in Service Reliability Management (SRM).

Before you begin

If your team needs trigger fields other than Assignment group, confirm that an admin has already configured them. For more information, see Configure fields for escalation triggers.

Role required: srm_manager or srm_admin

About this task

This procedure shows how to create escalation triggers in SRM. If your organization manages on-call scheduling using IT Service Management (ITSM), you can also use ITSM On-Call Scheduling to define escalation triggers. See Create an escalation trigger rule for more information. While that procedure lists ITSM roles, SRM users only need the srm_manager or srm_admin role.

For a broader overview of escalation processes in ITSM, see Designing an escalation process.

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
2. From the primary navigation, select **Teams** ( ).
3. Select your team, and then select the **Escalation triggers and policies** tab.
4. In the **Escalation triggers** panel, select **Create trigger**, and fill in the Escalation trigger form.

Field	Description
Escalation trigger name	Name of the trigger. Example: `P1 incidents`.
Order	Order of execution for the trigger. When a team has multiple escalation triggers, the triggers with lower values are evaluated first.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Option to activate or deactivate the trigger.
Conditions	Choose the table (**Alert** or **Incident**) and set the conditions for the trigger. When conditions are met, the system triggers an escalation for the relevant team. Example: `Priority is 1 - Critical`.
Advanced options	Define what happens when the trigger conditions are met and when the trigger runs. For **Trigger action**, select **Workflow**, **Subflow** or **Script**, then choose the specific item. Example: Select **Workflow**, and **On-Call: Assign by Acknowledgment** to auto-assign the incident to the person who acknowledges it. Select **Run trigger rule every time the selected field changes** to run the trigger when one of the chosen fields updates. If not selected, the trigger runs only when the Assignment group changes.

5. Select **Save**.
   The UI displays `The Escalation trigger has been added successfully`. The trigger is now active and runs when the defined conditions are met.

Working with SRM reliability tasks

Alerts, incidents, and change requests are reliability tasks. From creation to resolution, SRM helps you manage your alerts throughout the response life cycle.

The Reliability Tasks pane ( ) has several tabs:

- **Incidents** are created manually or based on Service Level Objectives (SLOs) and Service Level Indicators (SLIs). For more information on incidents, see Working with incidents in SRM. For more information on SLO, SLI, and error budget actions, see Create SLOs, SLIs, and error budget policies.
- **Changes** can be created within SRM. See Manually create an SRM change task.

The Express List pane ( ) provides a focused view of alerts to help you monitor, evaluate, and resolve health issues efficiently. You can create alerts from SRM service pages or by using integrations. For more information on alerts, see Express List in the Service Operations Workspace for ITOM and Manually create an SRM alert.

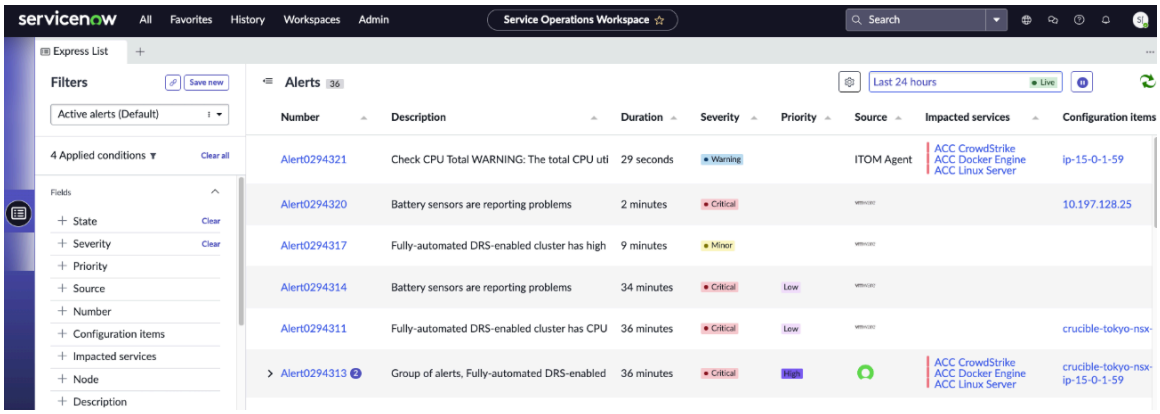
Responders and above are notified for updates to reliability tasks based on their notification preferences.

Working with alerts in SRM

Monitor, evaluate, and resolve health issues in the Express List.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Event Management Express List feature provides a customizable, sortable view for accessing and managing alerts. Use the Express List feature to prioritize alerts, understand their impact, and resolve issues faster.



As a Service Reliability Management (SRM) user, you automatically have the evt_team_operator role, which lets you access the Express List feature ( ). To learn more about that role, see Roles used by Express List.

Visit the following to work with alerts in the Express List feature:

- Acknowledge viewed alerts in Express List
- Assign alerts in Express List
- Close an alert in Express List
- Create an incident from an alert in Express List
- Monitor incoming alerts
- Place an alert in the Acknowledged state
- Place an alert in the Maintenance state

In SRM, integrations create alerts or you create alerts manually. Visit the following link to learn how to create an alert from the **Services** page:

Manually create an SRM alert

Create an alert for testing purposes or if you think an issue poses a risk.

Before you begin

Role required: srm_admin, srm_manager, or srm_responder

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. In the navigation pane, select **Services**.
3. Select the service that you want to trigger an alert for.
4. Select the **Related alerts** tab.
5. Select **Trigger alert** and fill out the **Trigger an alert** form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To trigger an alert, you must first create an event to get processed. Only **Service** is required.

Trigger an alert

Field	Description
Service	Select a service for the event.
Source	Manual.
Node	Enter the name of the node (for example, FQDN, IP address, or MAC address) associated with the event.
Type	Enter a type of event.
Resource	Enter a node resource (process or service) associated with the event.
Metric Name	Enter the name of the metric associated with the event.
Source instance	Enter a data source for the event.
Message key	Enter an identifier for multiple events related to the same event.
Severity	Select the expected impact of this event. Choices are: ○ Critical: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ Major: Major functionality is severely impaired or performance has degraded. ○ Minor (default): Partial, non-critical loss of functionality or performance degradation occurred. ○ Warning: Attention is required, even though the resource is still functional. ○ OK: The resource is still functional.
Time of the event	Select the date and time that the event occurred in the source system.
Description	Enter information describing the event.
Additional information	Add more information relevant to the event.
Processing notes	Enter relevant processing information.

6. Select **Trigger**.
   Service Reliability Management (SRM) creates an event to generate the alert. Refresh the screen to see the event processing results.

   Express List automatically displays your alert. If enabled, SRM triggers the applicable automations and on-call escalation workflows.

What to do next

Consider making the following optional adjustments to your alert for testing purposes or team collaboration:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Acknowledge the alert or assign it to someone on your team.
- Add comments or work notes in the **Compose** panel.
- Add an attachment related to the alert using the attachment icon .

Working with incidents in SRM

Plan ahead of service disruptions and have SRM send notifications and create status when incidents occur. Distractions are minimized and teams stay focused on remediation.

You can manually create incidents within SRM or create an error budget action to do so. See Manually create an SRM incident or Create SLOs, SLIs, and error budget policies for more information.

- Manual creation from an alert.
- Manual creation from the incident view.
- Automatically from Alert automations, if Alert automations are installed.

The **Assigned to** field on an incident specify who should be notified. When a team is selected as a responder, team automations are checked to determine which schedule to use for the notifications.

Note:

The **Assigned to** field is cleared when the **Assigned-team** or **Service** field is updated on an incident. Escalation policies for the newly assigned teams run. The field remains cleared until a user on the new team acknowledges an escalation notification.

If the Service is changed and the new Service does not have an assigned team, no changes occur.

When a service is deleted, its integrations, alerts, incidents, and automations are removed. Deleting a service isn't a recoverable action so consider deactivating the service instead.

Responders and above are notified for updates to incidents based on their notification preferences. If you made the update, you won't be notified.

You can resolve incidents by selecting specific incidents or in bulk. See Resolve an SRM incident, or Close an SRM incident or Cancel an SRM incident.

Note:

Incidents in the **Resolved** state are automatically closed after 3 days.

For more information on the areas and fields available in an incident, see SRM incidents.

Export list information to a file from the list view.

Respond to an incident in the following ways:

- Tag an incident.
- Update the priority of an SRM incident.
- Set the state of the incident.
- Copy an SRM incident.
- Add a service to an SRM incident.
- SRM incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Resolve an SRM incident.
- Cancel an SRM incident.
- Close an SRM incident.
- Reopen an SRM incident.

Manually create an SRM incident

Create an incident if you think an issue poses a serious risk and should be taken care of as soon as possible.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

About this task

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the Incidents tab.
4. Select **New**.
5. Fill in the fields on the Create New Incident form, as appropriate.

   Only the **Short Description** field is required.

Incident Field mapping

Field	Description
Short Description	Add brief description of the incident.
Description	Add detailed description of the incident.
Number	Identifier assigned to the incident.
Impact	Select is a measure of the effect of the incident. Impact affects **Priority**. Choices are: ○ 1 - High ○ 2 - Medium ○ 3 - Low
Assignment group	Select a team to work on the incident by typing or searching.
Priority	Automatically set based on **Impact** and **Urgency**. It identifies how quickly the incident should be addressed. See **Priority Data lookup rules** table below.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Values are: ○ 3 - Moderate ○ 4 - Low ○ 5 - Planning
Category	Select a category for the incident. Choices are: ○ --None-- ○ Inquiry/Help (default) ○ Software ○ Hardware ○ Network ○ Database
Urgency	Select a measure of how long the resolution can be delayed until an incident has a significant business impact. Urgency affects **Priority**.
Service	Select a service associated with the incident.
Severity	Select a severity to associate with the incident by typing or searching. Choices are: ○ 1 - High ○ 2 - Medium ○ 3 - Low
Configuration item	Select a asset to associate with the incident by typing or searching.
Assigned to	Assign team member to work on the incident by typing or searching.
State	Choose a state for the incident. Choices are: ○ New (default) ○ In Progress ○ On Hold ○ Resolved ○ Canceled See SRM incident states for more information.
Watchlist	Select individuals to watch the incident by typing or searching.
Resolution code	Select a resolution code when you have one. Choices are: ○ None (default) ○ Duplicate ○ Known error ○ No resolution provided ○ Resolved by caller ○ Resolved by change

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Resolved by problem ○ Resolved by request ○ Solution provided
Resolution notes	Enter any relevant resolution information.

Note: Priority is calculated according to the following sample data lookup rules:

Priority Data lookup rules

Impact	Urgency	Priority
1 - High	1 - High	1 - Critical
1 - High	2 - Medium	2 - High
1 - High	3 - Low	3 - Moderate
2 - Medium	1 - High	2 - High
2 - Medium	2 - Medium	3 - Moderate
2 - Medium	3 - Low	4 - Low
3 - Low	1 - High	3 - Moderate
3 - Low	2 - Medium	4 - Low
3 - Low	3 - Low	5 - Planning

6. Select **Save**.
   The incident is created and the new incident form displayed.
7. Add an attachment related to the incident in the **Actions** panel using the **Attachments** icon .
8. Create an incident template using the Template icon .
9. Start or join a Zoom meeting, Microsoft Teams, or Slack channel in the **Collaboration** panel..
10. Select **Save**.
    The incident appears with comments, work notes, and incident activity captured in the **Activity** stream. For more information on incident fields, see SRM incidents.

Reassign an SRM incident

Reassign an incident to a responder when the incident tasks should be addressed by a particular team member.

Before you begin

This action is available when the **Assigned to** field in the incident is populated.

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the **Incidents** tab.
4. You have two options.

Option	Description
Option	Description
In the incident list view	Double-click the **Assigned to** field for the inci dent and replace the team member from the list menu.
In the Details tab of incident form	Delete the name in the **Assigned to** field and reassign. Select **Save**.

The incident is now assigned to the new responder and an email notification sent. The assignee is displayed in the list view and on the form.

Update the priority of an SRM incident

If the priority of an incident should be changed, you can manually update it to reflect its new criticality.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
   You're taken to your SRM Home page.

Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the **Incidents** tab.
4. In the Incident list view, select a **Priority** value from the list menu.
   - 1 - Critical
   - 2 - High
   - 3 - Moderate
   - 4 - Low
   - 5 - Planning (default)
5. Select **OK**.
   The new priority is reflected in the incident list view and incident header and form field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add a service to an SRM incident

Add a service to an incident to increase the amount of data for the incident.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. You have two options.

Option	Description
In the incident list view	Double-click the **Service** field for the incident and replace the team member using search. Select **OK**.
In the incident form	Select a new **Service** value from the list menu. Select **Save**.

   For value choices see SRM incidents.
   The new service is displayed in the incident list view and incident form.

Add resolution code and notes to an SRM incident

Add a resolution code and notes to an incident when you have resolved the incident.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Open the incident.
4. In the Incident **Details** panel, select a **Resolution code** from the list menu.
5. Enter text in the **Resolution notes** text box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The resolution notes are displayed in the **Activity** timeline panel.

6. Select **Save**.

Copy an SRM incident

Copy an incident, if you have a similar issue.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Open the incident you want to copy.
4. Using the list menu under the More option button, select **Copy incident**.
5. Select a team member from the list menu for the **Caller** field.
   After the incident is copied, the **Activity** timeline of the new incident is updated with the original incident as a work note.

Resolve an SRM incident

Resolve an incident, if you need it reviewed, or you think it has already been handled, but aren't ready to close it.

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Select the **Incidents** tab.
4. You have two options.

Option	Steps
In the incident list view	**a.** Double-click the **State** field (or use the key board shortcut) for the incident and select from the list menu. **b.** Select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
	Tip: If you have the srm_admin role, you can update multiple incidents at once. First, select the relevant incidents and select **Edit**. Then use the **State** drop-down to choose the appropriate value and select **Update**.
In the incident form	**a.** Select a new **State** field value from the list menu. **b.** Select **Save**.

For value choices, see SRM incidents.
The new state is displayed in the incident list view, incident form, and form header.

Result
Resolved incidents remain in the Incidents list view. Check your filters if you don't see them.

Note:

When you resolve an incident, the related alerts remain open until you close the incident.

Cancel an SRM incident

Close an incident, if you think it is not an issue, or if it has already been handled.

Before you begin
Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Open the incident you want to cancel.
4. You have two options.

Option	Steps
In the incident list view	**a.** Double-click the **State** field (or use the key board shortcut) for the incident and select from the list menu. **b.** Select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
	Tip: If you have the srm_admin role, you can update multiple incidents at once. First, select the relevant incidents and select **Edit**. Then use the **State** drop-down to choose the appropriate value and select **Update**.
In the incident form	**a.** Select a new **State** field value from the list menu. **b.** Select **Save**.

For value choices, see SRM incidents.
The new state is displayed in the incident list view, incident form, and form header.

Result
Canceled incidents remain in the Incidents list view. Check your filters if you don't see them.

Note:

When you cancel an incident, the related alerts are closed.

Close an SRM incident

Close an incident when it's not an issue or has already been handled.

Before you begin
Role required: srm_responder, srm_manager, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. You have two options.

Option	Steps
In the incident list view	**a.** Double-click the **State** field (or use the key board shortcut) for the incident and select from the list menu. **b.** Select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
	Tip: If you have the srm_admin role, you can update multiple incidents at once. First, select the relevant incidents and select **Edit**. Then use the **State** drop-down to choose the appropriate value and select **Update**.
In the incident form	**a.** Select a new **State** field value from the list menu. **b.** Select **Save**.

For value choices, see SRM incidents.
The new state is displayed in the incident list view, incident form, and form header.

Result
Closed incidents remain in the incidents list view. If they don't appear, try adjusting your filters.

Note:

When you close an incident, any related alerts are closed.

Reopen an SRM incident

Reopen a closed incident if you think the issue is not yet resolved.

Before you begin
Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. From the primary navigation, select **Reliability tasks** ( ).
3. Find and open the incident you want to reopen.
   Check your filters if you don't see them.
4. You have two options.

Option	Steps
In the incident list view	**a.** Double-click the **State** field (or use the key board shortcut) for the incident and select from the list menu. **b.** Select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
	Tip: If you have the srm_admin role, you can update multiple incidents at once. First, select the relevant incidents and select **Edit**. Then use the **State** drop-down to choose the appropriate value and select **Update**.
In the incident form	**a.** Select a new **State** field value from the list menu. **b.** Select **Save**.

For value choices, see SRM incidents.
The new state is displayed in the incident list view, incident form, and form header.

Manually create an SRM change task

Create a change task to implement a controlled process for modifying approved and supported actions for SRM.

Before you begin

For general information on Change requests, see Using Change Management.

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
   You're taken to your SRM Home page.

   Note: If you use other Service Operations Workspace (SOW) applications, you may see the SOW Home page instead of the SRM Home page. The SOW Home page includes SRM alerts and incidents in its metrics.

2. Select **Reliability tasks** ( ).
3. Select the **Changes** tab.
4. Select **New** from the **Changes** list header.
5. In the **Select a change** window, search for a change record or select an SOW change creation page card to select the type of change request.
6. Select **Next**.
7. In the form Details tab, fill in the fields on the **Change request**, **Impact**, **Assignment**, **Planning**, **Schedule**, **Notes**, and **Closure information** forms.
   For more information, see Create change request forms.
8. **Optional:** Select **Assign to me**.
9. Select **Save**.

   The change request is created and a **Related Records** tab appears for the request.

10. **Optional:** You can take the following steps in **State** workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional) If the change request requires approval, you'll see the **Request approval** button. Select **Request approval** and **State** moves to **Assess**. See Approve a change request for SRM for instructions on approving a change request.

If the change request is pre-approved or doesn't require approval, you can move the **State** to **Scheduled**.

Once approved and scheduled, you can select **Implement** to put the change request into action.

Once implemented, you only after reviewing the details on the change request, select Review. The change request is moved to the **Review** state.

Note: All open change tasks are set to **Canceled**.

For more information on **State** in Change requests, see, SRM change request states

Service Reliability Management reference

Reference topics provide additional information about administering Service Reliability Management.

SRM roles and responsibilities

Roles grant users access to different parts of the SRM console. Roles determine the actions that users can or can't perform in Service Reliability Management.

SRM has the following predefined roles:

Note: The SRM experience was optimized for you to having just the SRM roles. Additional roles could change the UI and have unintended consequences.

Roles List

Role	Tasks
SRM Administrator [srm_admin]	• Update a service managed by any SRM team • Assign new incidents • Create and edit incidents • Create and edit changes • Create teams • Update any SRM team • Create and edit on-call shifts • Delete on-call shifts • Create and edit escalation policies and triggers • Delete escalation policies and triggers • Schedule coverage request • Submit time off • Create event

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles List (continued)

Role	Tasks
SRM Manager [srm_manager]	• Update a service managed by your SRM team • Assign new incidents • Create and edit incidents • Create and edit changes • Create teams • Update SRM teams that you manage • Create and edit on-call shifts • Delete on-call shifts • Create and edit escalation policy and trigger • Delete escalation policies and triggers • Schedule coverage request • Submit time off • Create event
SRM Responder [srm_responder]	• Update a service if you are in the support group tied to the service • Assign new incidents • Create and edit incidents • Create and edit changes • Create teams • View on-call shifts • View escalation policies and triggers • Edit contact preferences • Schedule coverage request • Submit time off • Create event
Administrator [admin]	• Update a service managed by your SRM team • Delete services • Assign new incidents • Create and edit incidents • Create and edit changes • Delete incidents • Create teams

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles List (continued)

Role	Tasks
	• Update SRM teams that you manage • Delete on-call shifts • Override contact preferences • Manually create an alert • Delete alerts • Submit time off

Create team form

Request to create a team to start monitoring your services.

Create a team form

For more information, see Add an SRM team.

Field	Description
Team name	Name the team.
Team manager	Manager for the team.
Team email	Email contact for the team.
Team members	Members for your team.
Tags	Words that describe or relate to your team.
Briefly describe the team responsibilities	Description of your team. For example, team responsibilities or geographic location.

Create a shift form in Service Reliability Management

Set up an on-call schedule for your team to ensure that the right person is always available to quickly respond to incidents and critical alerts.

Create a shift form

For more information, see Create an SRM on-call schedule.

Create new shift

Field	Description
Shift name	Name for the shift.
All day shift	If selected, the shift is an all-day commitment.
Shift starts	Date and time the shift begins.
Shift ends	Date and time the shift ends.
Repeats	Shift repetition. Choices are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create new shift (continued)

Field	Description
	• Never • Daily • Weekly
Every	How often to repeat. Display depends on the time frame chosen.
More options	More options to customize your schedule.
Timezone	User time zone.
Holiday schedule	Schedule to use for the holiday.
Repeats until	Date and time to end repetition.

Create shift using shift template

Field	Description
Shift name	Name for the shift.
Template/Schedule	Existing templates for shifts. Choices are: • 24 x 7 • Off hours (workday 8:00 - 5:00) • Off hours (workday 9:00 - 5:00) • Workday 8:00 - 5:00 • Workday 9:00 - 5:00

Add service form

Create or add an existing service to your instance so that alerts and incidents on that service are available to your teams within SRM.

Add a service form

For more information, see Add a service to SRM.

Add services for your teams

Field	Description
Service name	Enter a name for your service. For example, Cloud storage service. Your teams see this name in SRM.
Service class	Select either service instance or technology management service .
Business criticality	Specify how important the service is to the business:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add services for your teams (continued)

Field	Description
	• 1 - most critical • 2 - somewhat critical • 3 - less critical • 4 - not critical
Operational status	Select the status of your service: • Operational • Non-operational • Repair in Progress • DR Standby • Ready • Retired • Pipeline • Catalog
Short description	Describe your service to help your teams understand its purpose and other relevant information.

Edit service details form

Edit an existing service owned by your team.

Service Details form

For more information, see Edit service details in SRM.

Field	Description
Name	Name of the service.
Support group	SRM team managing the service.
Business criticality	How important this service is the business.
Owned by	Service owner. May not be part of an SRM team.
Operational Status	Status for the service's ability to perform operational functions.
Stakeholders	Product owners or service consumers who determine the target availability of a service.
Environment	Choices are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• None • Development • Production • Test
Managed by group	Team manager responsible for the service. Add by search or edit using the text editor.
Change group	Team responsible for changes. Add by search or edit using the text editor.
Status	Status of the service.
Life Cycle Stage	Choices are: • Deploy • Design • End of Life • Ideation • Operational
Phase	Phase of the service. Choices are: • None • Pipeline • Catalog • Retired
Location	Address where the service resides. Add by search or edit using the text editor.
Used for	Purpose for the service. Choices are: • Production (default) • Staging • QA • Test • Development • Demonstration • Training • Disaster recovery
Short description	Additional information about the service.
Support by	SRM team managing the service. Add by search or edit using the text editor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up escalation policies form in SRM

Escalation policies define the order and conditions in which members or devices receive notifications.

Escalation policy form

Field	Description
Name	Name of the escalation policy.
Active on shift	Team that receives the notifications on their shift..
Create from scratch	Option to create your own policy.
Create from template	Option to create a policy by using a template created by your admin.
Description	Text describing the policy.
Active	Option to activate or deactivate the policy.
Use as default	Option to use this team as the default
Order	Order of execution. This is the hierarchy or chain of command. When there are multiple escalation policies with the same conditions for a team, the escalation policy with the smaller order number is executed first.
Conditions	Conditions for the policy. The table and conditions that define the escalation policy These conditions are checked after the escalation is started by an escalation trigger. If the conditions are met, the policy is run.
Escalation steps	Escalation steps to add. See the Escalation steps form for more information about the fields.
Escalation notifications	Notification conditions for the policy. **Note:** When user preference override is on, your escalation policy overrides any policy that the on-call agents set for their own notification preferences. When user preference override is off, the on-call agents' notification preferences take priority over this escalation policy.
Add notification step	Additional notification steps to add. You can select email, call, or SMS. You can add as many attempts as you like.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Escalation steps form

Add escalation step

Field	Description
Escalation step name	Name of the escalation step.
Order	Order of execution. This is the hierarchy or chain of command.
Responder level	Level of authority or expertise needed to respond to the incident.
Rotate through members	Option to notify all members, one by one, until one of them acknowledges the incident or until all of them are notified.
Additional audience	Specific users, teams, groups, or devices that you want to notify.
Time to next step after last notification	The maximum amount of time that will pass before the issue is escalated to the next step. For example, if a responder can't resolve the issue within 30 minutes of the notification, the issue is escalated to the manager.

Domain separation and SRM

Domain separation is supported for Service Reliability Management (SRM).

Support level: Basic*

The support level is Basic but has some exceptions or special conditions.

- Business logic: Ensure that data goes into the proper domain for the application's service provider (SP) use cases.
- The user interface, cache keys, reporting, rollups, and aggregations all use the domain at production run time.
- The owner of the instance must be able to set up the application to function across multiple tenants.

For more information on support levels, see Application support for domain separation.

Overview of domain separation

- Domain separation is present in all metadata tables in the application. Instance level tables also have domain separation explicitly. Other internal tables, such as the internal Team Request table, are domain-separated implicitly by referencing domain-separated records.
- System properties are not domain-separated, which has implications for Team Management features. The properties are shared by multiple domains and are set at the instance level. Domain-specific setup for these is not supported.
- Where another application is being leveraged (for example the Event Management Connectors) domain separation is determined by the domain-separation capabilities of that application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How domain separation works in the Service Reliability Management application

The specific conditions indicated by the Basic* support level rating above relate to team management:

- New teams created through a catalog item backed by an Integration Hub flow are setup by the Service Operations Workspace administrator. They can initiate it from the Service Portal. An SRM admin, manager or responder can do it through the SRM workspace. Instructions appear in the SRM documentation.
- Integration Hub subflows and actions control management of SRM teams.
- Only one catalog item and flow can be set up for each instance. The customer is responsible for setting up team properties to support domain separation as a customization of the existing flows.
- The requestor of a team catalog item is associated with the domain and is available as part of the request item. As a result, if needed, the requester can create the team in a specific domain or the catalog Item and extend it to capture the domain another way. In either case, the Service Operations Workspace must make changes to the Integration Hub flows and actions to support this.

For more information, see Domain separation and On-Call Scheduling.

Domain separation for service providers

Create change request forms

Fill out the fields in the forms to create a change task to implement a controlled process for modifying approved and supported actions for SRM.

Change request form

Create a new change request. For more information, see Manually create an SRM change task.

Field	Description
Short description	Brief description of the change request.
Description	Description based on Short description.
Number	Identifier for the change request.
Category	Category for the change request. Choices are: • Hardware • Software • Service • System Software • Application Software • Network • Telecom

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• Documentation • Other (default)
Model	Model to use for the change request. Standard (default)
Risk	Risk the issue poses. Choice are: • High • Moderate (default) • Low
Type	Type of change request. Standard (default). Read-only.
Impact	Impact the issue poses. Choices are: • 1 - High • 2 - Medium • 3 - Low (default)
State	State of the change request. Choices are: • New (default) • Assess If approval is required further states are unavailable. • Scheduled • Implement • Canceled
Work notes list	Team members to receive notifications when work notes are added. **Note:** An administrator must have already created an email notification for the work notes list for this to be available.
Work notes	Any additional information related to the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact, Assignment, Planning, Schedule, Notes, and Closure information

Field	Description
Configuration item	Asset affected by the issue.
Service	Service affected by the issue.
Service offering	Service offering affected by the issue.
Assignment group	Team assigned to the change request
Assigned to	User assigned to the change request.
Justification	Reasoning for the change request.
Implementation plan	Imported text.
Risk and impact analysis	Analysis of risk and impact of the issue.
Backout plan	Imported text.
Test plan	Imported text.
Planned start date	Expected date to begin change.
Planned end date	Expected date to finish change.
Actual start date	Date change implementation began.
Actual end date	Date change implementation ended.
Conflict status	Not run. Read-only.
Conflict last run	Based on Conflict status. Read-only
Watch list	Interested users.
Work notes list	Team members to receive notifications when work notes are added. **Note:** An administrator must have already created an email notification for the work notes list for this to be available.
Additional comments	Additional notes for the request.
Work notes	Additional notes on the work done for the request
Close code	Code for the change request. Choices are: • None (default) • Successful • Successful with issues • Unsuccessful
Close notes	Notes on the change request closure.

SRM incident states

Incidents can be in a few different states depending on how they are acted on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An incident is created in SRM when a third-party monitoring tool has an event. Incidents can be manually created or assigned. Edit actions from the incident form using the state button in the form. Use the **Save** button in the form to keep any changes you've made. Changes to incidents in the list view are automatically saved.

Incident states

State	Description
New	State on incident creation. The incident is logged but not yet worked on.
In Progress	The incident is assigned being worked on.
On Hold	The responsibility for the incident shifts temporarily to another entity to provide further information, evidence, or a resolution.
Resolved	A satisfactory fix is provided for the incident to ensure that it does not occur again.
Closed	The incident is closed when it is confirmed that the incident is satisfactorily resolved.
Canceled	Incident was triaged but found to be a duplicate incident, an unnecessary incident, or not an incident at all. To reopen an incident. Select **New**.

SRM alert states

Alert can be in a few different states depending on how they are acted on.

An alert is created in SRM when a third-party monitoring tool has an event. Alerts are manually assigned. An alert is one of four states. You can edit actions from either the Alerts list or the Alert form. Use the **Save** button in the form to keep any changes you've made. Changes to Alerts in the list view are automatically saved.

Note: You can acknowledge and assign an alert in any state.

Alert actions

State	Description
Open	State on alert creation. From this state you can acknowledge and set to: **Flapping** Flapping occurs when the event source continues to generate events even after its associated alert has been closed. See Configure alert flapping for more information on event flapping. **Closed** Closes the alert.
Reopen	From this state you can acknowledge and set to: **Open** Sets the alert to the **Open** state. **Flapping**

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert actions (continued)

State	Description
	Flapping occurs when the event source continues to generate events even after its associated alert has been closed. **Closed** Closes the alert.
Flapping	Flapping occurs when the event source continues to generate events even after its associated alert has been closed. From this state you can set to: **Open** Sets the alert to the **Open** state. **Reopen** Reopens the alert. **Closed** Closes the alert.
Closed	From this state you can set to: **Open** Sets the alert to the **Open** state. **Reopen** Reopens the alert. **Flapping** Flapping occurs when the event source continues to generate events even after its associated alert has been closed.

SRM change request states

Incidents can be in a few different states depending on how they are acted on.

Change requests can be manually created in SRM. Edit actions from the change request form using the state field in the form or using buttons in the change request record. Use the **Save** button in the form to keep any changes you've made. Changes to change requests in the list view are automatically saved.

Change request states

State	Description
New	State on change request creation. The request is logged but not yet worked on.
Assess	The change request approval is being worked on.
Scheduled	The change request is scheduled for work.
Implement	The change request is taking action.
Review	The change request is moved to the **Review** state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change request states (continued)

State	Description
	Note: All open change tasks are set to **Canceled**.
Closed	The change request is closed.
Canceled	Change request was triaged but found to be a duplicate, or unnecessary. **Note:** You cannot reopen a canceled changed request.

CMDB service classes

Service Reliability Management (SRM) typically supports several Configuration Management Database (CMDB) service classes.

Types of CMDB service classes that SRM supports:

- Service instances (cmdb_ci_service_auto)
- Technology management services (cmdb_ci_service_technical)
- Query-based services (cmdb_ci_query_based_service)
- Mapped application services (cmdb_ci_service_discovered)
- Calculated application services (cmdb_ci_calculated)
- Tag-based application services (cmdb_ci_service_by_tags)

Troubleshoot SRM

Find answers to issues that you may encounter when using Service Reliability Management (SRM).

Condition

When trying to remove a service from SRM, you see one of the following messages:

- `<service-name> couldn't be removed from SRM. Check your permissions. Only SRM team managers can remove their team's services.`
- `<x> services couldn't be removed from SRM. Check your permissions. Only SRM team managers can remove their team's services.`

Cause

You're not assigned the required role to remove the selected services. As an SRM manager, you can only remove services that belong to your teams. You can still view and filter services across teams, but you can't remove services owned by another team.

Remedy

To remove the service from SRM, follow these steps to identify the manager to contact:

1. Navigate to **Workspaces** > *Service Operations Workspace* > **Services**.
2. Select the filter icon ( ) and remove the existing filters, letting you view services not assigned to your teams.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

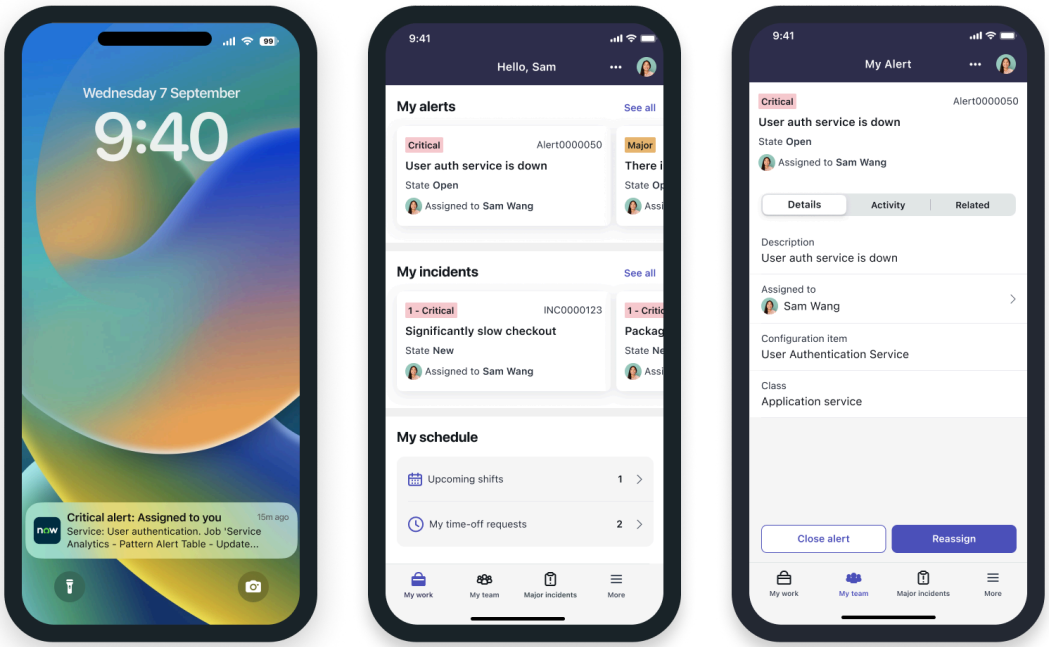
3. Find and select the service you want to remove.

4. Select the **Details** tab and then select the information icon (ⓘ) in the Support group field.

The manager's name appears below the team name. Contact the manager to request the removal of the service from SRM.

ITOM Mobile Agent

Stay connected and keep services reliable with ITOM Mobile Agent, which lets you access Service Reliability Management (SRM) features on iOS and Android devices. Use it to track alerts, manage incidents, work on change and catalog tasks, and manage on-call shifts on the go.



Get started

Explore	Configure
Learn about ITOM Mobile Agent, including its benefits and common workflows.	Install ITOM Mobile Agent and configure notifications.

Exploring ITOM Mobile Agent

Learn how you can use ITOM Mobile Agent to manage service reliability on the go, including its capabilities, benefits, and a sample workflow.

ITOM Mobile Agent overview

Use ITOM Mobile Agent to access Service Reliability Management (SRM) features on iOS and Android devices. With ITOM Mobile Agent, you can track alerts, manage incidents, and work on change and catalog tasks on the go. You can also manage on-call schedules by checking shifts, requesting time off, and filling scheduling gaps.

To help you manage service reliability in one place, ITOM Mobile Agent auto-integrates with existing ServiceNow mobile apps. It runs in the ServiceNow Agent app and automatically includes ITSM Mobile Agent features. With that setup, you can manage alerts, incidents, on-call schedules, and tasks in one mobile app.

Note: If you already use ITSM Mobile Agent for incidents, on-call schedules, and tasks, install ITOM Mobile Agent to add alerts to your mobile experience. With ITOM Mobile Agent, you get and configure alert notifications and view alerts in the My work, My team, and Notifications tabs. See Install ITOM Mobile Agent for installation instructions.

ITOM Mobile Agent users

The following table lists user roles and what each user can do in ITOM Mobile Agent:

User	Description
Admin	Admins install ITOM Mobile Agent so teams can access service reliability features on the go.
SRM admin	SRM admins customize alert and incident notifications for ITOM Mobile Agent. They make sure that the relevant people are aware of critical issues.
SRM manager	SRM managers track team progress, monitor unassigned issues, and review performance metrics. They also handle on-call schedules, including shift rescheduling, time-off requests, and scheduling gaps.
SRM responder	SRM responders manage alerts, incidents, and tasks on the go. They accept, assign, and close alerts; create and collaborate on incidents; and process critical issues. They can also view upcoming shifts and request time off.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ITOM Mobile Agent workflow

This sample workflow shows how ITOM Mobile Agent helps you manage services and the teams assigned to them:

1. Monitoring tools generate critical alerts when they detect issues, and the ITOM Mobile Agent system sends mobile alert notifications to on-call responders.
2. As an on-call SRM responder, you acknowledge, reassign, or close the alerts. If needed, you create incidents from the alerts, and then the ITOM Mobile Agent system assigns them to the appropriate team.
3. You troubleshoot and collaborate on incidents, escalating them to major incidents when necessary, and then resolve and close the incidents, providing relevant details as needed.
4. As an SRM manager, you adjust shifts, approve time-off requests, and resolve scheduling gaps for the on-call responders. Use dashboards to view alert trends, incident resolution times, and team performance.

ITOM Mobile Agent benefits

Working with ITOM Mobile Agent has the following benefits:

Improve service reliability

Minimize downtime by managing alerts and incidents on the go.

Respond to issues faster

Keep on-call engineers connected, letting them accept, assign, and close alerts from anywhere.

Notify the right people

Customize push notifications to make sure that the relevant people are aware of critical issues.

Boost collaboration

Help teams work efficiently by managing on-call schedules and filling coverage gaps on mobile.

What to explore next

To learn more about configuring and using ITOM Mobile Agent, see:

- Configuring ITOM Mobile Agent
- Using ITOM Mobile Agent
- ITOM Mobile Agent reference

Configuring ITOM Mobile Agent

Set up and configure ITOM Mobile Agent.

Configuration overview

Use the pages in this section to set up and configure ITOM Mobile Agent. The information covers required and optional setup steps, including installing the app, managing alerts, and customizing alert recipients.

ITOM Mobile Agent auto-integrates with ITSM Mobile Agent, so you can manage alerts, incidents, and on-call schedules from the same mobile app. Where relevant, this section

links to ITSM Mobile Agent content, providing additional configuration options for your mobile experience.

Required configuration steps

If you're an admin, start by installing ITOM Mobile Agent. If you're a Service Reliability Management admin, manager, or responder, you can start by downloading the ServiceNow Agent app and then logging in.

- Install ITOM Mobile Agent
- Download the ServiceNow Agent app
- Log in to ITOM Mobile Agent

Optional configuration steps

After you log in to ITOM Mobile Agent, you can work with the core features. Visit the following links to configure and customize ITOM Mobile Agent further to meet your team's needs:

- Configure when to send alert notifications for ITOM Mobile
- Customize ITOM Mobile Agent email recipients
- Customizing other mobile settings for ITOM Mobile Agent

Install ITOM Mobile Agent

Install and give your teams access to ITOM Mobile Agent.

Before you begin

Service Reliability Management (SRM) services, service integrations, teams, and on-call schedules must be set up. ITOM Mobile Agent connects to your existing SRM setup, helping your teams manage alerts, incidents, tasks, and on-call schedules.

Role required: admin

About this task

ITOM Mobile Agent runs in the ServiceNow Agent app. When you install ITOM Mobile Agent, your teams can access it in the ServiceNow Agent app on their devices.

This procedure is for admins managing mobile access for their teams. If you aren't an admin and want to use ITOM Mobile Agent on your mobile device, see Download the ServiceNow Agent app.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Search for and select ITOM Mobile Agent.
   If you can't find ITOM Mobile Agent, request it from the ServiceNow Store.
3. Review the listed dependencies and, if needed, install the required plugins and applications.
4. Select **Install**.

   After the application is installed, your teams can access ITOM Mobile Agent by downloading the ServiceNow Agent app and logging in to the relevant instance.

What to do next

To start using ITOM Mobile Agent, see Download the ServiceNow Agent app and Log in to ITOM Mobile Agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also customize ITOM Mobile Agent to meet your team's needs:

- Configure when to send alert notifications for ITOM Mobile
- Customize ITOM Mobile Agent email recipients
- Customizing other mobile settings for ITOM Mobile Agent

Download the ServiceNow Agent app

Download the ServiceNow Agent app to use ITOM Mobile Agent on your device.

Before you begin

ITOM Mobile Agent must be installed. See Install ITOM Mobile Agent for more information.

Role required: srm_manager, srm_responder, or srm_admin

About this task

The ITOM Mobile Agent application runs in the ServiceNow Agent app. To access ITOM Mobile Agent, download the ServiceNow Agent app on your device.

Procedure

1. Download the ServiceNow Agent app for your device:
   - For iOS, use the App Store.
   - For Android, use Google Play.
2. Confirm that the app is on your device.

   Look for the ServiceNow Agent app icon ( ). The app appears on your device with the name Agent.

What to do next

To start using ITOM Mobile Agent, see Log in to ITOM Mobile Agent. You must log in to receive push notifications about alerts and incidents.

Log in to ITOM Mobile Agent

Log in to your ITOM Mobile Agent instance on the ServiceNow Agent app to manage alerts, incidents, and on-call schedules on the go.

Before you begin

ITOM Mobile Agent must be installed, and the ServiceNow Agent app must be downloaded on your device. See Install ITOM Mobile Agent and Download the ServiceNow Agent app for more information.

You must also have your instance address, for example `nebula-dev.service-now.com`, or a QR code for the instance. If you don't have one, contact your admin.

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Tap the ServiceNow Agent icon ( ) on your device.
2. Enter the address of your instance manually or with a QR code.

Option	Description
Manual entry	Replace `example.service-now.com` with the address of your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	You don't need to include `service-now.com`. For example, enter `nebula-dev` for `nebula-dev.service-now.com`.
QR code	Tap the QR code icon and scan the QR code.

3. **Optional:** In the **Nickname** field, enter an alternative name for your instance.
   Alternative names can help you quickly navigate between different instances on your device.
4. Tap **Save and log in**, enter your credentials, and then tap **Log in**.
   The app displays `Logged into <instance-name> as <username>` and the ITOM Mobile Agent **My work** tab.

> **Note:** You must be logged in to get push notifications about alerts and incidents. If you aren't, you only get email notifications.

What to do next
Visit these links to start using ITOM Mobile Agent:

- Work with alerts in ITOM mobile
- Managing incidents and major incidents on mobile
- Working with On-Call Scheduling on mobile
- Working with tasks on mobile

Configure when to send alert notifications for ITOM Mobile

Keep your teams informed by configuring when ITOM Mobile Agent sends a notification about an alert.

Before you begin
Role required: admin

About this task
By default, ITOM Mobile Agent sends a push notification and email when an alert meets these conditions:

- **Assigned to is empty** - The alert isn't assigned to anyone.
- **State is not Closed** - The alert state isn't closed. It's either empty, flapping, open, or reopen.
- **Severity is Critical** - The alert severity is critical. It isn't clear, empty, OK, major, minor, or warning.

You can update those conditions as needed. For example, the ITOM Mobile Agent app can send notifications for both critical and major alerts. However, if you customize the conditions, the conditions don't receive future release updates. That behavior is intentional to avoid overwriting your work.

> **Note:** To get push notifications, you must log in to ITOM Mobile Agent. If you log out, you only get email notifications.

This procedure is for admins configuring alert push notifications and emails. To manage other notification features, see Customizing other mobile settings for ITOM Mobile Agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *Mobile App Builder*.
2. Search for and select **ITOM Mobile Agent**.
3. Select **Mobile notifications**.
4. In the **When to send** section, update or add to the assigned to, state, and severity conditions. For example, adding the condition **OR [Severity][is][Major]** under the condition **[Severity][is][Critical]** sends a push notification and email when the **Severity** field of an alert is Critical or Major.
5. Implement your changes by selecting **Save**.
   The page displays `Your changes have been saved.`

What to do next

To customize who receives emails about alerts, see Customize ITOM Mobile Agent email recipients. You can also customize other notification features, such as setting custom notification tones and overriding the Do Not Disturb setting for critical issues. See Customizing other mobile settings for ITOM Mobile Agent for more information.

Customize ITOM Mobile Agent email recipients

Customize who receives emails about alerts to help reduce notification overload and efficiently delegate responsibilities.

Before you begin

Role required: srm_admin or admin

About this task

By default, ITOM Mobile Agent sends emails about alerts to everyone in a team's group email. You can customize the email recipients as follows:

- Exclude managers from alert emails, reducing notification overload.
- Include individual team members on alert emails, making sure that the right people stay informed.

Procedure

1. Navigate to **All** > **Service Reliability Management** > **Teams**.
2. In the list, find the team that you want to customize.
3. Choose one or more options to include or exclude certain recipients from email alerts.

Option	Instruction
Exclude managers from alert emails	In the **Exclude manager** column, set **false** to **true**.
Include individual team members on alert emails	In the **Include members** column, set **false** to **true**.

4. Save your changes by selecting the check mark.
   Your updates appear in the **Teams** list, and ITOM Mobile Agent sends emails accordingly.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customizing other mobile settings for ITOM Mobile Agent

Learn how to customize your mobile experience further. Configure actionable notifications, set custom notification tones, and override the Do Not Disturb setting for critical issues to help your teams stay informed.

Explore other settings

ITOM Mobile Agent auto-integrates with ITSM Mobile Agent, letting you manage alerts, incidents, and on-call schedules from the same mobile app. Visit the following ITSM Mobile Agent documentation to learn about customizing mobile notifications.

- Configurable actionable notifications for ITSM Mobile Agent
- Enable Push notification categories for ITSM Mobile Agent
- ITSM Mobile email notification redirection via web
- Set custom alert tones in ITSM Mobile Agent for different incident priority
- Enable Override do not disturb to receive critical alerts

Using ITOM Mobile Agent

Work with alerts, incidents, on-call schedules, and tasks on the go.

ITOM Mobile Agent tasks

Work with alerts in ITOM mobile

Manage alerts on the go. Learn how to assign, reassign, and close alerts in ITOM Mobile Agent. You can also add work notes to alerts and create incidents from alerts.

Add work notes to an alert

Add work notes to an alert to update your team, share important information, and document your actions.

Role required: srm_manager, srm_responder, or srm_admin

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the More options icon ( ).
4. Select **Add work notes** and enter your notes.
5. Save and add your notes to the alert by tapping **Submit**.

ITOM Mobile Agent displays `Success! Comments added`. The assigned team member also receives a push notification that the alert has had comments added.

To view an alert's work notes on mobile, navigate to the alert and select the **Activity** tab.

Assign an alert

Assign an alert to make sure the correct team member acts on it. You can assign an alert to yourself.

Role required: srm_manager, srm_responder, or srm_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the More options icon ( ) and select **Assign alert**.
4. Tap **Assigned to** and select a team member to assign the alert to.
5. Implement your changes by tapping **Submit**.

The assigned team member receives a push notification that the alert has been assigned to them. The alert also appears in their **My work** tab.

Close an alert

Close an alert to show that the issue is resolved or that no further action is needed.

Role required: srm_manager, srm_responder, or srm_admin

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the **More options** icon ( ) and select **Close alert**.

ITOM Mobile Agent displays Alert closed successfully. The alert no longer appears in the assigned team member's **My work** tab.

To view closed alerts that were assigned to you, tap **My work** and then tap **See all** in the My Alerts section. The **Closed** tab shows your closed alerts.

Create an incident from an alert

Create an incident when an alert signifies a critical issue that disrupts or could disrupt your system.

When you create an incident from an alert, ITOM Mobile Agent assigns the incident to the same team but not the same responder. For example, if the alert is assigned to the Network Ops team and responder Alex, the incident is assigned to the Network Ops team.

Role required: srm_manager, srm_responder, or srm_admin

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the **More options** icon ( ) and select **Create incident**.

ITOM Mobile Agent displays a notification similar to `INC0013579 was created from Alert0002468`. You can view the incident in the **My team** tab. For more information about managing incidents in ITOM Mobile Agent, see Managing incidents and major incidents on mobile.

Note: If you don't see the option to create an incident from an alert, make sure that the alert is assigned to a team. To assign the alert to a team, see Assign alerts in Express List. In the Express List, teams are also known as assignment groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reassign an alert

Reassign an alert to make sure the correct team member or an available team member acts on it. You can reassign an alert to yourself.

Role required: srm_manager, srm_responder, or srm_admin

1. On your device, tap the ServiceNow Agent icon ( ).
2. Tap the **Notifications** tab and select the relevant alert.
3. Tap the **More options** icon ( ) and select **Reassign alert**.
4. Tap **Assigned to** and select a team member to reassign the alert to.
5. Implement your changes by tapping **Submit**.

ITOM Mobile Agent displays Alert reassigned successfully. The assigned team member receives a push notification and the alert appears in their **My work** tab.

Managing incidents and major incidents on mobile

Manage and resolve incidents on the go using ITOM Mobile Agent. Learn how to create, process, and collaborate on incidents on your mobile device. You can also track and collaborate on major incidents.

ITOM Mobile Agent auto-integrates with ITSM Mobile Agent, letting you manage alerts, incidents, and on-call schedules from the same mobile app. Refer to the following ITSM Mobile Agent documentation to learn about managing incidents on your mobile device.

Manage an incident

- Collaboration with incidents
- Collaboration with incident tasks
- Create an incident from app landing page
- Generating task summarization for incident records
- My team dashboard
- Performance metrics
- Process a breached incident
- Process an incident at risk
- Unassigned incidents

Manage a major incident

- Active major incidents
- Collaboration with major incidents
- Major incident dashboard
- Review and work on a major incident candidate

Working with On-Call Scheduling on mobile

Manage on-call schedules on the go using ITOM Mobile Agent. As a manager, learn how to manage shifts, time-off requests, and scheduling gaps. As a responder, learn how to request time off, view who is on call, and see upcoming shifts.

ITOM Mobile Agent auto-integrates with ITSM Mobile Agent, letting you manage alerts, incidents, and on-call schedules from the same mobile app. Visit the following ITSM Mobile Agent documentation to learn more about your mobile app settings.

Settings

Service Level Objective Management

Service Level Objective Management (SLO Management) helps your organization define, track, and meet agreed-upon service quality standards. It works alongside Service Level Agreements (SLAs) to help make sure that services meet customer expectations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview of how SLO Management works

- SLAs set the expectations

  SLAs are formal agreements that outline the level of service a customer can expect. SLAs can include response times, resolution times, and uptime targets.

- SLOs defines how to meet expectations

  SLOs are specific, measurable objectives that an organization sets to achieve the SLAs. They translate the broad goals of the SLA into actionable metrics.

- ServiceNow SLO Management helps manage SLOs. It offers functionalities to:
  - Define SLOs based on various metrics.
  - Monitor SLO performance in real-time.
  - Generate alerts when SLOs are at risk of being breached.
  - Track historical data to identify trends and improve processes.

Exploring SLO Management

Service Level Objective Management (SLO Management) helps IT services meet customer expectations.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLO Management overview

SLO Management is a framework for setting clear expectations and measuring the performance of IT services. It helps organizations deliver consistent services and identify areas for improvement. SLOs define the target service level for a specific service, such as incident resolution or service request fulfillment. Effective SLO management involves setting realistic objectives, monitoring performance, and continuously improving services to meet customer needs.

SLO Management users

Users

Users	Description	Contains Roles
admin	A ServiceNow administrator is responsible for the administration, development, operation, education, and maintenance of the ServiceNow platform. Responsible for installation and can perform Service Operations Workspace Admin Center configuration of SRM.	All
Administrator [srm_admin] **Note:** Not the ServiceNow *admin* role	SRM administrators can manage account settings, configurations, and users. Administrators can perform the following actions: • Access, create, edit, or delete all SRM configurations. • Add or manage integrations. • Create Integrations with Application Performance Monitoring (APM) tools • Set up and maintain Reliability Indicators. • Set up and maintain Error Budget Policies.	• Manager • Responder
Manager [srm_manager]	Managers oversee a team of service reliability engineers (SREs). Managers assign SREs to the team on-call schedule, monitor their performance, create procedures to deal with incidents, and develop solutions. Managers help ensure resilience across all the systems and the DevOps workflows.	Responder

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users (continued)

Users	Description	Contains Roles
	Managers can perform the following actions within the context of their teams: • Define and set up and teams, on-call schedules, and services. • Add and delete users such as responders, and managers for the teams the are a part of. • Add or manage integrations. • Create Integrations with Application Performance Monitoring (APM) tools • Set up and maintain Reliability Indicators. • Set up and maintain Error Budget Policies.	
Responder [srm_responder]	An SRE that uses SRM to perform everyday tasks. Responders are the individuals who are on call and diagnose and remediate incidents. Responders can only access configurations that they're a part of. They can only access the alerts or incidents for which they have permissions. SREs can perform the following actions, within the context of their teams: • Set up services, teams, and integrations • Confirm their on-call schedules • Manage incident and alert records • Update teams that they've created • Add other responders • Create Integrations with Application Performance Monitoring (APM) tools • Set up and maintain reliability metrics • Set up and maintain error budget actions	Inherits 17 roles including the following: • cmdb_read • sn_sow.sow_user • sn_sow_srm.srm_responder • workspace_user • slo_operator

Note: If you're using the SLO plugin without SRM, make sure that the required alert and cmdb_ci read access is granted to team members.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLO Management workflow

1. Define SLOs - Identify critical services and define SLOs based on customer expectations and business requirements.

   Note: SLOs can also be generated automatically using the Now Assist SLO creator agent. For details, see Generating service level objectives.

2. Establish SLIs - Develop Service Level Indicators (SLIs) to measure SLO performance.
3. Monitor and analyze - Track SLI data and analyze performance against SLO targets.
4. Identify gaps and improve - Determine areas where SLOs aren't being met and implement changes to improve service performance.
5. Review and refine - Regularly review SLO performance and refine SLOs as needed.

SLO Management benefits

- Improved service quality - SLOs help IT services meet customer expectations, leading to increased satisfaction and loyalty.
- Increased transparency - Clear SLOs provide a shared understanding of service expectations between IT and customers.
- Better resource allocation - SLOs help prioritize resources and focus on areas that need improvement.
- Enhanced collaboration - SLO management encourages collaboration between IT teams and customers to achieve common goals.
- Data-driven decision making - SLO performance data informs decisions and drives continuous service improvement.
- Automated SLO generation - The SLO creator agent analyzes operational data to generate SLOs, helping teams get started with SLO-based monitoring. For details, see Generating service level objectives.

Working with reliability metrics

Learn about the reliability metrics and features that can help you track service health, respond to issues, and support business goals.

Service reliability dashboard

The Service reliability dashboard displays a customizable, high-level view of service performance. It helps you monitor and manage reliability using visualizations that track service states, error budgets, and service level objectives (SLOs) over time.

The dashboard displays information about all services in Service Reliability Management (SRM). You can access the dashboard in Service Operations Workspace in the following ways:

- Navigate to **Services (** **)** > **Service reliability**.
- Navigate to **Home (** **)** > **Service reliability**

For more details, see Visualizations in the Service reliability dashboard.

Note: You can also view SLO information for all services on the Services Overview tab. See Working with SRM services for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notification destinations

Notification destinations help keep teams informed about service reliability. Attach them to error budget policies to send notifications when a policy is breached.

To view and manage notification destinations in Service Operations Workspace, navigate to **Teams** > **[Your team]** > **SLO Notification destinations**.

Visit the following links to learn more about creating and working with notification destinations:

- Create a notification destination in SRM
- Create SLOs, SLIs, and error budget policies
- Notifications for breached error budgets

Reliability metrics tab

The Reliability metrics tab shows how well a specific service is meeting its reliability goals. Use it to track SLOs, service level indicators (SLIs), and error budgets for a service.

To view the Reliability metrics tab in Service Operations Workspace, navigate to **Services (** **)** > **[Your service]** > **Reliability Metrics**.

See these links to learn more about what you can do in the Reliability metrics tab:

- Create SLOs, SLIs, and error budget policies
- Edit a reliability metric
- View SRM reliability metrics

Service level objectives table

On the Reliability metrics tab, the Service level objectives table includes the following details about the service SLOs:

- **Name** - Name of the SLO. You can select the name to view the SLO record.
- **Reliability** - Current state of the SLO. For example, stable, at risk, or critical.
- **% Error budget remaining** - Percentage of the error budget still available in the current compliance period.
- **Compliance period** - Time window used to calculate performance:
  - Month - Current month, for example, if the current date is January 26, the month is January 1 through January 31.
  - Rolling 7, 30, or 90 days - Number of days from the current date. For example, for rolling 7 days, the duration is 7 days back from the current date.
- **SLI type** - Performance category being measured:
  - Availability - Percentage of time your service or configuration item is available, also known as uptime.
  - Errors - Frequency of your service errors.
  - Latency - Time that it takes to service a request.
  - Saturation - Fullness of your system, focusing on resource usage.
- **Source type** - Origin of the data used to calculate the SLIs for this SLO:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

  - Alert - Uses alerts from integrated monitoring tools.
  - Outage - Uses outages detected by monitoring tools and reported by users. An outage indicates when the service was unavailable. This source type excludes planned outages, such as scheduled maintenance.
- **Updated** - The date and time the SLO was last edited.
- **Updated by** - The user name of the person who last edited the SLO.
- **State** - Status of the SLO. For example, running or retired.

Note: For performance purposes, SLO and SLI records ([sn_sow_srm_slo_history] and [sn_sow_srm_sli_metric]) are archived after one year and deleted five years later. Archived data is omitted from tables and visualizations.

Using SLO Management

Using SLO Management ensures IT services meet customer expectations, improves service quality and transparency, and enables data-driven decision making.

Activate SLO-based change approval decisions

Activate Service Level Objective (SLO) change approval decisions to evaluate change requests based on SLO performance.

Before you begin

Review change approval policies and their terminology, including policy inputs, decisions, and approval definitions. For more information, see Change approval policies.

Role required: admin

About this task

Activate the Service Level Objective Change policy's decisions to include SLO performance in your change management process. The policy is active by default, however, its decisions are inactive.

When you activate the policy's decisions, the policy evaluates SLOs as inputs and implements the following:

- Require group manager approval if these conditions are true:
  - The lowest SLO error budget is less than 25%.
  - The highest SLO burn rate is greater than 1%.
- Auto-approve change requests if these conditions are true:
  - The lowest SLO error budget is greater than 25%.
  - The highest SLO burn rate is less than 1%.

Procedure

1. Navigate to **All** > **Change** > **Change Policy** > **Change Approval Policies**.
2. Select the **Service Level Objective Change policy**.
3. In the **Decisions** tab, set **Active** to true for these decisions:
   - **Budget < 25% and Burn Rate > 1**
   - **Budget > 25% and Burn rate < 1**
4. Select **Update** to save your changes.
   The decisions are active and part of your change management process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Use a test change request to verify that change requests are either auto-approved or routed to a manager as expected.

You can also customize the Service Level Objective Change policy, including its name and conditions, as needed.

For more advanced setups, use Flow Designer to customize the SLOs and services included as policy inputs:

> **Important:** Customizing the flow prevents it from receiving future release updates. That behavior is intentional to avoid overwriting your customizations.

1. Navigate to **Process Automation** > **Flow Designer**.
2. In the list of flows, select **Change - SLO – Authorize** and then select **SLO - Get worst performing SLOs**.
3. Customize the **Action Inputs** section.
4. Select **Done** to implement your changes.

Create a notification destination in SRM

Set up notification destinations to help keep teams informed about service reliability.

Before you begin

Before creating notification destinations, set up the Microsoft Teams Graph spoke. When registering an application in the Microsoft Azure portal, grant the following Microsoft Teams Graph API permissions:

- `ChannelMessage.Send`
- `Group.ReadWrite.All**`

For setup instructions, see Set up the Microsoft Teams Graph spoke.

Role required: srm_manager, srm_admin, or admin

About this task

Create a notification destination to deliver messages to a specific Microsoft Teams channel. After you set up a notification destination, team members can attach it to error budget policies to receive messages about policy breaches.

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
2. From the primary navigation, select **Teams** ( ).
3. On the Teams page, select the team you want to use the notification destination.
4. Select the **SLO Notification destinations** tab, select **Create a destination**, and then fill out the form.

Field	Description
Channel URL	Deep link to the relevant Microsoft Teams channel. You can find deep links to chan nels in Microsoft Teams. They fol low this general format: `https://`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	`teams.microsoft.com/l/channel/19%abcdef`.
Destination name	Display name of the notification destination. Teams see this name when adding notification destinations to error budget policies.

5. **Optional:** Select **Send test notification** to verify your setup.
   When successful, a message appears in the relevant Microsoft Teams channel. The message is titled `Test Notification` and includes the following text:

   ```
   This is a test notification from the Service Reliability
    Management (SRM) Team '<team-name>'.
   ```

6. Select **Save**.
   The notification destination appears in the SLO Notification destinations tab. The table includes details about the Microsoft Teams channel and when the notification destination was last updated.

What to do next

To use and learn more about notification destinations, visit the following pages:

- Create SLOs, SLIs, and error budget policies
- Notifications for breached error budgets

You can also edit and delete notification destinations from the SLO Notification destinations tab. Deleting a notification destination removes it from all error budget policies where it was previously used.

Create SLOs, SLIs, and error budget policies

Define service level objectives (SLOs), service level indicators (SLIs), and error budget policies to monitor service health. These tools help you and your teams track performance and respond when needed.

Before you begin

To send notifications when an error budget policy is breached, your team must have a notification destination configured. You can check by navigating to **Teams** > **[Your team]** > **SLO Notification destinations** in Service Operations Workspace. For more information, see Create a notification destination in SRM.

Note: By default, the outage data source for SLIs includes unplanned and degradation outages. Administrators can include planned outages by adding `planned` to the `sn_sow_slo.outage_supported_types` system property value.

Role required: srm_admin, srm_manager, or srm_responder

About this task

Create SLOs, SLIs, and error budget policies to monitor service health and help make sure that your services support business goals.

In Service Reliability Management (SRM), an SLO must have at least one SLI. SLIs can be filtered to a service or configuration item (CI) within the parent service hierarchy. Filtering an SLI to a CI can help you more accurately track service health and identify root causes faster.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each SLI can be associated with only one SLO, helping prevent conflicting performance expectations.

Note: SLOs can also be generated automatically using the SLO creator agent. For details, see Generating service level objectives.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace* > **Services ( )**.
2. On the **Services** page, select the service you want to monitor, then select the **Reliability metrics** tab and select **Add SLO & SLI**.
3. In the Service Level Objective (SLO) form, fill in the fields for your SLO and select **Next**.
   For information about the SLO fields, see Create SLO form.
4. In the Service Level Indicators (SLI) form, select the data source for your SLI.

Data source	Description
Alerts	Base the SLI on alerts from integrated monitoring tools. Use alerts when you want your SLI to include early warning signs and a broader view of reliability.
Outages	Base the SLI on outages detected by monitoring tools and reported by users. Use outages when you want to measure actual downtime and customer impact.

Note: If you create multiple SLIs for an SLO, they must use the same data source.

5. In the same form, select **Add indicators for <data source>**, fill in the fields for your SLI, and then select **Next**.
   For more information about the SLI fields, see Create SLI form.
6. **Optional:** In the Error budget policies form, select **Add policy**, and fill in the fields for your error budget policy.
   For more information, see Add an error budget policy form.

   Note: If you don't add an error budget policy, the SLO objective percentage is only informational. Adding a policy helps you take corrective actions based on the performance data. If you're not ready to add a policy, you can add one later.

7. Review your SLO, SLI, and error budget policy, and then select **Activate**.

   Your SLO, SLI, and error budget policy are now active. The SLO record opens, displaying its reliability state and error budget information.

What to do next

See the following to learn how to monitor and manage your SLOs:

- Working with reliability metrics - Learn where and how to view SLO performance.
- Edit a reliability metric - Update your SLOs to keep them aligned with your reliability goals.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edit a reliability metric

Update a reliability metric to keep it relevant and aligned with your team's goals.

Before you begin

Updating reliability metrics, such as Service Level Objectives (SLOs) or Service Level Indicators (SLIs), during active measurement periods can result in graph inconsistencies.

Role required: srm_admin, srm_manager, or srm_responder

About this task

To help you manage reliability-metric history, Service Reliability Management (SRM) follows specific naming conventions. When you edit a reliability metric, SRM does the following:

- Retires the existing SLO.
- Creates a copy of the SLO with your edits in a draft state, which you can either save as a draft or activate.
- Appends a number to the copy name, for example, Uptime (2) or Uptime (3).

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
2. Follow these steps to access the **Reliability metrics** tab:
   a. Select the **Services** page icon ( ).
   b. Select the service that uses the reliability metric you want to edit.
   c. Select the **Reliability metrics** tab.
3. To edit a reliability metric, select the relevant reliability metric, and then select **Edit** and **Continue to edit**.
4. Make your changes in the Details, Service level indicators, or Error budget policies tabs.

   Note: If you change the SLI data source, all existing SLIs for the SLO are removed and you must create new ones. An SLO can use only one data source type, and each data source has unique settings that can't be preserved or automatically converted.

   While you can't recover the removed SLIs while editing the SLO, you can view the earlier versions in the Reliability metrics tab.

5. To save and implement your changes, select **Activate**.

   Your edited reliability metric appears in the Reliability metrics tab. SRM sets the state to running and includes a version number in its name, for example, Uptime (3).

   The Activity panel on the Details tab records changes, providing a history of updates to the reliability metric.

What to do next

Managing SLOs requires ongoing updates to make sure that they reflect your reliability goals. You can edit or retire existing SLOs and, if needed, reactivate retired SLOs.

Note: If you reactivate a retired SLO, SRM creates and activates a new copy of it. For example: If there are two versions of an SLO, Uptime (1) and Uptime (2), and you reactivate Uptime (1), SRM creates an active version called Uptime (3).

View SRM reliability metrics

Learn about an existing service level objective (SLO) and service level indicator (SLI).

Before you begin

Role required: srm_manager, srm_responder, or srm_admin

Note: Administrators can view any Service Reliability Management (SRM) SLO.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
2. From the primary navigation, select the **Services** icon ( ).
3. Select a service, select the **Reliability metrics** tab, and then open an SLO.
4. View the SLO header to get key information about the SLO, SLI, and state.

Header element	Description
SLI type	○ **Availability**: Percentage of time the service is available. ○ **Errors**: Frequency of service errors. ○ **Latency**: Time taken to service a request. ○ **Saturation**: Fullness of the system, focusing on resource use.
SLO type	○ **Duration**: Measures the time that the service spends without breaching. The associated metrics are: ▪ **Objective (percentage)**: The target percentage of the SLI that the service is expected to meet. ▪ **Error budget**: The remaining error budget, shown in days and time, before the objective is breached. ○ **Count**: Measures the number of occurrences during a compliance period. The associated metrics are: ▪ **Limit (occurrences)**: The number of occurrences that triggers a breach. ▪ **Remaining breach occurrences**: The number of occurrences left before a breach occurs.
State	○ **Draft**: The SLO isn't active yet. You can add new SLIs, update existing ones, or delete the SLO. ○ **Running**: The SLO is active. You can edit, retire, or delete the SLO. Editing a running SLO automatically retires it and creates a

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header element	Description
	new copy. See Edit a reliability metric for more information. ○ **Retired**: The SLO is no longer active. You can reactivate it if needed.
Service	The service associated with the SLO.
Reliability	○ **Stable**: All SLOs have more than 25% of their error budget remaining. ○ **At risk**: All SLOs have some error budget remaining, but at least one SLO has less than 25% left. ○ **Critical**: At least one SLO has fully used its error budget.

Note: From the header, you can delete, retire, or edit the SLO. Deleting an SLO also deletes the associated SLIs. Retiring an SLO changes its state, but you can reactivate it later from the SLO page or the Reliability metrics tab.

5. Select the **Overview** tab to view summary metrics and performance charts for the SLO.
   - Historic periods: Select a time range. The available periods span from the SLO creation date to the present in defined increments.
   - Summary metrics: View details about SLO performance depending on the configured SLIs and error budget policy thresholds.
   - Service level indicators: View the SLIs associated with the SLO.
   - Service level objective (SLO) history:
     - For duration SLOs, view charts for error budget used, error budget remaining, and burn rate.
     - For count SLOs, view charts for cumulative breach occurrences, burn rate, and alerts, incidents & changes impacting this service.

   You can point to the charts to view daily values.
6. Select the **Details**, **Service level indicators**, and **Error budget policy** tabs to view key configuration details.

   For information about the details shown, see Create SLO form, Create SLI form, and Add an error budget policy form. On the Error budget policies tab, you can select **Add policy** to define actions based on performance data.

   The Details tab also includes a Work notes field and Activity panel to record and track changes to the reliability metric.

What to do next

To learn how to create or edit SLOs, see Create SLOs, SLIs, and error budget policies and Edit a reliability metric.

© 2026 ServiceNow, Inc. All rights reserved.

Generating service level objectives

Use the service level objective (SLO) creator agent to auto-generate SLOs for Service Reliability Management (SRM) services and configuration items (CIs). The agent can help teams adopt SLOs faster and monitor service performance.

SLO creator agent overview

The SLO creator agent requires the Now Assist for ITOM plugin and automatically generates SLOs in SRM by analyzing operational data for services and CIs.

- **Schedule and scope:** The SLO creator agent runs every 14 days and processes up to 25 services or CIs. It only processes items without auto-generated SLOs in any state.
- **Evaluation process:** To generate SLOs, the agent analyzes historical alerts, incidents, and outages associated with a service or CI. If the service or CI has related CIs, the agent also evaluates data from those items to identify recurring reliability issues and create SLOs.
- **Results:** The agent creates 1 SLO per service or CI with up to 10 service level indicators (SLIs). The generated SLOs are active by default, and the team assigned to the service or CI gets an email when the error budget falls to 25% or below.

  To keep teams informed, email notifications are sent to the relevant team manager when the agent generates new SLOs. SRM managers and responders can review, edit, and turn off the SLOs once they're created.

You can manage the SLO creator agent, including turning the agent on or off and managing notification settings. For more information, see Manage SLO creator agent settings. To view SLOs generated by the agent and review details about their creation, see View generated SLOs.

SLO creator agent

Get auto-generated SLOs to help your teams adopt SLOs and monitor service performance in SRM.

To access the agent in AI Agent Studio:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select the **AI agents** tab.
3. Select **SLO Creator Agent**.

The SLO Creator Agent page lets you manage the agent, including defining security controls. To modify the agent, duplicate it and adjust the settings.

Important: When you modify an agentic workflow, AI agent, or tool, make sure that you update all instructions accordingly.

AI agent used to generate SLOs

One agent is used to create SLOs in SRM.

AI agents and their roles

AI agent	AI agent role
SLO creator agent	Creates SLOs for SRM services and CIs by examining historical incidents, outages, and alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: This agent is turned on by default. For more information, see Now Assist skills, agents, and agentic workflows on by default.

Manage SLO creator agent settings

Activate or deactivate the service level objective (SLO) creator agent and configure the notification settings.

Before you begin

You must have Now Assist for ITOM and Service Reliability Management (SRM) installed on your instance. For more information, see Install Now Assist plugins and Install Service Reliability Management from Admin Center or ServiceNow Store.

Role masking enables users to limit the roles and privileges of agentic workflows during tool execution. Agentic workflows and their AI agents that get installed with Now Assist applications are assigned pre-defined roles. If you select *`Users with specific roles`* for user access, you must configure the security controls to include these roles. Data access settings must also include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

For an overview of how and when the SLO creator agent generates SLOs, see Generating service level objectives.

Role required: srm_admin

Procedure

1. Navigate to **All** > *`Service Operations Workspace`* > **Configurations**.
2. Select **Service Reliability Management** > **Activate** > **AI-generated SLOs**.
3. Configure the SLO creator agent settings.

Setting	Description
Allow the agent to automatically generate SLOs from service alerts and outages.	Turns on or off the SLO creator agent. When the agent is active, it generates SLOs based on alerts, incidents, and outages for eligible services and configuration items (CIs).
Include a policy to email the assigned team if the error budget is less than or equal to 25%.	Sends an email notification to the team assigned to the service or CI when the SLO error budget reaches 25% or lower.
Email team managers when an SLO is generated, or the team if no manager is assigned.	Sends an email notification when the agent generates a new SLO. If a team manager is assigned to the service or CI, the manager receives the notification. Otherwise, the notification is sent to the group email. If no group email exists, all group members with an email address receive the notification.

4. Select **Save** to implement your changes.
   The UI displays `Settings saved`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

To view SLOs generated by the agent, see View generated SLOs. To modify or deactivate the SLOs after they're created, see Edit a reliability metric.

View generated SLOs

View service level objectives (SLOs) generated by the SLO creator agent and review information about how they were created.

Before you begin

You must have Now Assist for ITOM and Service Reliability Management (SRM) installed on your instance. For more information, see Install Now Assist plugins and Install Service Reliability Management from Admin Center or ServiceNow Store.

For an overview of how and when the SLO creator agent generates SLOs, see Generating service level objectives.

Role required: srm_manager, srm_responder, or srm_admin

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace* > **Services**.
2. Select a service and then select the **Reliability Metrics** tab.
3. Select an SLO generated by the SLO creator agent.
   SLOs generated by the agent display `Now Assist` in the Created by column.
4. Select the **Details** tab.
5. In the Activity panel, review the work notes.
   SLOs generated by the SLO creator agent include work notes that summarize the data analyzed and configuration used during creation. The following example shows the type of information recorded in the work notes:

```
=== AI-Generated SLO ===

[Issue Pattern Description]
Analysis of 15 alerts over the last month revealed ten distinct
 reliability-impacting patterns for the Webhook Delivery
 Tracking Service.
Critical webhook delivery failures, data contract violations,
 SAML assertion rejections, RBAC permission denied spikes,
 Kafka consumer lag,
JSON deserialization failures, AZ failover health check
 failures, schema registry compatibility failures, JWT
 signature validation failures,
and gRPC deadline exceeded errors were identified. Each pattern
 was validated through field-value mapping and encoded query
 construction,
ensuring actionable and trackable SLIs.

[Metrics]
· In the last Month: 0 Major Incidents, 0 Sev1 Incidents, 11
 critical alerts, 1 outage → risk score of 27
· Monthly compliance period selected based on risk
 concentration and alert volume
· Data source: 15 alerts analyzed (full dataset available)

[SLO Configuration]
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
· Service classified as Most Critical → 99.99% reliability
 target selected
· Monthly compliance period chosen for consistent tracking of
 reliability issues
· Duration SLO type selected for continuous measurement of
 reliability
· SLI type: Errors - keywords and patterns found in 80% of
 alerts, with additional latency and availability issues
 identified
· Source: em_alert (alerts provide granular signal for
 reliability tracking)

[SLIs Created]
· 10 SLIs created covering 100% of reliability events (15 of 15
 alerts):
1. Webhook Delivery Failure Rate (main CI sys_id: <sys_id>)
- Tracks critical webhook delivery failures
- 2 alerts matched (13% of total events)
- All events led to service downtime
- Filter:
 metric_name=Webhook_Delivery_Failure_Rate^classification=webho
ok_failure^severity=critical
- Example: Alert <alert_id>
2. Data Contract Violation Rate (main CI sys_id: <sys_id>)
- Tracks critical data contract violations
- 2 alerts matched (13%)
- Example: Alert <alert_id>

[Additional SLIs follow the same pattern for each reliability
 issue identified]

· All reliability events are covered by the SLIs created.

Created by Now Assist SLO Creator Agent
```

What to do next

To learn more about SLOs, including SLO types and compliance periods, see Working with reliability metrics. To edit or deactivate an SLO in SRM, see Edit a reliability metric.

SLO Management reference

Reference topics provide additional information about Service Level Objective Management.

Add an error budget policy form

Learn about the available fields for setting up error budget policies.

Fields in the Add an error budget policy form

The following table describes the available options in the Add an error budget policy form. For step-by-step instructions, see Create SLOs, SLIs, and error budget policies.

Field	Description
Policy name	Display name of the error budget policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Threshold type	Select how you want to track your error budget. • **Burn rate (count)**: Tracks how quickly the error budget is being consumed. A higher burn rate means faster consumption. • **Error budget remaining (%)**: Tracks the percentage of the error budget that's still available during the specified period. **Note:** You can add multiple thresholds to a policy, but each must be unique. If you try to add a duplicate threshold, an error message appears.
Threshold value	The point at which you get notified based on the selected SLO indicator. • Burn rate: Set a value that indicates the burn rate is too high. For example, to be notified when your service or configuration item is burning through its error budget twice as fast as expected, set the threshold to 2. • Error budget remaining: Set a value that indicates the remaining error budget is too low. For example, to be notified when only 25% or less of the error budget remains, set the threshold to 25%. **Note:** The threshold values support up to 4 decimal places and then round up.
Policy action	[Optional] If a breach occurs, select the action that you want to take: • Create incident. • Send an email. • Notify Microsoft Teams. If you select this option, you must also select a relevant notification destination. To set up a notification destination for your team, see Create a notification destination in SRM. **Note:** To learn about the notifications that teams receive for breached error budget policies, see Notifications for breached error budgets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create SLO form

Learn about the available fields for adding a service level objective (SLO) to Service Reliability Management.

Service level objective form

The following table describes the available options in the Service level objective form. For step-by-step instructions, see Create SLOs, SLIs, and error budget policies.

Fields in the Service Level Objective form

Field	Description
Name	Name of the SLO.
SLI type	• **Availability**: Percentage of time the service is available. • **Errors**: Frequency of service errors. • **Latency**: Time taken to service a request. • **Saturation**: Fullness of the system, focusing on resource use.
How do you want to measure this objective?	You can measure this objective by: • **Duration**: The amount of time the service spends without breaching. It's the only value available. • **Count**: The number of periods or occurrences in a given compliance period.

Measuring by Duration

Field	Description
Objective (%)	The percentage of how available (uptime) you want the service to be over a length of time. If measuring by duration, an objective percentage of Five Nines (99.999%) means that the service wasn't available for 26 seconds per month, or about 5 minutes and 35 seconds per year. This is used to calculate your error budget.
Compliance period	Period for which the metrics are calculated. The available options are: • **Month**: The duration is considered to be the current month. For example, if the current date is 26th January, the duration will be considered from 1st January until 31st January. • **Rolling 7 days**: The duration is considered to be 7 days from the current date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Measuring by Duration (continued)

Field	Description
	• **Rolling 30 days**: The duration is considered to be 30 days from the current date. For example, if the current date is 26th January, the duration will be considered from 25th December. • **Rolling 90 days**: The duration is considered to be 90 days from the current date. For example, if the current date is 26th January, the duration will be considered from 25th October.
Error budget	Auto-populated. The maximum level of errors (downtime) allowed over a certain period. A percentage of total service availability. Once you set your objective (%), your error budget is automatically calculated using this formula: 1 – (Desired) Availability. The error budget of a service will be calculated in days, hours, minutes, and seconds for a desired availability of 99.99% (Four Nines) of the year by: **1.** Calculating the total time in seconds in a year: 31536000 seconds. **2.** Determining the error budget as 1 – (Desired) Availability: 1 - 0.9999 = 0.0001. **3.** Converting the error budget to time units. For example, if the error budget is 0.0001: • Error Budget in Seconds = 0.0001 * 31,536,000 seconds = 3,153.6 seconds. • Error Budget in Minutes = 3,153.6 seconds / 60 = 52.56 minutes. • Error Budget in Hours = 52.56/60 = 0.875 hours. • Error Budget in Days = 52.56 minutes / (24 * 60) ≈ 0.0364 days. **Note:** Your error budget appears in units of days, hours, minutes, and seconds only when you measure your SLO by duration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Measuring by Count

SLO type	Count by periods or Count by occurrences
Limit occurrences	The number of occurrences after which a breach occurs. Limit occurrences act as an error budget.
Compliance period	Period for which the metrics are calculated. The available options are: • **Month**: The duration is considered to be the current month. For example, if the current date is 26th January, the duration will be considered from 1st January until 31st January. • **Rolling 7 days**: The duration is considered to be 7 days from the current date. • **Rolling 30 days**: The duration is considered to be 30 days from the current date. For example, if the current date is 26th January, the duration will be considered from 25th December. • **Rolling 90 days**: The duration is considered to be 90 days from the current date. For example, if the current date is 26th January, the duration will be considered from 25th October.

Note: The **Assignment group** is auto-populated.

Create SLI form

Learn about the available fields for adding a service level indicator (SLI) to a service level objective (SLO).

Add SLI form

The following table describes the available options in the Add SLI form. For step-by-step instructions, see Create SLOs, SLIs, and error budget policies.

Fields in the Add SLI form

Field	Description
SLI name	Enter a name for your SLI. For example, Critical router issue.
Data source	This field is auto-populated. The alerts or outages are used to calculate the error budget.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields in the Add SLI form (continued)

Field	Description
Service or configuration item	• <Service-name> - Select this option to filter your SLI to the entire service. This option helps you measure overall service health. • Related configuration item - If your service includes one or more configuration items (CIs) in its hierarchy, select this option to filter your SLI to specific CIs. This option provides a more granular view of service health. **Note:** By default, only level-one CIs appear in the CI list. Administrators can change the number of levels displayed by updating the `sn_sow_slo.slo_rollup_depth` system property value.
Set conditions (optional) Customize your SLI by filtering it to specific alerts or outages. The fields in this section are optional.	
Add condition set	Select this option to specify the alerts or outages included in the error budget. For example, for alerts, if you set the condition to **Status is Critical**, only alerts with a critical status count toward the error budget.

Notifications for breached error budgets

Details about the notifications that teams receive for breached error budget policies.

When notifications are sent

When a service or configuration item breaches its error budget policy and a notification destination is set, Service Reliability Management (SRM) sends a notification to the configured Microsoft Teams channel.

Notification content

The message contains details about the breach to help team members learn about the issue and act. In Microsoft Teams, the message is titled `Error budget policy violation` and lists the following information:

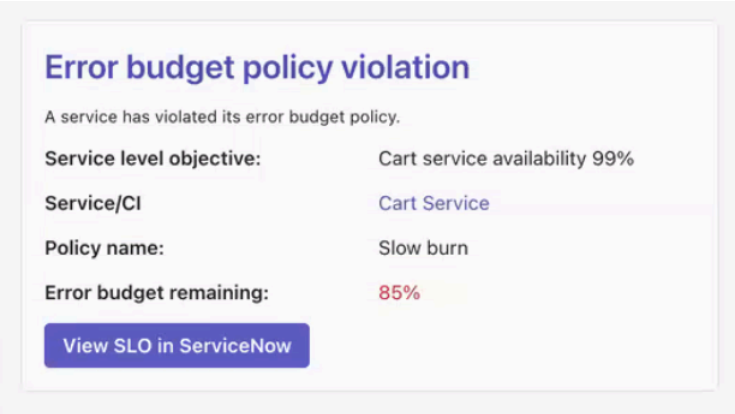
- Service level objective - Name of the service level objective (SLO), for example, `Navigation service availability 99.95`.
- Service/CI - Name of the associated service or configuration time. Select the name to open the relevant service in SRM.
- Policy name - Name of the error budget policy that was breached.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Error budget remaining - Percentage of error budget left at the time of the breach.
- View SLO in ServiceNow - Link to view the SLO details in SRM.

Sample notification

The following image is a sample notification in Microsoft Teams. It shows an error budget policy violation for the Cart service and details about the SLO and error budget remaining.



Related documentation

See Create a notification destination in SRM and Create SLOs, SLIs, and error budget policies.

Visualizations in the Service reliability dashboard

List of visualizations and options on the Service reliability dashboard in Service Reliability Management (SRM).

Service state charts

Top-level charts show the number of services in critical, at-risk, and stable states. Their states are based on the error budget remaining on their service level objectives (SLOs). You can select the charts to view service names, adjust the time range, and access additional chart options.

Note: An error budget is the amount of failure a service can experience before breaching its SLO.

Each visualization also includes a trend line showing changes in service count over the past 12 months. Smaller figures indicate how the count has changed compared to a week ago, for example, ↓25 (22%) since Jun 11.

Chart	What it is	How to use it
Critical	Displays the number of services in a critical state. Critical services have 0% error budget remaining on their SLOs.	View how many services have consumed their error budgets and identify the services needing immediate attention.
At risk	Displays the number of services at risk. At-risk services have <= 25% error budget remaining on their SLOs.	Monitor how many services are approaching critical thresholds and find issues early.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart	What it is	How to use it
Stable	Displays the number of stable services. Stable services have more than 25% error budget remaining on their SLOs.	Get insights into overall service health and identify if services are staying reliable over time.

Risk trends over time

Line charts track the number of SLOs with high burn rates and low error budget remaining over the past 12 months. You can use them to find recurring patterns and potential reliability risks.

Chart	What it is	How to use it
High burn rate (>=1)	Shows the number of SLOs with a burn rate >= 1 over time. A high burn rate indicates that the service linked to the SLO is likely to breach its error budget before the compliance period ends. For example, if a service has 30 days to meet its SLO but is using up its error budget in 15 days, the burn rate is 2.	• Find risks early by seeing when services begin consuming error budgets too quickly. • Identify emerging or recurring reliability issues by tracking burn rates over time. • Point to the chart to see the number and percentage of SLOs with a high burn rate at that time. • Select the chart to view SLO details, adjust the time range, and access additional chart options.
Low budget remaining (<=25%)	Shows the number of SLOs with low or no error budget remaining over time.	• Monitor how many services are nearing or have breached their SLOs. • Track rising trends, which might indicate declining reliability or recurring issues that need investigation. • Point to the chart to see the number and percentage of SLOs with little or no error budget remaining at that time. • Select the chart to view SLO details, adjust the time range, and access additional chart options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service level objectives (SLOs) table

The SLOs table lists the SLOs defined in Service Reliability Management (SRM), and it's sorted by SLO name by default. Use the table to monitor overall reliability, identify services at risk, and find the assigned teams.

The SLO table includes the following columns by default. To customize the columns shown, select the gear icon.

- Name - Name of the SLO. You can select the arrow to sort the table by SLO name, and you can select the name to view the SLO record.
- Reliability - Current state of the SLO. For example, stable, at risk, or critical.
- Measured reliability - Percentage showing the actual performance of the service. For example, if your SLO is 99.9% success, and the actual performance for the month is 99.7%, the measured reliability is 99.7%.
- Objective (percentage) - Target SLO value.
- Burn rate - Numeric value showing how quickly the service is consuming its error budget.
- % Error budget remaining - Percentage of the error budget still available in the current compliance period.
- Service - Name of the service associated with the SLO. You can select the service name to view the service record.
- Assigned - Team responsible for the service.

Dashboard filters and actions

The Service reliability dashboard is built with Platform Analytics and includes standard dashboard features. For details on customizing, duplicating, or sharing dashboards, see the Dashboards in Platform Analytics documentation.

Note: Changes to the Service reliability dashboard affect all SRM users on your instance. To create a personalized version, either build a new dashboard or duplicate the existing dashboard and edit it. Learn more in Create a dashboard with the in-line editor and Duplicate a Platform Analytics dashboard.

Service Observability

The ServiceNow® Service Observability application enables operators to triage and manage incidents in a complex and distributed system. Application and platform telemetry insights from multiple observability tools are combined into a centralized workflow.

Exploring Service Observability

Service Observability helps operations teams triage and manage incidents in a complex and distributed production system. It combines external observability monitoring systems' telemetry with related data from the Configuration Management Database (CMDB) and displays both in a single workflow in the Service Operations Workspace (SOW).

Service Observability overview

Service Observability displays application, infrastructure, and network health metrics in the SOW related to a given service. Metrics can be ingested from an external observability vendor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(application, network, and cloud monitors) and displayed alongside information for related configuration items in the CMDB.

Service Observability supports the following observability vendors:

- Amazon CloudWatch
- AppDynamics
- Cisco ThousandEyes synthetic tests
- Datadog
- DynatraceSaaS and on-premise (both Classic and Grail environments)
- Microsoft Azure Monitor
- New Relic
- Prometheus on-premise
- SolarWinds on-premise
- Splunk Observability and logs from Splunk Enterprise
- Zabbix on-premise

Service Observability supports the following databases:

- MySQL
- PostgreSQL (not supported with Splunk)
- RDS (Relational Database Service) for Amazon CloudWatch

After connecting an observability vendor to Service Observability, you map services in the CMDB to observability metrics using existing tags.

With this data mapping, Service Observability displays metrics for entities such as host, database, or network components, along with details about related CI information. Operators use these metrics and contextual information, including current incidents and alerts, to assess service health.

Note: Operators can also use the Analyze a dashboard in Service Observability and the Analyze service health in Service Observability Now Assist AI skills to generate an analysis for them.

For example, say you use Dynatrace to monitor your `checkout` service, databases, and hosts, and that metrics from all these entities use the tag `checkout-service` to denote requests coming from that service. By mapping the `checkout` service CI to the Dynatrace data tagged with `checkout-service`, Service Observability retrieves metrics for those databases and hosts and CIs related to the service, then displays them together. Operators can pinpoint issues on entities related to the service and narrow down the mitigation process without having to leave the SOW.

Service Observability users

Users

User	Description
System admin	Version 1.5 only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users (continued)

User	Description
	System admins configure users and teams, register services to be monitored, connect Service Observability to observability vendors, and then map those services to that data. They can also view the data in the SOW
Service Observability admin	Version 1.6.x and later. Service Observability admins can configure users and teams, connect Service Observability to observability vendors, and then map services to that data. They can also view the data in the SOW. Admins can also customize dashboard templates used to display metrics and related information.
Operator/ operations manager **Note:** These users must belong to an `srm` group type to see all data.	Operators use Service Observability when triaging incidents in the SOW. They can view basic health metrics for a service, along with related incidents, alerts, and changes. They can get more detailed information by navigating to the **Observability** tab to view additional service metrics, along with metrics from related entities, such hosts, networks, or databases.

Service Observability workflow

Admins configure Service Observability by creating a connection to an observability vendor and then mapping CI services to that data. Operators use Service Observability to determine if another related entity is causing issues surfaced by the service's performance.

As an admin, you:

1. Determine the services to be monitored by Service Observability based on business criticality.
2. Connect existing observability vendor instances to Service Observability.
3. Map services to observability metric data using vendor-based tags attached to that data.
4. Customize the templates used to display metric charts.

As an operator or manager, you:

1. Spot an issue with a service while working in the SOW, for example, from an alert, the Service dashboard, or Express List, then navigate to the Service Details page.
2. View overall health metrics for the service, along with related incidents, alerts, and changes. If one of the metrics seems unhealthy, navigate to the Observability tab.
3. View more detailed service metrics, as well as information from related entities, to start root cause investigation. When finding that the issue is further down the system's stack, identify the ownership for that entity to start remediation.

Service Observability benefits

Benefit	Feature	Users
Consolidate data from existing monitoring tools, network health tools, cloud providers, ServiceNow agents, and third-party tools for a full-stack view of service health: • Connect data from external Observability vendors. • Map that data to CMDB services • View combined data in the SOW	• Connect a Service Observability data source • Create and manage data mappings .	Admins
Increase efficiency and reduce mean time to resolution (MTTR). View combined metrics from entities associated with a service to begin to determine blast radius and ownership of an incident.	View service health metrics	Operators
See related changes to the system and alerts associated with a service in one place.	View overall service health.	Operators
Use generative AI to analyze metric data and find insights to help determine service health.	• Analyze a dashboard in Service Observability • Analyze service health in Service Observability	Operators
See Service Observability data as part of Incident Management workflows	Digital End-User Experience and Service Observability UI experience on investigate tab	Operators
Customize dashboard templates.	Customize Service Observability dashboard templates	Admins

What to explore next

To learn more about configuring and using Service Observability, see:

- Configuring Service Observability
- View overall service health
- View service health metrics
- Service Observability reference

© 2026 ServiceNow, Inc. All rights reserved.

Configuring Service Observability

After you install Service Observability, you must connect external observability systems and map that data to services. You can also customize the out-of-the-box dashboards to show different information, including data from other ServiceNow products.

Configuration overview

Install Service Observability

If you have the system admin role, you can install the Service Observability application (`sn_sow_svcobs`). The application installs related ServiceNow® Store applications and plug-ins if they aren't already installed.

Before you begin

- Confirm that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Service Observability application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: system admin [admin]

About this task

The following items are installed with Service Observability:

- Plugins
- Store applications
- Roles
- Tables

For more information, see Components installed with Service Observability.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Service Observability application (`sn_sow_svcobs`) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate teams and services

Follow this step only if you are on version 1.5.0 of Service Observability. Assign existing teams to Service Observability so they can view the data returned by the Configuration Management Database (CMDB) on those pages. Activate the services in the CMDB for use in Service Observability.

Before you begin

- Users assigned to a group that manage the activated services.
- Services that you want to monitor in Service Observability should be configured in the CMDB.

Role required: system admin

About this task

Note: Follow this step only if you are on version 1.5.0 of Service Observability.

Teams are used in both Service Reliability Management and Service Observability to give existing roles and groups the ability to view CMDB data on the **Overview** and **Observability** tabs.

The services that you want to monitor in Service Observability must be activated. Activation enables you to map data from an observability monitoring instance to that service and then view that service's related data on the **Overview** and **Observability** tabs.

Note: Teams and services activated for Service Observability are also activated for Service Reliability Management (SRM). Service Observability admins can create a single service. For more information, see Add a service to SRM. When Service Observability admins create a single service, it's automatically activated for Service Observability and SRM. For more information, see Service Reliability Management.

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Configurations** and choose the **Service Operations Management** card.
2. Navigate to **Service Operations Management** > **Assign and activate** > **Activate teams and services**.
3. Choose **Activate teams and services**.
4. Select the assignment groups that you want as teams in Service Observability and then select **Activate**.
   Only teams that haven't already been assigned are displayed.
5. In the modal, select **Confirm**.
6. In the Service class drop-down menu, select a CMDB service type.
7. From the list of services, select which services to activate for Service Observability and select **Activate**.
8. In the modal, select a support team for the services and choose **Confirm**.
   You now have services that can be monitored in Service Observability

What to do next

1. Connect a Service Observability data source
2. Create and manage data mappings

© 2026 ServiceNow, Inc. All rights reserved.

Connect a Service Observability data source

Connect Service Observability to an external observability system. Service Observability displays metrics in the Service Operations Workspace (SOW) from that observability instance.

Before you begin

You must enter a connection URL and credentials for your observability vendor. You can either use an existing connection or create one. Note the following for specific vendors:

Vendor-specific connection information

Observability Vendor	Connection information
AWS	The connection URL must be specific to the region to be monitored, for example, `https://monitoring.us-east-2.amazonaws.com`.
Azure	The connection URL should be `https://management.azure.com`.
Splunk Observability	The connection URL must include the Realm, for example, https://stream.[REALM].signalfx.com
Zabbix	The connection URL must be the IP on which the Zabbix server is hosted

If you're using existing credentials, you need the credential name. If you're creating credentials, collect the following information.

Vendor-specific credential requirements

Observability vendor	Credential type	Information needed
AppDynamics	OAuth 2.0	• OAuth Client ID • OAuth Client secret • OAuth token URL • AppDynamics account name
Azure	OAuth 2.0	• OAuth Client ID • OAuth Client secret • OAuth token URL • Subscription ID
AWS	AWS credentials	• Access key • Secret key If the user associated with this key is restricted to specific permissions, they must

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Vendor-specific credential requirements (continued)

Observability vendor	Credential type	Information needed
Dynatrace SaaS Grail	API	API Platform Token The token must have `storage:metrics.read` and `storage:bucket.read` scope permissions.
Dynatrace on-premise	API	• API key. The key must be an environment scoped token. • The name of the MID Server your Dynatrace instance is hosted on
New Relic	API	• Account ID • API key
Prometheus on-premise	Basic Auth	• Basic Auth credential user name • Basic Auth credential password • The name of the MID Server your Prometheus instance is hosted on
SolarWinds	Basic Auth	• Basic Auth credential user name • Basic Auth credential password • The name of the MID Server your SolarWinds instance is hosted on
Splunk Enterprise	API	Bearer Token
Splunk Observability	API	Access token
ThousandEyes	API	API key
Zabbix	Basic Auth	• Basic Auth credential user name • Basic Auth credential password

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Vendor-specific credential requirements (continued)

Observability vendor	Credential type	Information needed
		• The name of the MID Server your Zabbix instance is hosted on. The MID Server must be in an active state.

Role required: sn_sow_svcobs.admin

About this task

The first step to ingesting observability data is to create a connection to the observability instance.

Service Observability supports the following observability vendors:

- Amazon CloudWatch
- AppDynamics
- Cisco ThousandEyes synthetic tests
- Datadog
- DynatraceSaaS and on-premise (both Classic and Grail environments)
- Microsoft Azure Monitor
- New Relic
- Prometheus on-premise
- SolarWinds on-premise
- Splunk Observability and logs from Splunk Enterprise
- Zabbix on-premise

Procedure

1. Navigate based on your version of Service Observability.
   - Version 1.5.0: Navigate to **All** > **Service Operations Workspace** > **Configurations**, then navigate to **Service Observability Management** > **Manage Observability** > **Data sources**
   - Version 1.6 or later: Navigate to **All** > **Service Operations Workspace** > **Configurations**, then navigate to **Service Observability** > **Data sources**.
2. Select your observability vendor.
3. On the **Add connection** form, fill in the fields.
   You can use an existing HTTP or HTTPs connection and an existing credential or create one.
4. Select **Save**.

Result

A new connection appears in the list of observability data sources. You use this connection when you create a data mapping.

What to do next

Map your connection to the services that you want to monitor in Service Observability. See Create and manage data mappings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create and manage data mappings

Map your services to the data from a connected external observability vendor instance, and view it in charts for the service.

Before you begin

- If you are on version 1.5.0, activate the services that have data from an external observability instance. For instructions on how to activate the services, see Activate teams and services. For later versions, you don't need to activate services. You can map any of the following service types:
  - Service instance
  - Mapped application service
  - Calculated application service
  - Dynamic CI group
  - Technology management service
  - Tag-based service
  - Offerings
  - Business service
- Connect a Service Observability data source

Role required: sn_sow_svcobs.admin

About this task

When a service CI is mapped to specific observability vendor metric tag key/value pairs, Service Observability displays metrics containing those tags for that service. These metrics are grouped by the following entity types:

- Application: Metrics associated with the selected service
- Compute: Metrics associated with the hosts the service is run on
- Databases: Metrics associated with databases used by the service
- Networking: Metrics associated with network devices used by the service.

For example, say you have metrics from New Relic that are used to monitor services, databases, and hosts. On those metrics, you have used the tag `service_name`. Say you have also mapped the `checkout` service CI to the observability metadata key/value pair `service_name = checkout`. Service Observability shows you all the database and host metrics tagged with `service_name = checkout` in the context of the `checkout` service CI.

If some of your metrics on different entities use a different key name or a different key value, you can create exceptions. For example, if your host metrics use `service` instead of `service_name`, you can create an exception to include those metrics.

Each entity type has its own dashboard and each metric or related CI has its own default chart. You can customize the templates used for the dashboards and charts. See Customize Service Observability dashboard templates for more information.

Note: To understand how Service Observability creates these mappings, see Observability vendor entity mappings for Service Observability.

For a description of the field values, see Service Observability data mapping form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the Data mappings page, following the procedures for your version of Service Observability.
   - Version 1.5.0: Navigate to **All** > **Service Operations Workspace** > **Configurations**, then navigate to **Service Observability Management** > **Manage Observability** > **Data mappings**
   - Version 1.6.x or later: Navigate to **All** > **Service Observability** > **Configure Data mappings**.
2. Select **Create your first mapping** or **Create mapping**.
3. On the Observability data mapping page, enter a name for the mapping.
4. Choose the services that should use this mapping.
   - For version 1.5.0: Enter the names of the activated services that you want to map. For information about activating services, see Activate teams and services
   - For version 1.6.x and later:
     a. Choose **Select services**.
     b. Use the navigation to narrow down the list to the type of service you're searching for.
     c. Select the services to add to the mapping. You can add services from any combination of service type.

        Note: Use the filter to narrow down the service list.

     d. Select **Add services** to add them to the mapping.

   The Mapping preview pane updates to show the selected service, or the first service in a list of services.
5. Create a rule to determine how Service Observability should map internal services to the observability entities using tag keys and values.

   a. Select the data source for this map.

   b. Enter the tag key that you want to use to map the observability data to the service.
   The key can be any tag you use on your observability metadata, for example `service`. The entered key must match the tag you use in the observability metadata and is case-sensitive.

      Note: If you use more than one tag to represent a service, you can create an exception. For example, if most tags use `service` except for database metrics, which use `service_name`, you can create an exception for the database metrics.

   c. Manually enter a tag value or choose one from the drop-down menu.

      Note: Values are case-sensitive.

      Values can be strings that are from your observability metadata, like a service name, or they can be a variable used to represent multiple instances, for example `$(service)`. When your key represents a service, a drop-down menu shows fields from the corresponding CI that can be used as a variable. If you choose to use a variable, be sure that the values resolve to values sent in the observability data.

      Note: If you selected more than one service to map, the drop-down displays only the fields that are common to all selected services.

   You can now test your mapping or add exceptions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. **Optional:** If some of your entities use different key names or values, create exceptions to the default policy by configuring them in the Exceptions card.
7. Test the mapping.
   The **Mapping preview** panel shows the test results for the first service mapped. Service Observability sends a request through the connection and returns the entities found using the provided mapping. If you created an exception using a different source, the panel shows the results from each source separately. If the results don't seem correct, try reconfiguring the mapping by changing the tag key or value.

   If you have more than one service mapped, use the **Service** drop-down menu to select and test a different service.
8. Select **Save mapping**.

Result

On the **Observability** tab of the Service details page, dashboards and charts show metrics for the entities found from the mapping.

Customize Service Observability dashboard templates

You can customize the Service Observability dashboards on both the Overview and Observability tabs of the Service Details page. You can change or add metrics and related data to fit your business needs.

Service Observability dashboards are built using templates specific for each observability vendor and entity tab. They're built using Platform Analytics, letting you customize templates to meet your business needs. For example, you might want to display metrics from your observability vendor that aren't available by default.

The Service Observability dashboards use vendor-specific templates. You can see what each template displays by default from its respective reference topic.

- Amazon CloudWatch templates for Service Observability
- AppDynamics templates for Service Observability
- Azure Monitor templates for Service Observability
- Cisco ThousandEyes templates for Service Observability
- Datadog templates for Service Observability
- Dynatrace templates for Service Observability
- New Relic templates for Service Observability
- Prometheus templates for Service Observability
- SolarWinds templates for Service Observability
- Splunk Observability templates for Service Observability
- Zabbix templates

Note: When you make a customization, you're changing the template and not the individual service's dashboard. This means that dashboards for any services that also use the same data source are also changed.

Along with observability data, you can also add charts for data from ServiceNow tables and also from data stored in the MetricBase and Health Log Analytics applications.

When you customize a template, a copy of the original is saved so that you can reimplement it if needed. Default dashboards display a `Certified` tag.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edit observability data charts on Service Observability dashboard templates

Edit Service Observability dashboard templates to view different observability vendor metrics on the Overview or Observability tabs' charts. Metrics are scoped to the selected service.

About this task

When you edit or add an observability chart on a dashboard, you use the Edit data source page of Platform Analytics to create a query. You use the built-in query editor for simple metric queries and the Advanced mode to create more substantial queries or to paste a query copied from a chart from your observability vendor instance.

When creating an observability chart, you can use the query builder to create simple queries or use the advanced mode to create more substantial queries.

Use simple queries to return metrics associated with services, hosts, and databases. The returned metrics are aggregated across the time window set by the user.

Use advanced query mode to cut and paste queries from existing observability charts into Service Observability. For most observability vendors, you can simply copy a query from an existing chart in your observability instance.

Both query types support template variables that let you use the same query to return metrics for multiple entity instances.

Before you begin

Role required: sn_sow_svcobs.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note: Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

   The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.
3. To do basic editing, such as rearranging, resizing, or deleting charts, follow the instructions for Edit in-line Platform Analytics dashboard elements.
4. To add a vendor query for a new chart, follow these steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In Edit mode, select **Add new element** and choose **Data visualization** > **New visualization**.

b. In the **Configuration panel**, select `Line` for **Visualization type** and choose **Add data source**.

c. In the **Add data source** page, open **Service Observability** in the navigation panel and select your observability vendor.
Be sure to select the same vendor used on the template you're editing.

d. Enter a query in the **Metric** card.

Use the query builder to edit a simple vendor-specific query.

To copy a full query from your vendor chart, activate the **Advanced** switch and paste in a query from your vendor chart.

For AWS and Azure, instead of entering a query in advanced mode, you can import selected charts from an existing dashboard. Select **Import from AWS/Azure Dashboard**. Select a data source name, then select a dashboard and from the list of charts, select the one to import, then select **Import query**. The query for the chart is pasted into the Query box.

Use template variables to replace any hard-coded entities or time periods to have the query return results that match both the service and time period selected in the UI.

Note: Use the **Docs** link to refer to the vendor-specific documentation for help with creating the query.

e. To preview your query, select **Run** and then choose a service and entity.

f. When satisfied with your query, select **Add this source** to add the chart to the template.

5. To edit an existing query, follow these steps.

a. In Edit mode, select the chart to edit.

b. In the **Data sources** section of the Configuration panel, use the **More actions** menu to select **Edit**.

c. In the **Edit data source** page, edit the query in the **Metric** card.

Use the query builder to create a simple vendor-specific query.

To copy a full query from your vendor chart, activate the **Advanced** switch and paste in a query from your vendor chart.

For AWS and Azure, instead of entering a query in advanced mode, you can import selected charts from an existing dashboard. Select **Import from AWS/Azure Dashboard**. Select a data source name, then select a dashboard and from the list of charts, select the one to import, then select **Import query**. The query for the chart is pasted into the Query box.

Use template variables to replace any hard-coded entities or time periods.

Note: Use the **Docs** link to refer to the vendor-specific documentation for help with creating the query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. To preview your query, select a service and an entity and select **Run**.

e. When satisfied with your query, select **Apply** to add the chart to the template.

6. When done customizing, select **Save** and then **Exit editing mode.**
7. To return the template to the default (Certified) version, use the **More actions** menu to select **Return to certified**.

Edit ServiceNow data on Service Observability dashboard templates

Edit Service Observability dashboard templates to view data from problem and business app records on the Overview or Observability dashboards.

Before you begin

Role required: sn_sow_svcobs.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note: Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

   The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.
3. To do basic editing, such as rearranging, resizing, or deleting charts, follow the instructions for Edit in-line Platform Analytics dashboard elements.
4. To add a new ServiceNow table, follow these steps:
   a. In Edit mode, select **Add new element** and choose **List**.
   b. In the **Configuration panel** in the **Data sources** section, choose **Add data source**.
   c. In the **Add data source** page, find the **Table** whose data you want to display and choose **Add this source**.
   d. In the **Columns and rows** section, add and arrange the columns to display.
5. To edit an existing chart, follow these steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In Edit mode, select the chart to edit.

b. In the **Data** section of the Configuration panel, verify that the correct table is selected in **Table** field.

c. In the **Columns and rows** section, add and arrange the columns to display.

6. When done customizing, select **Save** and then **Exit editing mode.**

7. To return the template to the default (Certified) version, use the **More actions** menu to select **Return to certified**.

Add MetricBase charts to Service Observability dashboard templates

Add MetricBase data to charts on Service Observability dashboard templates when you want to view those metrics in context of Service Observability.

About this task

You can add metrics that are stored in the MetricBase application to your Service Observability dashboards. These charts display with data scoped to the selected service.

Before you begin

Role required: sn_sow_svcobs.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.

2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note: Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

   The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.

3. To do basic editing, such as rearranging, resizing, or deleting charts, follow the instructions for Edit in-line Platform Analytics dashboard elements.

4. To add a new chart with MetricBase data, follow these steps:

   a. In Edit mode, select **Add new element** and choose **Data visualization**, select **New Visualization**, and then select **Line**.

   b. In the **Data sources** section of the Configuration panel, select **Add data source**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the **Add data source** page, navigate to **MetricBase** > **Monitorable Item** and select the data to display, and then choose **Add this source**.
The data is added to the dashboard.

d. Use the controls in the **Data** section of the Configuration panel to select the metric and configure the query.

5. When done customizing, select **Save** and then **Exit editing mode.**
6. To return the template to the default (Certified) version, use the **More actions** menu to select **Return to certified**.

Add Health Log Analytics data

Add a graph showing logs from Health Log Analytics (HLA) in a Service Observability dashboard.

About this task

You can add logs from HLA to your Service Observability dashboards. These charts display with data scoped to the selected service.

Before you begin

Role required: sn_sow_svcobs.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note: Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

   The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.
3. To do basic editing, such as rearranging, resizing, or deleting charts, follow the instructions for Edit in-line Platform Analytics dashboard elements.
4. To add a new chart with HLA data, follow these steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In Edit mode, select **Add new element** and choose **Data visualization**, select **New Visualization**, and then select **Line**.

b. In the **Data sources** section of the Configuration panel, select **Add data source**.

c. In the **Add data source** page, navigate to **Health Log Analytics** > **Log components**.

d. Enter a saved search or select a component and then optionally add conditions or a Lucene query, as described in Step 5 of Create log data dashboards and visualizations in Health Log Analytics.

e. Once the filter is correct, choose **Add this source**.
The data is added to the dashboard.

f. Use the controls in the **Data** section of the Configuration panel to further configure the chart.

5. When done customizing, select **Save** and then **Exit editing mode.**
6. To return the template to the default (Certified) version, use the **More actions** menu to select **Return to certified**.

Add Splunk Enterprise data to Service Observability dashboard templates

Add Splunk Enterprise data to charts on Service Observability dashboard templates when you want to view those metrics in context of Service Observability.

About this task

You can add metrics that are stored in Splunk Enterprise to your Service Observability dashboards. These charts display with data from the query you add to the chart.

Note: The results from these queries are not automatically scoped to the selected service.

Before you begin

You need a connection to your Splunk Enterpise instance. See Connect a Service Observability data source for more information.

Role required: sn_sow_svcobs.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Open the template in editing mode.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you're editing a certified template, select **Duplicate**.
- If you're editing a custom template, select **Edit**.

Note: Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.

3. To do basic editing, such as rearranging, resizing, or deleting charts, follow the instructions for Edit in-line Platform Analytics dashboard elements.
4. To add a new chart with MetricBase data, follow these steps:

   a. In Edit mode, select **Add new element** and choose **Data visualization**, select **New Visualization**, and then select **Line**.

   b. In the **Data sources** section of the Configuration panel, select **Add data source**.

   c. In the **Add data source** page, navigate to **Service Observability** > **Splunk Enterprise Metrics**, paste in a query from an existing Splunk chart, and then choose **Add this source**. The data is added to the dashboard.

   d. Use the controls in the **Data** section of the Configuration panel to select the metric and configure the query.

5. When done customizing, select **Save** and then **Exit editing mode.**
6. To return the template to the default (Certified) version, use the **More actions** menu to select **Return to certified**.

Use synthetic monitoring with Service Observability

Create a synthetic monitor to test your service's endpoints. Then display the results by customizing a Service Observability dashboard.

Overview of using synthetic monitoring with Service Observability

Synthetic monitoring simulates user transactions on a service's HTTP endpoints, enabling you to identify performance bottlenecks, help confirm up-time, and optimize user experiences. It continually calls a service's endpoint to test availability, response times, or the presence of a defined string in the response body. When a test fails the configured criteria, it can send an alert. For more information about synthetic monitoring, see Exploring synthetic monitoring.

The results of the monitor's test can be added to the Service Observability Overview dashboard and to the Observability Service dashboard. To view synthetic data related to a service on a dashboard, you first create a monitor that tests the endpoints of your service. Then you customize a dashboard template to add the monitor's test results.

Note: When you customize the template to add synthetic monitoring, you're adding it to all dashboards that use that template. Services that don't have a configured monitor display an empty chart.

1. Create a synthetic monitor to test a service.

   Install and configure synthetic monitoring and then create a monitor to continually test your service's endpoints using status code, response time, or response body as criteria.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Add synthetic monitor results to a Service Observability dashboard

   Customize a Service Observability dashboard template to add synthetic monitoring test results.

Create a synthetic monitor to test a service

Install and configure synthetic monitoring and then create a monitor for your service.

Before you begin

Your service must have an HTTP-reachable endpoint, configured as a CI in the HTTP(S) Endpoints [cmdb_ci_endpoint_http] table of the Configuration Management Database (CMDB).

Role required: n_sow_svcobs.admin, sn_sow_synthetics.synthetics_admin

Procedure

1. Install synthetic monitoring.
   See Install synthetic monitoring for more information.
2. If needed, create a location to run the monitor from.
   Monitors can be run locally from a ServiceNow Glide instance or from your environment using either a cluster of Agent Client Collector (ACC) agents or from a MID Server. If you choose to run them from your environment, you must create a location. See Create synthetic monitoring locations for more information.
3. Create the monitor.
   Follow the steps in Create and edit a synthetic monitor. Be sure to select the service you want to monitor as the **Related service CI**.

What to do next

Once you create the monitor, it begins running tests. View the results of those tests to verify the results before embedding synthetic monitoring into a Service Observability dashboard. For more information about viewing monitor test results, see Identifying system issues with synthetic monitoring.

Once you have expected results, move on to Add synthetic monitor results to a Service Observability dashboard.

Add synthetic monitor results to a Service Observability dashboard

Add a synthetic monitor to a dashboard in Service Observability by customizing an existing dashboard template.

About this task

Once you have created monitors for your services, you can display those results on your Service Observability dashboards by customizing the template to include a chart that queries synthetic monitoring. You can add synthetic monitoring to either the Overview dashboard or the Observability > Service dashboard.

> **Note:** When you customize the template to add synthetic monitoring, you're adding it to all dashboards that use that template. Services that don't have a configured monitor display an empty chart.

Before you begin

Role required: sn_sow_svcobs.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Open the template in editing mode.
   - If you're editing a certified template, select **Duplicate**.
   - If you're editing a custom template, select **Edit**.

   Note: Duplicating a certified template keeps you from overwriting it and also lets you reinstall it.

   The new dashboard is titled with the words `- Copy` appended. Use the pencil icon to change the dashboard name.
3. To add a new ServiceNow table, follow these steps:
   a. In Edit mode, select **Add new element** and choose **List**.
   b. In the **Configuration panel** in the **Data sources** section, choose **Add data source**.
   c. In the **Add data source** page, search for and select the synthetic monitoring data source, depending on the data you want to display.
   - If you want to display the status of all tests associated with a service, select the `Single API` [sn_synthetics_check_single_api] table.
   - If you want to display the results of a single synthetic test for a service, select the `Single API Result` [sn_synthetics_check_single_api_result] table.

   Note: Leave the **Follow filters** check box selected. This control enables the chart to display information for the selected service.
4. In the **Default display** section, choose **Add** to begin adding columns from the table to the new list.
5. Choose **Save** and then **Exit editing mode** to return to the dashboard.
   The synthetic monitoring data now appears on the dashboard.

What to do next

For detailed instructions about editing dashboards, see Edit in-line Platform Analytics dashboard elements.

Monitoring services and investigating issues

Operators use Service Observability to monitor the health of their services and to triage and manage incidents. They can view performance metrics from external observability monitoring systems in the context of an application service and its related CIs (Configuration Item).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview of using Service Observability

Service Observability can display metrics from an observability monitoring instance in context of a service. Along with metrics for the service and information about related CIs, Service Observability can infer entities related to the service, like a host or database, and display their metrics. This functionality gives an operator a more holistic view of what might be affecting performance.

The **Overview** tab on the Service Details page shows high-level performance metrics for the service and other contextual information such as open alerts or incidents affecting the service. The **Observability** tab displays more detailed metrics from the observability system for the service, along with metrics for inferred entities that are found through data mappings configured during setup. It also shows information about CIs related to those inferred entities. Instead of having to switch to an external tool, an operator can view those external metrics in the context of the Service Operations Workspace (SOW).

Note: Operators can also use the Analyze a dashboard in Service Observability and the Analyze service health in Service Observability Now Assist AI skills to generate an analysis for them.

- View overall service health

  In the **Overview** tab of the Service Details page in the SOW, view overall service health and related information, like alerts and changes.

- View service health metrics

  In the **Observability** tab, view more detailed service metrics, as well as metrics from related entities such as databases, hosts, and network components.

View overall service health

View overall service health and related events, like alerts and changes, with the **Overview** tab on the Service Details page in the SOW.

Before you begin

- For version 1.5, a service must be activated. For more information, see Activate teams and services.
- A data mapping must be configured. For more information, see Create and manage data mappings.

Role required: operator [snc_sow_svcobs.manager]

About this task

When you have been notified that a service is experiencing performance issues, you can begin your investigation with the **Overview** tab on the Service Details page.

Note: Operators can also use the Analyze a dashboard in Service Observability and the Analyze service health in Service Observability Now Assist AI skills to generate an analysis for them.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Services** list: Choose a service from the list.
- **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
- **List**: Navigate to **Application Services** > **Services** and select a service.
- **Express list** alert: Select a service from the **Impacted services** column.

The Service Details page opens and the Overview tab is displayed.

Trouble?
If charts are displaying error messages, see Chart error states.

2. Use the charts in the Overview section to help determine where there might be performance issues.
   The Overview section shows the basic rate, error, and duration (RED) metrics along with metrics for key transactions found on the service. Hover over a metric to view more details.

   Note: If more than one service is found with the same name, select an individual service using the **All services** drop-down menu.

3. Change the time period using the time picker.
4. Use the other charts on the page to view related information about the service, such as recent changes, open incidents, and trends for incidents and alerts.
   These charts help explain whether recurring incidents or alerts might be caused by performance issues on the service. For detailed information about using this page, refer to the corresponding Overview templates for your observability vendor described in Service Observability templates.

What to do next

To view more detailed metrics and metrics for related entities, select the **Observability** tab. For more information, see View service health metrics.

View service health metrics

View detailed metrics for a service, as well as metrics from related entities, such as databases and hosts, on the **Observability** tab in SOW.

About this task

The **Observability** tab on the Service details page displays metrics for related entities inferred from external observability instances, enabling you to view related metrics without having to leave the ServiceNow platform.

The metrics are grouped by the following entity types:

- Application metrics: Metrics associated with the application services
- Computer metrics: Metrics associated with the hosts of the service
- Databases: Metrics associated with databases used by the service

For example, say you have metrics from New Relic used to monitor services, databases, and hosts. Say that you also have an issue with the `checkout` service and want to view performance information and metrics related to that service. Service Observability can show you the service, database, and host metrics related to that service that are coming from New Relic, along with related CI information from the ServiceNow platform. Each entity type has its own dashboard and each metric and related CI information has its own chart.

Note: Operators can also use the Analyze a dashboard in Service Observability and the Analyze service health in Service Observability Now Assist AI skills to generate an analysis for them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- For version 1.5.0, a service must be activated. For more information, see Activate teams and services.
- A data mapping must be configured. For more information, see Create and manage data mappings.

Role required: operator [snc_sow_svcobs.manager]

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. Select the **Observability** tab.
   The **Observability** tab shows the related metrics and CI information available for the service. Use the navigation pane to view the entity dashboards.

   Note: If you don't see navigation options for an entity, then the metrics for that entity haven't been discovered or mapped.

3. Select an entity to view its dashboard.
   You can do the following with the charts:
   - Display metrics for a single entity by electing the **All [entity type]** drop-down list and choosing an entity.

     Note: If more than one entity returned metrics, charts display multiple lines with one line for each entity.

   - Display metrics from a different time period using the time picker. The default time period is the last hour.
   - Refresh the charts to the current time period of the last hour by selecting the **Refresh** button.
   - Hover over a point to view detailed information.

   For detailed information about using this page, refer to the corresponding Observability templates for your observability vendor described in Service Observability templates.

Service Observability reference

Reference topics provide additional information about administering and using Service Observability.

Components installed with Service Observability

Several types of components are installed with activation of the Service Observability plugin, including tables and user roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed

Role title [name]	Description	Contains roles
Operator/ Operations manager [snc_sow_svcobs.manager]	Triages incidents in the SOW. Views basic health metrics for a service and more detailed service metrics from related entities.	• sn_sow_srm.srm_responder • connection_admin • evt_mgmt_connector_instance_write
Service Observability admin [sn_sow_svcobs.admin]	Configures data sources and adds data mappings. Customizes dashboard templates.	• sn_sow_srm.srm_admin • connection_admin • evt_mgmt_connector_instance_write • sn_sow_itsm_admin.sow_admin_user

Store applications installed

The following are installed when you install Service Observability.

Store application [plugin]	Description
Service Observability UI [sn_service_obs_ui]	The Overview and Observability tabs in the Service Details page of the SOW.
Service Reliability Management	Service Reliability Management and Service Observability display service performance metrics together to give a holistic view into service health.
Platform Analytics	Enables customizing the dashboards.

Tables installed

Table	Description
Dashboard fragments [sn_sow_svcobs_dashboard_fragments]	Contains the definitions of dashboards in JSON format.
Service to data mapping configuration map [sn_sow_svcobs_svc_to_config_map]	Associates data mapping configurations with a registered service using the CMDB Group Contains Configuration Item [cmdb_group_contains_ci] table.
Data mapping configurations [sn_sow_svcobs_mapping_config]	Defines a data mapping configuration for a service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Data mapping configuration rules [sn_sow_svcobs_mapping_config_rules]	Defines a single tag-based mapping rule.
Observability data source [sn_sow_svcobs_data_source]	Defines a third-party observability vendor data source (an `http_connections`) that can be used to get telemetry for services.
Service Observability entity records [sn_sow_svcobs_entity_records]	Records configuration items and unknown monitored objects for entities that appear in dashboards.
Service Observability PA Dashboards sn_sow_svcobs_pa_dashboards	Contains reference information for customized dashboards.

Domain separation and Service Observability

Domain separation is supported for Service Observability. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Domain separation and Service Observability overview

Domain separation is present in all aspects of the synthetic monitoring application. Users belonging to a specific domain see only the data existing in their own domain.

How domain separation works in Service Observability

When data is separated by domains in Service Observability, users can only configure and see the observability data in their own domain. By default, all users and records are set to the parent domain unless the admin assigns them to a specific domain.

You define the domain-separated environment when you configure your data inputs. All relevant records and data processing in the Service Observability program flow reside in the same domain as the data input. The domain name of a data input appears in the Domain column that is displayed in the tables in your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability manages all aspects of the data, such as the data mappings and the data displayed on dashboards. When a property is changed, the new value affects new sources only in the specific domain.

Domain separation for service providers

Observability vendor entity mappings for Service Observability

Understand how Service Observability maps service, host, and database entities to your observability vendor resources.

Service Observability displays metrics from your observability vendor for services, hosts, databases, and network components on the Observability dashboards based on the key:value pairs in the mapping rules you create during configuration. Service Observability sends a request to the observability vendor using that mapping as a filter to find related entities. Any additional filtering needed to find the entities is noted in the following sections.

Amazon CloudWatch entity mapping

Resources are returned using the AWS `GetResources` API.

Service Observability entity category	Service Observability entity dashboard	AWS resource
Application	API Gateway - HTTP	API Gateway HTTP APIs
	API Gateway - REST	API Gateway REST APIs
	ELB	ELB application load balancers
	Lambda	Lambda functions
Compute	Host	EC2 instances
Databases	RDS	RDS database instances

AppDynamics entity mapping

Resources are returned using the value of the `entityName` property.

Service Observability entity category	Service Observability entity dashboard	AppDynamics resource
Application	Service	AppDynamics applications returned by the `/controller/rest/applications/` API
Compute	Host	Server nodes for applications returned by the `/controller/sim/v2/user/machines/keys/` API
Databases	MySQL	MySQL database instances returned by the `/controller/`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability entity category	Service Observability entity dashboard	AppDynamics resource
		`rest/databases/collectors/`
	PostgreSQL	MySQL database instances returned by the `/controller/rest/databases/collectors/`

Azure entity mapping

Resources are returned using the Azure `ResourceGraph` API.

Service Observability entity category	Service Observability entity dashboard	Azure resource
Application	Service	• `Microsoft.Compute/cloudServices` • `Microsoft.Web/sites`
Compute	Host	`Microsoft.Compute/virtualMachines`
Databases	MySQL	• `Microsoft.DBforMySQL/servers` • `Microsoft.DBforMySQL/flexibleServers`
	PostgreSQL	• Microsoft.DBforPostgreSQL/servers • `Microsoft.DBforPostgreSQL/flexibleServers`

Datadog entity mapping

Service Observability entity category	Service Observability entity dashboard	Datadog resource
Application	Service	Entities returned from the Software Catalog: List Entities API

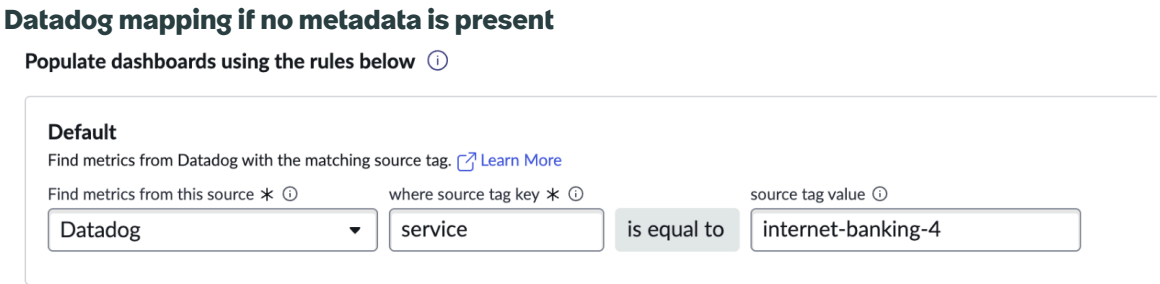
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability entity category	Service Observability entity dashboard	Datadog resource
Compute	Host	Hosts returned from the Hosts: List Hosts API
Databases	MySQL	Databases returned by filtering the `mysql.net.max_connections` metric, filtered by the provided key:value pair in the data mapping. **Note:** If your databases don't emit this metric, they aren't mapped.
	PostgreSQL	Databases returned by filtering the `postgresql.connections` metric, filtered by the provided key:value pair in the data mapping. **Note:** If your databases don't emit this metric, they aren't mapped.

Items of note:

- Service entities: The `Software Catalog list entities` API only returns data for services that include metadata. If you want to map services that don't include metadata, you must create a mapping using `service` as the tag and the name of the service as the value.

  For example, say you have a service named `internet-banking-4` that you want to use in a mapping and it doesn't contain metadata. You set up the mapping as shown in this screenshot.

- Default dashboard templates: The Requests, Errors, and Latency charts on the Overview and Observability dashboard templates are created using the Datadog `trace.http.request` trace metric. If a service isn't emitting that metric, no data is found. You can customize the template to use a different trace metric query. See Customize Service Observability dashboard templates for more information.

Dynatrace entity mapping

You can use either the Dynatrace Classic query or Grail (DQL) query, however both require separate data connections. For Grail queries, Service Observability first queries the Grail data source and if not found, will fall back to a Classic query.

Service Observability entity category	Service Observability entity dashboard	Dynatrace resource
Application	Service	Services
Compute	Host	Hosts
Databases	MySQL	MySQL database instances
	PostgreSQL	PostgreSQL database instances

New Relic entity mapping

Service Observability entity category	Service Observability entity dashboard	New Relic resource
Application	Service	Application services
Compute	Host	Hosts
Databases	MySQL	MySQL database instances
	PostgreSQL	PostgreSQL database instances

Prometheus entity mapping

Service Observability entity category	Service Observability entity dashboard	Prometheus resource
Application	Service	Applications
Compute	Host	Server nodes for applications
Databases	MySQL	MySQL database instances
	PostgreSQL	PostgreSQL database instances

SolarWinds entity mapping

Service Observability entity category	Service Observability entity dashboard	SolarWinds resource
Application	Service	Application services
Compute	Host	Hosts
Networking	Firewall	By default, data mappings find and display metrics using Palo Alto Firewall keys.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability entity category	Service Observability entity dashboard	SolarWinds resource
		If you want metrics from a different firewall, follow the instructions for customizing dashboard templates.
	Load Balancer	By default, data mappings find and display metrics using F5 Big-IP Load Balancer keys. If you want metrics from a different load balancer, follow the instructions for customizing dashboard templates.
	Interface	Network interfaces
	Other Network Devices	Other network devices, such as switches and routers

Items to note:

- You can use custom properties for key/value pairs in a data mapping.
- If you are using SolarWinds as an exception in your mapping to ingest networking metrics, using custom properties is optional. If you do use them, only entities with those properties in their metadata are returned. If you leave the tag and key values blank, all supported entities are returned.

Splunk entity mapping

Resources are returned using the Splunk Metric time series Metadata API. Service Observability searches for matching key:value pairs in custom properties and then falls back to searching dimensions.

The returned payload is then filtered by the presence of a specific metric in the metadata that corresponds with an entity type.

Service Observability entity category	Service Observability entity dashboard	Splunk Property or dimension	Splunk metric used for filtering
Application	Service	• Property: `sf_service` • Dimension fallback: `service.name`	`sf_metric:service.request`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability entity category	Service Observability entity dashboard	Splunk Property or dimension	Splunk metric used for filtering
Compute	Host	• Property: `host.name` • Dimension fallback: `host.id`	`sf_metric:disk.summary_util`
Databases	MySQL	• Property: `mysql.instance.name` • Dimension fallback: `mysql.instance.endpoint`	`sf_metric:mysql.threads`
	PostgreSQL	Not supported	

Zabbix entity mapping

In Zabbix, every monitored entity is categorized as a host. To enable differentiation between entities, Service Observability searches for keywords in attributes on metadata tags, including host tags, inherited tags, templates, and host groups. Any Zabbix host that does not match a keyword are classified and displayed as Host entities.

The following table shows the keywords used to find distinct entities. Keywords are case insensitive.

Service Observability entity category	Service Observability entity dashboard	Metadata keyword
Application	Service	• Apache • nginx • Kubernetes • cluster • application
Compute	Host	Any non-matching keyword
Databases	MySQL	• Mysql • Msql • mariadb
	PostgreSQL	• Postgres • Psql

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability entity category	Service Observability entity dashboard	Metadata keyword
		• Pgsql • Postgresql
Networking	Firewall	• Firewall • palo-alto • palo alto • pan • fortigate • fortinet • fgt • sophos • sonicwall • watchguard • zscaler By default, data mappings find and display metrics using Palo Alto Firewall keys. If you want metrics from a different firewall, follow the instructions for customizing dashboard templates.
	Load Balancer	• Loadbalancer • load_balancer • alb • nlb • f5 • netscaler • big-ip • bigip By default, data mappings find and display metrics using F5 Big-IP Load Balancer keys. If you want metrics from a different load balancer, follow the instructions for customizing dashboard templates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Observability entity category	Service Observability entity dashboard	Metadata keyword
	Other Network devices	• Network • router • rt • gateway • gw • juniper • junos • switch • catalyst • nexus • arista

Item to note:

The default dashboards for each entity type display metrics using Zabbix standard keys. If your implementation uses custom item keys, you need to customize your dashboard templates accordingly.

Advanced query support for AWS and Azure

Understand how to create advanced queries for Service Observability dashboard charts.

Advanced queries in Service Observability support most vendor-specific query languages. Simply copy a query from the observability chart and paste it into the Advanced query field in Service Observability. However, queries to AWS and Azure must be JSON-formatted and follow the guidelines outlined in this topic.

Note: As of version 1.10, you can import charts directly from AWS and Azure. See Edit observability data charts on Service Observability dashboard templates for more information.

AWS advanced queries

Data from AWS is accessed using the `GetMetricData` API. Queries can be either a direct request in JSON format to that API or they can be in the form of a `DashboardBody` metric widget. For example, you can use the widget representation for a chart that exists on an AWS CloudWatch dashboard.

Example: Direct GetMetricData request

The following example shows a `GetMetricData` JSON query for a chart that displays the average CPU Utilization for an ELB instance.

```
{

    "StartTime": 1637061900, // can be replaced with “${START}”
    "EndTime": 1637074500, // can be replaced with “${END}”
    "MetricDataQueries": [
        {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            "Expression": "SELECT AVG(CPUUtilization) FROM
 SCHEMA(\"AWS/EC2\", InstanceId)",
            "Id": "q1",
            "Period": 300,
            "Label": "Cluster CpuUtilization"
        },
        {
            "Id": "m1",
            "Label": "Unhealthy Behind Load Balancer",
            "MetricStat": {
                "Metric": {
                    "Namespace": "AWS/ApplicationELB",
                    "MetricName": "UnHealthyHostCount",
                    "Dimensions": [
                        {
                            "Name": "LoadBalancer",
                            "Value":
 "app/EC2Co-EcsEl-EXAMPLE69Q/fdd2210e799e4376" // can be
 replaced with “${ENTITIES}” or “${ENTITIES_ELB}”
                        }
                    ]
                },
                "Period": 300,
                "Stat": "Average"
            }
        }
    ]
}
```

Example: Copied source for a single object in an AWS CloudWatch dashboard

This example shows the JSON copied directly from a single object in the widgets list of the Source view for a CloudWatch dashboard.

```
{
  "type": "metric",
  "x": 9,
  "y": 0,
  "width": 15,
  "height": 5,
  "properties": {
    "view": "timeseries",
    "metrics": [
      [ "AWS/ApplicationELB", "RequestCountPerTarget",
 "TargetGroup", "targetgroup/api-tg/1e3dc9z72fe21ca2",
 "AvailabilityZone", "us-west-1a" ],
      ["...", "targetgroup/api-tg-cs/82a1db5f950073e1", ".",
 "." ]
    ],
    "region": "us-west-1"
  }
}
```

Both types of queries can use template variables to represent a set of entities or the start and end time selected in the UI. For example, instead of querying for a single ELB instance, you can replace the `Value` field for the `LoadBalancer` dimension with `${ENTITY_ELB}`. The

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

query is run against each ELB instance associated with the selected service in the Service Observability UI. The chart displays a time series for each one.

Note: JSON objects copied from the source of a CloudWatch dashboard don't include explicit time fields. The values from the time picker in the Service Observability UI are used automatically.

Template variables

AWS field	Template variable
`Dimensions[n].Value`	• `ENTITIES` • `ENTITIES_HOST` • `ENTITIES_LAMBDA` • `ENTITIES_API_GATEWAY_HTTP` • `ENTITIES_API_GATEWAY_REST` • `ENTITIES_ELB` • `ENTITIES_RDS` The `Dimensions[n].Value` field must be a resource identifier key.
`StartTime`	`START`
`EndTime`	`END`

Azure advanced queries

You run an advanced query for an Azure-based chart by copying the source from the Azure UI and pasting it in the **Advanced query** field.

To copy the source:

1. In the Azure UI, export and download the dashboard.
2. Copy the JSON for a single chart. Charts are located at `properties.lenses[i].parts[j].metadata.settings.content.options.chart`.
3. Paste the JSON into the query field. The JSON must include at least the following:

```
```
{
“metrics”: [
  “name”: string,
  “resourceMetadata”: {
    “id”: string
    }
  ]
}
```
```

The `id` field must be either an Azure resource ID or a template variable.

Service Observability template variables

Understand the template variables that you can use in your queries when editing Service Observability dashboards and charts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can use the following template variables in your query. Variables enable the query to be used for multiple services, hosts, and database instances, as well as for the time period currently selected for the dashboard.

Note: Amazon CloudWatch uses slightly different template variables. See Advanced query support for AWS and Azure for more information.

Aside from the variables listed below, you can also use any tag key used in the chart's data mapping as a template variable.

Template variables

Variable	Description
`{$ENTITIES_HOST}`	Returns metrics for the selected host
`{$ENTITIES_MYSQL}`	Returns metrics for the selected MySQL instance
`{$ENTITIES_POSTGRESQL}`	Returns metrics for the selected PostgreSQL instance
`{$ENTITIES_SERVICE}`	Returns metrics for the selected service.
`{$ENTITIES}`	Returns metrics for the selected entity; either service, host or database.
`{$START_TIME}`	Returns metric time series using the selected start time.
`{$END_TIME}`	Returns metric time series using the selected end time.

Example query

Let's say you're using NewRelic and you create a data mapping that maps the key `service` to the value `checkout-service`.

A simple query built using the query builder might look like this:

```
rate(count(apm.service.transaction.duration), 1 minute
```

It would return the rate of transactions for the `checkout-service` service.

Instead you might use a full vendor query like this:

```
SELECT rate(count(apm.service.transaction.duration), 1
 minute) as 'Web throughput' FROM Metric WHERE (entity.guid
 = 'NDc2NDMyNXxBUE18QVBQTElDQVRJT058MTA3NjIyODQwMw') AND
 (transactionType = 'Web') LIMIT MAX SINCE 30 minutes ago
 TIMESERIES UNTIL now
```

It would return the duration for the hard-coded `NDc2NDMyNXxBUE18QVBQTElDQVRJT058MTA3NjIyODQwMw` entity from the last 30 minutes.

To create a query that would return the time series for any selected service at any time period, you can replace the entity and times with template variables:

```
SELECT average(convert(apm.service.transaction.duration, unit,
 'ms')) as metricValue,
 average(convert(apm.service.transaction.duration, unit, 'ms'))
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
- 100 as loop FROM Metric WHERE entity.guid IN (${ENTITIES})
FACET entity.guid, entity.name SINCE ${START} UNTIL ${END}
TIMESERIES LIMIT 25
```

Service Observability templates

View the templates for your observability vendor to understand the default dashboards provided by Service Observability.

See Customize Service Observability dashboard templates for information about customizing these templates.

Amazon CloudWatch templates for Service Observability

Templates used to create Amazon CloudWatch dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Amazon CloudWatch Overview tab for Service Observability

Information that is displayed on the Amazon CloudWatch **Overview** tab of the Service Details page in the SOW.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Invocations	Aggregate rate of transactions through the service.	AWS
Errors	Number of transactions that have an error.	AWS
Duration	Aggregate duration of transactions through the service, in milliseconds.	AWS

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related Configuration Items (CIs) that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB

Active Connections	Number of connections currently used by the service.	Azure
Aborted Connections	Number of connections from the service terminated by the database	Azure
MySQL Uptime	Total time in seconds that this MySQL instance has been running since its last restart.	Azure
Slow Queries	Number of queries that take longer than the specified threshold to execute. This threshold is typically defined by the `long_query_time` parameter in MySQL.	Azure

PostgreSQL

Chart	Description	Data source
Storage %	Percentage of storage currently being consumed by the service.	Azure
CPU %	Percentage of CPU currently being consumed by the service.	Azure
Memory %	Percentage of memory currently being consumed by the service.	Azure

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PostgreSQL (continued)

Chart	Description	Data source
Active Connections	Number of connections currently used by the service.	Azure
Aborted Connections	Number of connections from the service terminated by the database	Azure
Succeeded Connections	Number of successful connections from the service to the database.	Azure
Deadlocks	Number of deadlocks encountered by the service.	Azure
Is Database Alive	`1` if database is up, `0` if it is down.	Azure
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

Cisco ThousandEyes templates for Service Observability

Templates used to create Cisco ThousandEyes synthetics dashboard in Service Observability. You can edit this template as needed.

See Customize Service Observability dashboard templates for more information.

Cisco ThousandEyes Observability tab for Service Observability

Dashboard and charts on the Cisco ThousandEyes Observability tab of the Service Details page in the SOW.

Synthetic Tests dashboard

This dashboard displays synthetic monitoring metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Network Test

Chart	Description	Data source
Latency	Network latency measurements over time.	Cisco ThousandEyes
Jitter	Variation in latency measurements over time.	Cisco ThousandEyes
Packet loss %	Percentage of network packets lost during transmission.	Cisco ThousandEyes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTTP Test

Chart	Description	Data source
Throughput	HTTP throughput measurements showing data transfer rates.	Cisco ThousandEyes
Response Time	HTTP response time measurements for the monitored service.	Cisco ThousandEyes

Page Load Test

Chart	Description	Data source
Time to complete	Time required to fully load the monitored page.	Cisco ThousandEyes
Error Count	Number of errors encountered during page load tests.	Cisco ThousandEyes

Datadog templates for Service Observability

Templates used to create Datadog dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Datadog Overview tab for Service Observability

Information that is displayed on the Datadog**Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Request	Aggregate rate of transactions through the service.	Datadog
Errors	Percent of transactions that have an error.	Datadog
Latency	Aggregate duration of transactions through the service, in milliseconds.	Datadog

Transactions charts

The Transactions charts show metrics for specific key transactions on the service. The key transactions are determined by your observability system configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart name	Description	Data source
Requests	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	Datadog
Errors	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	Datadog
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	Datadog

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

Datadog Observability tab for Service Observability

Dashboard and charts on the Datadog Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service KPIs

Chart	Description	Data source
Requests	Aggregate rate of requests through the service.	Datadog
Errors	Number of transactions that have an error.	Datadog
Latency	Aggregate duration of transactions through the service, in milliseconds.	Datadog

Top Transactions

Chart	Description	Data source
Requests	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	Datadog
Errors	Each line represents the number of errors on a key transaction in the service. Hover over a point to view the different transaction names.	Datadog
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	Datadog

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU Utilization	Percent of the host processing power being consumed.	Datadog
Memory Utilization	Percent of memory the host is using.	Datadog
Disk Utilization	Percent of disk space being used.	Datadog
All Active Servers	Information for all hosts the service is actively using. Select a host link to view more detailed information.	CMDB

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Host (continued)

Chart	Description	Data source
All Active VM Instances	Information for all virtual machines (VM) the service is actively using. Select a VM link to view more information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
Max Connections	Maximum number of concurrent connections that can be established with the MySQL database server.	Datadog
Failed Connections	Number of failed attempts to connect to the MySQL server.	Datadog
Slow Queries Rate	Number of database queries that have been categorized as slow by Datadog.	Datadog
Data Reads	Number of read operations performed on the MySQL database.	Datadog
Data Writes	Number of write operations performed on the MySQL database.	Datadog
Cache Utilization	Percentage of the cache memory being used by the MySQL database.	Datadog
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

PostgreSQL

Chart	Description	Data source
Connections	Total number of connections to the database server, including all connection states such as active, idle, and others.	Datadog
Connections Used	Number of connections to the database used by this service.	Datadog
Active Waiting Queries	Number of queries in the queue waiting to be executed.	Datadog
Deadlocks	Number of deadlocks encountered by the service.	Datadog
Rollbacks	Number of transactions rolled back by the service.	Datadog
Buffer Hits	Number of times disk blocks were found in the buffer cache, so that a read wasn't necessary.	Datadog
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dynatrace templates for Service Observability

Templates used to create Dynatrace dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Dynatrace Overview tab for Service Observability

Information that is displayed on the Dynatrace **Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Rate	Aggregate rate of transactions through the service.	Dynatrace
Error %	Percent of transactions that have an error.	Dynatrace
Latency	Aggregate duration of transactions through the service, in milliseconds.	Dynatrace

Key Transactions charts

The Transactions charts show metrics for specific key transactions on the service. The key transactions are determined by your observability system configuration.

Chart name	Description	Data source
Rate	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	Dynatrace
Error %	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	Dynatrace
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	Dynatrace

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

Dynatrace Observability tab for Service Observability

Dashboard and charts on the Dynatrace Observability tab of the Service Details page in the SOW.

Dynatrace dashboards are the same for both managed and SaaS environments.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Service Basic metrics

Chart	Description	Data source
Rate	Aggregate rate of transactions through the service.	Dynatrace
Error %	Percent of transactions that have an error.	Dynatrace
Latency	Aggregate duration of transactions through the service, in milliseconds.	Dynatrace
Client error rate	Rate of errors the service clients experienced.	Dynatrace
Client throughput	Rate of client requests for this service.	Dynatrace

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Basic metrics (continued)

Chart	Description	Data source
Client response time	Response time for client requests on this service, in milliseconds.	Dynatrace
Total DB connections	Number of databases that this client has connections to. **Note:** Not available with Grail (DQL) queries.	Dynatrace
DB connection errors	Number of errors received by the client when trying to access databases. **Note:** Not available with Grail (DQL) queries.	Dynatrace
Time spent in database calls	Duration of requests to databases, in milliseconds. **Note:** Not available with Grail (DQL) queries.	Dynatrace

Service Transactions

Chart	Description	Data source
Key Request Count	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	Dynatrace
Key Request Error %	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	Dynatrace
Key Request Response Time	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	Dynatrace

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU utilization	Percent of the host processing power being consumed.	Dynatrace
Memory utilization	Percent of memory the host is using.	Dynatrace
Disk utilization	Percent of disk space being used.	Dynatrace
Network RX - bytes received	Count of bytes received.	Dynatrace
Network TX - bytes transferred	Count of bytes sent.	Dynatrace
All Active Servers	Information for all hosts the service is actively using. Select a host link to view more detailed information.	CMDB
All Active VM Instances	Information for all virtual machines (VM) the service is actively using. Select a VM link to view more information.	CMDB

Process

Chart	Description	Data source
CPU Usage	Percent of the host processing power being consumed.	Dynatrace
Memory Usage	Percent of memory the host is using.	Dynatrace
Requests	Rate of requests per second	Dynatrace
Throughput	Size of requests, in megabytes per second.	Dynatrace
Latency	Aggregate duration of transactions, in milliseconds.	Dynatrace

Process Group

Chart	Description	Data source
CPU Usage	Percent of the host processing power being consumed.	Dynatrace
Memory Usage	Percent of memory the host is using.	Dynatrace
Requests	Rate of requests per second	Dynatrace
Throughput	Size of requests, in megabytes per second	Dynatrace
Latency	Aggregate duration of transactions, in milliseconds.	Dynatrace
All Active Servers	Information for all hosts the service is actively using. Select a host link to view more detailed information.	CMDB

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
CPU utilization	Percent of the database's processing power being consumed.	Dynatrace
Memory utilization	Percent of memory the database is using.	Dynatrace
Availability	Percent of time the database is available.	Dynatrace
Connections	Number of connections to the database.	Dynatrace
Slow queries	Number of database queries that have been categorized as slow by Dynatrace.	Dynatrace
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

PostgreSQL

Chart	Description	Data source
Deadlocks	Number of deadlocks detected in this database.	Dynatrace
Committed Transactions	Number of transactions in this database that have been committed.	Dynatrace
Active Backend Connections	Number of backends currently connected to this database.	Dynatrace
Query Conflicts	Number of queries cancelled due to conflicts with recovery in this database.	Dynatrace
Active Time	Time spent executing SQL statements in this database.	Dynatrace
Fatal Sessions	Number of database sessions to this database that were terminated by fatal errors	Dynatrace
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

New Relic templates for Service Observability

Templates used to create New Relic dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

New Relic Overview tab for Service Observability

Information that is displayed on the New Relic **Overview** tab of the Service Details page in the SOW.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Rate	Aggregate rate of transactions through the service.	New Relic
Error %	Percent of transactions that have an error.	New Relic
Latency	Aggregate duration of transactions through the service, in milliseconds.	New Relic

Transactions charts

The Transactions charts show metrics for specific key transactions on the service. The key transactions are determined by your observability system configuration.

Chart name	Description	Data source
Rate	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	New Relic
Error %	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	New Relic
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	New Relic

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB

MySQL (continued)

Chart	Description	Data source
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

PostgreSQL

Chart	Description	Data source
Scheduled Checkpoints	Average number of scheduled checkpoints that were performed.	New Relic
Buffers Written for Checkpoint	Average number of buffers written during checkpoints.	New Relic
Buffers Written by Background Writer	Average number of buffers written by the background writer.	New Relic
Buffers Allocated	Average number of buffers allocated.	New Relic
Checkpoint Write Time	Time in milliseconds spent writing files to disk.	New Relic
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

Prometheus templates for Service Observability

Templates used to create Prometheus dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Prometheus Overview tab for Service Observability

Information that is displayed on the Prometheus **Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Request Rate	Aggregate rate of transactions through the service, per second.	Prometheus
Error %	Percent of transactions that have an error.	Prometheus
Average Response Time	Average duration of transactions through the service, in seconds.	Prometheus

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service KPIs (continued)

Chart	Description	Data source
Throughput	Count of successful transactions, per second.	Prometheus
Active Requests	Count of current in-flight requests to the service.	Prometheus
Response Time (95th Percentile)	95th percentile response time for HTTP requests, in seconds.	Prometheus
Average Request Size	Average size of requests to the service, in bytes.	Prometheus
Average Response Size	Average size of responses from the service, in bytes.	Prometheus

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU utilization	Percent of the host processing power being consumed.	Prometheus
Memory utilization	Percent of memory the host is using.	Prometheus
Disk utilization	Percent of the host disk being used.	Prometheus
All Active Servers	Information for all servers the service is actively using. Select a host link to view more detailed information.	CMDB
All Active VM Instances	Information for all virtual machines the service is actively using. Select a host link to view more detailed information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
Thread Utilization %	Percent of the database's threads being consumed.	Prometheus
Queries Per Second	Number of queries made to the database by the service, per second.	Prometheus
InnoDB Memory %	Percent of InnoDB buffer pool being consumed.	Prometheus

MySQL (continued)

Chart	Description	Data source
Active Connections	Number of connections to the database.	Prometheus
Aborted Connections	Rate of aborted connections.	Prometheus
Uptime	Average number of hours the database has been available.	Prometheus
Inbound Network Traffic	Number of bytes per second of inbound traffic to the database.	Prometheus
Outbound Network Traffic	Number of bytes per second of outbound traffic to the database.	Prometheus
Slow Queries	Rate of slow queries detected by MySQL, per second.	Prometheus
All MySQL Instances	Information for all databases the service is actively using. Select a database link to view more detailed information.	CMDB

PostgreSQL

Chart	Description	Data source
Active Sessions	Count of sessions currently active.	Prometheus
Idle Sessions	Count of idle sessions.	Prometheus
Committed Transactions	Total committed transactions since server start.	Prometheus
Failed Transactions	Total rolled back transactions since server start.	Prometheus
Deadlocks	Total deadlocks detected since server start.	Prometheus
Locks Count	Current count of locks given out by the database.	Prometheus
Cache Hit Ratio	Percentage of database requests that can be served by the cache.	Prometheus
All PostgreSQL Instances	Information of all databases the service is actively using. Select a database link to view more detailed information.	CMDB

SolarWinds templates for Service Observability

Templates used to create SolarWinds dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

SolarWinds Overview tab for Service Observability

Information that is displayed on the SolarWinds **Overview** tab of the Service Details page in the SOW.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Chart name	Description	Data source
Rate	Aggregate rate of transactions through the service.	SolarWinds
Error %	Percent of transactions that have an error.	SolarWinds
Latency	Aggregate duration of transactions through the service, in milliseconds.	SolarWinds

Transactions charts

The Transactions charts show metrics for specific key transactions on the service. The key transactions are determined by your observability system configuration.

Chart name	Description	Data source
Rate	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	SolarWinds
Error %	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	SolarWinds
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	SolarWinds

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart name	Description	Data source
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

SolarWinds Observability tab for Service Observability

Dashboard and charts on the SolarWinds Observability tab of the Service Details page in the SOW.

Note: The X axis on SolarWinds charts use Universal Time Code (UTC) instead of the user's timezone.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Service basic metrics

Chart	Description	Data source
Rate	Aggregate rate of transactions through the service, per minute.	SolarWinds
Latency	Aggregate duration of transactions through the service, in milliseconds.	SolarWinds
Time spent in database calls	Duration of requests to databases, in milliseconds.	SolarWinds
Time spent in database queries	Time spent querying the database, in milliseconds.	SolarWinds
Database throughput	Rate of database requests for this service per minute.	SolarWinds

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU utilization	Percent of the host processing power being consumed.	SolarWinds

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Host (continued)

Chart	Description	Data source
Memory utilization	Percent of memory the host is using.	SolarWinds
Disk utilization	Percent of disk space being used.	SolarWinds
All Active Servers	Information for all hosts the service is actively using. Select a host link to view more detailed information.	CMDB
All Active VM Instances	Information for all virtual machine instances the service is actively using. Select a VM link to view more detailed information.	CMDB

Database dashboards

Database metrics are currently not supported for SolarWinds.

Networking dashboards

These dashboards display metrics for network devices related to the service.

By default, the Firewall dashboard displays Palo Alto metrics and the Load Balancer dashboard displays F5 Big-IP metrics.

Firewall

Chart	Description	Data source
CPU Utilization	Percentage of CPU utilization on the firewall device.	SolarWinds
Session Utilization	Percentage of session capacity currently in use.	SolarWinds
Drop Rate	Percentage of network packets/connections that the device has intentionally blocked or failed to process.	SolarWinds
Availability	Percentage of time the firewall is available.	SolarWinds
Recent Changes	Table displaying recent configuration changes made to the firewall device.	CMDB
Current Open Incidents	Table listing active incidents affecting the firewall device.	CMDB
All Active Alerts	Table listing all active alerts related to the firewall device.	CMDB

Load Balancer

Chart	Description	Data source
Connection Utilization	Percentage of available connections currently in use.	SolarWinds
Inbound Rate	Rate of bytes per second received from the configured nodes.	SolarWinds

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Load Balancer (continued)

Chart	Description	Data source
Outbound Rate	Rate of bytes per second sent to the configured nodes.	SolarWinds
Pool Member Status	Pool Availability Status: • 0: None (no status available) • 1: Available, all members healthy • 2: Degraded, some members down • 3: Unavailable, all members down • 4: Unknown, status cannot be determined	SolarWinds
Error	Percentage of inbound errors on the load balancer.	SolarWinds
Latency	Aggregate duration of transactions through the load balancer, in milliseconds.	SolarWinds

Interface

Chart	Description	Data source
Error	Percentage of inbound errors on the interface.	SolarWinds
Traffic	Rate in bytes per second of traffic through the interface.	SolarWinds
Bandwidth Utilization	Percentage of available bandwidth.	SolarWinds

Other Networking Devices

Chart	Description	Data source
CPU Utilization	Percentage of CPU utilization on the networking device.	SolarWinds
Packet Loss	Percentage of packets dropped.	SolarWinds
Error	Percentage of errors on the networking device.	SolarWinds

Splunk Observability templates for Service Observability

Templates used to create Splunk Observability dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Splunk Observability Overview tab for Service Observability

Information that is displayed on the Splunk **Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart name	Description	Data source
Rate	Aggregate rate of transactions through the service.	Splunk
Error %	Percent of transactions that have an error.	Splunk
Latency	Aggregate duration of transactions through the service, in milliseconds.	Splunk

Key Transactions charts

The Key Transactions charts show metrics for specific key transactions on the service. The key transactions are determined by your observability system configuration.

Chart name	Description	Data source
Rate	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	Splunk
Error %	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	Splunk
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	Splunk

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
All Active alerts	Listing of active alerts that affect this service.	CMDB

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Splunk Observability tab for Service Observability

Dashboard and charts on the Splunk Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

Service KPIs

Chart	Description	Data source
Rate	Aggregate rate of transactions through the service, per minute.	Splunk
Error %	Percent of transactions that have an error.	Splunk
Latency	Aggregate duration of transactions through the service, in milliseconds.	Splunk

Service top transactions

Chart	Description	Data source
Rate	Each line represents the throughput of a key transaction through the service. Hover over a point to view the different transaction names.	Splunk
Error %	Each line represents the percentage of errors on a key transaction in the service. Hover over a point to view the different transaction names.	Splunk
Latency	Each line represents the response time for a key transaction on the service. Hover over a point to view the different transaction names.	Splunk

Compute dashboard

This dashboard displays metrics for hosts related to the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Host

Chart	Description	Data source
CPU utilization	Percentage of CPU currently being consumed by the service.	Splunk
Memory utilization	Percentage of memory currently being consumed by the service.	Splunk
Disk utilization	Percentage of disk space currently being consumed by the service.	Splunk
All Active Servers	Information for all hosts the service is actively using. Select a host link to view more detailed information.	CMDB
All Active VM Instances	Information for all VM instances the service is actively using. Select a host link to view more detailed information.	CMDB

Database Dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
Queries Per Second	Number of queries per second the service is sending to the database.	Splunk
Row Locks Rate	Frequency at which row locks are encountered by transactions from this service.	Splunk
Buffer Pool Usage	Usage of the buffer pool to access cached data by this service.	Splunk
Table I/O Wait Time	Time in milliseconds that the database is waiting on Input/Output operations on tables sent by this service to complete.	Splunk
Threads	Number of threads used by this service	Splunk
Uptime	Amount of time in (?) that the database has been running since its last restart.	CMDB

Zabbix templates

Templates used to create Zabbix dashboards in Service Observability. You can edit these templates as needed.

See Customize Service Observability dashboard templates for more information.

Zabbix Overview tab for Service Observability

Information that is displayed on the Zabbix **Overview** tab of the Service Details page in the SOW.

KPIs section

The KPIs section displays basic performance metrics for the service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart name	Description	Data source
CPU Usage (System)	Displays the system CPU usage percentage over time.	Zabbix
CPU Load	Shows the CPU load average for the system.	Zabbix
Running Processes	Number of processes currently running on the system.	Zabbix
Available Memory (%)	Percentage of memory currently available on the system.	Zabbix

Contextual information section

The Recent changes table shows changes made to the system that might have an impact on the service. This data comes from the related configuration items in the CMDB.

Status indicators section

The Status indicators section displays charts for related CIs that might be affecting the service.

Chart name	Description	Data source
SLO Error Budget	Information about your current error budget for this service, as configured in Service Reliability Management (SRM). For more information on error budgets, see Create SLOs, SLIs, and error budget policies.	CMDB
Systems impacted	Services or service offerings that have a relationship to the selected service.	CMDB
Open incidents last 30 days	Day-by-day occurrence of open incidents affecting this service over the last month.	CMDB
Open alerts last 30 days	Day-by-day occurrence of alerts affecting this service over the last month.	CMDB
Current open incidents	Listing of active incidents that affect this service.	CMDB
Current open alerts	Listing of active alerts that affect this service.	CMDB

Zabbix Observability template for Service Observability

Dashboard and charts on the Zabbix Observability tab of the Service Details page in the SOW.

Application dashboard

This dashboard displays performance metrics for the selected service.

Note: If the dashboards have been customized, they might not reflect the information shown on this page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service

Chart	Description	Data source
CPU Usage (System)	CPU usage percentage over time.	Zabbix
CPU Load	CPU load for the system: rolling one minute average.	Zabbix
Running Processes	Number of processes currently running on the system.	Zabbix
Available Memory (%)	Percentage of memory currently available on the system.	Zabbix

Compute dashboard

This dashboard displays metrics for hosts related to the service.

Host

Chart	Description	Data source
CPU Load	CPU load average for the host on a rolling one minute average.	Zabbix
CPU Idle Time	Percentage of time the CPU is idle.	Zabbix
Memory Available	Percentage of available memory on the host.	Zabbix
Running Processes	Number of processes currently running on the host.	Zabbix
Network RX	Network data received in bytes per second.	Zabbix
Network TX	Network data transmitted in bytes per second.	Zabbix
All Active Servers	Information for all active server instances with their operating system, CPU count, RAM, disk space, and support group information.	CMDB
All Active VM Instances	Information for all virtual machine instances the service is actively using. Select a VM link to view more detailed information.	CMDB

Database dashboards

These dashboards display metrics for databases related to the service.

MySQL

Chart	Description	Data source
Active Connections	Number of active database connections.	Zabbix
Queries Per Second	Rate of database queries executed per second.	Zabbix

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MySQL (continued)

Chart	Description	Data source
Rows Deleted By Queries Per Second	Number of rows deleted by queries per second.	Zabbix
Rows Returned By Queries Per Second	Number of rows returned by queries per second.	Zabbix
Rows Inserted By Queries Per Second	Number of rows inserted by queries per second.	Zabbix
Rows Updated By Queries Per Second	Number of rows updated by queries per second.	Zabbix
All MySQL Instances	Table listing all MySQL database instances with their operational status, class, and support group information.	CMDB

PostgreSQL

Chart	Description	Data source
Number of Connections	Total number of active database connections.	Zabbix
Number of Waiting Connections	Number of database connections currently waiting.	Zabbix
Connected Backends	Number of connected backend processes.	Zabbix
Rows Returned By Queries Per Second	Number of rows returned by queries per second.	Zabbix
Rows Inserted By Queries Per Second	Number of rows inserted by queries per second.	Zabbix
Rows Deleted By Queries Per Second	Number of rows deleted by queries per second.	Zabbix
All Postgresql Instances	Table listing all PostgreSQL database instances with their operational status, discovery source, category, subcategory, and support group information.	CMDB

Networking dashboards

These dashboards display metrics for network devices related to the service.

By default, the Firewall dashboard displays Palo Alto metrics and the Load Balancer dashboard displays F5 Big-IP metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Firewall

Chart	Description	Data source
CPU Utilization	Percentage of CPU utilization on the firewall device.	Zabbix
Session Utilization	Percentage of session capacity currently in use.	Zabbix
Memory Utilization	Percentage of memory utilization on the firewall device.	Zabbix
Availability	Uptime and availability status of the firewall device: • 0: Unavailable • 1: Available	Zabbix
Recent Changes	Table displaying recent configuration changes made to the firewall device.	CMDB
Current Open Incidents	Table listing active incidents affecting the firewall device.	CMDB
All Active Alerts	Table listing all active alerts related to the firewall device.	CMDB

Load Balancer

Chart	Description	Data source
Current Connections (To Node)	Number of current connections from server-side to the configured nodes.	Zabbix
Requests TX	Rate of bytes per second sent to server-side from the configured nodes.	Zabbix
Requests RX	Rate of bytes per second received server-side from the configured nodes.	Zabbix
Pool Availability State	Pool Availability Status: • 0: None (no status available) • 1: Available, all members healthy • 2: Degraded, some members down • 3: Unavailable, all members down • 4: Unknown, status cannot be determined	Zabbix
Packets TX	Number of packets transmitted per second from the server-side to the configured nodes.	Zabbix
Packets RX	Number of packets received per second by the server-side from the configured nodes.	Zabbix
Inbound Error %	Percentage of inbound errors on the load balancer.	Zabbix
Outbound Error %	Percentage of outbound errors on the load balancer.	Zabbix

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Other Networking Devices

Chart	Description	Data source
CPU Utilization	Percentage of CPU utilization on the networking device.	Zabbix
Availability	Uptime and availability status of the networking device: • 0: Unavailable • 1: Available	Zabbix
Inbound Error %	Percentage of inbound errors on the networking device.	Zabbix
Outbound Error %	Percentage of outbound errors on the networking device.	Zabbix
Inbound Traffic	Amount of inbound network traffic in bytes per second.	Zabbix
Outbound Traffic	Amount of outbound network traffic in bytes per second.	Zabbix

Service Observability data mapping form

Field descriptions for the Observability data mapping form. Use this form to map activated services in Service Observability to metrics from your observability instance. Each service can be mapped only once, but can contain exceptions to include all related entities.

Field	Description
Mapping name	Name for the mapping. The name should be descriptive so that users understand where the data is coming from.
Services	Service to use for this mapping. Each service can be mapped only once. For version 1.5.0 of Service Observability, services must be activated to be mapped. To activate a service, see Activate teams and services.
Default	
Find metrics from this source	Existing data connection to use for metrics. To add a connection, see Connect a Service Observability data source.
where source tag key	Tag key that you want to map to the activated service. If you use more than one tag to represent a service, you can create an exception. For example, most tags use `service_name` except for database metrics, which use `service`.
source tag value	Value that represents the service name. Values can be strings or a variable that represents fields on the CI for the service. You can use variables on your observability data as the value to map multiple entities at once. For example, if your observability data uses the `$service_name` variable and you enter that as the **source tag value**, all services using that value are mapped.
Exceptions	
For entity type	Entity that uses a different key or value than the default.
Find metrics	Existing data connection to use for metrics. To add a connection, see Connect a Service Observability data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
from this source	
where source tag key	Tag key that you want to map to the activated service for this entity.
source tag value	Value that represents the service name. Values can be strings or a variable that represents fields on the CI for the service.

Chart error states

Understand the different error states that the charts in Service Observability might display and how to fix them.

Error message	Fix
Set up this service's observability data mapping	Observability mapping hasn't been configured for the service by an admin. See Create and manage data mappings.
Data mapping is not configured	Observability mapping hasn't been configured for the service by an admin. See Create and manage data mappings.
Authentication failed	Service Observability can't connect to the data source. See Connect a Service Observability data source.
No results found	No metrics were found for the chart.
Something went wrong	Connection to the data source was successful, but the observability instance didn't respond. This error might be due to a connection timeout on the observability vendor side.
No impacted systems found (Impacted systems chart on the Overview page)	Only services found on your service map can be displayed. Update your service map to include all services that should be included in the chart. See Service Mapping.
Set up objectives (SLO Error Budget chart on the Overview page)	SLOs haven't been configured for Service Reliability Management. See Create SLOs, SLIs, and error budget policies.

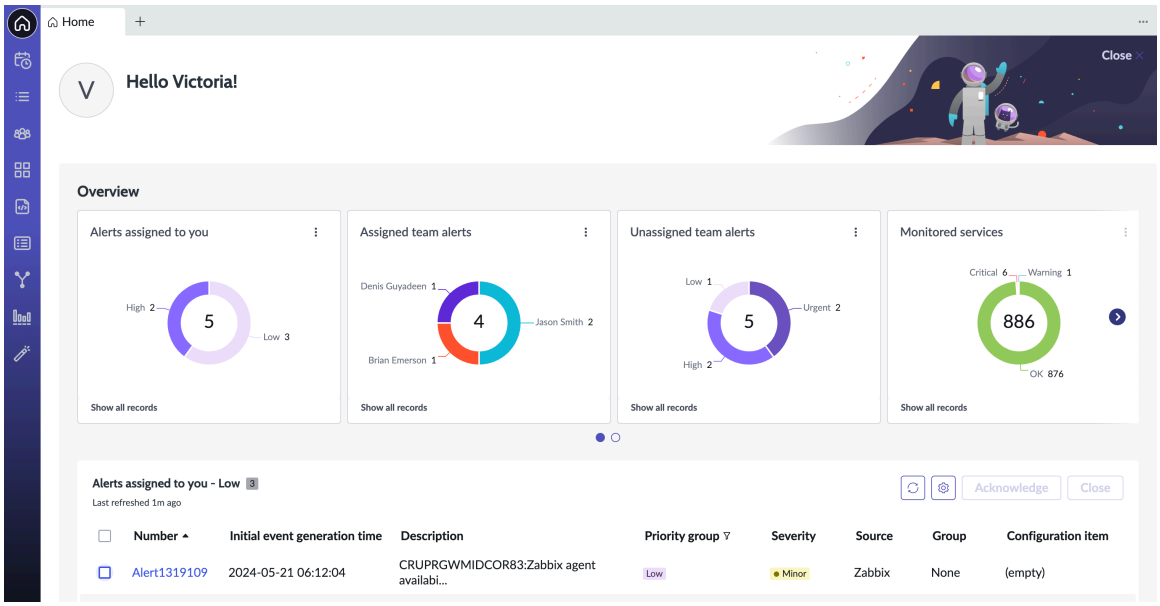
Service Operations Workspace for ITOM

ServiceNow® Service Operations Workspace (SOW) is a configurable workspace designed to streamline IT Operations Management (ITOM) workflows, offering a unified experience for multiple IT operational processes. Configurable and user-friendly, it consolidates various tasks into a single interface, allowing seamless navigation and easy access to tools and information.

By centralizing workflows, it enhances collaboration, facilitates efficient task management, and provides real-time insights through different metrics. Highly customizable, it enables you to tailor the workspace to your specific needs, optimizing productivity and workflow efficiency. With its comprehensive set of features, including automation and collaboration tools, Service Operations Workspace empowers users to work more effectively across different workflows,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

boosting productivity organization-wide. Scalable to accommodate evolving business needs, it ensures continued support for IT environments of all sizes, delivering superior services and driving operational excellence.



For information regarding subscriptions for ITOM Service Operations Workspace, check the ITOM AIOps subscription at Subscription for ITOM Health.

When setting up the Service Operations Workspace, it's crucial to configure both IT Operations Management (ITOM) for managing alerts and IT Service Management (ITSM) for resolving incidents and delivering services. This integrated setup ensures access to the full range of features, facilitating comprehensive management of IT operations and service quality.

To know about the ITSM features, see Service Operations Workspace for ITSM.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Exploring Service Operations Workspace for ITOM

Discover how Service Operations Workspace for ITOM streamlines the entire life cycle of alerts, including alert generation, notification, grouping, analysis, investigation, resolution, and closure.

Overview of Service Operations Workspace

Service Operations Workspace for ITOM provides powerful AIOps Experience capabilities, namely the Express List, Integrations Launchpad, Alert Automation, and AIOps Dashboards, each delivering unique value.

Express List

Express List revolutionizes alert management by providing a consolidated platform for efficient triage, root cause analysis (RCA), and alert remediation. With real-time updates, dynamic filtering, and an intuitive preview pane, users can effortlessly manage their alert workflows and take immediate action with unparalleled ease and speed.

Integrations Launchpad

Integrations Launchpad offers a hub of seamless connections to various external tools and services, simplifying the onboarding of new data sources. This streamlines the integration process, allowing users to effortlessly leverage their existing ITOM ecosystem within the ServiceNow platform. The Integrations Launchpad enhances data exchange and cross-platform collaboration, boosting efficiency and productivity.

Alert Automation

Alert automation provides crucial support as organizations navigate complex IT infrastructures and rising data volumes. Manual alert handling is error-prone and inefficient, underscoring the need for automated systems. By disregarding irrelevant or false-positive alerts through ignore alert automation, and by using alert enrichment, grouping, and response, these systems streamline alert response, reduce human error, and ensure consistent, timely actions.

AIOps Dashboards

AIOps Dashboards provide comprehensive visualizations of critical operational data and insights. Users can monitor key performance indicators (KPIs), track service health, and gain valuable context on the overall IT environment. These customizable dashboards empower users with actionable insights, facilitating data-driven decision-making and ensuring proactive responses to potential issues.

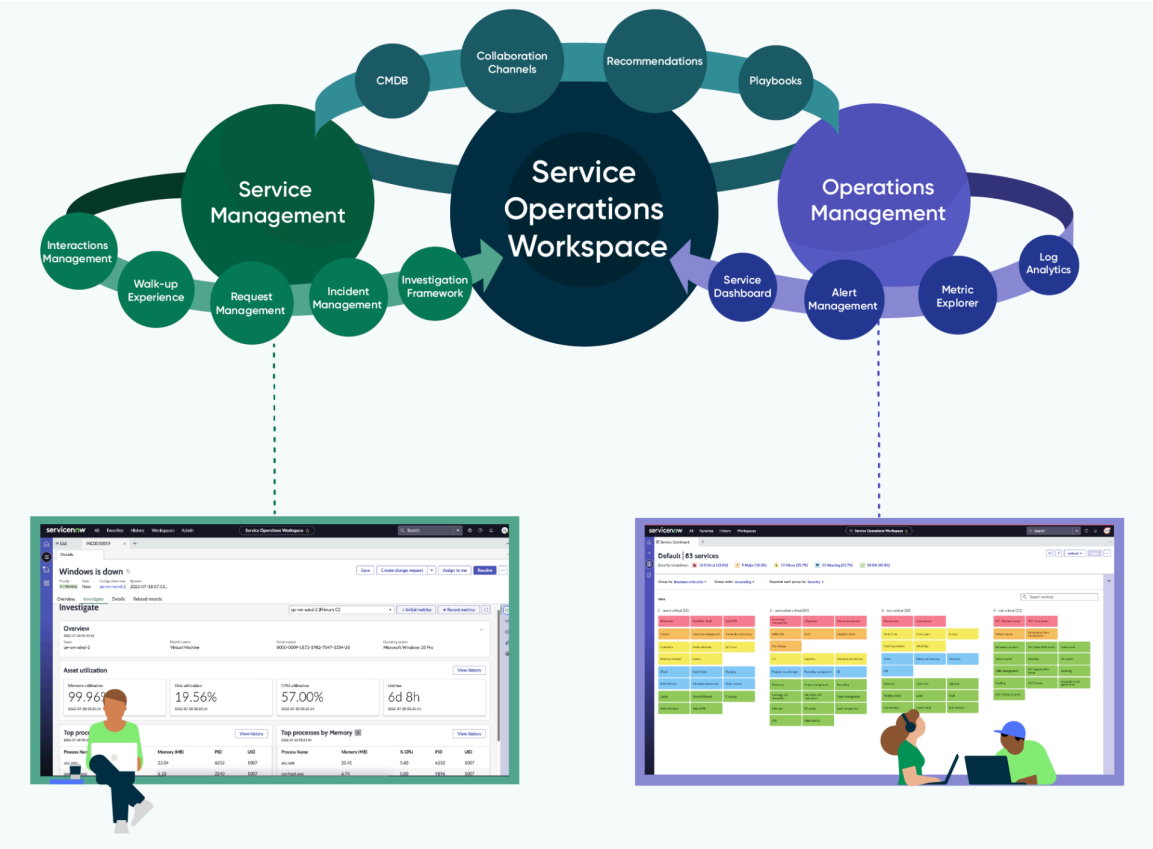
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When setting up the Service Operations Workspace, it's crucial to configure both IT Operations Management (ITOM) for managing alerts and IT Service Management (ITSM) for resolving incidents and delivering services. This integrated setup ensures access to the full range of features, facilitating comprehensive management of IT operations and service quality.

For more information, see Exploring Service Operations Workspace for ITSM.



Operator experience in Service Operations Workspace

1. Start of day: The operator begins by reviewing an overview of alerts and metrics in the Service Operations Workspace to prioritize work.
2. Alert prioritization: The operator prioritizes alerts based on SLAs, priority level, and urgency.
3. Alert investigation: The operator investigates alerts in detail, leveraging historical data and trends.
4. Access alert information: The operator accesses all related information from the alert record page for a comprehensive view.
5. Resolve alerts: Using tailored recommendations, the operator resolves alerts efficiently.
6. Subject matter expert (SME) consultation: For complex or high-priority tasks, the operator reaches out to SMEs or uses automated tools.
7. Collaboration: The operator collaborates with team members and stakeholders directly from the alert, sharing insights and coordinating responses.
8. Initiate change requests or maintenance: To prevent future occurrences, the operator initiates change requests or maintenance activities, addressing root causes and implementing long-term solutions.

Users

Role title [name]	Description
Admin [evt_mgmt_admin]	Configures and sets up Event Management properties and rules.
Operator [evt_mgmt_operator]	Manages alerts, including closing and acknowledging them.
User [evt_mgmt_user]	Manages the lifecycle of alerts, including performing basic operations such as viewing and acknowledging them.

Benefits

Unify experience for multiple workflows

Consolidate various IT operations workflows into a single, intuitive interface, allowing seamless task management across different areas of IT operations, thus enhancing efficiency and reducing complexity.

Provide automated recommendations

Enhance efficiency and decision-making with automated recommendations tailored to operator actions.

Deliver real-time insights

Provide real-time analytics and reporting capabilities for each integrated workflow, enabling informed decision-making and proactive problem-solving by monitoring key performance metrics and tracking operational status in real-time.

Targeted experience

Offer dynamic and minimal content based on the current task, with the next task accessible with minimal clicks. Provide access to related alerts to support faster response times.

Customize configurability

Enable organizations to tailor the workspace to specific requirements and preferences, optimizing productivity by displaying relevant data and tools for each workflow.

Enhance productivity

Empower users to work more efficiently across multiple workflows by automating routine tasks, providing access to relevant information, and facilitating collaboration, thus boosting productivity organization-wide.

Scale seamlessly

Accommodate changes in workload, requirements, and operational complexity for all integrated workflows, ensuring continued support for evolving IT environments, regardless of organizational size.

Service Operations Workspace for ITOM user interface

Explore the interface to understand how an operator can prioritize tasks and offer solutions.

Access Service Operations Workspace

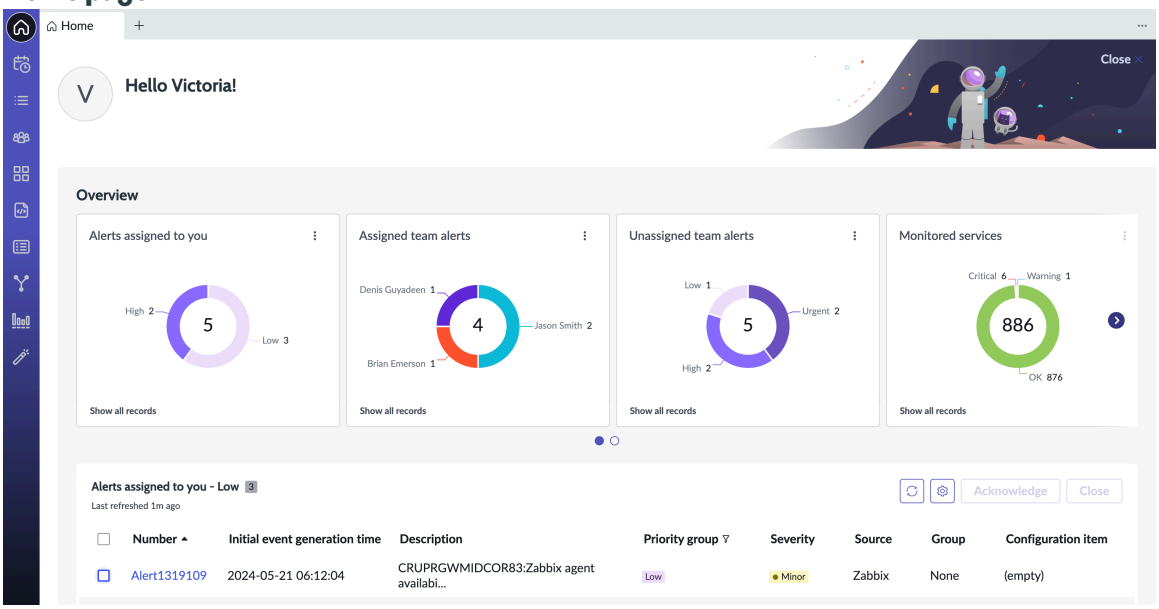
Open the workspace by navigating to **Workspaces** > **Service Operations Workspace**.

Home page

To access information on the Home page, select the home icon ( ).

The home page provides operators with a comprehensive snapshot of the current operational landscape. The Overview section presents vital insights, including alerts assigned to the operator, team-based alerts, unassigned team alerts, monitored services, and open alerts. This Alerts Assigned to You section furnishes operators with specific details regarding alerts tailored to their responsibilities. Information includes the alert number, initial event generation time, description, priority group, severity, source, group, configuration item, state, node, metric name, and last updated timestamp. Both sections streamline operations by offering operators a concise overview and personalized insights into alerts relevant to their responsibilities, facilitating swift prioritization and proactive resolution of critical issues.

Home page



List page

To access information on alerts from List, select the List icon ( ).

The **Lists** tab displays predefined lists, while the **My Lists** tab allows users to create and customize their own lists for personalized task management. For detailed instructions on creating a list, see Create a list in Service Operations Workspace for ITOM.

Configuring Service Operations Workspace for ITOM

Configure Service Operations Workspace for ITOM so that you can manage IT alert volumes efficiently and customize the workspace to enhance service delivery and operational visibility.

The Service Operations Workspace for ITOM is a centralized hub designed to optimize IT Operations Management by focusing on the handling and resolution of alerts. By leveraging this workspace, administrators can streamline the process of monitoring, triaging, and resolving alerts, thus enhancing service delivery and operational efficiency.

Note: Installing the AIOps Experience application [sn_sow_aiops] provides you with Service Operations Workspace for ITOM.

If you want information regarding subscriptions for ITOM Service Operations Workspace, check the ITOM AIOps subscription at Subscription for ITOM Health.

When setting up the Service Operations Workspace, it's crucial to configure both IT Operations Management (ITOM) for managing alerts and IT Service Management (ITSM) for resolving incidents and delivering services. This integrated setup ensures access to the full range of features, facilitating comprehensive management of IT operations and service quality.

To know about the ITSM configurations, see Configuring Service Operations Workspace for ITSM.

Install Service Operations Workspace for ITOM application

You can install the AIOps Experience [sn_sow_aiops] application to get Service Operations Workspace for ITOM if you have the admin role.The application includes demo data and installs related ServiceNow® Store applications if they are not already installed.

Before you begin

- Confirm that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the AIOps Experience application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Service Operations Workspace supports domain separation. For details, see Domain separation and Event Management.

Role required: admin

About this task

The following items are installed with AIOps Experience [sn_sow_aiops] plugin.

- Roles
- Plugins

For more information, see Components installed with AIOps Experience.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the AIOps Experience [sn_sow_aiops] using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are the sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

ITOM AIOps configuration center

The ITOM AIOps configuration center is a centralized hub to manage AIOps settings. It helps you integrate monitoring tools, optimize alerts, metrics, and logs, manage services, dashboards, teams, and authorization—streamlining event-to-response workflows for better visibility, noise reduction, and operational efficiency.

You can access ITOM AIOps configuration center by navigating to **Workspaces** > **Service Operations Workspace** and then selecting the ITOM AIOps configuration center icon that is available at the bottom of the left navigation pane.

Note: The ITOM AIops configuration center is accessible only to aiops_admin.

The AIOps configuration center provides a single interface to configure and administer AIOps capabilities in Service Operations Workspace (SOW). You can:

- Integrate monitoring tools to bring in events, logs, and metrics.
- Optimize how alerts are enriched, grouped, ignored, and responded to.
- Fine-tune metrics and log rules for accurate anomaly detection and alerting.
- Set up synthetic monitoring for app uptime.
- Manage services (service monitoring dashboards, SLIs/SLOs, error budgets) for Service Observability and Service Reliability Management.
- Access AIOps dashboards to track performance, operations, and business value.
- Configure authorization for admins, integrations, APIs, and notifications.
- Govern teams and approvals for service creation and on-call schedules.

The AIOps configuration center consolidates all administrative tasks needed to set up and operate ITOM AIOps effectively—making it easier to streamline monitoring, improve incident response, and maintain service reliability.

Customize the Service Operations Workspace for ITOM home page

You can customize the data displayed in sub pages of the home page that is available in the base system. For any visual styling changes, you need to create a copy of that landing page and edit it.

Modify the greeting text on the landing page

Customize the header message that is a part of the greeting text on the home page. This will create a more personalized user experience, making visitors feel welcomed and valued, and can also help in setting the right tone and context for the information presented.

Before you begin

Role required: evt_mgmt_admin or admin

About this task

The Get service desk agent shift data broker server script calls the `SOWServiceDeskAgentShift` script includes to display the shift information in the greeting text.

While the display text can be customized for the default landing page, the visual styling changes to the text can be done only by creating a copy of the landing page.

Suppose you are on call until Monday, March 21. You can update your greetings to reflect your on-call status.

Header

Hello Grady!

You are on-call until Monday, Mar 21 12:00 AM

Procedure

1. Navigate to **All** > **Service Operations Workspace Admin Center** > **Overview**.
2. On the **Overview** tab, from the **Initial Setup** section, select the **Configure the landing page** option.
3. On the Landing Page form, select **Configure** next to **Greetings**.
   The Script Includes form is displayed for SOWServiceDeskAgentShift, which internally calls the SOWServiceDeskAgentShiftSNC
4. Copy the **Script** value of SOWServiceDeskAgentShiftSNC.

   a. Navigate to **All** > **System Definition** > **Script Includes**.

   b. From the list of Script Includes, open SOWServiceDeskAgentShiftSNC.

Modify the first-level cards in the Service Operations Workspace for ITOM Overview section

Customize the data displayed in the first-level cards in the Overview section by configuring various parameters such as the header label, data source, metric, group by field, and viewAllQuery. This allows for a more tailored and relevant display of information.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **sys_ux_client_script_include.list**.
2. From the UX Client Script Includes list, select `SowEMLandingPageUtilsSNC` client script include definition.
3. On the UX Client Script Include form, edit the **Script** field.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example:

```
  }
    };
   const labelMap = {
       'em_alert': {
           'alerts_assigned_to_you': {
               '1': 'Alerts assigned to you - Urgent',
               '2': 'Alerts assigned to you - High',
               '3': 'Alerts assigned to you - Moderate',
               '4': 'Alerts assigned to you - Low'
           },
           'open_alerts': {
               '1': 'Open alerts - Urgent',
               '2': 'Open alerts - High',
               '3': 'Open alerts - Moderate',
               '4': 'Open alerts - Low'
           },
           'team_alerts_assigned': 'Assigned team alerts - to
',
           'team_alerts_unassigned': {
               '1': 'Unassigned team alerts - Urgent',
               '2': 'Unassigned team alerts - High',
               '3': 'Unassigned team alerts - Moderate',
               '4': 'Unassigned team alerts - Low'
           }
       }
```

4. Click **Update**.

Create a copy of the Service Operations Workspace for ITOM landing page

Make visual styling changes to the sub-pages in the home page. This will enhance the overall user experience by providing a consistent and visually appealing interface, improving navigation, and ensuring that key information is easily accessible and engaging.

Before you begin

Role required: evt_mgmt_admin or ui_builder_admin

About this task

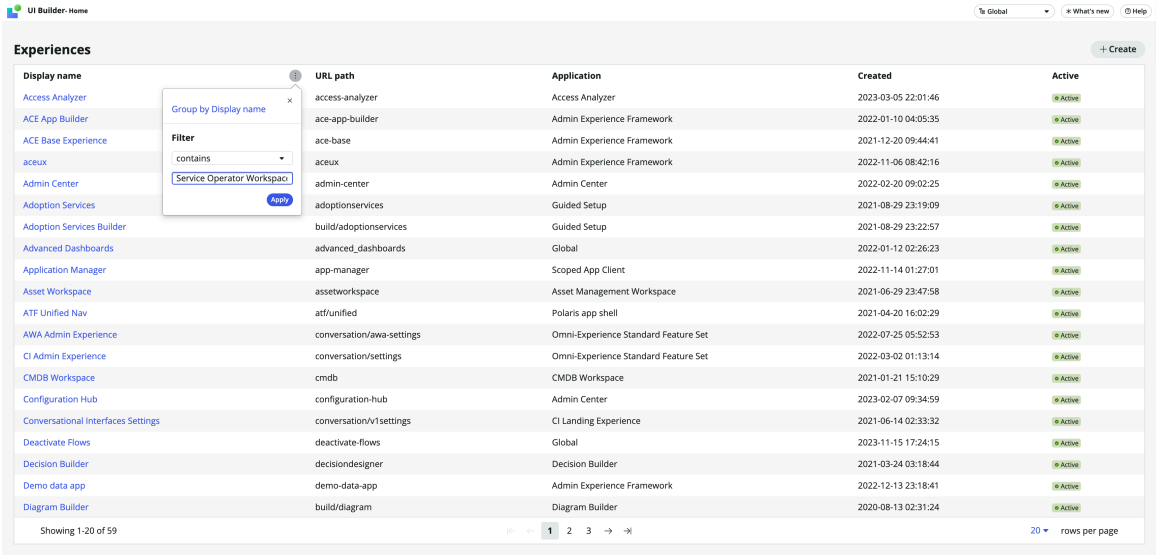
A page is content that lives at a specific URL. When a user opens the URL, they will see a different variant of this page based on the audience, conditions, and order that you set.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. From the **Display name** field, filter and search for **Service Operations Workspace**.

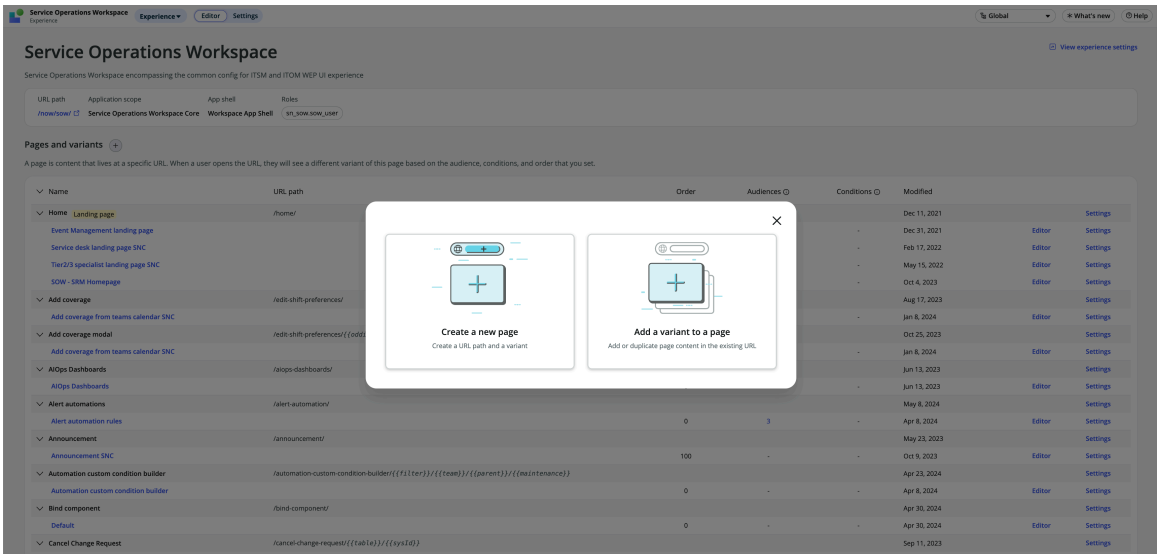
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Experiences page opens.



3. Open **Service Operations Workspace** by selecting it.

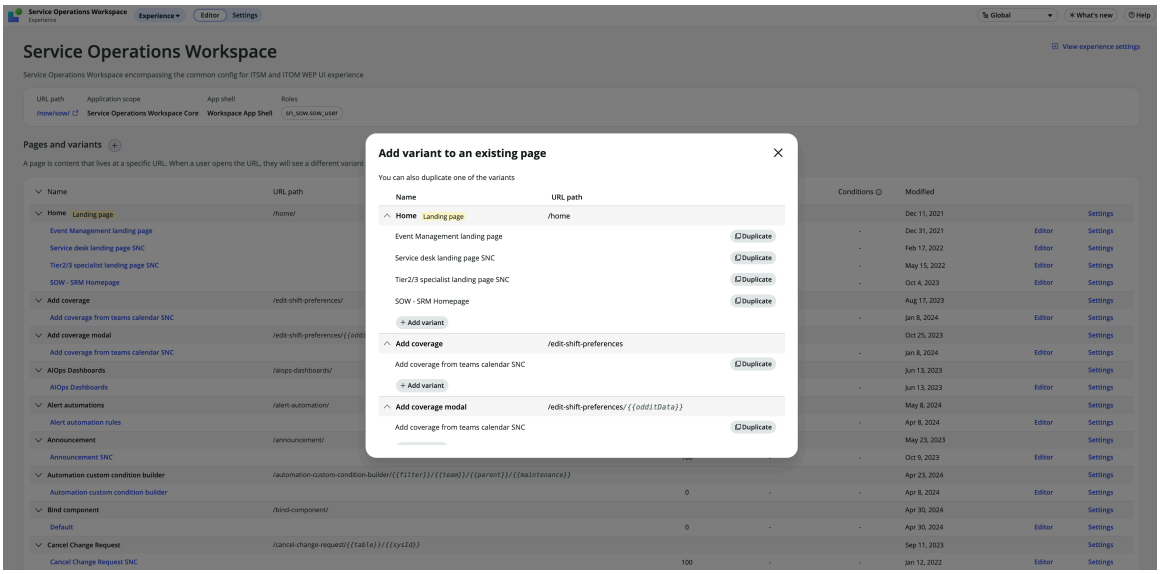
4. Next to **Pages and variants**, select the plus icon (⊕).



5. Select **Add a variant to a page**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Add variant to an existing page window opens.



6. To create a duplicate page content in the existing URL path, select **Duplicate** and follow the steps.

Open your configurable workspace experience in UI Builder

Access your Configurable Workspace experience in UI Builder for editing.

Before you begin

Role required: ui_builder_admin or admin

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select **Experiences**.
3. Select your experience.

Result

Your Configurable Workspace experience opens in UI Builder.

Redirect to the Service Operations Workspace home page

Enable quick task prioritization by directing agents to the homepage immediately upon logging into the ServiceNow instance. This improves workflow efficiency by granting agents immediate access to essential tools and information, facilitating the timely resolution of critical tasks and issues.

Before you begin

Ensure that the value of the *glide.login.home property* is set to `/now/nav/ui/home`. This property specifies the default homepage that is displayed upon logging in.

Role required: evt_mgmt_admin

Procedure

1. Select **All** and then search for `sys_properties.list`.
2. Add the *sn_sow.service_desk_groups* property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Value** field, enter the sys_id of the user group to which the operator belongs.

   Note: If you want to specify multiple service desk groups, add a comma-separated list of group sys_ids in the value field.

4. Select **Update**.

Open your Configurable Workspace experience in UI Builder

Access your Configurable Workspace experience in UI Builder for editing.

Before you begin
Role required: ui_builder_admin or admin

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select **Experiences**.
3. Select your experience.

Result
Your Configurable Workspace experience opens in UI Builder.

Service Operations Workspace

The Service Operations Workspace monitors services within your Event Management environment, enabling you to review their status and identify those at risk of suboptimal performance. This empowers you to promptly address any issues.

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

You can configure the Service Operations Workspace to remain logged in for up to 24 hours. For more information, see Manage user sessions.

View application service health information in Service Operations Workspace

Monitor the health of services and filter the information that you want to view, allowing you to focus on the most relevant data and make informed decisions quickly.

Before you begin
Role required: evt_mgmt_user or evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

   Note: The application services that appear in the Service Dashboard are those added to the Impact Filter Services list. For more information, see Add application services for impact calculation.

3. Perform the following actions as required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Features and actions

Features	Actions
Make the tile size larger or smaller.	**a.** Select the Display settings icon ( ). **b.** From the **Display settings** pop-up window, select the size. Group services by selected criteria	Select the arrow next to **Group By** and then select the criteria by which you want to group services. Group order	Select the arrow next to **Group order** and then select the criteria by which you want to group services. Segment each group by	Segment each group by severity, business criticality, and cost to categorize and organize them into distinct groups based on these attributes. Filter information	Filter the information displayed on the dashboard ensuring you focus on relevant data for effective monitoring.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Features	Actions
	○ To set a global filter, select the Filter icon ( ) and set the global filter condition, add filter conditions, and then select **Apply**.  ○ To exclude a severity from the display, select it in the **Severity Breakdown** ribbon. Filtered-out severities will appear dimmed. To restore a dimmed severity to the display, simply select it again. 
Create a user view in Service Operations Workspace

Create and customize a user view in the Service Operations Workspace to enable viewing information in the format you want.

Before you begin

Note: The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

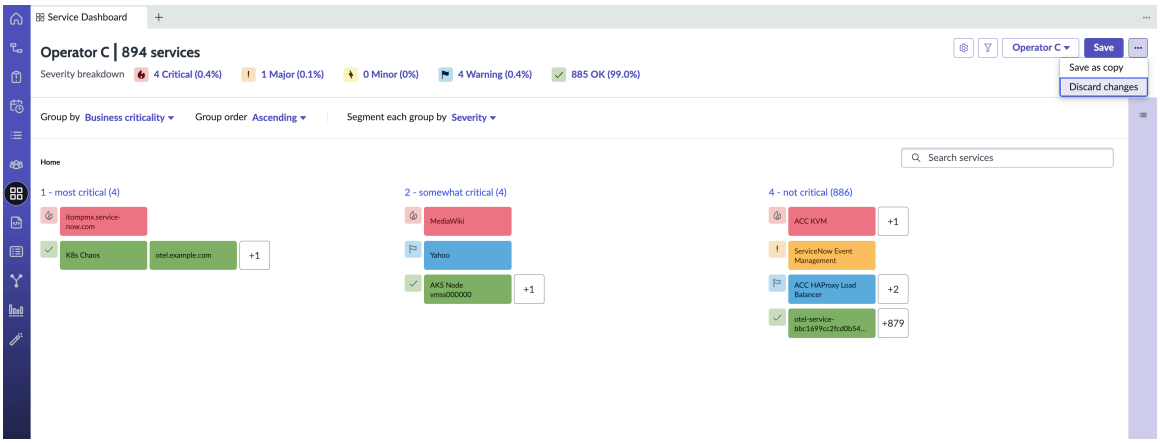
   Note: The application services that appear in the Service Dashboard are those added to the Impact Filter Services list. For more information, see Add application services for impact calculation.

3. Customize the dashboard appearance by selecting output criteria from the **Group by**, **Group order**, or **Segment each group by** filters, or by selecting the relevant **Severity breakdown**. Selecting **Service group** > **All** in the **Group by** filter displays all service groups.
4. Configure the information for the view to display by clicking the filter services icon ( ) and setting a global filter.

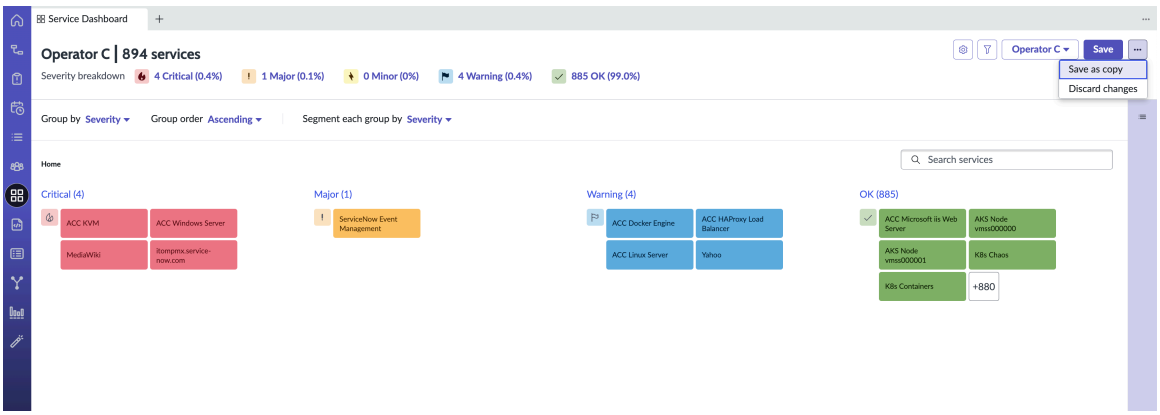
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, you can configure a filter to display only those services assigned to a specific user.

Note: To discard your changes and revert to the view's most recently saved state, select the More actions icon (•••) and select **Discard changes**.



5. Save your new view by clicking the More actions icon (•••) next to the **Save** button and select **Save as copy**.



6. In the Save as copy dialog box, enter the name of your view in the **View name** field.

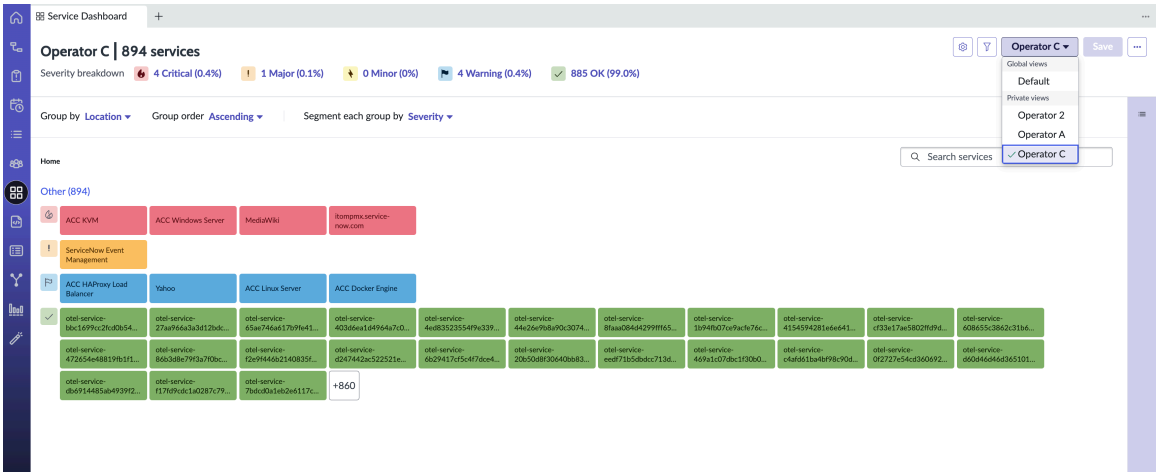
   The view is saved as a **Private view** (visible only to the logged-in user) and is available for use.

   Views are grouped in the following categories:

   - **Global views**: Visible to all users. Only an Event Management administrator can create a global view.
   - **Private views**: Visible only to the logged-in user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can switch between different views by selecting a view from the list next to the **Save** button.



Delete a user view in Service Operations Workspace

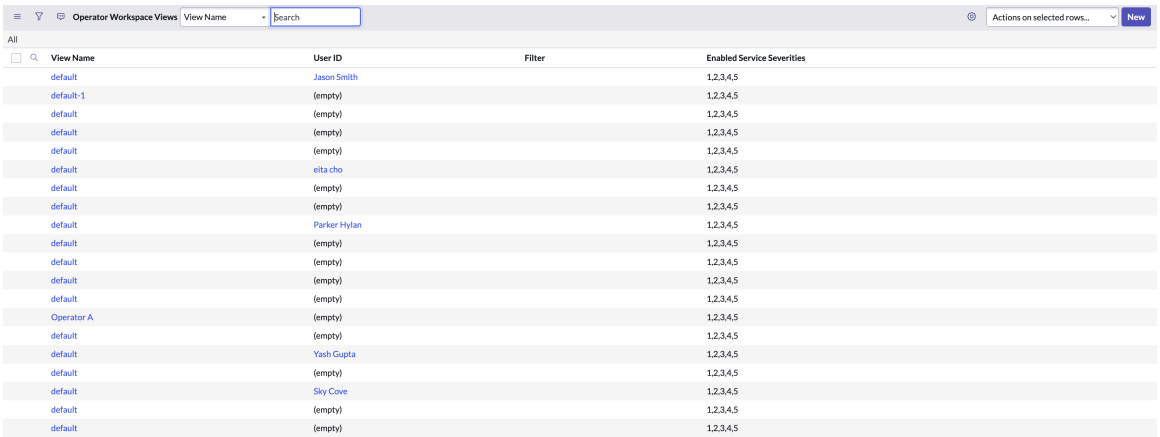
Delete a Service Operations Workspace user view you no longer need. You perform this action from the Event Management menu, outside of Service Operations Workspace.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. In your Event Management instance, in the navigation pane, search for *`noc_user_view.list`*.
   The Operator Workspace Views page opens.



View Name	User ID	Filter	Enabled Service Severities
default	Jason Smith		1,2,3,4,5
default-1	(empty)		1,2,3,4,5

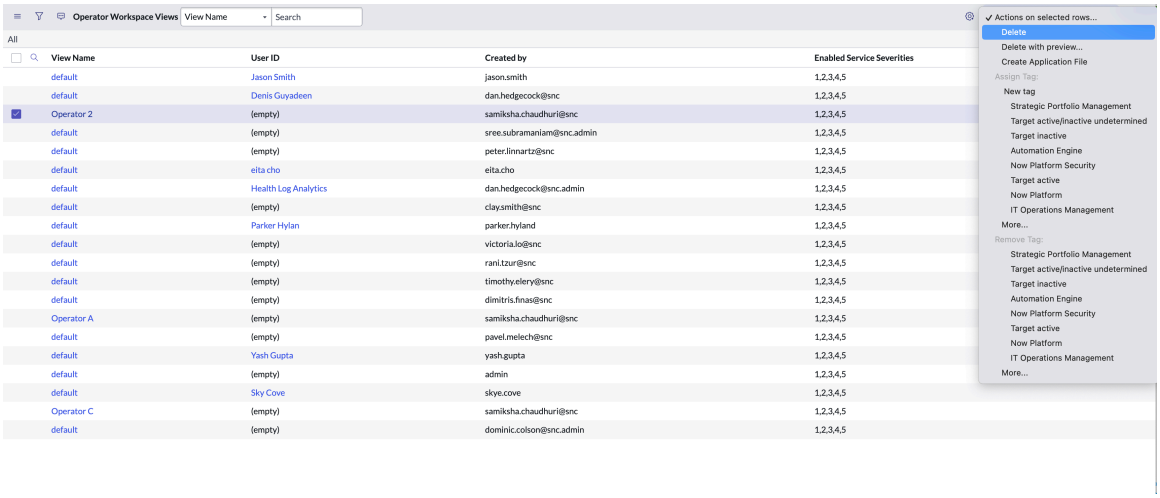
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Actions on selected rows** list, select **Delete**.



View application service details in Service Operations Workspace

View comprehensive information about an application service, including its name, business criticality, ownership, process and operational status, traffic-based discovery details, discovery status, and relevant comments. This enables thorough analysis of the application service's current state and usage, provides clarity on ownership and criticality, and facilitates effective prioritization of resources and actions.

Before you begin

Role required: evt_mgmt_user, evt_mgmt_operator, or evt_mgmt_admin

About this task

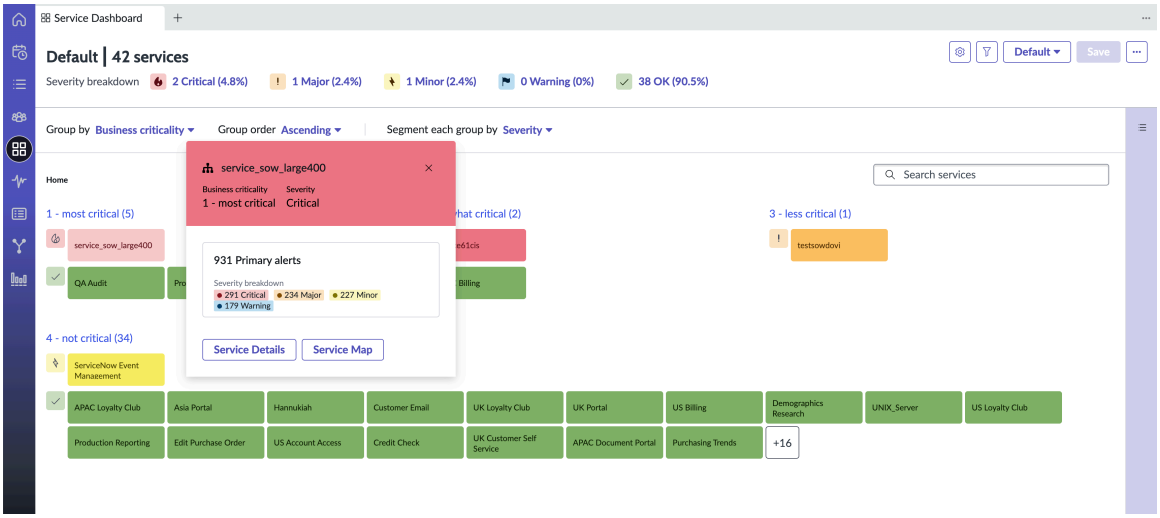
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

   Note: The application services that appear in the Service Dashboard are those added to the Impact Filter Services list. For more information, see Add application services for impact calculation.

3. Select a service tile.
   A pop-up window displays the business criticality and severity of a service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Service Details**.
   By default, the **Details** tab is selected.

   The details page provides comprehensive information about an application service.

   For information on the fields, see Application service details page.

View primary alerts associated with a service

View the primary alerts associated with a service to help troubleshoot issues with the service.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

   Note: The application services that appear in the Service Dashboard are those added to the Impact Filter Services list. For more information, see Add application services for impact calculation.

© 2026 ServiceNow, Inc. All rights reserved.

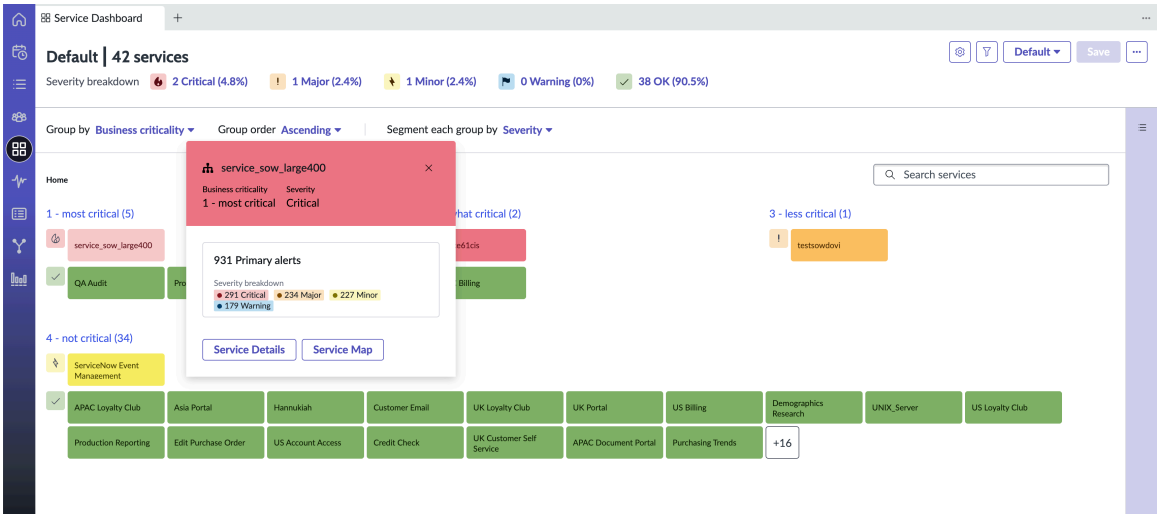
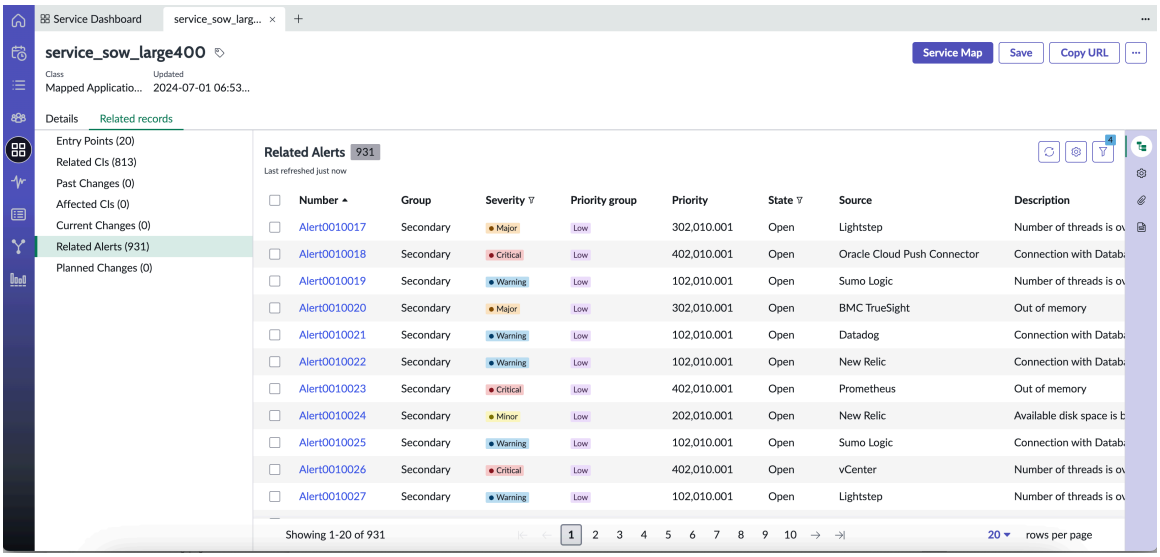
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select a service tile.
   A pop-up window displays the business criticality and severity of a service.



4. Select **Service Details**.
   By default, the **Details** tab is selected.
5. Select the **Related records** tab.
6. From the left pane, select **Related Alerts**.



View details about an alert by selecting its number in the **Number** column.

Create a list in Service Operations Workspace for ITOM

Customize lists in Service Operations Workspace by creating new lists, changing their order, modifying their content, or deleting lists as needed. This flexibility allows operators to organize information according to their specific requirements, facilitating easier navigation, quicker access to relevant data, and streamlined workflow management.

Before you begin

Role required: itil

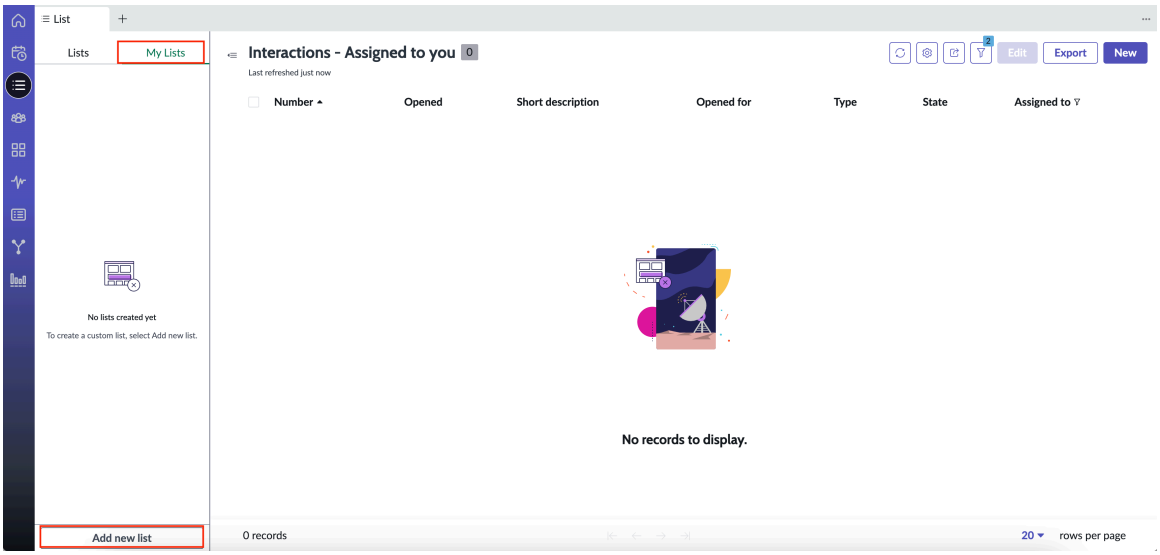
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Create custom groupings of records listed under the **Lists** tab, such as incidents tied to a specific company. Customize existing lists or create new ones exclusively visible under the **My Lists** tab for personalized organization.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **My Lists** tab.
4. Select **Add new list**.



5. Create a list by either basing it on an existing list or creating a new one.
   - To base your list on an existing list, select **Start from existing**.
   - To begin a new list, select **Create your own.**
6. On the form, fill in the fields.
   For more information on the fields, see Create list fields.
7. Select **Create**.
   The list appears in the **My Lists** tab.

Rename a list in Service Operations Workspace for ITOM

Rename a list to better reflect its content or purpose. This customization allows operators to align list names with their workflow terminology, improving clarity and usability.

Before you begin

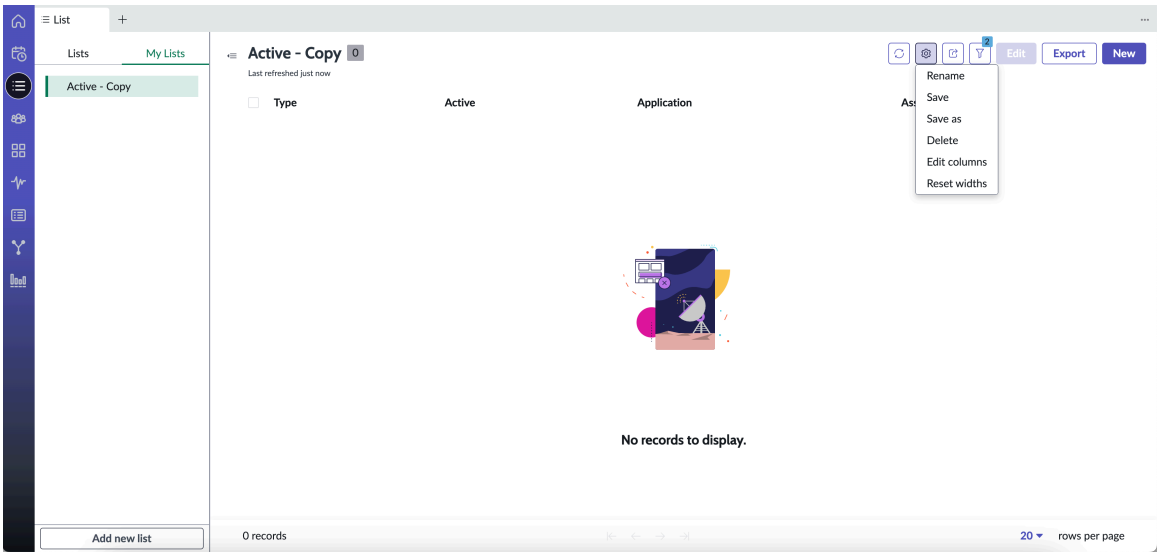
Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **My Lists** tab.
4. Select the list you wish to rename.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the settings icon ( ) and then select **Rename**.



6. In the **Rename** pop-up window, in the **Title** field, rename the name of the list and select **Save**. The list is renamed.

Reorder list in Service Operations Workspace for ITOM

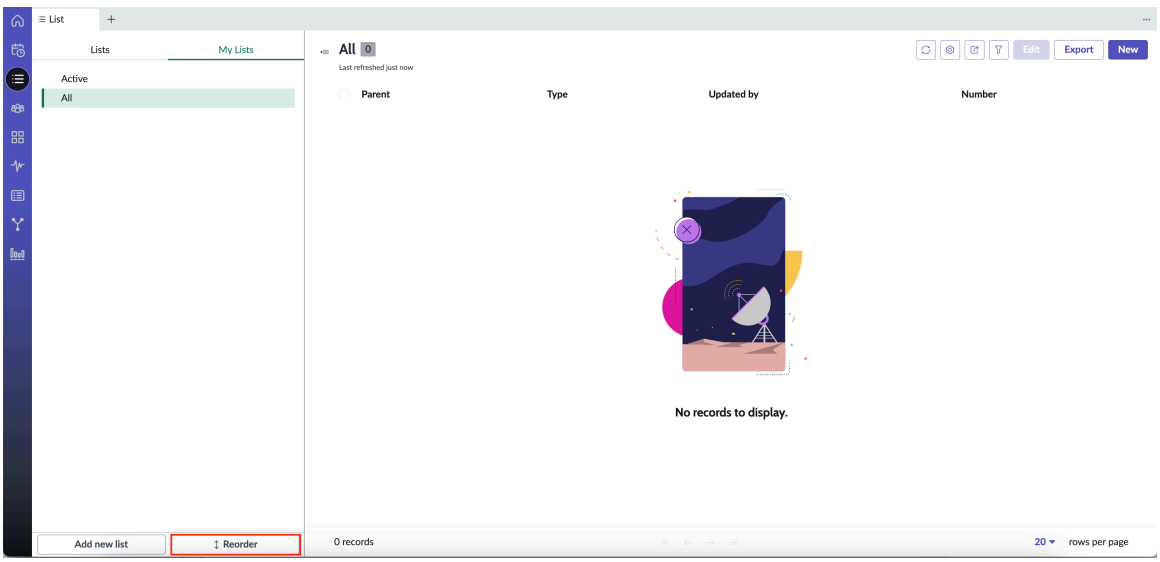
Reorder lists to prioritize information and enhance workflow organization.

Before you begin

Role required: itil

Procedure

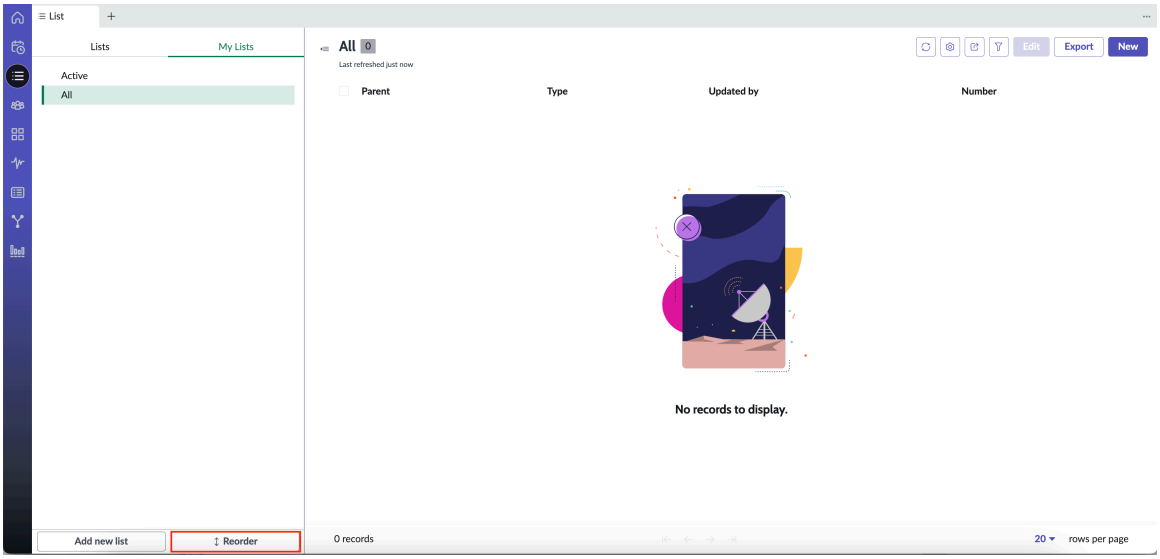
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **My Lists** tab.



4. Select the list you want to reorder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Reorder** to adjust the position of the list.



Delete a list in Service Operations Workspace for ITOM

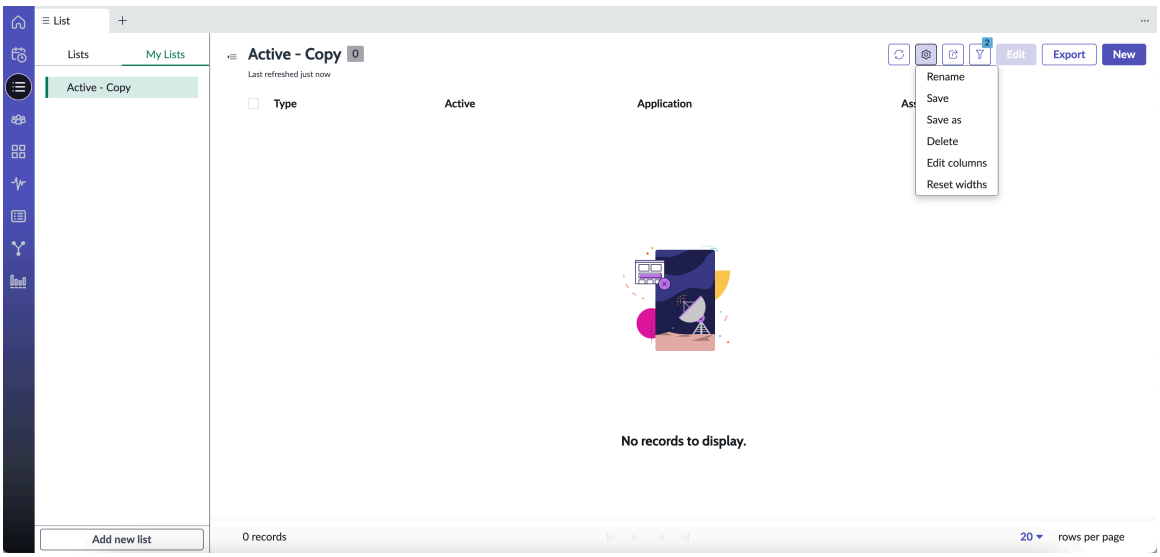
Delete a list to efficiently manage data sets, declutter your workspace, and maintain organized information.

Before you begin

Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **My Lists** tab.
4. Select the list you wish to delete.
5. Select the settings icon ( ) and then select **Delete**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the confirmation pop-up window, select **Delete**.
   The list is delete.

View unified service map and the impact paths in Service Operations Workspace

Visualize relationships between Configuration Items (CIs) and alerts with real-time updates and detailed impact paths. Enhance troubleshooting and proactive management by quickly identifying root causes and dependencies for both discovered services and application services.

Before you begin

Role required: evt_mgmt_user, evt_mgmt_operator, or evt_mgmt_admin

About this task

The enhanced service map in Service Operations Workspace displays the impacted path of an alert to enable you to quickly assess its impact on a service. You can access the enhanced service map directly from the Service Dashboard, or from the preview panel or from an impacted service in the Express List.The service map has several modes of display:

- For a service with up to 60 CIs, regardless of alert status, the map shows all CIs.
- For a service with more than 60 CIs without alerts, the map shows up to 60 CIs.
- For a service with more than 60 CIs with alerts, the map shows the impacted path of the most recent alert with the highest severity.

You can also investigate a wider view of the service topology on the service map for up to 250 CIs regardless of alerts. For a broader view, select **Clear** and choose a mode of either up to 60 or up to 250 nodes.

Note: Admins can continue using the legacy service map to manage the propagation of severity. Access the map by navigating to **Services** > **Application Services**.

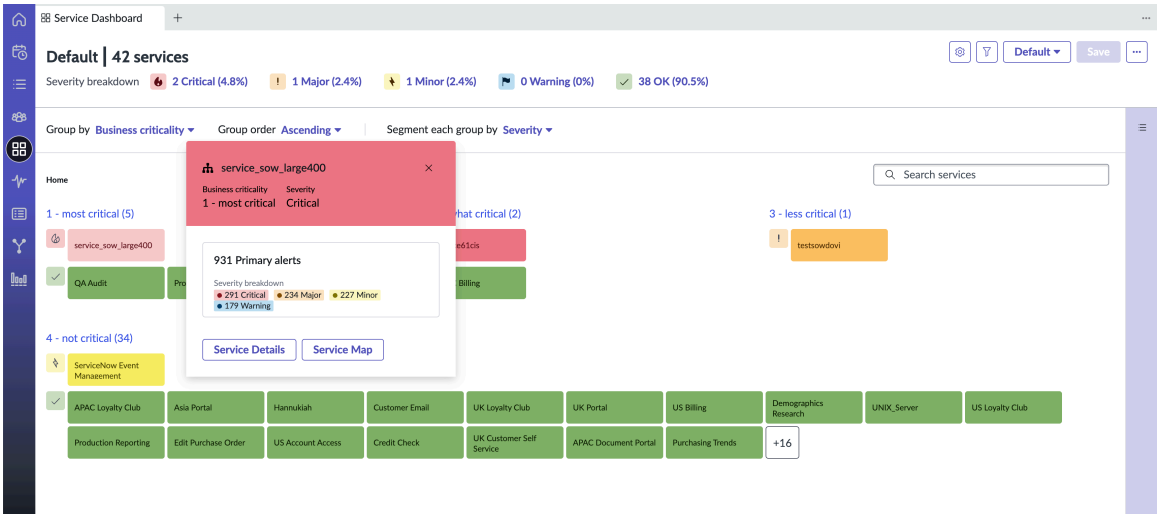
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left navigation bar, select the Service Dashboard icon: .
   The Service Dashboard page appears.

   Note: The application services that appear in the Service Dashboard are those added to the Impact Filter Services list. For more information, see Add application services for impact calculation.

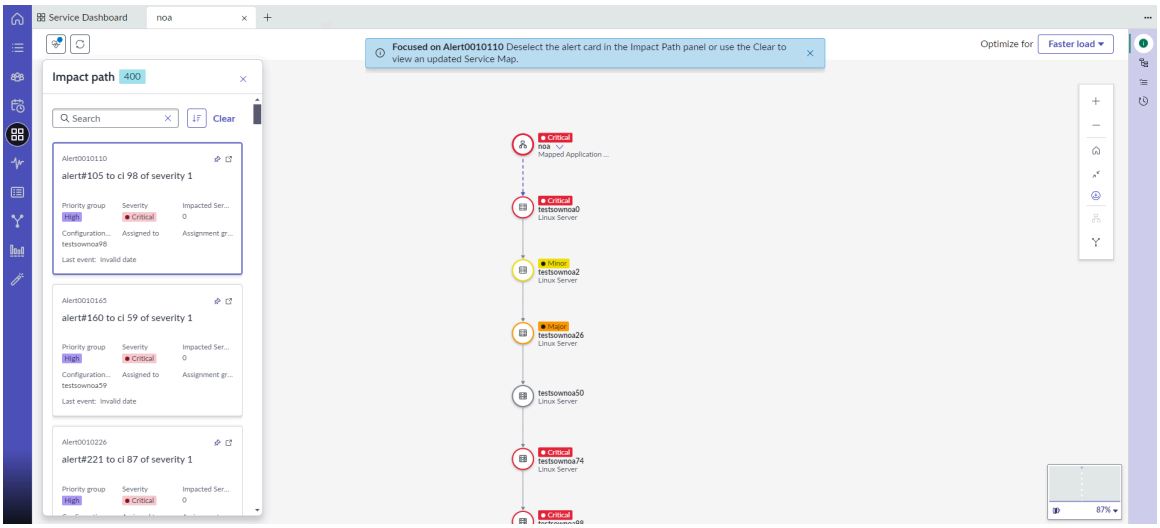
3. Select a service tile.
   A pop-up window displays the business criticality and severity of a service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Service Map**.

The application map along with the CI relationships appears.

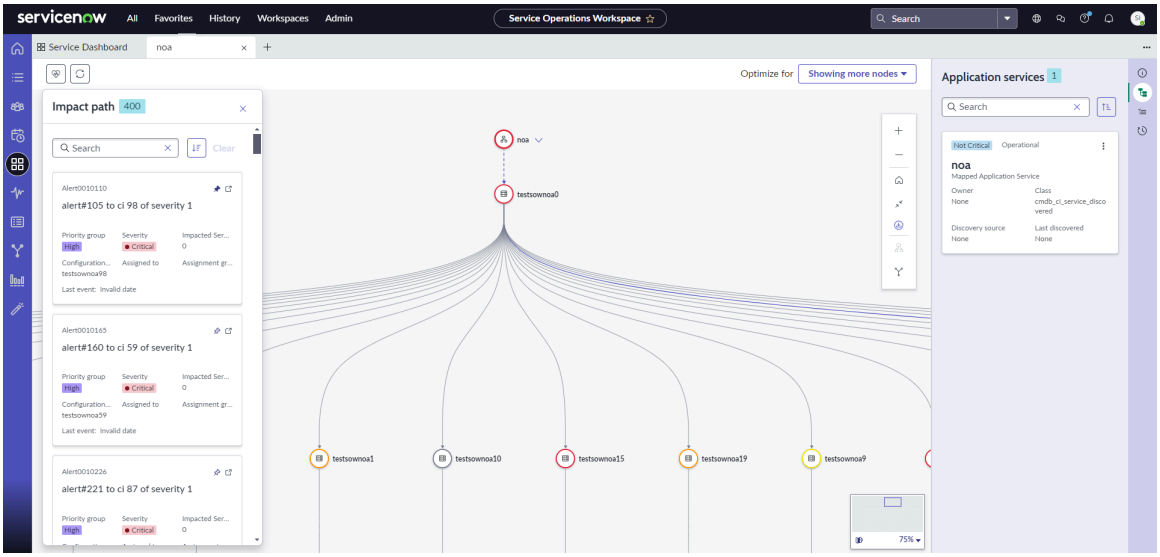


Note:

Depending on the size of the service, the unified map either shows the full map (if it contains up to 60 CIs) or an Impact Path leading to the most critical alert (for maps with over 60 CIs). For large maps, you can reveal more CIs by clearing the existing selecting and navigating to the **Showing more nodes** optimization option.

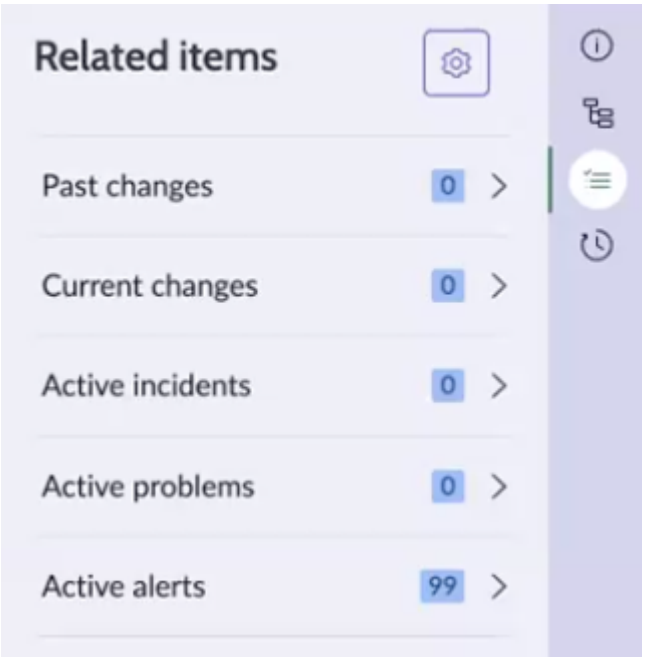
Impact Path shows alerts on the selected CI and all CIs within its impact subtree.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If the **Impact path** panel is closed, you can open it by selecting the Impact path icon ( ).

To view active alerts directly associated with the selected CI, select the Related items icon ( ) in the right pane, then select **Active Alerts**.

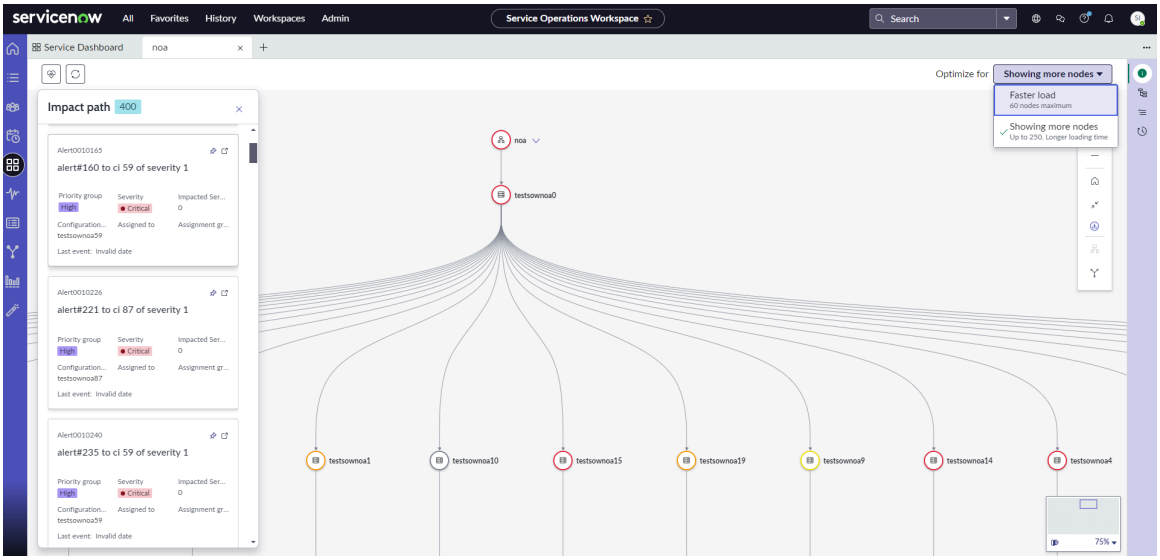


5. Navigate between alerts by selecting an alert card.

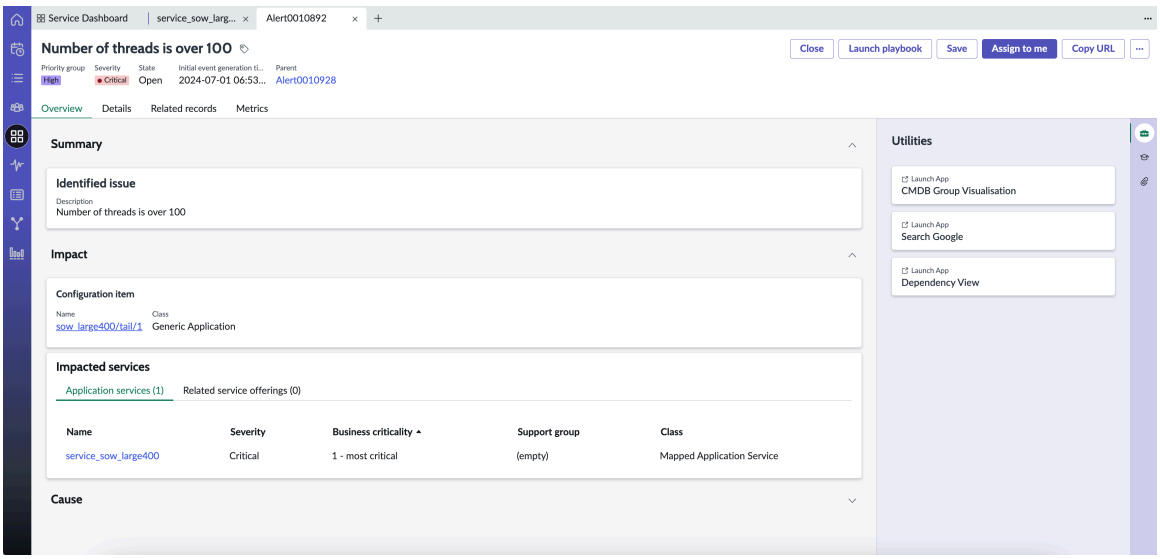
   Alternatively, use the search function to find an alert by description, CI, or alert number and focus on its impact path.

   Selecting any alert tile displays the unified map for that alert. To return to the full map for the service, select **Clear**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. To view alert details, select the Open Record Form icon ( ) on the alert card.
   The alert details page opens.



Enable and disable live updates for alert lists

Choose live updates for alert lists to receive real-time updates, or disable live updates and refresh the alert list manually.

Before you begin

Role required: evt_mgmt_user, evt_mgmt_operator, or evt_mgmt_admin

About this task

By default, the toggle for live updates is off, and you must enable it to receive live alert updates. Once enabled, the alert list automatically updates whenever an action is performed on an alert. Live updates enhance the accuracy and timeliness of the information displayed, enabling quicker response times, and improving overall system reliability and performance.

To update the alert list manually, you can switch the live updates toggle to off. Manual updates are useful when many alerts are being processed continuously, to avoid excessive refreshing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Set Read Role permissions to the Event Management user (evt_mgmt_user). Otherwise, the property won't be available.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select the **Default lists** tab.
4. Under **Alerts**, select the list where you want to enable or disable live updates.

   Note: Live updates aren't available for the **All Alert** list.

5. At the top of the alert list, select the toggle switch to turn live updates on or off.
   - When live updates are turned on, the setting is saved for future logins by the same user.
   - When live updates are off, the refresh button displays a counter to show the number of changes since the last refresh. You can select the refresh button anytime to update the list manually.

Configure alert metrics

Configure the metrics you want to be visible for Service Operations Workspace alerts or use the metrics configured with the base system to focus on relevant data for faster troubleshooting.

Before you begin

Ensure you have the Metric Intelligence (sn_metrics_ng) plugin installed.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Metrics View Configuration**.

View CI health in Metric Explorer

View the health and performance of an alert's CI using Metric Explorer, to help troubleshoot problematic areas in the CI.

Before you begin

All plugins related to Event Management, Metric Intelligence, and Metric Explorer, are required.

Roles required:

- To access Metric Intelligence metrics in Metric Explorer, the workspace_agent and itil roles are required.
- To configure the set of metrics that appears in Metric Explorer for a class, the admin or evt_mgmt_admin role is required.

About this task

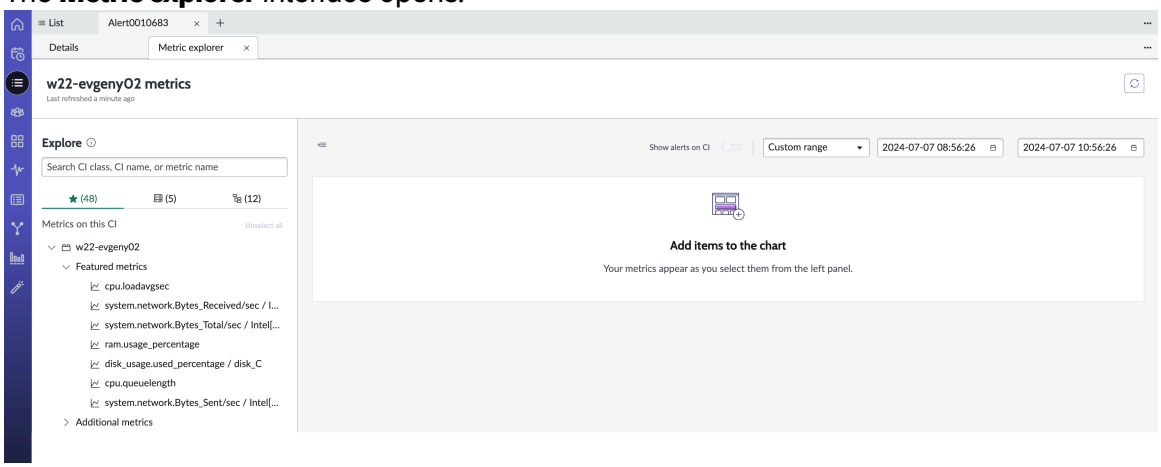
Metric Explorer displays the following Metric Intelligence data:

- Charts, control bounds, and aggregations for key metrics for Configuration Items (CIs), in a single location.
- Aggregation of metrics for CIs with resources, in a single consolidated time series.
- Ability for administrators to configure which metric types appear for each CI class.

Metrics are displayed only for alerts containing a CI.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select **Lists** > **Alerts** > **All Alerts**.
   The Alerts - All Alerts page opens.
4. Select the alert number to open it.
   The alert opens in a separate tab, displaying the **Overview** tab.
5. Select the **Metrics** tab.
6. Select the **Metric explorer** button.
   The **Metric explorer** interface opens.



Note: You can also access the **Metrics** subtab and **Metric Explorer** button when selecting a CI.

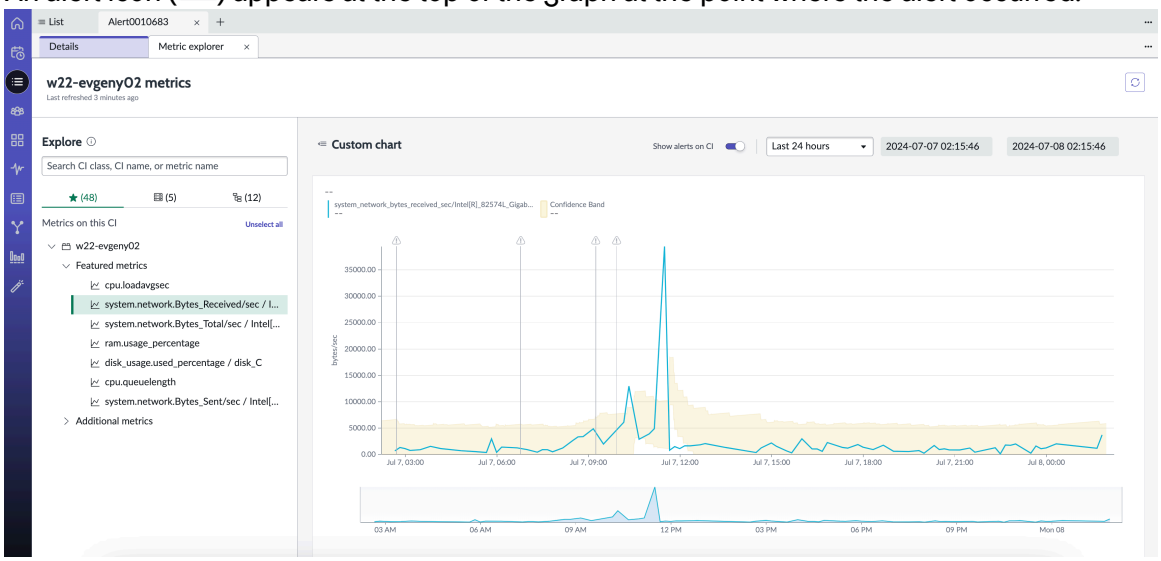
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select metrics in the Explore section to display the metrics in graph format in the **Custom chart** section.
   Metrics are divided according to the following subtabs:

Explore section subtabs

Subtab	Description
★	Displays metrics on the current CI.
	Displays metrics on other CIs on the same host.
	Displays metrics on entry points that relate to the service that the CI is impacting. **Note:** When working with large quantities of entry points (100K or more), collecting entry point metrics may cause system degradation. To prevent this, create the *sn_disable_selection_entry_point* property (**All** > **System Properties** > **All Properties**) and set it to **true** to turn off metric collection for entry points.

8. In the **Custom chart** section, configure a time range for which you want to view the displayed metrics.
9. Label alerts on the Custom chart by turning on the **Show alerts on CI** option.
   An alert icon (⚠) appears at the top of the graph at the point where the alert occurred.



View alert metric trends in Service Operations Workspace

View the metrics for an alert and adjust the time range to see the trends for either the alert or its associated Configuration Item (CI), enabling more accurate analysis and timely decision-making.

Before you begin

Ensure you have the Metric Intelligence (sn_metrics_ng) plugin installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

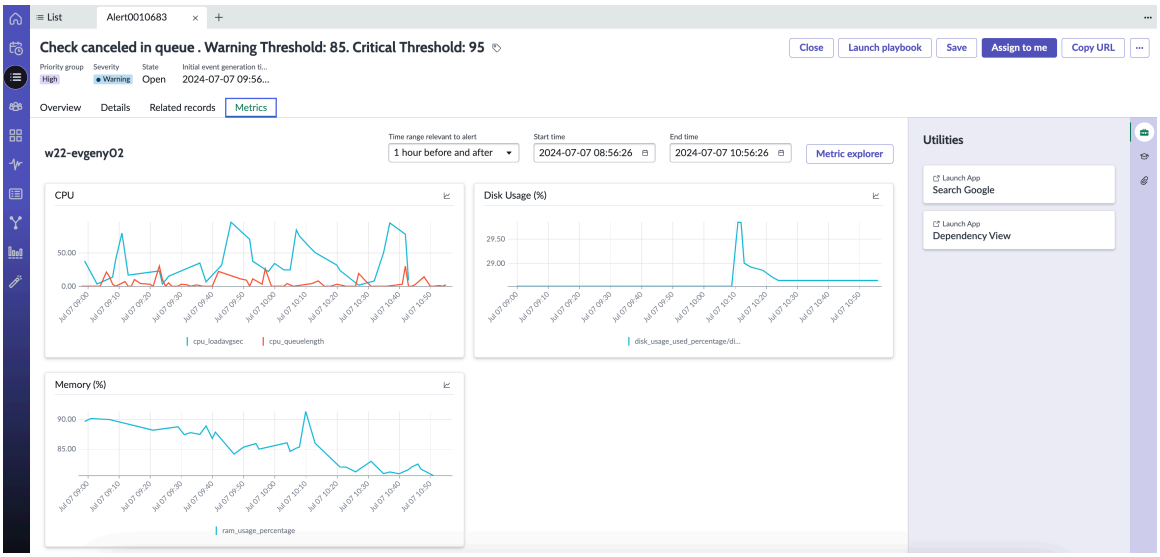
Configure the metrics to be displayed for the alert, as described in Configure alert metrics.

Role required: evt_mgmt_admin

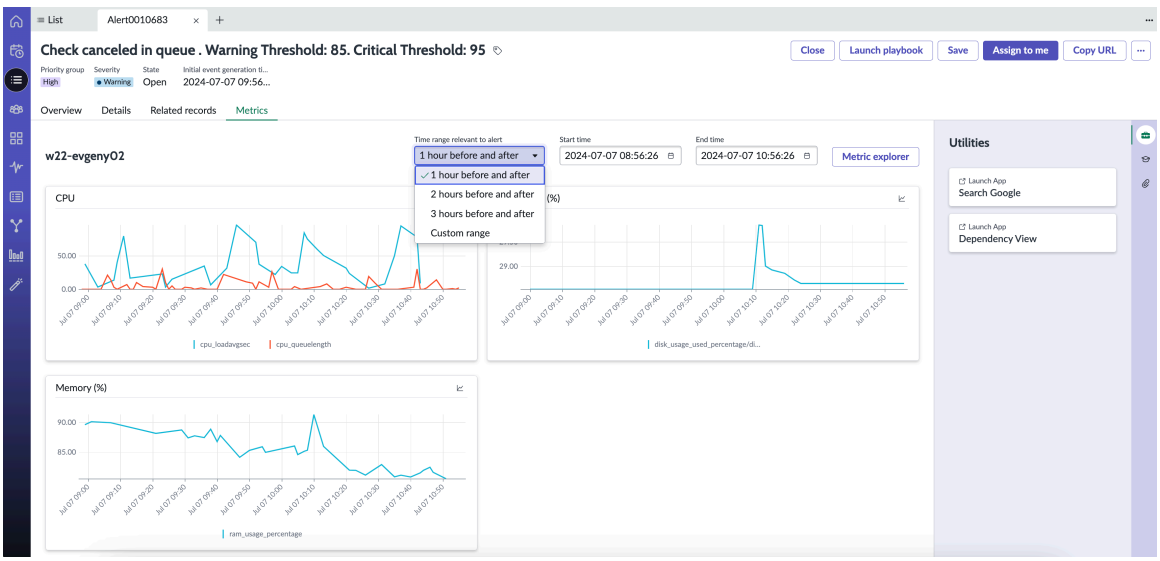
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the List icon: .
3. Select **Lists** > **Alerts** > **All Alerts**.
   The Alerts - All Alerts page opens.
4. Select the alert number to open it.
   The alert opens in a separate tab, displaying the **Overview** tab.
5. Select the **Metrics** tab.

Metrics tab



6. In the fields above the metric charts, configure the time range for the alert's metrics.



To customize the metrics display, configure the following properties on the **System Properties** > **All Properties** page:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *ws_metric.widgets_number_limit*: Specify the number of widgets/records that can be displayed on the metrics tab.
- *ws_metric.datasets_per_widget_limit*: Specify the number of charts/datasets that can be displayed on a chart.

Field name	Description
Time range relevant to alert	Duration for calculating metrics around the alert.
Start time	Start date and time for metric calculations.
End time	End date and time for metric calculations.

7. Select a parameter below a chart to hide the specified parameter's data on the chart.
8. **Optional:** Select the **Insights Explorer** button to view metrics by dragging and dropping them onto a timeline.
9. Select **Save**.
10. **Optional:** View a time range for an alert's CI.

    a. Select the **Overview** tab.

    b. Under the Impact section, on the **Configuration item** card, select the link to the CI that appears under the **Name** field.

    c. Select the **Metrics** tab.

    d. Select **Save**.

On-call scheduling in Service Operations Workspace for ITOM

ITOM Service Operations Workspace supports creating and managing your on-call shifts and schedules. On-call schedule determines who is on-call at a given time. Learn how to configure on-call calendars and escalation policies to ensure timely responses to critical issues, reducing downtime and maintaining service continuity. Streamlining these processes enhances team readiness, minimizes disruptions, and improves service reliability.

Getting started with on-call scheduling

To enable on-call scheduling for alerts, first incorporate the Alert table [em_alert] into the Trigger Rule Table Config list. For more information, see Add alert table to enable on-call scheduling for Service Operations Workspace for ITOM.

Teams in Service Operations Workspace

Use the Teams menu ( ) in Service Operations Workspace to view all teams. Select a team card to view and manage a team's schedule, define escalation policies, and team preferences for the selected shift. This feature verifies that your team knows who is on call, is accountable, and is confident that critical alerts or incidents are acknowledged. For information on creating a shift, see Create on-call shift for your team.

Add alert table to enable on-call scheduling for Service Operations Workspace for ITOM

Enable on-call scheduling by incorporating the Alert table [em_alert] into the Trigger Rule Table Config list. This allows for creating shifts and implementing escalation triggers and policies, ensuring teams can promptly respond to alerts and maintain operational continuity.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** and in the search field, type `trigger_rule_table_cfg.list`.
   The Trigger Rule Table Configs page opens.
2. On the form, fill in the fields with the following values.

   - In the **Table** field, select **Alert [em_alert]**.
   - In the **Trigger group** field, select **Assignment group**.
   - In the **Trigger user** field, select **Assigned to**.
   - In the **Journal** field, select **Work notes**.
3. Select **Submit**.

What to do next

Create on-call shift for your team.

Using Service Operations Workspace for ITOM

Service Operations Workspace for ITOM delivers a unified platform integrating various applications, specializing in streamlined alert management. Seamlessly manage IT Operations workflows while efficiently handling alerts, ensuring optimal performance and productivity.

When setting up the Service Operations Workspace, it's crucial to configure both IT Operations Management (ITOM) for managing alerts and IT Service Management (ITSM) for resolving

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

incidents and delivering services. This integrated setup ensures access to the full range of features, facilitating comprehensive management of IT operations and service quality.

For more information on the tasks within ITSM, see Service Operations Workspace for ITSM.

Integrations Launchpad in Service Operations Workspace for ITOM

The Integrations Launchpad showcases all Event Management connector integrations, allowing users to pull or push events from external or internal devices. This centralized hub simplifies Event Management by consolidating integration options in one place.

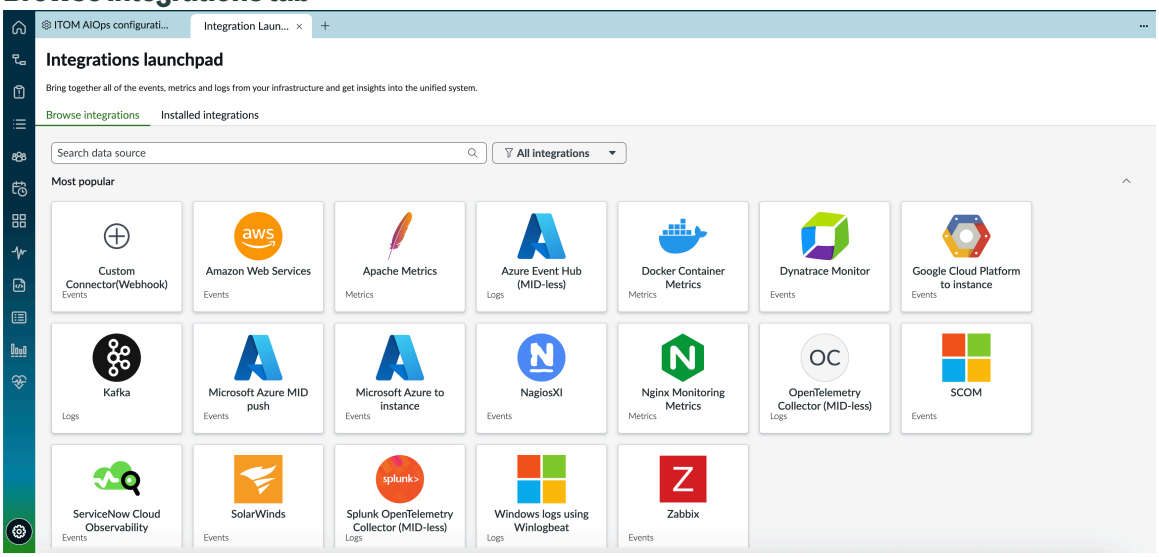
The Integrations Launchpad streamlines the process of managing and utilizing event connectors, enhancing operational efficiency and ensuring seamless integration of event data from various external sources. This centralization helps users maintain better control and visibility over their Event Management ecosystem.

Browse Integrations tab

Displays all pull, push, and custom connector integrations, including connectors available from the ServiceNow store and third parties. This tab features:

- Search Box: Helps you quickly find a specific data source by entering keywords, improving efficiency and saving time.
- All Integrations list: Organizes integrations into categories such as All Integrations, Events (Push, Pull, Custom), Metrics (ACC-M), and Logs (HLA). This categorization makes it easier for users to browse the list and select the relevant type of integration they need.

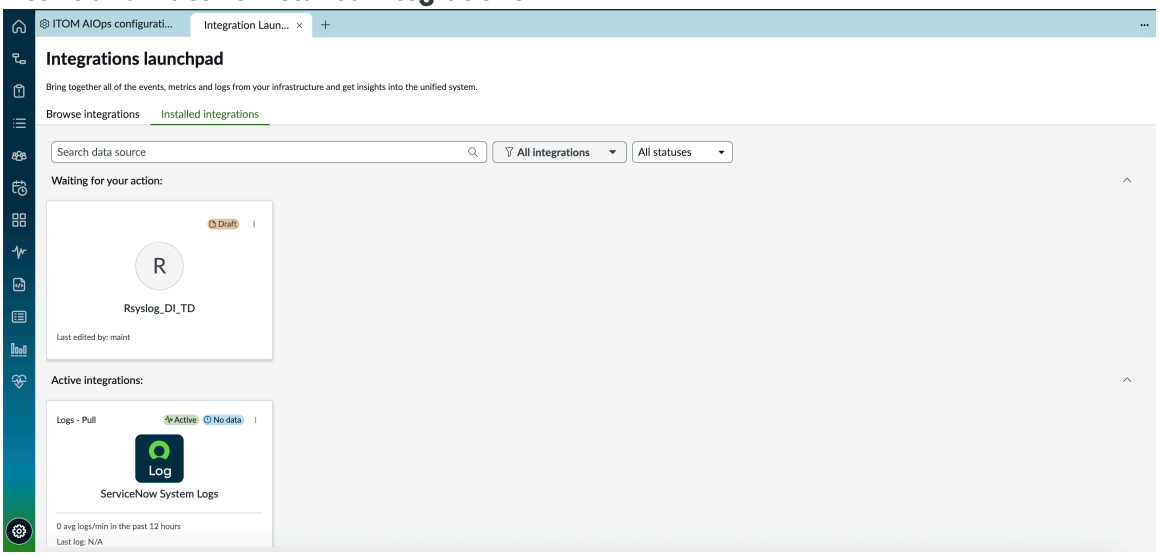
Browse integrations tab



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Installed Integrations tab

Active and inactive installed integrations



Lists all user-configured integrations, both active and inactive. This tab features:

- Search Box: Helps users quickly find a specific data source by entering keywords, improving efficiency and saving time.
- All Integrations list: Organizes integrations into categories such as All Integrations, Events (Push, Pull, Custom), Metrics (ACC-M), and Logs (HLA). This categorization makes it easier for users to browse the list and select the relevant type of integration they need.
- All statuses list: Allows you to filter integrations by their status—All Statuses, Active, Inactive, Draft, or No Data. This helps users quickly identify and manage integrations based on their current state.

Integration status and description

Status	Description
All statuses	All integration statuses
Active	Active integrations that were successfully installed
Inactive	Inactive integrations that were successfully installed
Draft	In-progress integrations with a configuration that was started but not completed
No data	Integrations that were successfully installed with no data

Configure an event pull connector

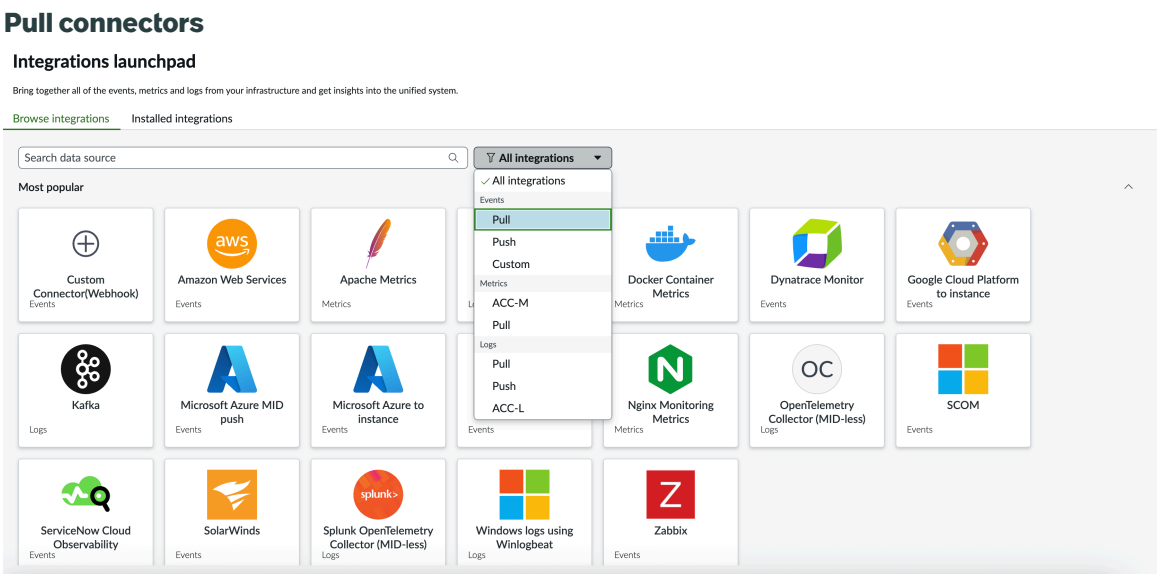
Configure event pull connectors that require a script, connector definition, and connector instance to pull events from external devices. These connectors automate the data retrieval process, ensuring the seamless integration of external events into your system for efficient monitoring and management.

Before you begin
Role required: evt_mgmt_admin

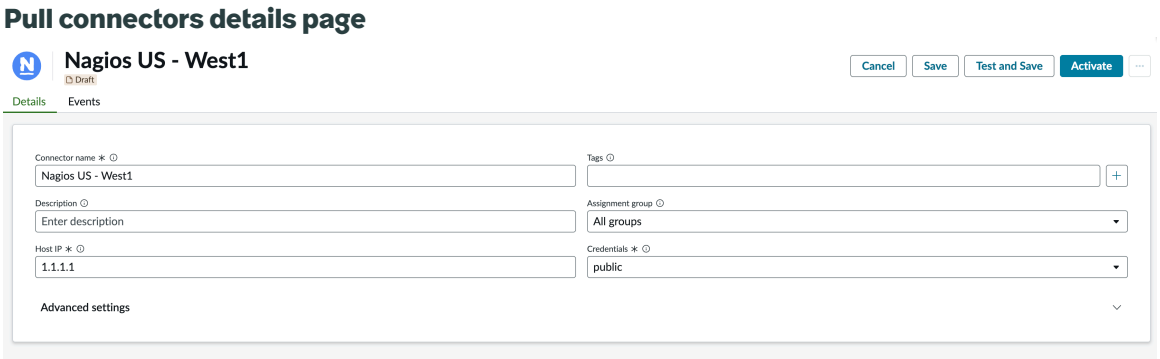
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Add integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Pull**.
   Only pull connector tiles are displayed.



5. Select a pull connector tile.
   If a pop-up menu opens, select the data to track from that connector and select **Continue**.



6. In the **Details** tab, in the **Connector name** field, enter a unique name for the connector type.
7. **Optional:** In the **Tags** field, enter tags to help locate and identify connectors of this type on the Express List.

   To add additional tags, select the plus icon ( ) next to the **Tags** field. The Add tags window opens.

   a. In the **Key** field, enter a tag key.

   b. In the **Value** field, enter a tag value.

   c. Select **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. **Optional:** In the **Description** field, enter brief information about this connector.
9. **Optional:** From the **Assignment group** drop-down list, select the group or team that is responsible for managing and maintaining the connector.
10. In the **Host IP** field, enter the IP address that is used to select the appropriate MID Server for communicating with the event source host.
    You can use the host name instead of the host IP.
11. From the **Credentials** drop-down list, select the valid credentials to access the event source host.
    To create a new credential, select **Create new credentials** and continue with the process.
12. **Optional:** If you want to customize configurations to meet specific requirements, select **Advanced settings** and fill in the form.

Field	Description
Connected MID Server	Determine whether you want to have the system choose the optimal MID Server or choose a specific MID Server yourself. Perform only if you must make modifications to the MID Server otherwise leave it empty and let the system choose the optimal MID Server.
Event collection schedule (seconds)	Enter the frequency in seconds that indicates how often the system should check for new events from the external event source. The value can't be lower than the minimum schedule property, which by default is 120 seconds.
Protocol	Defines the communication protocol used for retrieving events from external devices.
severity_by_state_type	Determines the severity level assigned to events based on their state type.
time_zone	Specifies the time zone used for recording and displaying event timestamps.
offset_min	Sets the time offset for event retrieval to ensure accurate synchronization.
Port	Verify the default values for your connector type such as port details or time formats and modify them as necessary. Default values from your connector are filled-in. Specifies the port number used for communication with external devices.
max_fetch_interval_min	Limits the maximum interval between event fetch operations.
initial_sync_in_days	Sets the duration for the initial synchronization process when retrieving historical data.

13. **Optional:** Test the connector before activating it by selecting **Test and Save**.
14. To save the connector, select **Save**.
15. To activate the pull connector, select **Activate**.
    The pull connector is activated and its tile is displayed in the **Installed Integrations** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

To confirm the successful configuration of the pull connector and the flow of events into the system, select the **Related events** tab. If the setup is successful, proceed to **Add automation** to establish an alert automation. For details on **Related events** tab, see Review integration and configuration health and for information on alert automation, see Alert automation in Service Operations Workspace for ITOM.

Configure an event push connector

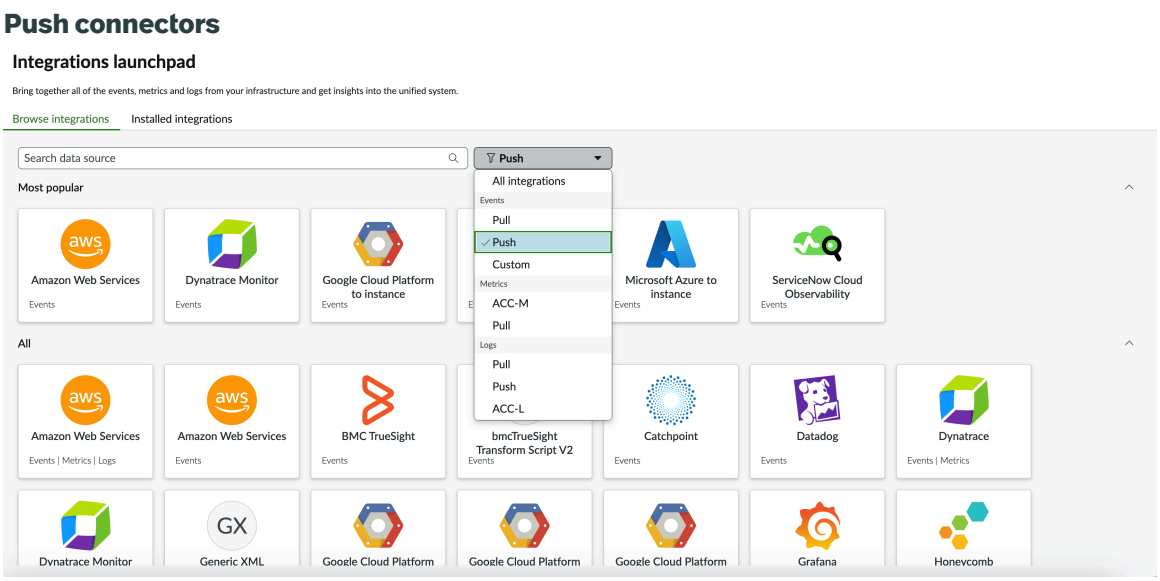
Integrate with an event push connector to connect to an external event source and push event information to your ServiceNow instance.

Before you begin

Role required: evt_mgmt_admin

Procedure

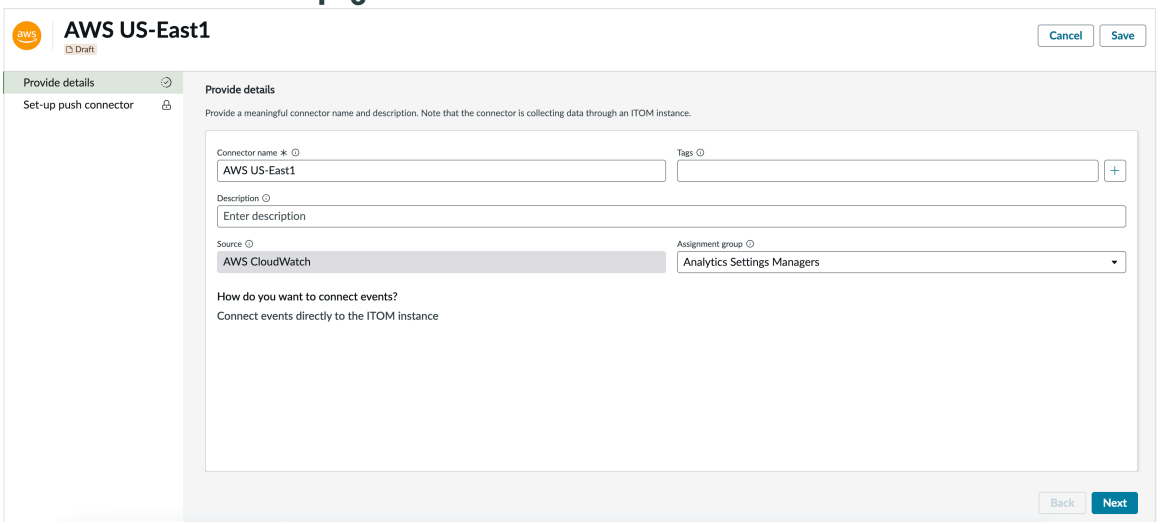
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Add integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Push**.
   Only push connector tiles are displayed.



5. Select a push connector type tile.
6. Provide details about the connector type on the **Provide details** screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Push connectors details page



a. In the **Connector name** field, enter a unique name for the connector type.

b. Optional: In the **Tags** field, enter tags to help locate and identify connectors of this type on the Express List.
To add additional tags, select the plus sign next to the **Tags** field. The Add tags window opens.

i. In the **Key** field, enter a tag key.

ii. In the **Value** field, enter a tag value.

iii. Select **Add**.

c. Optional: In the **Description** field, enter information to help identify this connector type.

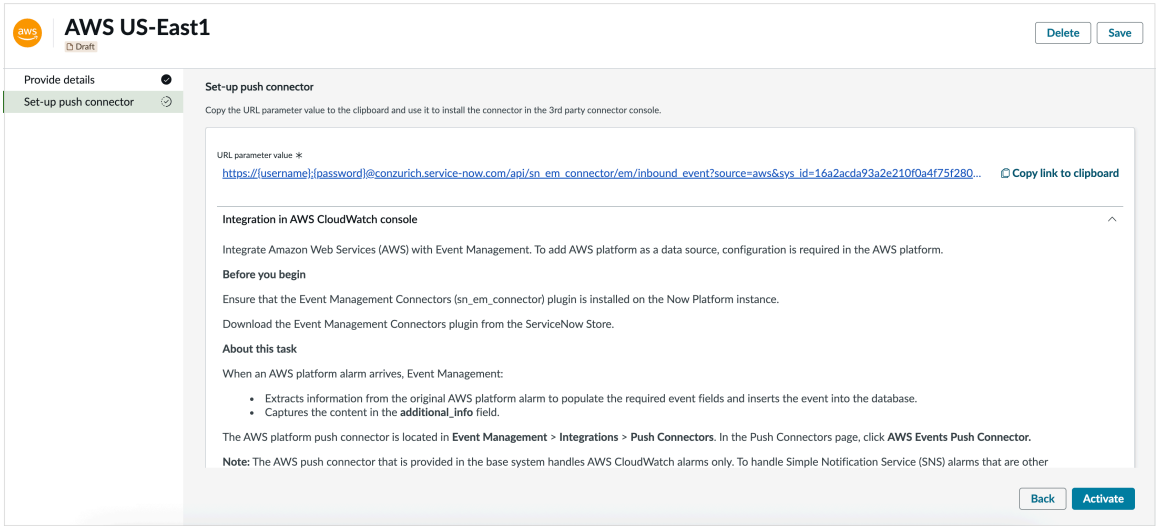
d. Verify that the vendor name in the **Source** field is correct.

e. Optional: From the **Assignment group** drop-down list, select the group or team that is responsible for managing and maintaining the Push connector.

f. Select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The connector is saved in draft mode, and the process advances to the Set-up push connector section.



7. In the **URL parameter value** field, select **Copy to clipboard** to copy the auto-generated URL parameter value to the clipboard.

   This URL is generated by the code that depends on the ServiceNow instance and connector type to receive events from the third-party connector. Pasting the URL in your third-party connector configuration creates a webhook that enables it to send events to the ServiceNow instance.

8. Select **Activate** and then select **OK**.
9. In the **Details** tab, view the connector details and the URL link and follow the step-by-step instructions to integrate your third-party connector with Event Management.
   The connector is saved and a notification is sent after the connector is active.

What to do next

To confirm the successful configuration of the pull connector and the flow of events into the system, go to the **Related events** tab. If the setup is successful, proceed to **Add automation** to establish an alert automation. For details on **Related events** tab, see Review integration and configuration health and for information on alert automation, see Alert automation in Service Operations Workspace for ITOM.

Configure an event custom connector

Authenticate your event custom connector as a data source to enable the pushing of event information to your ServiceNow instance. Define the custom connector by providing its details and mapping fields. This allows the extracted information from your custom connector's event messages to populate the required event fields. Finally, create and supply a URL for the custom connector webhook.

Before you begin

- Ensure the Event Management connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance. For more information, see Configure Event Management connectors.
- Ensure that the configuration items for the hosts managed by your custom connector exist in the ServiceNow AI Platform instance. These CIs can be physical or virtual and can be either manually created or discovered via IP discovery or Cloud Discovery. For more information, see Access to cloud environments for ITOM products.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: evt_mgmt_admin

About this task

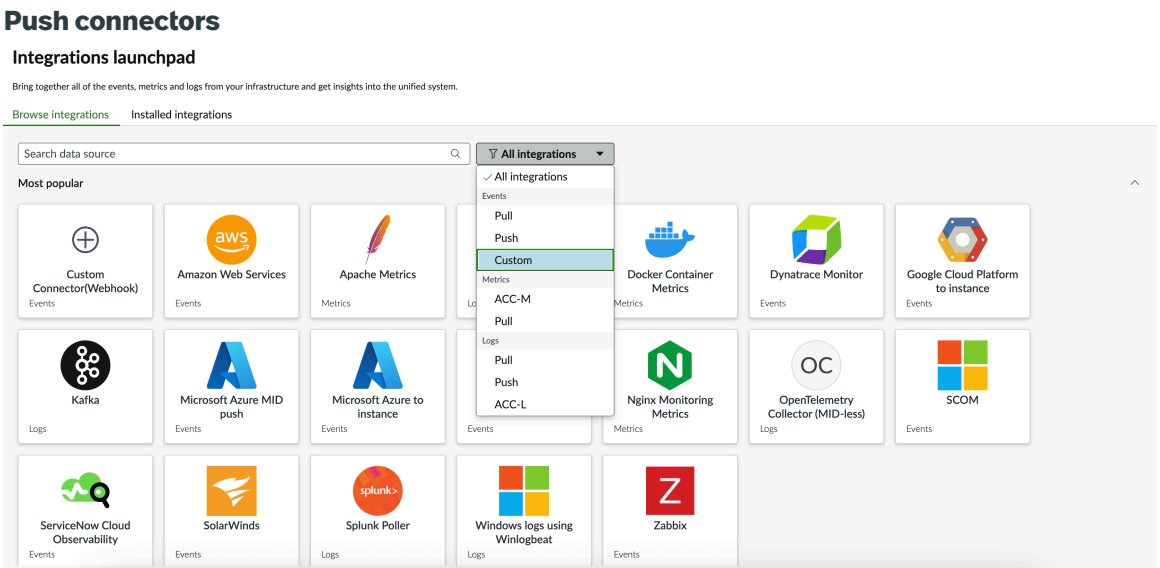
To start pushing event information to your ServiceNow instance, you must set your ServiceNow AI Platform instance as the REST endpoint using a standard webhook on your custom connector.

By providing connector details and mapping fields, you define the custom connector. The extracted information from the custom connector's event messages then populates the required event fields and inserts the event into the database.

The URL is generated by the code based on the ServiceNow instance and the custom connector. Use this URL to create a webhook that enables your custom connector to send events to the ServiceNow instance.

Procedure

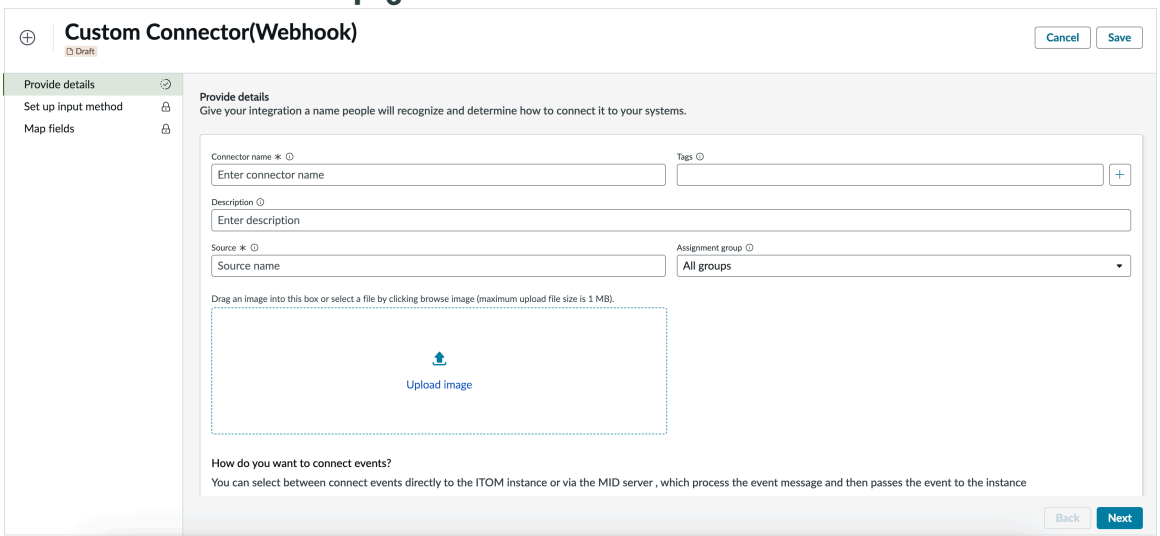
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Add integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Custom**.
   Only custom connector tiles are displayed.



5. Select a custom connector type tile.
6. On the **Provide details** page, provide the details for the connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Custom connectors details page



a. In the **Connector name** field, enter a unique integration name for the connector.

b. **Optional:** In the **Tags** field, enter tags to help locate and identify connectors of this type on the Express List.

   To add additional tags, select the plus icon ( ) next to the **Tags** field. The Add tags window opens.

   i. In the **Key** field, enter a tag key.

   ii. In the **Value** field, enter a tag value.

   iii. Select **Add**.

c. **Optional:** In the **Description** field, enter brief information about this connector.

d. In the **Source** field, enter the vendor used to gather events from the external event source.

   The **Source** field identifies the connector and serves as an identifier to recognize the source of events and alerts once the connector is active.

e. **Optional:** From the **Assignment group** drop-down list, select the group or team that is responsible for managing and maintaining the connector.

7. **Optional:** Drag or upload an image to display in your connector tile.
   - Drag an image into the box.
   - Browse to the image file by selecting **Upload image** and then choose the file.

   The maximum upload file size is 1 MB.
8. Determine whether you want to connect events directly to the ITOM instance or through a MID Server.
   - To send events directly to the ITOM instance, select **Directly to the ITOM instance**.
   - To send events through a MID Server, which processes and then passes the event to the instance, select **Via the MID server**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

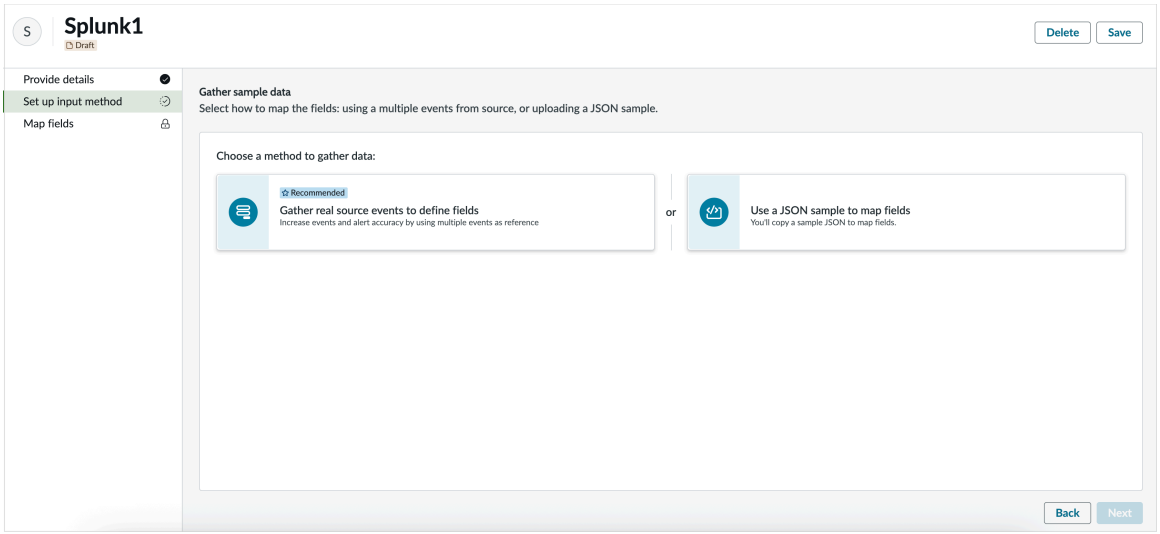
If a MID Server exists, from the **Select MID server** field, select an available MID Server connected to an events listener.

If you must create a MID Server, then select one of the following.

- **Configure MID web server extension**
- **Configure MID web service event collector context**

For more information, see Configure the MID Web Server extension and Configure the MID WebService Event Collector Context.

9. Select **Next**.



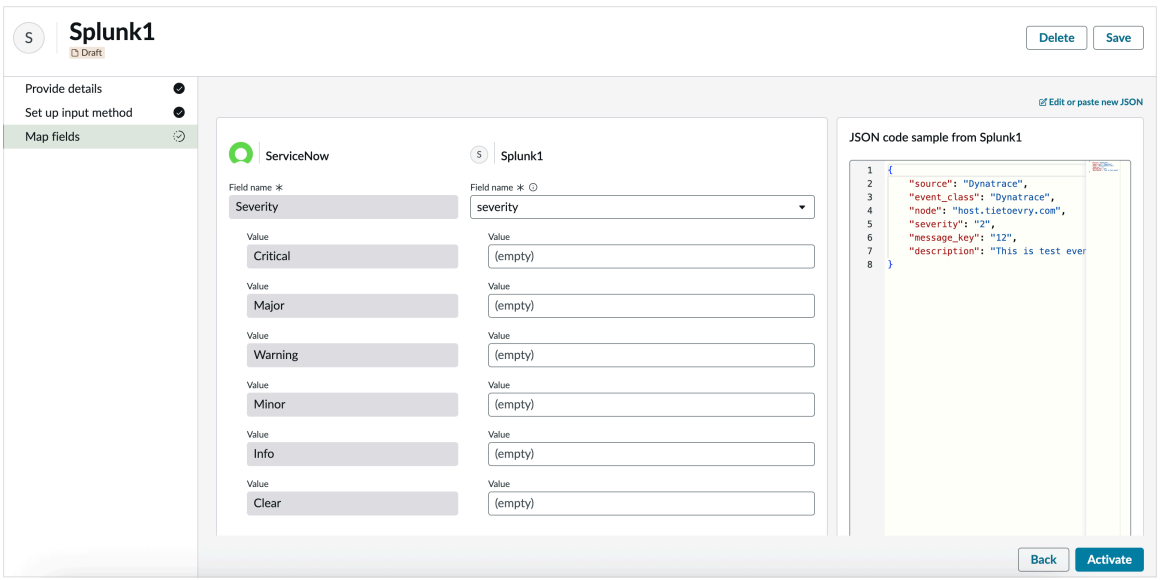
10. On the **Set up input method** page, select a method to gather event data.

Method	Description
Gather real source events to define fields	**a.** Select **Gather real source events to define fields**. **Note:** By gathering real-source events from your custom connector, you increase events and alert accuracy by using multiple events as a reference to define the fields. **b.** Select **Copy to clipboard** and copy the URL. **c.** Paste the URL into your custom connector's web hook setup to create a webhook that enables your custom connector to send events to the Service Now instance. Enter your basic authentication cre dentials into the monitoring system's webhook con figuration (such as the username and password). The webhook enables your custom connector to send events to the instance. **d.** Select **Check for events**. The number of events are displayed. The event creates JSON files that you can browse after selecting **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Method	Description
Use a JSON sample to map fields	**a.** Select **Use a JSON sample to map fields**. **Note:** Only if you have a sample JSON se lect this option. **b.** In the **Enter payload** dialog box, copy and paste your JSON sample payload to create and view the mapping to map the fields.  **c.** Select **Upload JSON**. **d.** Select **Edit or paste new JSON** to edit the JSON that you uploaded or paste a new one. **e.** Select **Copy to clipboard** and copy the URL. **f.** Paste the URL into your custom connector's web hook setup to create a webhook that enables your custom connector to send events to the Service Now instance. Enter your basic authentication cre dentials into the monitoring system's webhook con figuration (such as the username and password). The webhook enables your custom connector to send events to the instance.

11. Select **Next**.
The page opens where you can map fields.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12. On the **Map fields** page, in the connector field names column, enter at least one value that maps to the severity values listed in the ServiceNow **Severity** field column.
13. On the **Map fields** page, in the connector field names column, enter at least one value that maps to the severity values listed in the ServiceNow **Severity** field column.

    You can enter the severity value from the JSON code sample. To set a severity value, you must be familiar with your custom connector's payload and the types of severity it supports. The severity values of the received events must match the generated events in your system.

    Enable the system to create events correctly from incoming data by mapping the fields in your JSON code sample to the ServiceNow fields. The **Severity** and **Message key** information are automatically filled in to save you time and effort. The **Message key** provides the correct identifier for the events, ensuring de-duplication works correctly and redundant alerts are not generated.
14. **Optional:** To view multiple JSON files, select the arrow above the JSON sample.
15. **Optional:** In the Other fields section, in your connector column, specify custom event parameters that are optional but provide additional information about the event.
    If you choose not to provide the optional information, leave the field empty.

    a. In the **Description** field, enter a meaningful alert description.

    b. In the **Metric name** field, enter a metric name that allows you to associate events with the performance metrics or KPIs that triggered the alert.

    c. In the **Node** field, enter a node value to be used for CI binding.

    d. In the **Event time** field, enter the creation time of the custom connector event.
    If the event time isn't mapped, the system will use the default event time.

    e. In the **Event time settings** field, select the time format and the event time zone.
    - **Time format**: A GlideDateTime field in UTC or GMT format, with a maximum length of 40 characters.
    - **Time zone**: Times are stored in Coordinated Universal Time (UTC) and are displayed globally based on the system time zone.
16. Activate and save the connector by selecting **Activate** and then select **OK** on the confirmation pop-up window.
    You can view the connector details on the **Details** tab and your field mappings on the **Fields mapping** tab.

    Note: You cannot modify connector details when it is active. Deactivate the connector to make any changes.

Result

After the connector is activated, events start flowing from your custom connector console into the ServiceNow instance. The plug-in extracts information from the original custom connector event message to populate the required event fields and inserts the event into the database. To see the events in your ServiceNow AI Platform instance, navigate to All Events. For more information, see View events.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

To verify that the process was successfully completed and events are flowing into the system, view the related events on the **Related events** tab. If the setup is successful, proceed to **Add automation** to establish an alert automation. For information on alert automation, see Alert automation in Service Operations Workspace for ITOM.

Configure Solarwinds metric pull connector

Configure a metric pull connectors that require a script, connector definition, and connector instance to pull metrics from external sources. These connectors automate the data retrieval process, ensuring the seamless integration of external metrics into your system for efficient monitoring and performance analysis.

Before you begin

Role required: evt_mgmt_admin

About this task

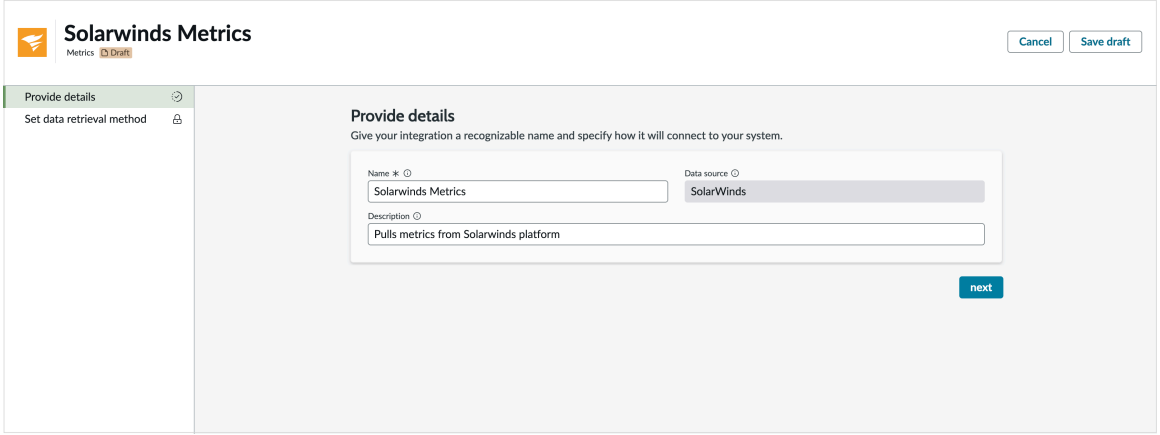
Note: The new UI for configuring metric pull connector is currently available only for the SolarWinds Metric Connector. For all other metric connectors, the configuration continues to use the Platform Table UI.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Add integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Metrics** > **Pull**.

   Only metric pull connector tiles are displayed.
5. Select a pull connector tile.
   If a pop-up menu opens, select the data to track from that connector and select **Continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. In the **Provide details** section, enter the following information and select **Next**.
   - In the **Name** field, enter a unique name for the connector type.
   - In the **Data source** field, the external source for retrieving metrics is auto-populated based on the tile type you select.
   - In the **Description** field, enter brief information about this connector.
7. In the **Set data retrieval method** section, enter the following information:
   - In the **Hostname/Host IP** field, enter the IP address that is related to the Solarwinds server.
   - From the **Credentials** drop-down list, select the valid credentials to access the event source host.
   - In the **Metrics collection schedule (seconds)** field, enter the time interval (in seconds) at which the connector retrieves metrics from the source host.
   - In the **MID Server** field, select a MID Server that collects metric data from external tools and securely sends it to ServiceNow.

     If none are available, ensure one is installed, running, and has the required capabilities.

     Note: You can select multiple MID Servers. The system randomly assigns one as the primary and uses the others as backups.
8. **Optional:** If you want to customize configurations to meet specific requirements, select **Advanced settings** and fill in the form.

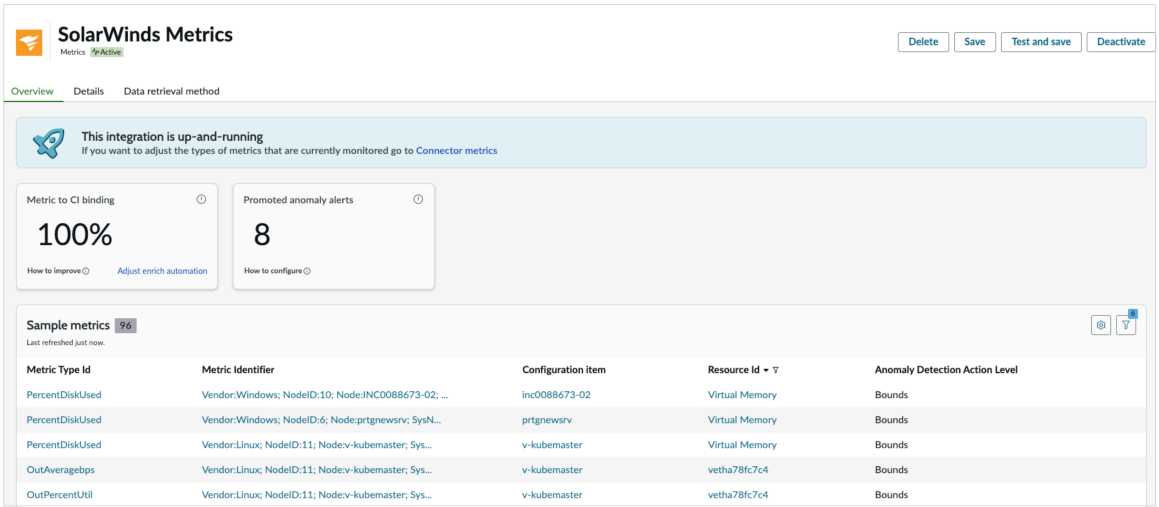
Field	Description
Max rows per query	Frequency in seconds that indicates how often the system should check for new metrics from the external event source. The value can't be lower than the minimum schedule property, which by default is 120 seconds.
Max fetch interval (in minutes)	Limits the maximum interval between event fetch operations.
Offset (in minutes)	Sets the time offset for event retrieval to ensure accurate synchronization.
Port	Specifies the port number used for communication with external devices.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	(Optional) Verify the default values for your connector type such as port details or time formats and modify them as necessary. Default values from your connector are filled-in.
Protocol	Defines the communication protocol used for retrieving events from external devices.
Debugging	○ Debug: Provides detailed logs for troubleshooting. ○ Log payload: Displays raw log data. Use only for debugging, as it can quickly fill the MID Server logs.

9. **Optional:** Test the connector before activating it by selecting **Test and Save**.
10. To save the connector, select **Save**.
11. To activate the pull connector, select **Activate**.
    The metric pull connector is activated and its tile is displayed in the **Installed Integrations** tab. When you open the tile, you can find the **Overview**, **Details**, and **Data retrieval method** tabs.

    The **Overview** tab allows you to verify that the connector is running and collecting data. It also offers options to improve system settings, such as refining alert definitions or enhancing binding configurations.



The **Details** tab allows you to update the connector's general information (such as name or description) and displays any errors encountered during its operation.

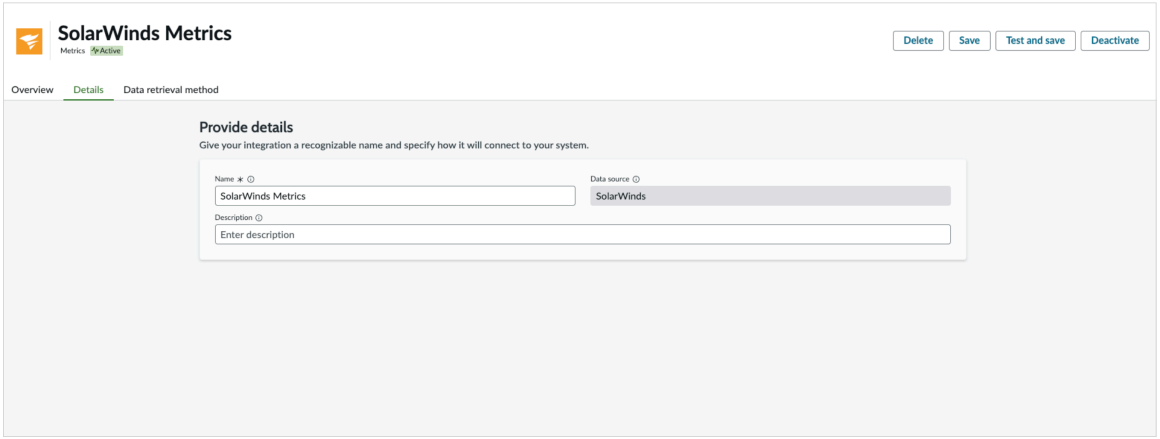
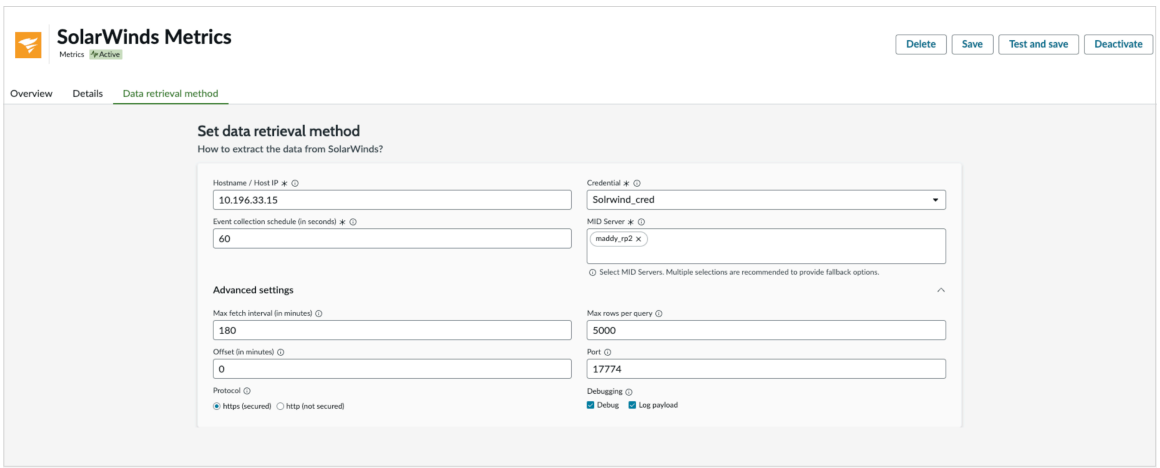
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The **Data Retrieval Method** tab contains the connector settings (such as host, port, and credentials) and may provide additional details for issues like MID Server errors.



Configure Dynatrace metric pull connector

Configure metric pull connectors that require a script, connector definition, and connector instance to pull metrics from external sources. These connectors automate the data retrieval process, ensuring the seamless integration of external metrics into your system for efficient monitoring and performance analysis.

Before you begin

Role required: evt_mgmt_admin

Configure the Dynatrace API Key credential from **All** > **Connections and Credentials** > **Credentials**. For more information on how to configure Dynatrace API Key credential, see API key credentials.

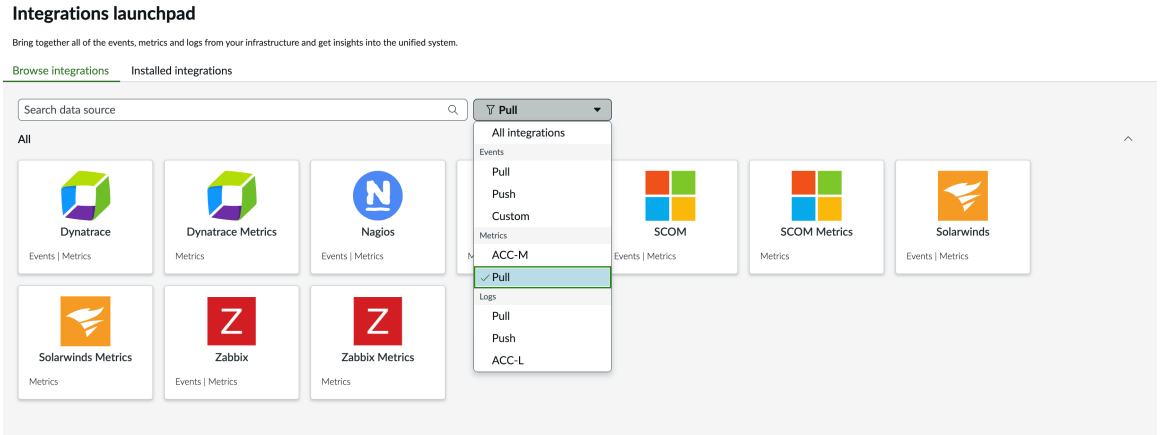
About this task

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Add integrations**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Metrics** > **Pull**.



Only metric pull connector tiles are displayed.

5. Select the **Dynatrace Metrics** connector tile.
6. In the **Provide details** section, enter the following information and select **Next**.
   - In the **Name** field, enter a unique name for the connector type.
   - In the **Data source** field, the external source for retrieving metrics is auto-populated based on the tile type you select.

     In this case, select **Dynatrace**.
   - In the **Description** field, enter brief information about this connector.
7. In the **Set data retrieval method** section, enter the following information:
   - In the **Hostname/Host IP** field, enter the IP address that is related to the Dynatrace server.
   - From the **Credentials** drop-down list, select the valid credentials to access the metrics source host.

     Select the credential.
   - In the **Metric collection schedule (in seconds)** field, enter the time interval (in seconds) at which the connector retrieves metrics from the source host.

     The default value is 60 seconds.
   - In the **MID Server** field, select a MID Server that collects metric data from external tools and securely sends it to ServiceNow.

     If none are available, ensure one is installed, running, and has the required capabilities. If none are available, ensure one is installed, running, and has the required capabilities. For example, the **Metric Intelligence Context** must be running on the same MID Server that you are configuring.

     Note: You can select multiple MID Server. The system randomly assigns one as the primary and uses the others as backups.
8. **Optional:** If you want to customize configurations to meet specific requirements, select **Advanced settings** and fill in the form.
   For more information on fields, see Dynatrace advanced settings fields.

9. **Optional:** Test the connector before activating it by selecting **Test and Save**.
10. To save the connector, select **Save**.
11. To activate the pull connector, select **Activate**.
    The metric pull connector is activated and its tile is displayed in the **Installed Integrations** tab. When you open the tile, you can find the **Overview**, **Details**, and **Data retrieval method** tabs.

    The **Overview** tab allows you to verify that the connector is running and collecting data. It also offers options to improve system settings, such as refining alert definitions or enhancing binding configurations.

    The **Details** tab allows you to update the connector's general information (such as name or description) and displays any errors encountered during its operation.

    The **Data Retrieval Method** tab contains the connector settings (such as host, port, and credentials) and may provide additional details for issues like MID Server errors.

Configure Datadog metric pull connector

Configure metric pull connectors that require a script, connector definition, and connector instance to pull metrics from external sources. These connectors automate the data retrieval process, ensuring the seamless integration of external metrics into your system for efficient monitoring and performance analysis.

Before you begin

Role required: evt_mgmt_admin

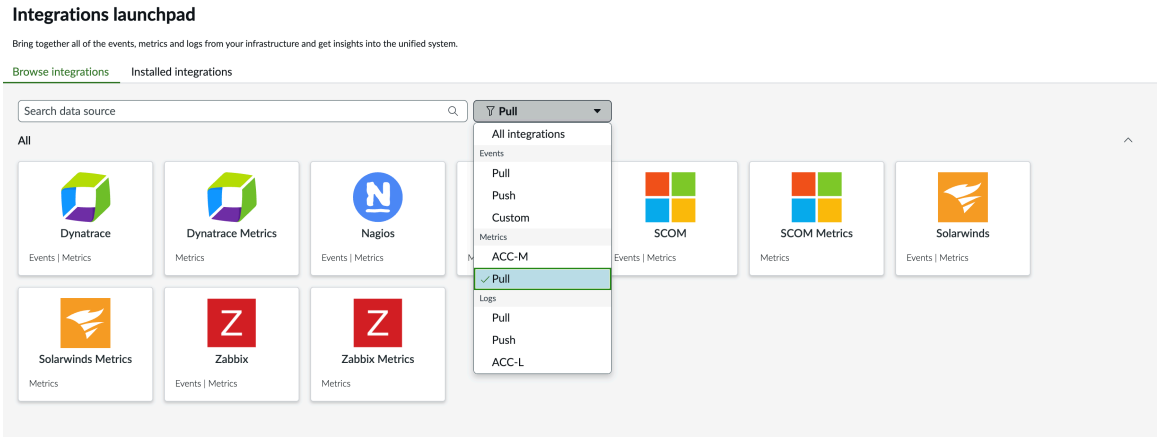
Configure the Datadog API Key credential from **All** > **Connections and Credentials** > **Credentials**. For more information on how to configure Datadog API Key credential, see API key credentials.

About this task

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Add integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Metrics** > **Pull**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Only metric pull connector tiles are displayed.

5. Select the **Datadog Metrics** connector tile.
6. In the **Provide details** section, enter the following information and select **Next**.
   - In the **Name** field, enter a unique name for the connector type.
   - In the **Data source** field, the external source for retrieving metrics is auto-populated based on the tile type you select.

     In this case, select **Datadog**.
   - In the **Description** field, enter brief information about this connector.
7. In the **Set data retrieval method** section, enter the following information:
   - In the **Hostname/Host IP** field, enter the IP address that is related to the Datadog server.
   - From the **Credentials** drop-down list, select the valid credentials to access the metrics source host.

     Select the credential.
   - In the **Metric collection schedule (in seconds)** field, enter the time interval (in seconds) at which the connector retrieves metrics from the source host.

     The default value is 60 seconds.
   - In the **MID Server** field, select a MID Server that collects metric data from external tools and securely sends it to ServiceNow.

     If none are available, ensure one is installed, running, and has the required capabilities. If none are available, ensure one is installed, running, and has the required capabilities. For example, the **Metric Intelligence Context** must be running on the same MID Server that you are configuring.

     Note: You can select multiple MID Server. The system randomly assigns one as the primary and uses the others as backups.
8. **Optional:** If you want to customize configurations to meet specific requirements, select **Advanced settings** and fill in the form.
   For more information on fields, see #unique_2481.
9. **Optional:** Test the connector before activating it by selecting **Test and Save**.
10. To save the connector, select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. To activate the pull connector, select **Activate**.
    The metric pull connector is activated and its tile is displayed in the **Installed Integrations** tab. When you open the tile, you can find the **Overview**, **Details**, and **Data retrieval method** tabs.

    The **Overview** tab allows you to verify that the connector is running and collecting data. It also offers options to improve system settings, such as refining alert definitions or enhancing binding configurations.

    The **Details** tab allows you to update the connector's general information (such as name or description) and displays any errors encountered during its operation.

    The **Data Retrieval Method** tab contains the connector settings (such as host, port, and credentials) and may provide additional details for issues like MID Server errors.

Review integration and configuration health

Review your events to ensure alerts are created as intended. Start this process by checking the health status of your integration. This provides useful statistics to highlight where you can make improvements to enrich alerts with relevant business context, group them for better noise reduction, escalate critical alerts promptly, and notify your team for swift response and resolution.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

About this task
Health state metrics indicate how effectively alert automations add context and reduce noise, helping operators lower the Mean Time to Repair (MTTR). When adding a new integration, review these metrics, assess the rates, and develop new rules to further enhance noise reduction and improve overall system performance.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Add integrations**.
4. In the **Browse Integrations** tab, select the **All integrations** drop-down list and select **Pull** or **Push** as required.
5. Select a pull, push, or a custom connector type tile.
   If a pop-up menu opens, select the data to track from that connector and select **Continue**.
6. Select the **Events** tab.

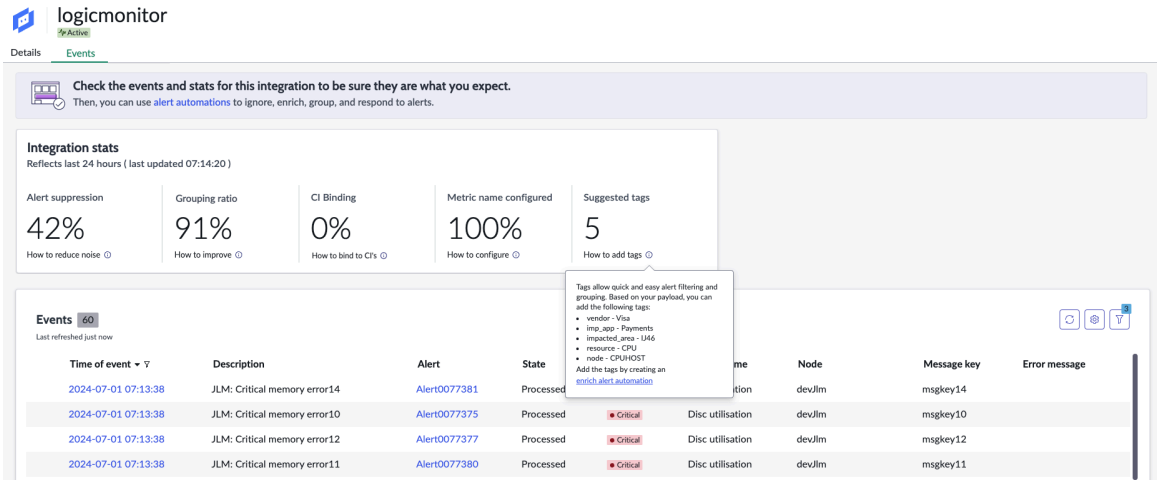
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. In the Health state section, view the data for alerts and their associated attributes.

Alert attributes

Alert attribute	Description
Alert Suppression	The suppression ratio indicates the proportion of alerts created to events received. Reducing unwanted alerts can be achieved by de-duplicating or ignoring them. ○ De-duplication: The **message_key** field is a unique identifier for an alert in the source monitoring system. It is used for de-duplication and alert flapping detection purposes. If the source event does not provide reliable unique values, you can use the default value or create your own. If the message key is not defined, the default message key will be <Source + Node + Type + Resource + Metric Name>. The guideline is for the event source to automatically populate the <Source + Node + Type + Resource + Metric Name> fields and generate the message key. This practice facilitates better distribution of event processing across instance workers and nodes. If the source event does not provide values for these fields, ensure they are populated using transform rules. This action, which does not impact event processing, is essential for de-duplication. Populate as many of these fields as possible before sending the event to the instance. Doing so enhances the distribution of events across processor workers, resulting in improved throughput and scalability. To learn more about de-duplication, see Event Management configuration preferences. To set the message key in your custom connector integration, see Configure an event custom connector. ○ Ignore alert event rules: Filter out low-quality alerts by creating an ignore automation.
Alert compression rate	When you group alerts, a high compression rate is desirable because it means fewer alerts remain for your operations team to review and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert attribute	Description
	act on. This can lead to improved team efficiency. The compression rate is calculated as 1 – (the number of alert groups + the number of ungrouped alerts) / total alerts. To learn about alert aggregation, see Alert grouping. One way to improve your alert compression rate is by defining a new grouping automation.
CI Binding	The percentage of alerts successfully bound to a Configuration Item (CI) in your CMDB is crucial. Aim for this number to be at or near 100% to enhance alert grouping, root cause analysis, assignment, and more. To bind a host, machine, or any device with an IP, populate the **Node** field with a unique hostname, FQDN, IP, or MAC address. This can be done within the integration itself or by creating an enrich automation. For more complex scenarios, you can override node-based binding using event rules. For more information on CI binding, see Binding alerts to CIs.
Metric name configured	Shows the percentage of alerts that have a metric name defined. It's crucial to aim for near 100% because it's used by default in our automated correlation algorithm. This can be achieved within the integration itself or by creating an enrich automation.
Suggested tags	Provides suggested alert tags based on the integration payload. Alert tags are structured fields that you can define to facilitate easier filtering and grouping of alerts. The tags are stored in *sn_itom_integ_app_recommendation_tags_suggestion*, and only the top 5 most popular tags are displayed. In case you prefer to refine the results of suggestion mechanism, you can use property *sn_itom_integ_app.evt_mgmt_tag_suggestion_ignore_keys*, which displays a list of lowercase field names or keywords, separated by commas, to be ignored when scanning additional alert info for tag suggestions. Default value is time.

8. In the Events section, ensure that your events are generating alerts as expected.

   Verify that alert fields and tags are populated correctly to make the alerts easier to read and filter in Express List. Confirm that severity values align with your operations team's expectations and that fields and tags follow a standardized format across sources for easier grouping.

   By verifying alert generation, you can be confident that your system is properly configured to detect and notify you of noteworthy occurrences. For information on the fields in the Events section, see Integration and configuration health event fields.

What to do next

Now that you've confirmed alerts from the events, you can initiate the alert automation process by selecting **Add automation**. This takes you to the ignore automation step, where you can disregard irrelevant or false-positive alerts. Following that, proceed to enrich, group, and

automate responses. This process involves transforming raw alerts into a format understandable by ServiceNow, grouping the alerts, and escalating an alert to ensure an immediate response from the appropriate team or individual. For more information on alert automation, see Alert automation in Service Operations Workspace for ITOM.

Activate integration

Activate integration allows you to enable a previously deactivated connector integration, restoring its functionality. This feature helps you seamlessly resume data flow and integration activities, ensuring continuity and efficient event management without the need to reconfigure the integration.

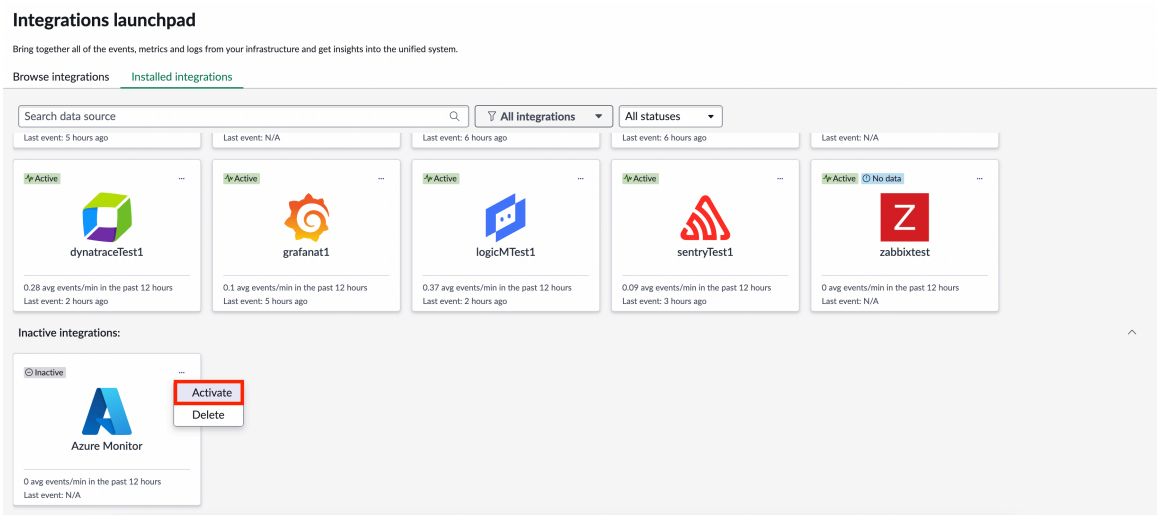
Before you begin

Ensure the integration is deactivated.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Manage installed integrations**.
4. Select the **Installed integrations** tab.
5. For the integration that you want to activate, select the Ellipses icon (•••) and then select **Activate**.



The selected integration is activated, and its status is shown as **Active** on the installation tile.

Deactivate integration

Deactivate integration allows you to temporarily disable an active connector integration without deleting it. This feature helps you manage integrations more effectively by pausing data flow when needed, reducing unnecessary event processing and improving system performance.

Before you begin

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.

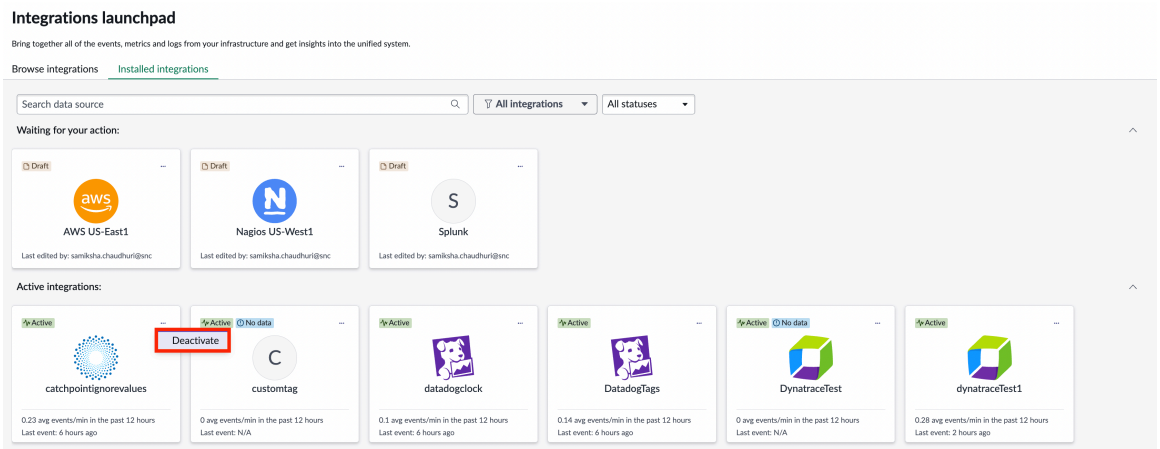
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Manage installed integrations**.
4. Select the **Installed integrations** tab.
5. For the integration that you want to deactivate, select the Ellipses icon (•••) and then select **Deactivate**.



The selected integration is deactivated, and its status is shown as **Inactive** on the installation tile.

Delete integration

Delete integration allows you to permanently remove a connector integration from your system. This feature helps you maintain a clean and organized system by eliminating unused or obsolete integrations, freeing up resources and reducing potential clutter.

Before you begin

Ensure the integration is deactivated.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the **Setup** > **Integrations** section, select **Manage installed integrations**.
4. Select the **Installed integrations** tab.
5. For the integration that you want to delete, select the Ellipses icon (•••) and then select **Delete**.

6. On the confirmation window, select **Delete**.
   The integration is deleted.

Express List in the Service Operations Workspace for ITOM

The ServiceNow Event Management Express List feature helps you identify health issues across the datacenter on the Service Operations Workspace. It provides a list of quick information on alerts so you can more efficiently monitor systems and services, resolve alerts, evaluate the alert impact, track issues, and report incidents.

https://player.vimeo.com/video/1199445396?h=c7b7151862&badge=0&autopause=0&player_id=0&app_id=58479

The Express List pane sortable alert list reduces the number of clicks necessary to access alert information. Selecting the check box of an alert opens a preview panel where you can view data that helps for prioritization, impact realization, and root cause analysis. You can easily modify the Express List pane to narrow down the display by using a provided fields list, displaying additional alert information, and filtering out or showing matching alerts. You can also modify the displayed time range.

Note:

Exporting alerts is not supported from the Express List. To export alerts, open the list view in Service Operations Workspace.

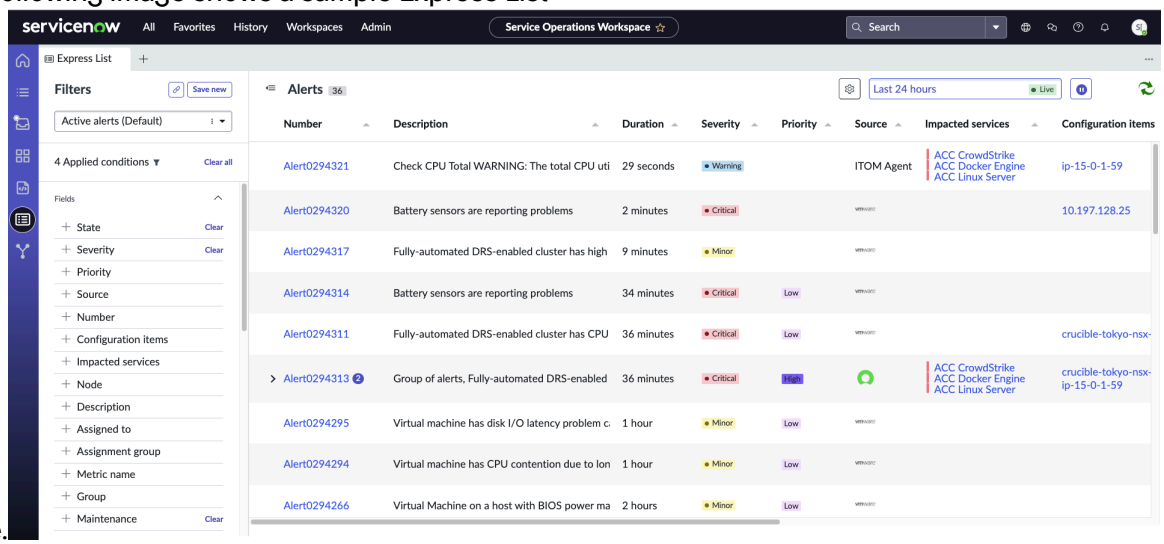
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following image shows a sample Express List pane.



Express List benefits

The Express List pane enables operators to more efficiently perform the following actions:

- **Monitoring systems or application services**. Monitoring the performance and capability of computer systems to see any discrepancies.
- **Resolving alerts**. Working on discrepancies to troubleshoot issues and promote the efficient functioning of IT infrastructure.
- **Tracking issues**. Tracking and documenting defects and resolutions in detail and reporting incidents.
- **Reporting incidents**. Escalating complex issues to management, other IT resources, third parties or vendors.

Alert information displayed in the Express List preview panel

The Express List preview panel displays additional alert information on the Express List pane. This information enables you to conduct an assessment that helps in resolving incidents without having to open multiple alert forms.

The **Info** tab on the preview panel displays the following information for a selected alert:

- Alert number (link)
- Status
- Duration
- Configuration items (with links)
- Metric name
- Node
- Resource
- Source
- Assigned to
- Assignment group
- Last Updated
- Impacted services

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see View data on impacted services on the preview panel in Express List.

- Additional info
- Custom field

You can view additional alert information by selecting any of the linked items.

The **Alerts in group** tab on the preview panel displays alert information for a selected alert group. Information for each alert is displayed in a tile with additional options for each alert in the group.

Each tile displays the following alert information:

- Alert number (link)
- Status
- Severity
- Configuration items
- Duration
- Metric name

Customizing the alert display time range

You can determine the time range of the displayed alerts. The default time range is the last 24 hours. The list continues to update with new alerts until you select the pause icon ( ). Selecting the current range setting in the upper right displays a dialog box with date and time range options:

- All time - The last 90 days
- Last 24 hours
- Last week
- Last 12 hours
- Last hour
- Last 15 minutes
- Custom - Enables you to select a date and time range from the pop-up calendar.

The **Default Time Range** field is introduced on the Express List view in the following versions:

- Service Operations Workspace Express List 26.6.1
- Service Operations Workspace Express List App 26.4.0
- Service Operations Workspace ITOM Apps 26.9.0

Default time ranges can be defined by your administrator using the system property *evt_mgmt.express_list.all_time_days*. This property specify the time range (in days) of displayed alerts.

Roles used by Express List

Detailed information on all roles that can access the Express List feature on the Service Operations Workspace.

Role title	Description	Contains roles
Event Management Administrator [evt_mgmt_admin]	Has read and write access to all Event Management features to configure Event Management.	• evt_mgmt_user • template_editor_global

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title	Description	Contains roles
	Note: Be careful with the evt_mgmt_admin role because it can be elevated to the admin role.	
Event Management Operator [evt_mgmt_operator]	In combination with the evt_mgmt_user permissions, can also activate operations on alerts such as acknowledge, close, open incident, and run remediations.	evt_mgmt_user
Event Team Operator [evt_team_operator]	Manages Event Management operations within a specific team as defined in the **Assignment Group** field. This role allows the operator to read and write alerts exclusively for their assigned team. Additionally, the operator can make configuration changes specific to their team, including updates to Alert Automation and Integrations Launchpad. **Note:** The evt_team_operator role must be assigned to an assignment group to view and manage alerts for that group. If the role is created but not associated with any groups that have alerts assigned, the operator cannot see any alerts.	
Event Management User [evt_mgmt_user]	Has read-only access to all Event Management features. The contained itil role grants access to manage incidents that are created from alerts. Can only view Express List.	itil
Event Management Integrator [evt_mgmt_integration]	Has create access to the Event [em_event] and Registered Nodes [em_registered_nodes] tables to integrate with external event sources.

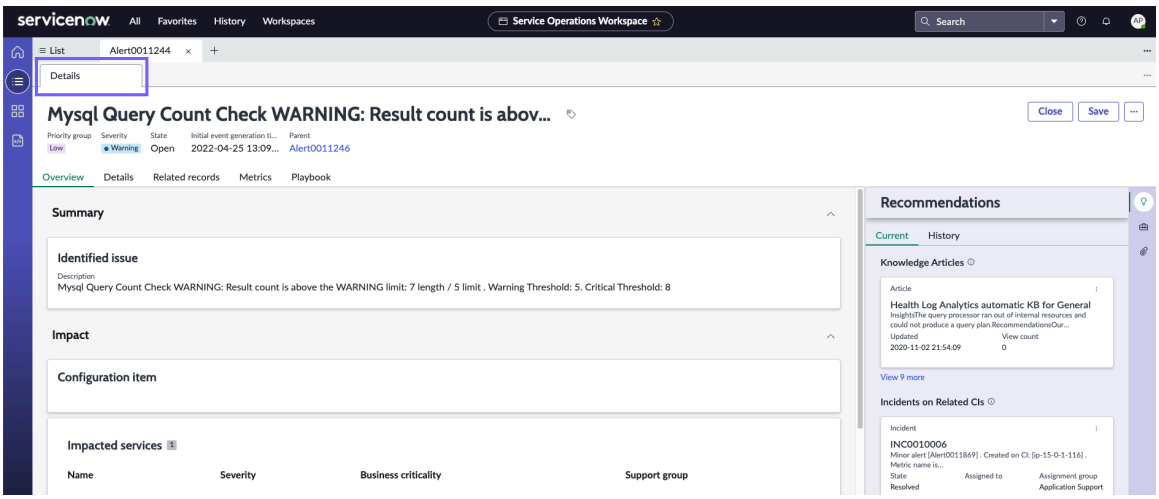
Alerts in Service Operations Workspace

The Service Operations Workspace interface displays an alerts list and details on specific alerts.

When clicking an alert in the alerts list, the **Details** tab of the selected alert appears and the issue that caused the alert (the identified issue) appears in the alert title. Only the subtabs relevant to the alert appear on the resulting page. For example, the **Alerts in Group** option appears in the **Related records** tab only for alert groups.

Details tab



The following table describes areas on the alert form.

Alert form areas

Feature	Description
Header	The header includes these details: • Description: The text from the **Description** field of the alert is displayed. • Priority group: Priority group to which the alert belongs. • Severity: Severity of the alert. • State: The state of the alert. • Initial event generation time: Date and time when the initial event was generated. • Parent: The primary alert in the group (relevant only for child alerts in a group). • Group: Group type to which the alert belongs (relevant only for alerts in a group). • Task: Number of the incident with which the alert is associated. The displayed information varies according to the alert type.
Overview tab	When viewing an alert with an assigned CI, this tab opens when selecting the alert. The information displayed varies depending on the type of alert (grouped, secondary, or primary). If you have installed the Health Log Analytics app, alert types include Health Log Analytics alerts and component-based alerts.

Assign alerts in Express List

Assign alerts in Express List to yourself, to someone else, or to an assignment group to balance your organization's work load.

Before you begin

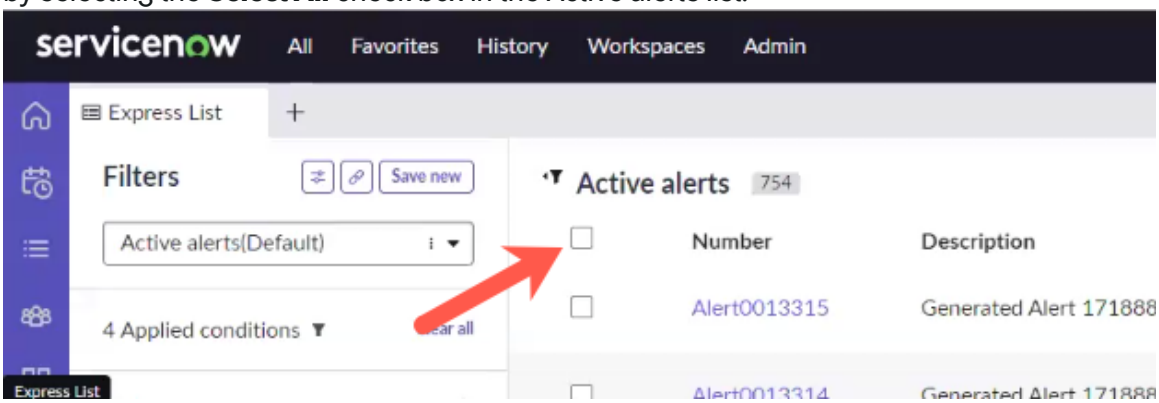
Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

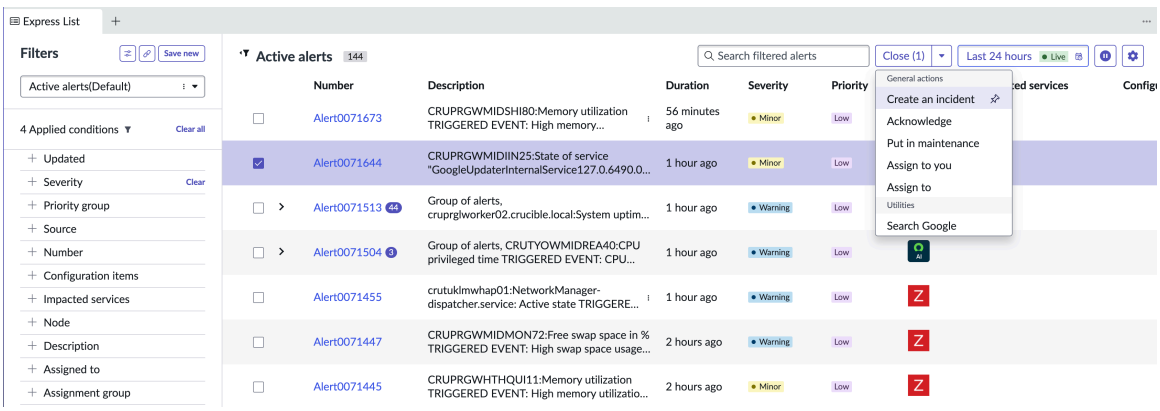
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Select the check box next to the alert number that you want to assign.

Note: You can perform the action on up to 1,000 alerts simultaneously by selecting the **Select All** check box in the Active alerts list.



4. Select the **Close** drop-down list.



5. Perform one of the following actions.

Assignment	Actions
Yourself	Select **Assign to you** and then select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assignment	Actions
Someone else	**a.** Select **Assign to**. **b.** Select the name of the person to whom you want to assign the alert from the **Assigned to** field. **c.** (Optional) Enter information about the as signment or alert in the **Work notes** field. **d.** Select the **Assign <number> alerts** button.
Assignment group	**a.** Select **Assign to**. **b.** Select the name of the group from the **As signment group** field. **c.** Select the name of the person to whom you want to assign the alert from the **Assigned to** field. **d.** (Optional) Enter information about the as signment or alert in the **Work notes** field. **e.** Select the **Assign <number> alerts** button.

Result

The assigned person appears in the **Assigned to** column and the assignment group appears in the **Assignment group** column in the Express List pane.

Identify an assigned Express List view

Identify Express List views assigned to you by your Event Management admin to make sure that you focus on specific services, priorities, or alerts.

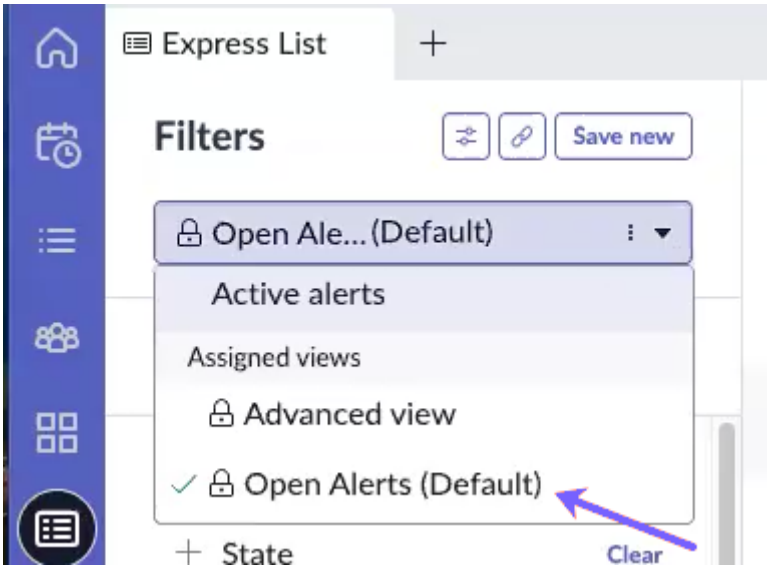
Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. **Optional:** In the Filters pane, turn on the **Use advanced filters** option to access advanced filters assigned to you.
4. From the drop-down list in the Filters pane, select an Express List view assigned to you. The default view is marked as Default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: You can't override the filters in views assigned to you. However, you can modify, save, and share these views locally.

The Filters pane lists the predefined filters. The Express List table displays the columns configured for the selected view.

Related topics

Configuring Express List views for users and user groups

Add or modify Express List columns

Add columns to the Event Management Express List display to focus the list of alerts that is displayed or modify the existing columns that are displayed.

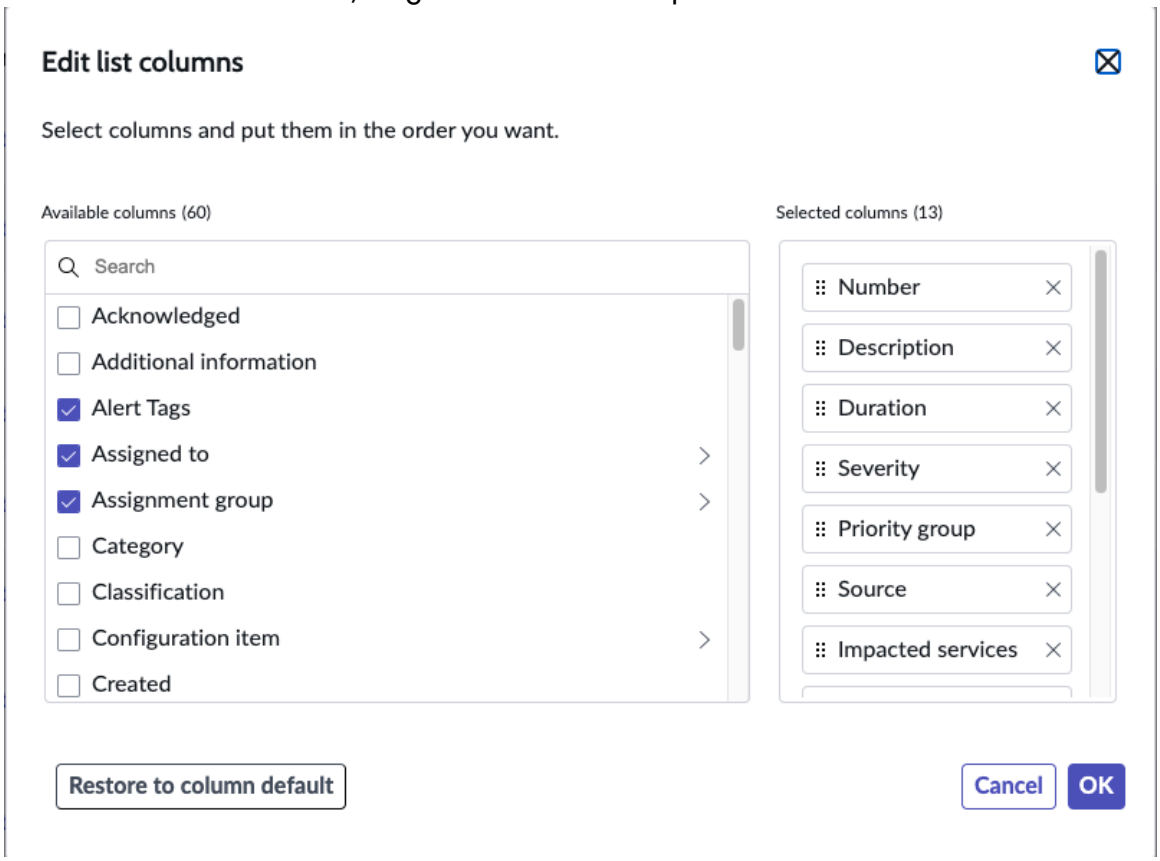
Before you begin
Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Edit the default columns in the pane.
   a. Select the gear icon ( ).
   b. In the **Available columns** list, select the desired columns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the **Selected columns** list, drag selected columns up or down to reorder the fields.



d. **Optional:** Select **Restore to column default** to return the columns to the default state.

e. Select **OK**.

4. **Optional:** Modify the column width, order, and sort direction directly in the Express List pane.

Option	Action
Column width	Point to the right side of the column until the bi-directional arrow appears and drag the col umn to the desired width.
Column order	Select the column header and drag it to the desired location.
Column sort	Select the column header and then select the arrow. The arrow direction indicates the sort order. Each selection of the arrow changes the sort direction.

What to do next

- Filter the Express List display by adding or removing fields
- Save a custom filter in Express List

Add custom fields to the Express List preview panel

Add custom fields from the Alert [em_alert] table to the Express List Info preview panel to track alert information.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **System Properties** > **All Properties**.
2. In the **System Properties** list, select **evt_mgmt.express_list.custom_fields**.

   If a message appears about the application scope, select **here** to be able to edit the record.
3. In the **Value** field, enter the custom name from the Alert [em_alert] table.
   If you want to provide more than one field, use commas to separate the field names.
4. Select **Update**.
5. **Optional:** View the custom fields on the preview panel:
   a. In the primary navigation, select the Express List icon ( ).
   b. Select a row or the information icon at the beginning of a row.

Result

The Info tab on the preview panel displays the custom fields at the bottom of the fields list.

Acknowledge viewed alerts in Express List

Acknowledge alerts that you've viewed to remove clutter in the Express List pane.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

About this task

Use Acknowledge to denote that the alert is known, and can temporarily be ignored. Do not use Acknowledge to mark an alert as needing attention.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Acknowledge selected alerts.
   You can acknowledge alerts regardless of whether you are working in the main pane or in the preview panel. The preview panel opens only when a single alert or alert group is selected.

Location	Action
The Express List pane	**a.** In the Express List pane, select the alert to acknowledge. You can select more than one alert row.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Location	Action
	Note: You can perform the action on up to 1,000 alerts simultaneously by selecting the **Select All** check box in the Active alerts list.  To display the individual alerts inside a group, select the chevron icon (›) at the beginning of the alert group row. **b.** From the **Close** drop-down list at the top right of the alert list, select **Acknowledge**.
The Express List preview panel for group alerts	**a.** Select an alert group row check box. **b.** In the **Alerts in group** tab, select an alert tile. **c.** Select the more actions icon (⋮). **d.** Select **Acknowledge**.

Result
The alert is acknowledged and its status is displayed at the top of the preview panel.

Monitor incoming alerts

You can monitor incoming alerts in Service Operations Workspace. You can also monitor and manage alerts in the Event Management interface.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. View the alert information.

Alerts column headings

Column heading	Description
Number	Unique ID generated by Event Management to identify the alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column heading	Description
Group	An entry in this column indicates that the associated alert is a member of an alert group. Alerts that do not have an entry in this column are ungrouped alerts. ○ **Automated**: Aggregated automatically by alert aggregation. A virtual alert is added to the group as the primary alert of the group. ○ **Rules-based**: Alert group created as a result of a user-configured correlation rule. ○ **Manual**: This alert is a member of an alert group that is formed when right-clicking an alert and setting it as secondary to the selected primary alert. ○ **CMDB**: CIs without historical data that were aggregated by alert aggregation based on CI relationships in the CMDB. ○ **Secondary**: This alert is a component of an alert group. The alert at the head of the group is known as the primary alert. When **Correlated Alerts** is selected, the secondary alerts that are under the primary alert do not display, making the Alerts list less cluttered and easier to review. ○ **None**: This alert is an ungrouped alert. To make an ungrouped alert become a member of a group, right-click it and select in the topic **Add to Groups**. Select the alert and click **Add Selected**. ○ **Text**: This alert is a member of an alert group that was created based on the similarity of their text or description. ○ **Log Analytics**: This alert is a member of a Log Analytics alert group. ○ **Component-based**: This alert is a member of a Log Analytics group that was created based on the affected IT components or services. ○ **Tag Cluster**: This alert is a member of an alert group that was created based on common tags or labels assigned to them. ○ **Network Traffic**: This alert is a member of an alert group that was created based on network traffic connections between processes of host CIs. ○ **Mixed**: This alert is a member of a grouping method that combines alerts using multiple grouping strategies, such as CMBD-based grouping and tag-based grouping, into a single, cohesive group.
Severity	The severity of the event. The value for this field is copied from the event unless the event closes the alert, in which case the previous severity is retained for reporting. ○ **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded. ○ **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. ○ **Warning**: Attention is required, even though the resource is still functional. ○ **OK**: An alert is created. The resource is still functional. ○ **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column heading	Description
Priority group	Indicates which alerts should be attended to first. Priority is calculated for each open alert and then mapped into one of four priority categories.
Priority	Value providing a guide as to the priority of the alert, based on a number of accumulated categories. For example, alert state and business criticality.
Source	Event monitoring software that generated the event, for example, SolarWinds or SCOM. Optionally, you can enter a description, for example, `Group Alert`. This field has a maximum length of 100.
Description	The alert description.
Node	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. This field has a maximum length of 100.
Configuration item	JSON string that represents a configuration item. For example, {"name":"SAP ORA01","type":"Oracle"}. The CI identifier that generated the event appears in the **Additional information** field. This field has a maximum length of 1000. Click to open the alert in dependency view.
Impacted Services	Lists the services affected by this alert group. Select an impacted service to view its record. **Note:** You can access the Service Map in Service Operations Workspace directly from the impacted service form by selecting **Service Map**. The service map shows the impacted path of alerts, enabling you to quickly assess their effect on the service. For more information, see View unified service map and the impact paths in Service Operations Workspace.  el-imp-service-open-map.png
Metric Name	Unique name that describes which metrics are collected and for which this alert has been created.
Maintenance	Shows whether the resource affected by the alert is in maintenance, Valid values are `true` or `false`.
Task	The corresponding task for the alert, such as an incident, change, or problem.
Parent	Reference to a parent alert.
Initial event generation time	Time that the initial event occurred in the remote system.

What to do next

If Operational Intelligence is activated, you can right-click an alert and click **View Metrics** to open the integrated Insights Explorer and Dependency Views map for the CI that is associated with the alert.

Related topics

- Metric Intelligence
- View alert information
- Alert grouping types and creation methods

Close an alert in Express List

Manually close alerts directly from the Express List pane or from the preview panel without waiting for them to be automatically closed if you already know the root cause or have fixed the problem.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Close selected alerts.
   You can close alerts regardless of whether you are working in the main pane or in the preview panel. The preview panel opens only when a single alert or alert group is selected.

Location	Action
The Express List pane	**a.** In the Express List pane, select the alert. You can select more than one alert row. **Note:** You can perform the action on up to 1,000 alerts simultaneously by selecting the **Select All** check box in the Active alerts list.  To display the individual alerts inside a group, select the chevron icon (›) at the beginning of the alert group row. **b.** From the **Close** drop-down list at the top right of the alert list, select **Close alert**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Location	Action
The Express List preview panel for group alerts	**a.** Select an alert group row. **b.** In the **Alerts in group** tab, select an alert tile. **c.** Select the more actions icon (⋮). **d.** Select **Close alert**.

Result
The alert is closed and its status is displayed at the top of the preview panel.

Create an incident from an alert in Express List

Create an incident from an alert directly from the Express List pane, saving you the time and effort of navigating to the incident record.

Before you begin
Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and doesn't have permission to perform this action.

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Create an incident from a selected alert.
   a. In the Express List pane, select the check box for the desired alert.

      Note: To display the individual alerts inside a group, select the chevron icon (›) at the beginning of the alert group row.

   b. Select the **Alert actions** drop-down list.

   c. Under **Response actions**, select **Create Incident**.

An incident is created from the selected alert and a confirmation message is displayed.

Mute a CI's alerts in Express List

Mute a CI's alerts in Express List to avoid alerts being issued when replacing or upgrading the CI.

Before you begin
Role required: evt_mgmt_operator, evt_mgmt_admin

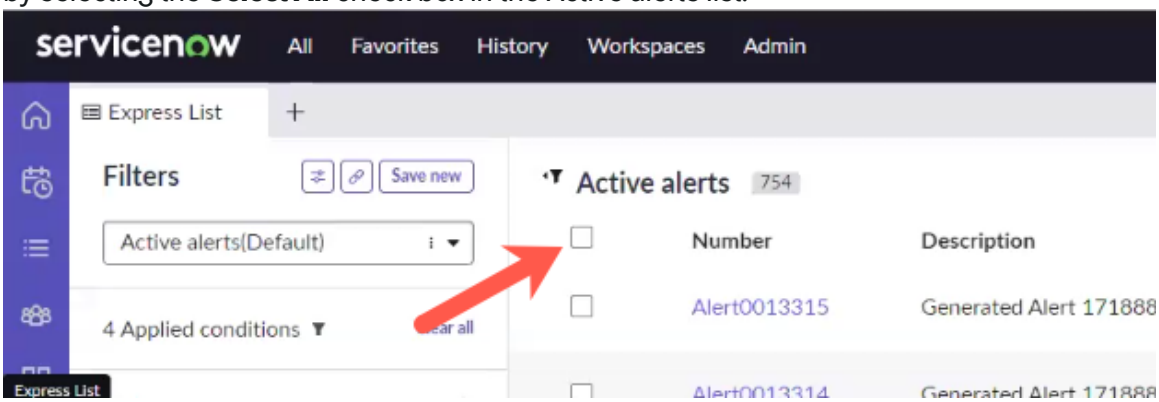
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Select the alert row check box.

Note: You can perform the action on up to 1,000 alerts simultaneously by selecting the **Select All** check box in the Active alerts list.



4. From the **Close** drop-down list, select **Put in Maintenance**.

Result
Alerts are muted for the configuration items of that alert.

Place an alert in the Maintenance state

Placing an alert into the Maintenance state indicates that there are issues with the alert's CIs that are being addressed.

Before you begin
Role required: evt_mgmt_admin or evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Filter with **Active alerts**.
4. Select an alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the **Details** subtab, select the **Maintenance** check box to place the alert into the Maintenance state.
6. Click **Save**.

Place an alert in the Acknowledged state

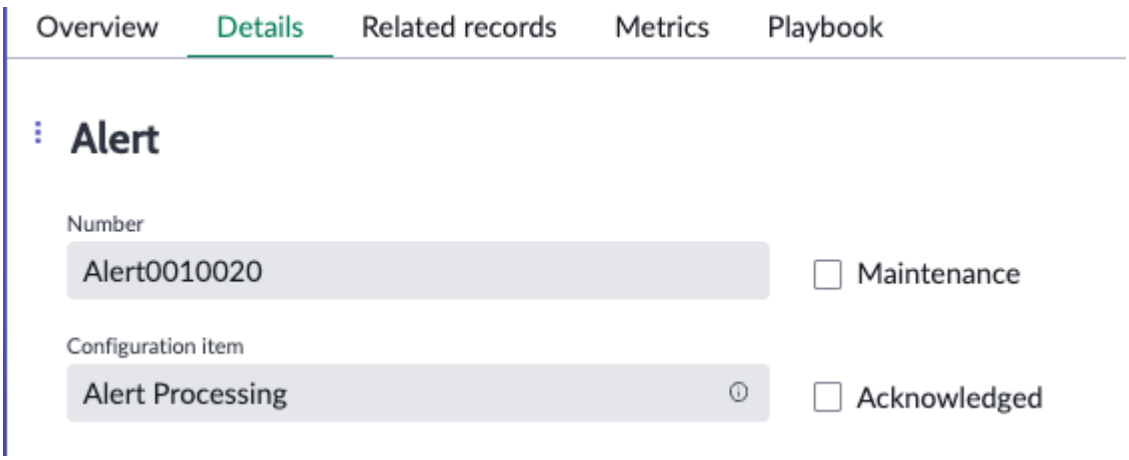
Placing an alert into the Acknowledged state indicates that the alert has issues that need to be addressed.

Before you begin
Role required: evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Filter with **Active alerts**.
4. Select an alert.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the **Details** subtab, select the **Acknowledged** check box to place the alert into the Acknowledged state.
6. Click **Save**.

Respond to an alert in Express List

Run a response action to remediate an alert issue manually from the Express List pane.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and doesn't have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Select the alert number to open it.
4. Select the response action for the alert from the **Close** drop-down list.

Note: If the list is empty, no response actions are available.

Run response actions on multiple alerts in Express List

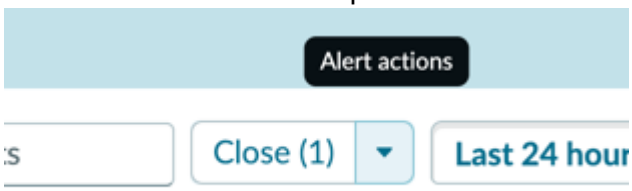
Run response actions to efficiently remediate and respond to issues on multiple alerts directly from the Express List pane.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

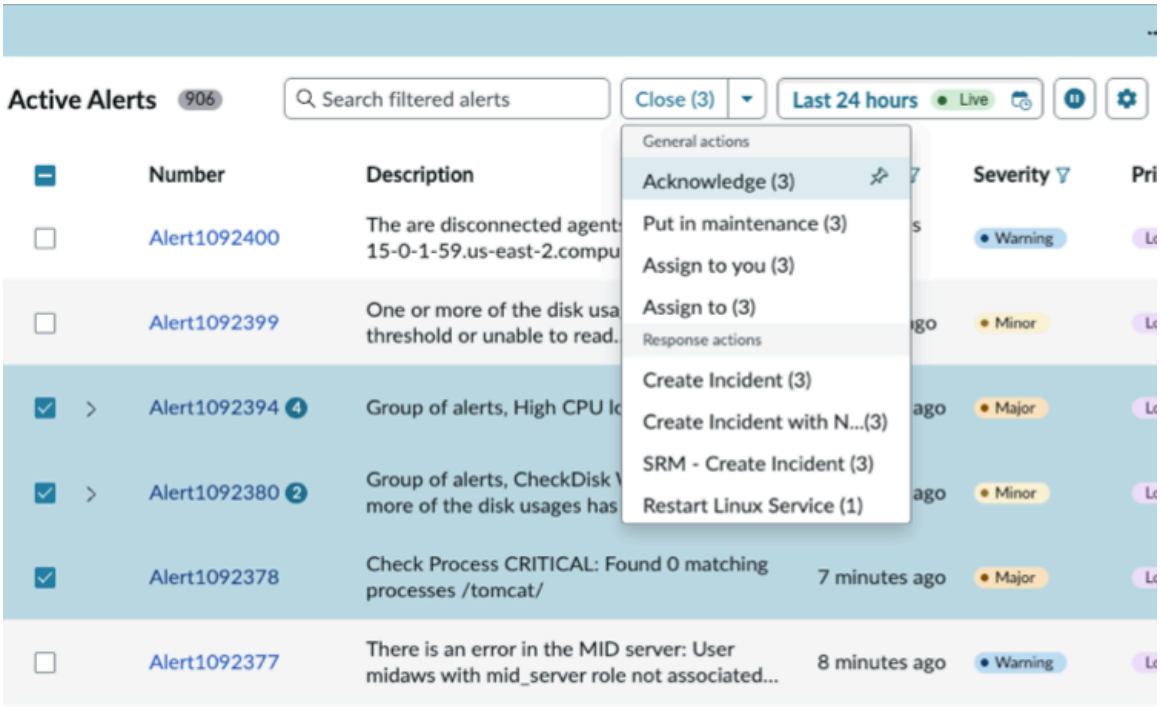
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. In the **Active Alerts** list, select the check boxes for desired alerts.
4. Select the **Alert actions** drop-down arrow to view **Response actions**.



5. Select a response action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: Numbers next to actions represent the number of alerts that can be addressed with that action. If the list is empty, no response actions are available.

The **Run response action** modal appears. The modal describes the number of alerts addressed with the selected action, and lists the selected alerts that aren't addressed.

View metrics for an alert

Viewing metrics enables you to understand historical data related to an alert's CI.

Before you begin

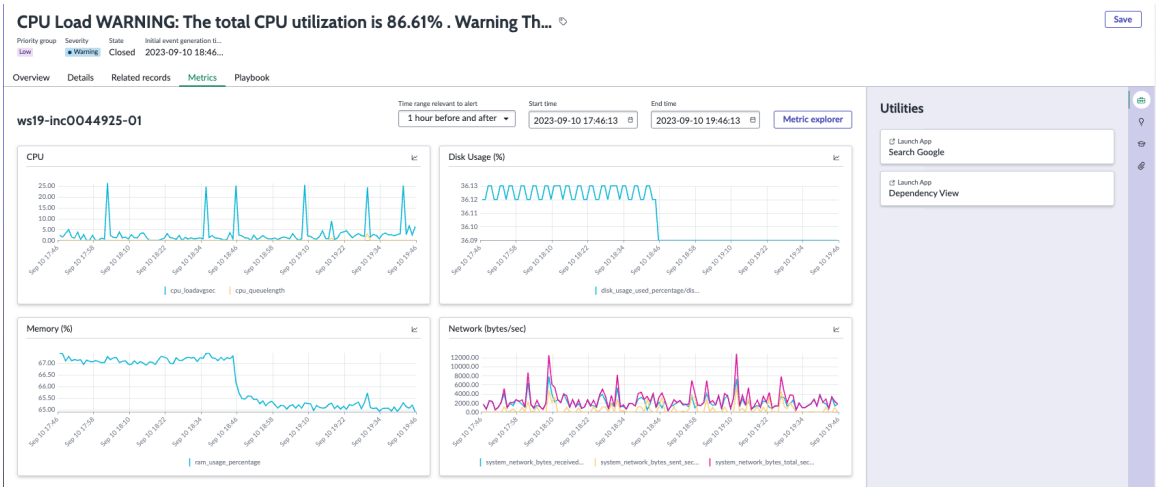
- Ensure that you install the Operational Intelligence (com.snc.sa.metric) plugin.
- Configure the metrics to be displayed for the alert, as described in Configure alert metrics.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Select an alert to open it.
4. Click the **Metrics** subtab.
   The configured metrics appear on the page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To customize the metrics display, configure the following properties on the **System Properties** > **All Properties** page:

- *ws_metric.widgets_number_limit*: Specify the number of widgets/records that can be displayed on the metrics tab.
- *ws_metric.datasets_per_widget_limit*: Specify the number of charts/datasets that can be displayed on a chart.

5. In the **Time range relative to alert** list, select the time range for which you want the metrics to be displayed for the alert:
   - 1 hour before and after (default setting)
   - 3 hours before and after
   - 5 hours before and after
   - Custom range (to configure a customized time range for the metrics to measure)
6. Click a parameter below a chart to hide the specified parameter's data on the chart.
7. **Optional:** Click the **Insights Explorer** button to view metrics by dragging and dropping them onto a timeline.

View metric values in the Insights Explorer

View details about the impact and cause of an alert in Express List

View information about an alert on the alert's Overview tab in the Express List.

Before you begin

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Select the alert number to open it.
   The alert opens in a separate tab, displaying the **Overview** tab.
4. View alert information on the **Overview** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview tab

Section	Description
Summary	Contains a description of the selected alert, describing why it is considered an issue.
Impact	Lists the Configuration item and any services impacted by the alert. The **Impacted Services** tile includes the following subtabs: ○ **Application services:** The application services affected by the alert. For details on application services, see Application services. ○ **Related service offerings:** The service offerings connected to the application services affected by the alert. Application services and their related service offerings display on a many-to-many basis. That is, several service offerings can relate to one or more application services, and several application services can relate to one or more service offerings.
Cause	Lists the log properties with information contributing the alert issue, as well as probable root causes for the alert.

View anomaly alert metric data in Express List

View visualizations for anomaly alerts to investigate anomalies using metric data. You can view visualizations from the Express List preview panel or the alert record.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. In the Active Alerts list, locate an anomaly alert.
   Information in the **Description** column can help you determine which alerts are anomaly alerts. For example, an alert description might warn about values nearing or exceeding configured thresholds, or metrics above or below a defined boundary.
4. Choose where to view the anomaly chart.

Option	Procedure
View the chart in the preview panel	**a.** Select the check box for the anomaly alert. **b.** In the preview panel, select the **Info** tab. A chart with a visual representation of the anomaly appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

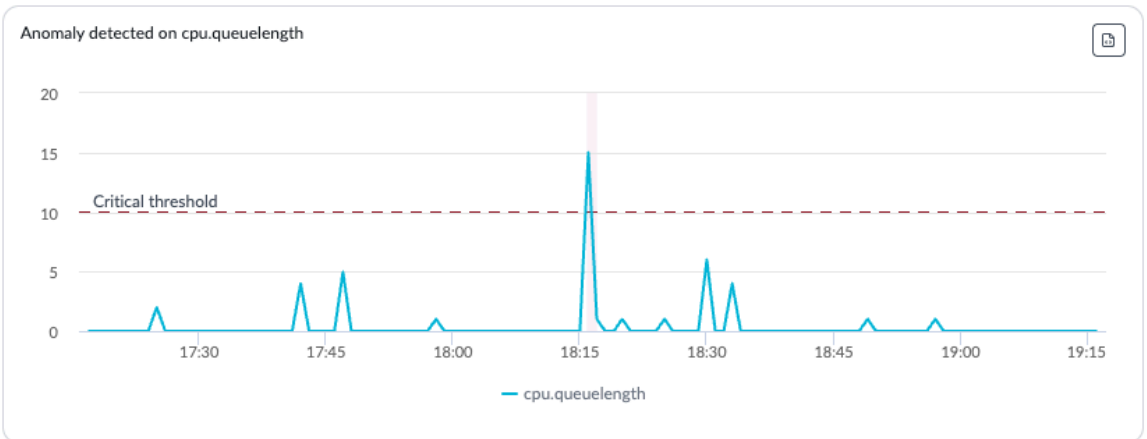
Option	Procedure
View the chart in the alert record	Select the number of the anomaly alert to open the alert record. The **Overview** tab opens by default. The anomaly chart is displayed.

Depending on how the metric anomaly is configured, one of two charts is displayed.

- When the Metric Intelligence statistical model is used to detect anomalies, the anomaly alert chart is displayed with upper and lower bounds based on machine learning models.

  For more information, see Understanding Metric Intelligence.

- When thresholds are configured by administrators, the static threshold metric anomaly alert chart shows anomalies defined using the configured thresholds.



Note:

The raw data used for the metric chart is available only for seven days. If older alerts are selected and the raw data is no longer available, a chart isn't shown.

For more information, see Create metric rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** Review surrounding metric data by selecting the **Open in Metric explorer** icon ( ) in the information panel.

   (Optional) The **Metric Explorer** tab displays the time frame of the anomaly. For an open alert, the chart shows one hour before and after the last time of event generation. For a closed alert, the chart shows one hour before and after the first event that created an alert. If there's no data, the chart isn't displayed.

   For more information, see Metric Explorer.

View Log Analytics anomaly alert charts in Express List

View visualizations for Health Log Analytics anomaly alerts to identify periods of behavior that deviate from expected ranges. You can view visualizations from the Express List preview panel or the alert record.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. In the Active Alerts list, locate a Log Analytics based alert.
   This option is available only for individual alerts or the underlying individual alerts within a group.
4. Choose where to view the anomaly chart.

Option	Procedure
View the chart in the preview panel	**a.** Select the check box for a Log Analytics based alert. **b.** In the preview panel, select the **Info** tab. A chart with a visual representation of the anomaly appears.
View the chart in the alert record	Select the number of the anomaly alert to open the alert record. The **Overview** tab opens by default. The anomaly chart is displayed.

5. **Optional:** Select the parameter to visualize anomaly data within that time period:
   - **Events per minute** - The default setting, which shows the detected anomaly.
   - **Day ago**
   - **Week ago**
6. **Optional:** Review relevant logs in context by selecting the Open in Surrounding logs icon: .
   The **Surrounding logs** tab displays the list of log lines that were generated one minute before and one second after the Log Analytics alert. For more information, see How Health Log Analytics generates alerts.

View data on impacted services on the preview panel in Express List

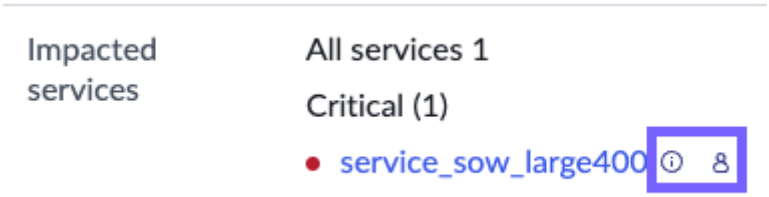
View extra information on the preview panel about impacted services that are bound to alerts.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. In the **Active Alerts** list, select an alert check box.
4. On the preview panel, open the Info tab.
5. Hover over the Impacted services section to display information icons.



6. Select the relevant icon to display extra information on an impacted service.

Impacted service information icons

Icon	Name	Description
ⓘ	Info	Displays the severity, the business criticality, and a short description of the impacted service. From this pop-up, you can open the service map in Service Operations Workspace by selecting **View service map**.  The service map shows the impacted path of alerts, enabling you to quickly assess their effect on the

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Icon	Name	Description
		service. For more information, see View unified service map and the impact paths in Service Operations Workspace. If metrics data exists for this service, you can open the Metric Explorer from the pop-up by selecting **View related metrics**.
	Contact person/group	Displays the name of the owner of the impacted service and the support group assigned to it.

Hide closed alerts in Express List

Choose whether to display the closed alerts in an alert group as well as the open alerts on the preview panel and in Link View.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. In the Active alerts list, select an alert group.

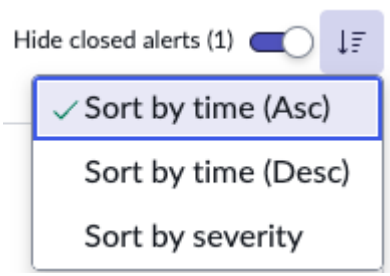
   The preview panel shows the default display:

   - The Alerts tab and Timeline view show only the open alerts. The closed alerts are hidden.
   - Link View shows the attributes of both open and closed alerts.
4. On the relevant tab, change the display.

   On the preview panel, Alerts tab:

   a. Show both the open and the closed alerts by switching the **Hide closed alerts** toggle to the closed position.

   b. (Optional) Sort the displayed alerts by time or by severity by selecting the sort icon ( ) and then choosing the relevant menu item.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you switch the toggle or sort the alerts in the Timeline view, the Alerts tab adjusts to reflect your selection.

In Link View: Show only the attributes of open alerts while hiding those of closed alerts by switching the **Hide attributes of closed alerts** toggle to the open position.

Generating case from an alert

Enable swift resolution by generating cases from alerts, either manually or automatically.

Customer Service Management provides integration with ITOM Event Management. This integration enables you to improve the customer experience by breaking down the silos that exist between the processes and systems used by front line customer service and back-office operations teams. By monitoring issues and creating cases proactively, you can better correlate customer issues and provide faster responses.

If you are using the integration between the Customer Service Management and Event Management applications, you can create a case for the customer install base affected by an alert. For more details, see Manually create a proactive case from an alert. You can also activate an alert rule to automatically create a proactive case from an alert when an incident is created. For more details, see Activate an alert rule to automatically create a proactive case from an alert.

Remove alerts from an alert group in Express List

Remove secondary alerts from an alert group directly from the Express List pane or from the preview panel.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Note: The evt_mgmt_user role is view-only and does not have permission to perform this action.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Remove a secondary alert from an alert group.
   You can remove alerts from a group regardless of whether you are working in the main pane or in the preview panel. The preview panel opens only when a single alert or alert group is selected.

Location	Action
The Express List pane	**a.** In the Active alerts list, select the chevron icon ( ) at the beginning of one or more alert group rows to display the alerts con tained in the group. **b.** Select one or more secondary alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Location	Action
	c. From the **Close** drop-down list at the top right of the list, select **Remove from group**. **Note:** When you are trying to remove the only secondary alert from an alert group, thereby ungrouping the group, a message displays that enables you to undo the action.
The Express List preview panel for a group of alerts	**a.** In the **Alerts in group** tab, select an alert tile. **b.** Select the more actions icon ( ). **c.** Select **Remove from group**.

Viewing links between alerts in alert groups in Express List

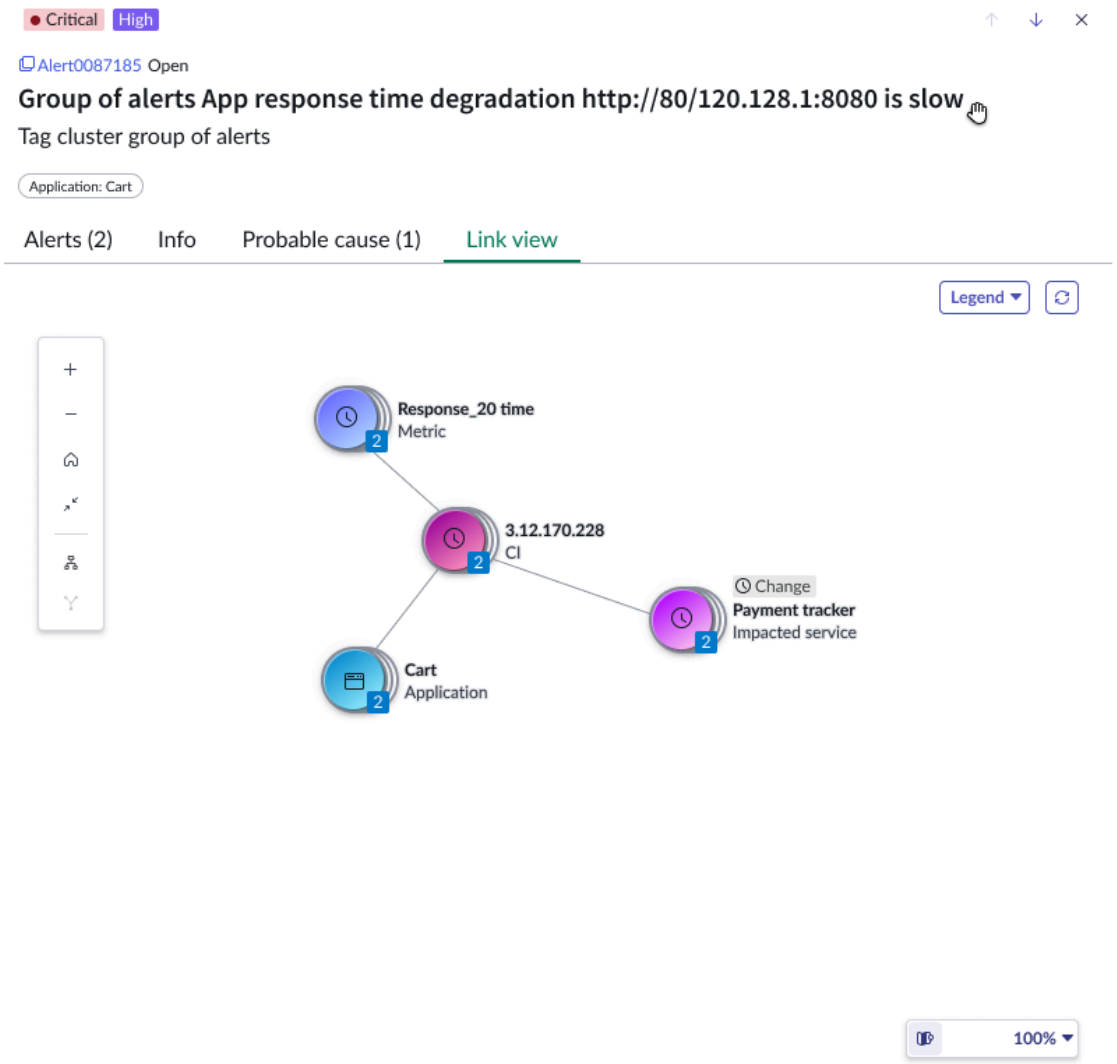
Gain a better understanding of the relationships between alerts in alert groups in the Express List by using Link View. Link View offers a visual representation of the relationships between the alerts in a group.

When Event Management generates an alert group, Link View shows how the attributes of the alerts in the group are linked. The colored tags represent configuration items (CIs) and other environment items in relation to the alerts.

The information shown in Link View is available without the need for a populated Configuration Management Database (CMDB). However, when the CMDB is populated, Link View offers additional value by providing the probable cause of the alerts and the service that the alert group impacts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample alert group in Link View



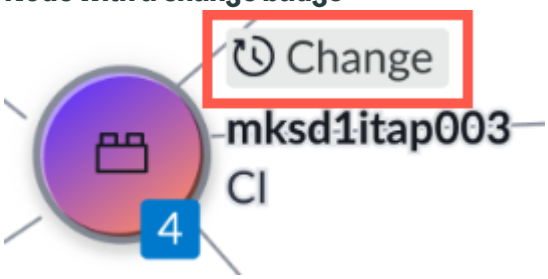
You can focus on your areas of interest by dragging the nodes in Link View to different positions. When you refresh an alert group, rearranged nodes appear in their original position again. Therefore, Link View is not refreshed automatically, but waits for you to do so manually.

If an alert on a CI impacts a service in the Configuration Management Database (CMDB), Link View shows the impacted service, enabling you to view it at a glance for quick triage.

A stacked node indicates that multiple nodes were mapped for the same tag. When the same key-value pair appears in more than one alert, the corresponding node is shown with a badge. For example, when the same key-value pair appears in two alerts, the badge on the node shows the number 2, as seen on the Payment tracker node in the sample alert group figure. When a node has no badge, the key-value pair appears in only one alert. An active change request, a probable cause of the alert, is marked by a Change badge.

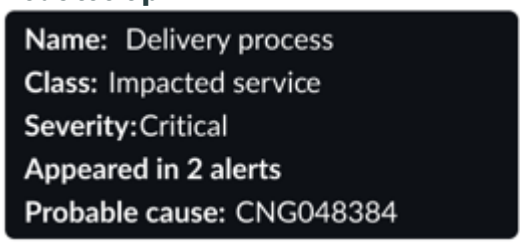
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Node with a change badge



The Link View legend lists the meaning of the symbols and colors used and enables you to toggle between hiding and showing types of tags to reduce noise. In addition, the legend describes the meaning of the various lines linking the alert attributes. Attributes linked by a solid line share one or more alerts, whereas attributes linked by a dotted line are correlated by grouping criteria. For a description of each tag, see Attributes in Express List Link View. Hovering over a node displays a tooltip that includes the name of the tag, its class, its severity, the number of alerts in which it appeared, and whether the alert is primary or secondary or the probable cause of the alert, if applicable.

Node tooltip



Currently, Link View is supported for several alert groups. For more information, see the following topics:

- Viewing links between alerts in tag-based alert groups
- Viewing links between alerts in rules-based alert groups
- Viewing links between alerts in CMDB-based alert groups
- Viewing links between alerts in network traffic-based alert groups
- Viewing links between alerts in log analytics-based alert groups
- Viewing links between alerts in mixed alert groups

Related topics

View links between alerts in a group in Express List

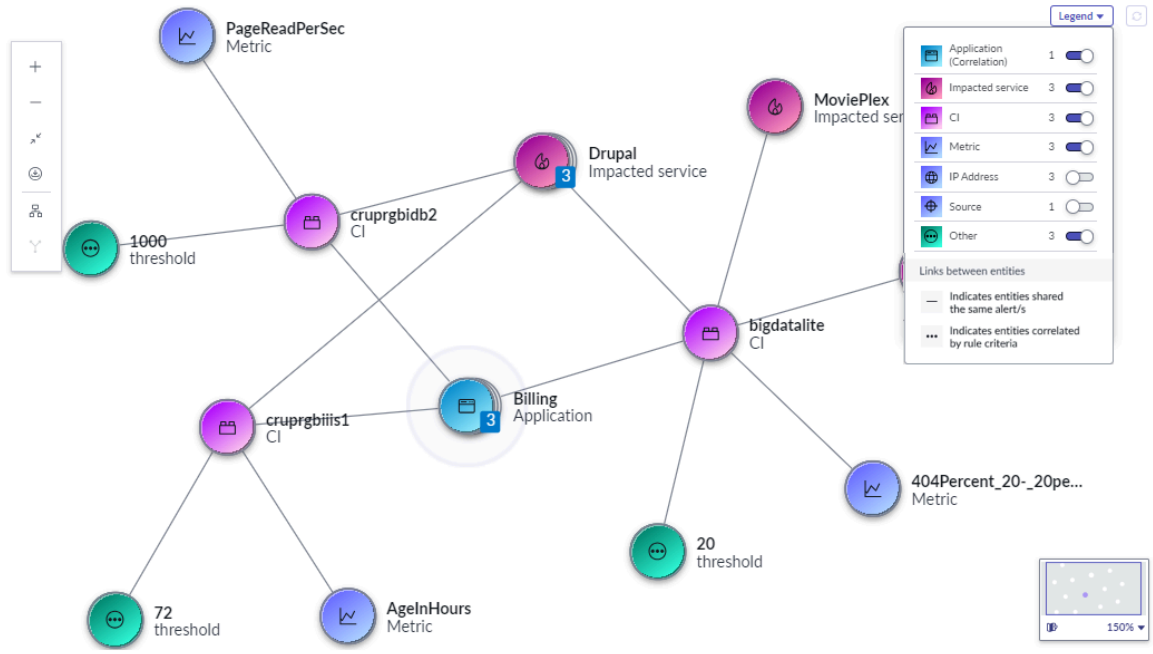
Viewing links between alerts in tag-based alert groups

View the connections between alerts in a tag-based alert group in Express List by using Link View. Link View shows how the attributes of the alerts in the group are linked with each other.

When you've set alert tags and Event Management has generated an alert group based on tag-based rules, Link View offers a visual representation of the relationships between the alerts in the group. The colored tags in the view represent Configuration Items (CIs) and other environment items in relation to the alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample tag-based alert group in Link View



In this example, the defining tag for the correlation, Application, is linked to the tags of the relevant CIs. However, a correlation can be defined by any tag or combination of two tags, such as Resource and Metric name. When the defining tag is missing from Link View, the correlation was based on information that is not represented in the view, such as the description. Each CI node is further linked to the tags that appeared on the same alert as that CI.

In an alert group that was generated from tag rules, nodes connected by a dashed line signify an approximate, "fuzzy" match. This means that the nodes were correlated when the match on the tag rule was not exact, but close enough to be significant. For example, this could happen when a location, email address, or IP pattern was similar enough to qualify as a match.

The Link View legend lists the meaning of the symbols and colors used to represent the tags and their number of unique nodes. In the legend, defining tags are marked as Correlation. You can toggle between hiding and showing tag types to reduce noise. For a description of each tag, see Attributes in Express List Link View.

Viewing links between alerts in rules-based alert groups

View the connections between alerts in a rules-based alert group in Express List by using Link View. Link View shows how the attributes of the alerts in the group are linked with each other.

When you've set alert rules and Event Management has generated an alert group based on these rules, Link View offers a visual representation of the relationships between the alerts in the group. The colored tags in the view represent Configuration Items (CIs) and other environment items in relation to the alerts.

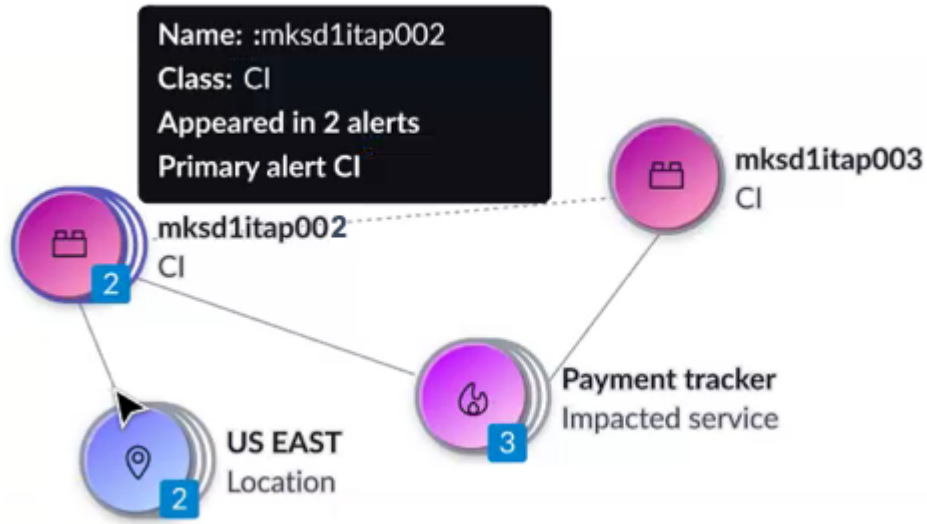
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample rules-based alert group in Link View



Rules-based alert groups are comprised of a primary alert and one or more secondary alerts. The primary alert is generated directly and is represented in Link View as the Home node. Secondary alert nodes are connected to the Home node by a dashed line, indicating that they don't share the same alert, but are correlated using rule criteria. A solid line between nodes indicates that the connected nodes share the same alert or multiple alerts.

If an alert on a CI impacts a service in the Configuration Management Database (CMDB), Link View shows the impacted service, enabling you to view it at a glance for quick triage. Hovering over a node displays a tooltip that includes the name of the tag, its type, the number of alerts in which it appeared, and whether it is a primary or secondary alert.

Viewing links between alerts in CMDB-based alert groups

View the connections between alerts in alert groups in Express List that were created based on the proximity of Configuration Items (CIs) in the Configuration Management Database (CMDB). Link View shows how the attributes of the alerts in the group are linked with each other.

When alerts on CIs that are located near each other in the CMDB topology occur within a certain time-frame, Event Management generates a CMDB-based alert group. Event Management correlates CIs in a service map when they are separated by a maximum of three other CIs. The colored tags in Link View offer a visual representation of the CIs and other environment items in relation to the alerts in the group.

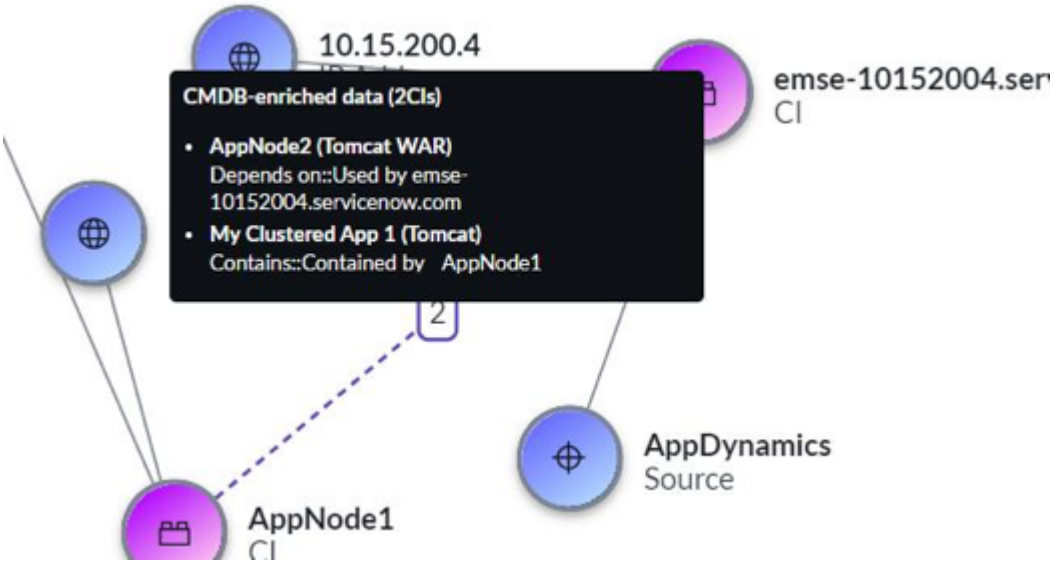
Sample CMDB-based alert group in Link View



In this sample Link View of a CMDB-based alert group, the dashed line with the number 2 between the CIs indicates that the CIs are not connected directly, but are separated by two CIs in the service map in the CMDB topology. The sample CMDB service map also shows correlated CIs separated by two CIs.

Sample service map with correlated CIs

Viewing links between alerts in log analytics-based alert groups

Use Link View in Express List to see why alerts in a log analytics-based alert group are correlated together through the visualization of shared attributes.

Link View for log analytics-based alert groups shows the connections between component-based alerts. Each component-based alert may involve multiple host configuration items (CIs). A component represents a logical part of a service instance where the alert was detected. Components can consist of multiple CIs that perform the same function, such as multiple redundant hosts. For more information, see Types of Health Log Analytics alerts.

The colored tags in the link view represent attributes of the alerts such as hosts, users, or correlation indicators extracted from the logs. The lines connect attributes that share the same alert. This visualization helps you understand the relationships between different alerts in the group using their shared attributes.

Log analytics-based groups often contain multiple correlation attributes within a single group. Link View enables you to explore why anomalies detected on different components were correlated into one group. By manipulating the attribute display, you can better understand the relationships between alerts that share common attributes.

Viewing links between alerts in mixed alert groups

View the connections between alerts in mixed alert groups in Express List by using Link View. Link View shows how the attributes of the alerts in the group are linked with each other.

Link View for mixed alert groups shows the connections between alerts in groups that combine different alert group strategies to form a single cohesive group. For more information, see Mixed alert grouping.

To view how different alert groups are visualized in Link View, see the description of Link view for the relevant alert group types. Currently, mixed groups are composed of Tag cluster alert groups, CMBD-based alert groups, Related log properties and shared impacted service. For more information about Link View for these groups, see Viewing links between alerts in tag-based alert groups, and Viewing links between alerts in CMDB-based alert groups.

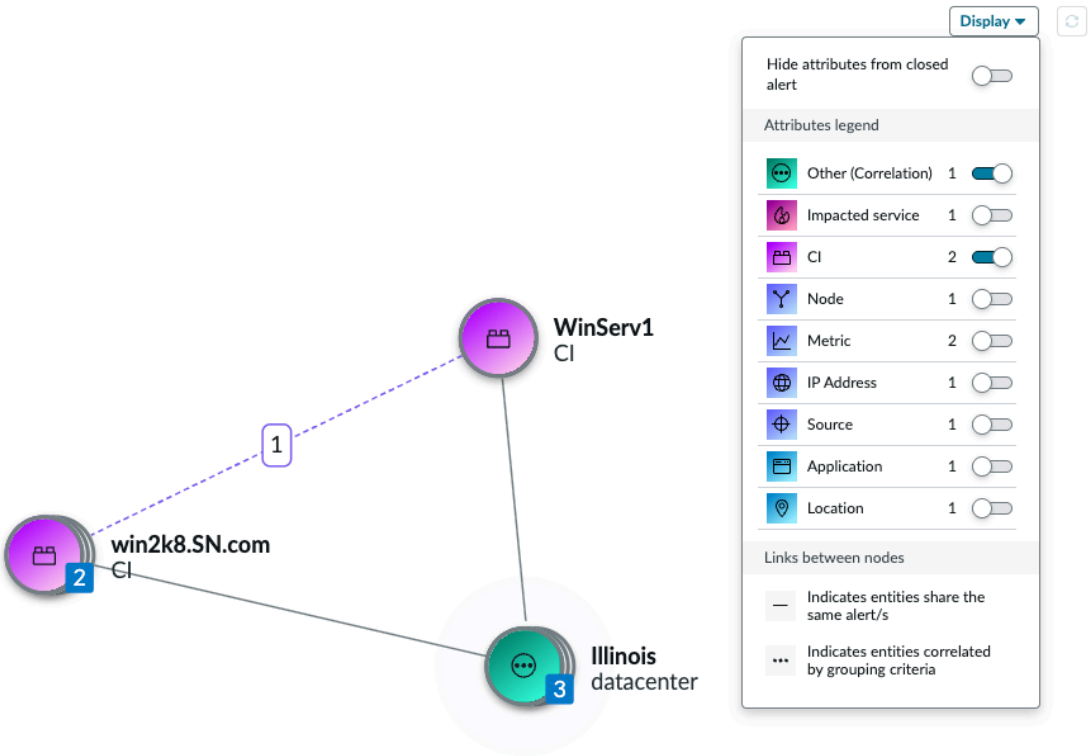
Sample mixed alert group in Link View



In this sample Link View of a mixed alert group, the dashed line with the number 1 between the CIs indicates that the CIs are not connected directly but are separated by a CI in the service map in the CMDB topology. The sample also shows the defining attribute for the correlation, datacenter, linked to the relevant CIs.

The Link View **Display** legend lists the meaning of the symbols used to represent the tags and their number of unique nodes. In the legend, defining tags are marked as Correlation. You can toggle between hiding and showing tag types to reduce noise. For a description of each tag, see Attributes in Express List Link View.

View links between alerts in a group in Express List

When an alert group is generated, understand better how the alerts in the group are linked by viewing a visual representation of their relationships in Link View.

Before you begin

For an overview of Link View in Express List, see Viewing links between alerts in alert groups in Express List.

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. In the fields in the interactive filter panel, select **Group** and then the check box for the alert groups you want to display.
4. In the **Active alerts** list, select the description of an alert group.
   The preview panel opens to the **Alerts in group** tab, which lists all the correlated alerts in the selected group.
5. Navigate to **Link View**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. View the relationships between all the alerts in the selected group.
7. **Optional:** Perform the following optional tasks.

Task	Action
Focus on an area of interest	Select one or more nodes and rearrange them in Link View by dragging them to a new location. **Note:** After refreshing the alert group, the nodes appear in their original posi tion again.
Refresh the alert group	Select **Refresh**. When you've refreshed the alert group, re arranged nodes appear in their original posi tion again. Newly-added nodes are marked as New. **Note:** The **Refresh** button is enabled when new data for the alert group is available. Link View doesn't refresh auto matically.
View the meaning of icons and colors	Select the Link View legend. (Optional) The legend also indicates the num ber of unique nodes displayed per tag. For a description of each tag, see Attributes in Ex press List Link View.
Reduce noise	In the Link View legend, toggle between hid ing and showing a tag type.
View information about an alert	Hover over a node to display a tooltip with in formation.

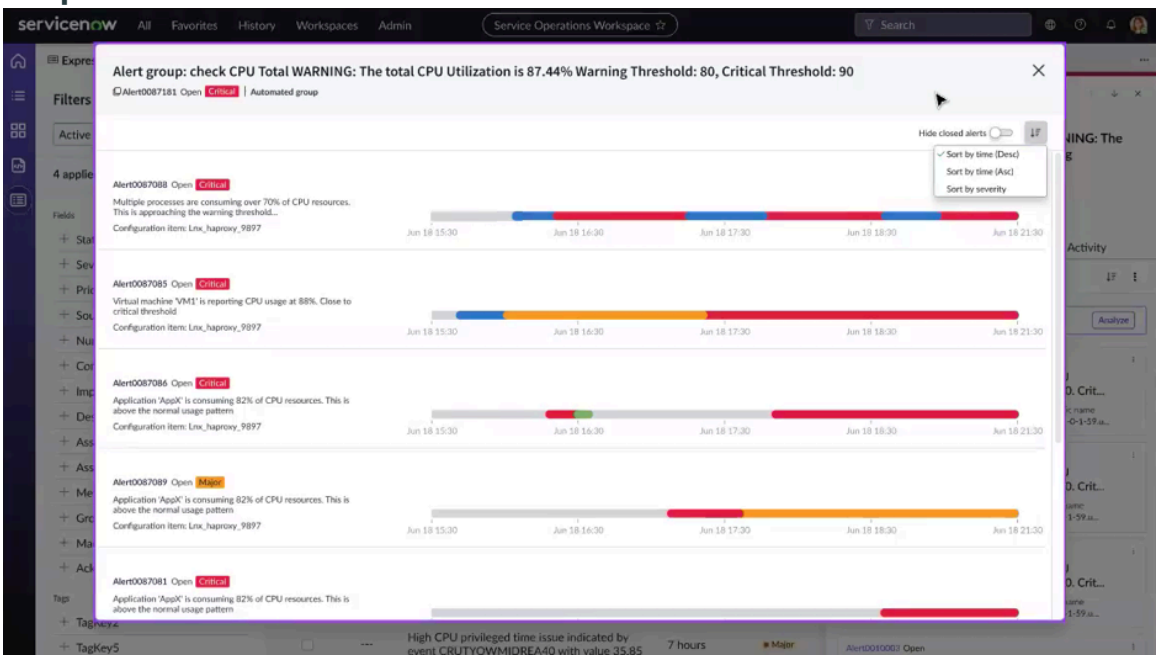
Exploring chronological data on the alerts in an alert group in Express List

Visualize the chronological sequence of events within an alert group in Express List using the Timeline view. This feature provides a comprehensive overview of when the alerts occurred, their severity changes, and other pertinent data for efficient triage and Mean Time to Resolution (MTTR).

In Timeline view, each alert is represented by a bar, enabling you to quickly discern the order of occurrence, severity transitions, and closure status. The timeline begins with the creation of the first alert and extends to the present moment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample timeline view



Standard severity colors are used in the bars, with gray segments indicating periods before alert creation or after its closure. Hovering over a severity bar reveals a tooltip with key alert details.

Severity range by color in Timeline view

Color	Severity
	Critical
	Major
	Minor
	Warning
	OK

The title of the Timeline view for an alert group summarizes the group's description, number, state, severity, and grouping type, derived from the primary alert. Detailed information including alert number, state, severity, a brief description, and associated Configuration Item (CI) or node, when available, is displayed for each alert within the group.

Exploring chronological data on the alerts in an alert group in Express List

Find alert records in Express List using text search

Perform a text search for alert records in a filtered list of alerts.

Before you begin
Role required: evt_mgmt_operator, evt_mgmt_admin

About this task
Event Management searches through the alerts that you're currently seeing in the Express List based on the filters and time range you have set. It searches in the following predefined fields even if they aren't visible: **Metric name**, **Node**, **Alert number**, **Alert Tags**, and **Description**. It treats the text that you enter as a single string rather than individual words.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. In the Search filtered alerts field, enter the search text.
   - Ensure that the text string meets or exceeds the minimum character requirement specified in the notification message.
   - The maximum character limit is 50.
   - The search isn't case-sensitive.

   Note: The minimum character requirement is determined by the *evt_mgmt.express_list.min_search_chars* system property setting.

4. **Optional:** Expand the search to all alerts, including secondary alerts that are a part of alert groups, by selecting **Switch search scope** and then selecting **Extended**.
5. Perform the search by selecting the check icon or pressing **Enter**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

The results match both the filters that you have applied and the string you entered in the Search filtered alerts field. In the resulting alert records, the string is highlighted and the filters show the number of records that match the string. Recent searches are saved and accessible from the Search filtered alerts field.

Run actions to resolve alert issues in Service Operations Workspace for ITOM

Resolve the underlying issue of an alert by running predefined remediation tasks, ensuring faster issue resolution and ensuring consistent resolution.

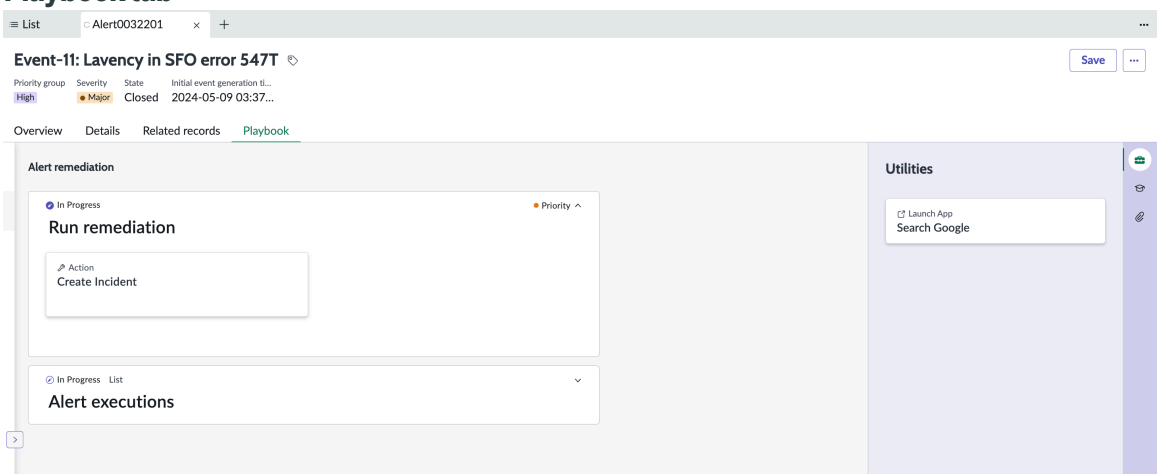
Before you begin

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Select the alert number to open it.
   The alert opens in a separate tab, displaying the **Overview** tab.
4. Select **Launch playbook**.
5. Select the **Playbook** tab.
   The **Run remediation** card displays the available remediation actions.

Playbook tab



6. Select the tile corresponding to the action you want to run.
   The selected action appears on the **Alert executions** card.

Result

When the action is complete, it appears in the **Completed** card underneath the Alert remediation section.

Launch a web application for an alert in Service Operations Workspace for ITOM

Launch a web application that was configured in an alert management rule to quickly access necessary tools, improving response times and efficiency.

Before you begin

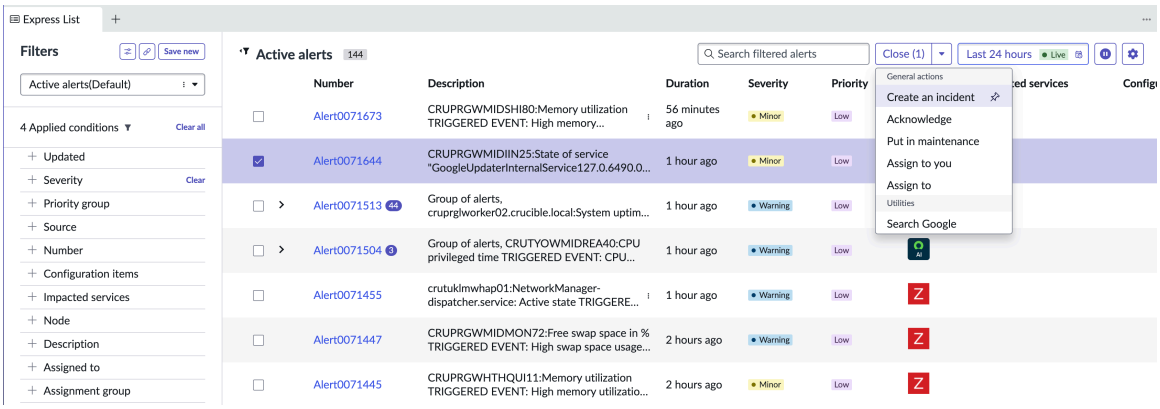
Role required: evt_mgmt_operator or evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Select the alert number to open it.

   The alert opens in a separate tab, displaying the **Overview** subtab. In the right panel, the **Utilities** tab is selected by default.



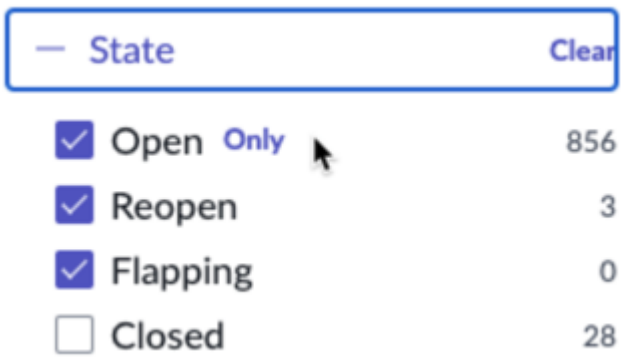
4. In the Utilities section, select the web application to launch the app.

Filtering the alert display in the Express List pane

Filters help you create different views of categorized alerts, creating a targeted list of alerts to prioritize and focus on, saving time and minimizing distractions.

The fields in the interactive Filters pane in Express List help you create different views of alerts. The default filters are determined by the selected Express List view.

You can interactively view the result of adding or removing any of the fields. The numbers next to each attribute indicate the number of alerts that are returned.



Alternatively, you can turn on the **Use advanced filters** option to set complex filters using a condition builder. The and/or logic provides more flexibility in filtering the alerts.

In the Filters pane, you can perform the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Filter by string, number, or date attributes. For more information, see Filter the Express List display using attributes.
- Add filters to or remove filters from the default filter list to focus on the applied filters. The most common filters are State, Priority, CI, and Impacted services. For more information, see Filter the Express List display by adding or removing fields
- Add or remove alert tags. Tags enable you to identify and group alerts easily without the need for discovery or accessing the Configuration Management Database (CMDB). For more information, see Categorize alerts displayed in Express List
- Display or hide alerts that match a selected alert. For more information, see Filter out or show matching alerts.
- Save, delete, assign as the default, or share the filter layout. For more information, see Save a custom filter in Express List.

Filter the Express List display using attributes

Filter the Express List display by text, number, and date attributes using the interactive Express List filter panel. Create a targeted list of alerts to prioritize and focus on.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. From the Filters panel on the left side, select whether to filter to text, number, or date attributes depending on your filter type.

Filter attribute type	Action
Text	Find elements by name by typing the first few characters to display the elements that start with those characters. Then select the values

Filter attribute type	Action
	that you want to view in the Express List pan  el.
Number of impacted services	Enter a condition to view alerts according to the number of alerts on the selected fil ter. For example, to display alerts that have fewer than 10 impacted services, you would select the **less than** condition and enter  10.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filter attribute type	Action
Date	View alerts according to the selected date and time range in the pop-up calendar in the Express List panel. 
Filter the Express List display by adding or removing fields

Add fields to or remove fields from the Express List pane filter using the interactive filter panel. Use filtering to create different views of categorized alerts.

Before you begin

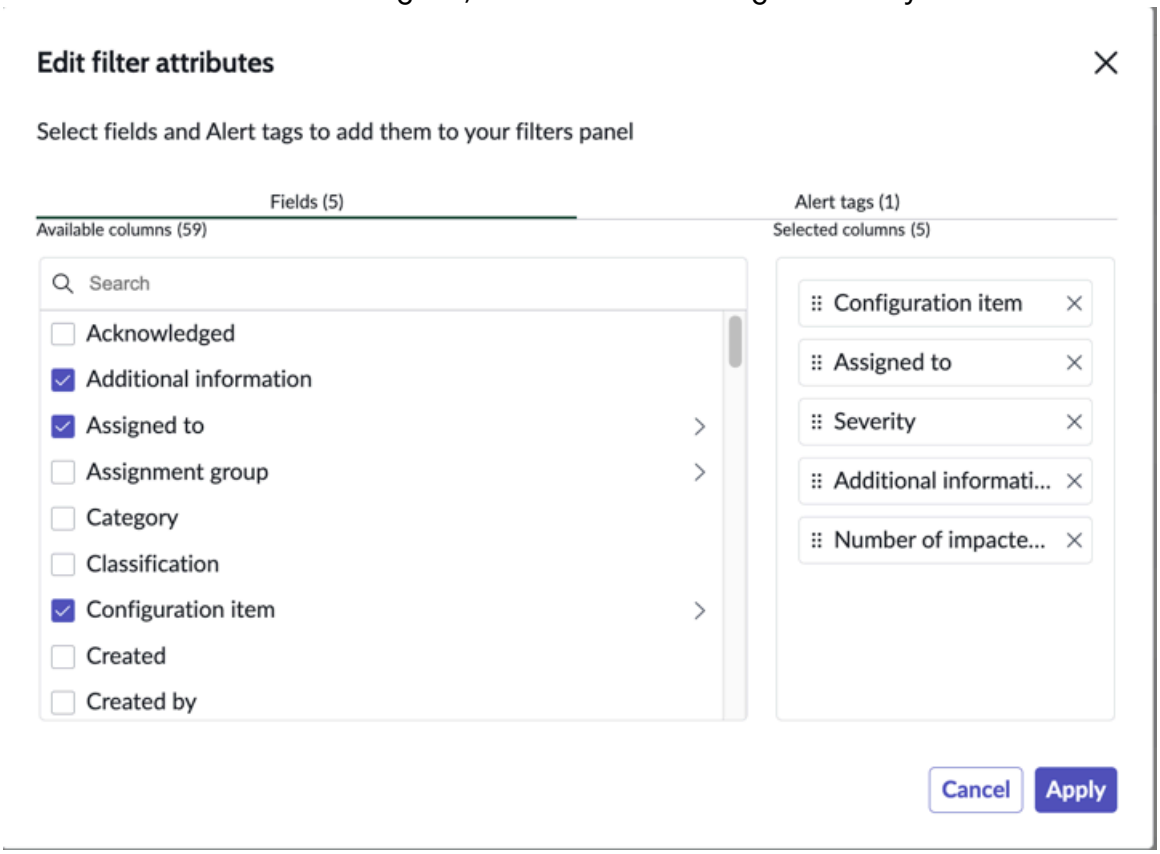
Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. In the left filter pane, select the Edit filter attributes icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **Edit filter attributes** dialog box, select fields or alert tags to add to your filter.

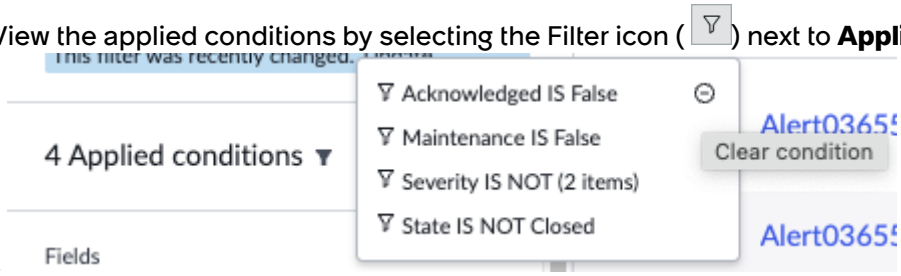


The **Fields** tab is displayed by default and displays the number of selected fields.

The number of available fields is displayed at the top of the column next to **Available columns**.

The selected fields are displayed in the right column. The number of selected columns are displayed at the top of the column next to **Selected columns**.

5. **Optional:** Find a specific field by entering its name in the **Search** field.
6. **Optional:** Rearrange the order of the selected columns by dragging them up or down in the right column.
7. **Optional:** Remove a column by selecting the **X** next to its name.
8. Select **Apply**.
9. **Optional:** Clear a filter by selecting **Clear** next to that filter name.
   Clear appears only if you selected or cleared any of the attribute check boxes of the selected filter.
10. **Optional:** View the applied conditions by selecting the Filter icon ( ) next to **Applied conditions**.



11. **Optional:** Remove a condition by selecting the **Clear condition**( ) icon.

Result

All the selected fields are displayed in the **Filters** panel in the **Fields** column.

Categorize alerts displayed in Express List

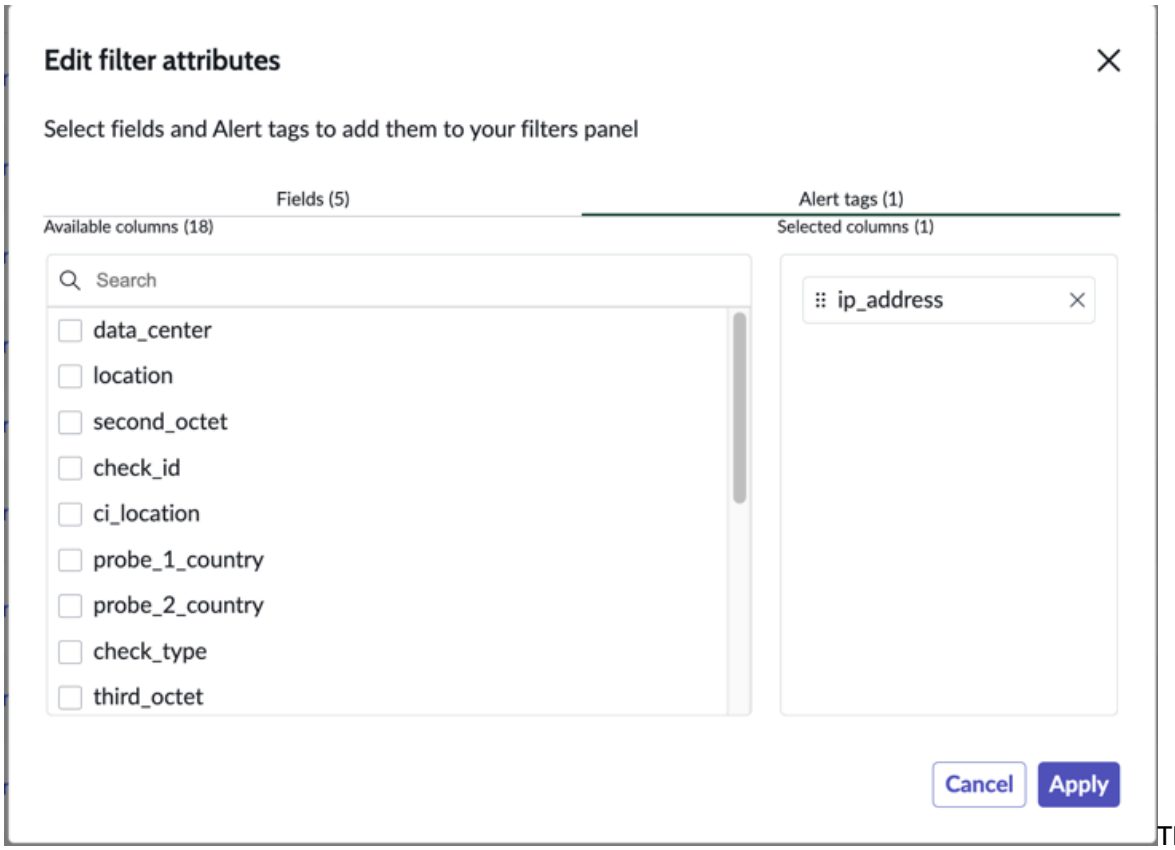
Create different views of alerts by adding tags in Express List to enable you to easily identify and group alerts without the need for discovery or accessing the CMDB.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. In the left filter pane, select the **Edit filter attributes** icon ( ).
4. In the **Edit filter attributes** dialog box, select the **Alert tags** tab.



The **Alert tags** tab title displays the number of selected alert tags.

The left column displays the number of available tags in the **Available columns** column title.

The selected tags are displayed in the right column. The number of selected tags is displayed in the **Selected columns** column title.

5. **Optional:** Find a specific tag by entering its name in the **Search** field.
6. **Optional:** Rearrange the selected tags by dragging them up or down in the right column.
7. **Optional:** Deselect a tag by selecting the (**X**) next to it.
8. Select **Apply**.

Result

All the selected tags are displayed in the **Filters** pane under the **Alert tags** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filter out or show matching alerts

Create different views of categorized alerts in Express List by either displaying or filtering out alerts that match a selected alert.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. Right-click an alert row.
4. Match or filter out matching alerts.
   - Display matching alerts by selecting **Show Matching** from the context menu.
   - Filter out matching alerts by selecting **Filter Out** from the context menu.

Save a custom filter in Express List

Save your custom view of categorized alerts in Express List to use again, share, or set as your default view. Saving your custom view saves all filters, tags, and conditions.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation, select the Express List icon ( ).
3. Once you have set up a filter that you want to reuse, set as your default view, or share with others, save the filter.
   For more information about filtering the Express List alert display, see the following topics:
   - Filter the Express List display using attributes
   - Filter the Express List display by adding or removing fields
   - Filter out or show matching alerts

   a. In the Express List select **Save new**.

   b. In the **Save new filter** dialog box in the **Filter name** field, enter a name for the filter.

   c. **Optional:** Make this filter your default filter by selecting **Set as default**.

   d. Select **Save** to save the filter.
4. **Optional:** Share a saved filter by copying its link to send to others.

   a. In the **Filters** panel, select the filter from the drop-down list.

   b. Select the Copy link to clipboard icon ( ).
5. **Optional:** Set a saved filter as your default filter.

   a. In the **Filters** panel, select the filter from the drop-down list.

   b. Select the More Actions icon ( ) and select **Set as default**.
6. **Optional:** Delete a saved filter.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Filters** panel, select the filter from the drop-down list.

b. Select the More Actions icon (⋮) and select **Delete filter**.

Using agentic and generative AI in Express List

Use the ServiceNow® Now Assist for IT Operations Management (ITOM) application in Express List to help you investigate alerts more effectively with agentic and generative AI.

The Now Assist for IT Operations Management (ITOM) application in Express List uses AI agents and skills to help you investigate and act on alerts. Use AI agents and skills to enhance alert triage, investigation, and analysis.

Review AI generated alert information and insights in Express List

View an alert analysis by Now Assist in Express List

View an alert analysis created by Now Assist using generative AI. Alert analyses include a human-readable brief of the alert and technical information to help you investigate the alert more effectively.

Before you begin

- Install the ITOM plugin in the Now Assist feature. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- View important information about the Now Assist for IT Operations Management (ITOM) application in Now Assist for IT Operations Management (ITOM).

Note: Currently, Now Assist for ITOM only supports tag-based, CMDB, Log Analytics, Mixed, Automated, and Network Traffic-based alert groups. For all other alert group types, it only analyzes the parent alert.

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. In the Active alerts list, select the information icon (ⓘ) next to the alert.
4. On the preview panel **Info** tab, select **Analyze** in Alert analysis by Now Assist.
5. View the information provided in the Alert analysis.
6. **Optional:** Use the Alert analysis icons to perform related tasks.

Alert analysis icons

Icon	Description
	Copy the content of the alert analysis to the clipboard.
	Refresh the alert analysis. **Note:** Refreshing regenerates the results. Past results are deleted.

© 2026 ServiceNow, Inc. All rights reserved.

Viewing an alert group analysis by Now Assist in Express List

View an analysis of alert groups in Express List, generated by Now Assist using AI. The analysis helps you better understand the nature of the alert group, why the alerts in the group were correlated, and how to proceed in the remediation process.

The AI-driven alert group analysis offers a simplified, human-readable description of the group and technical information to help you investigate it more efficiently. The information provided is based on descriptions and Configuration Item (CI) details relating to the individual alerts in the group. Alert group analysis is supported for the following alert group types:

Tag-based alert groups

Tags help categorize alerts based on common attributes, such as impacted systems or services. Alerts in tag-based alert groups share certain tags, indicating similarities in the issues. The alert analysis for these groups presents the shared tags that were used to correlate the alerts in the group. It also provides insights into why these alerts were grouped. In addition, the analysis offers suggestions for a course of action based on the similarities between the tags.

CMDB alert groups

When an alert is created on a CI in the Configuration Management Database (CMDB), Event Management looks for alerts on other CIs that are closely related to it in the CMDB topology. A close topological relationship between CIs suggests an interdependence between components in the IT infrastructure and contributes to alert correlation. When a relationship between CIs is found, a CMDB alert group is formed. The alert analysis for CMDB alert groups explains the nature of the group and why it was formed, and the relationships between the CIs. It also provides technical information to help you decide on which alerts to concentrate your investigation.

Log Analytics alert groups

When Event Management identifies multiple Log Analytics alerts that are related in important ways, it groups them into a Log Analytics group. The system generates a Log Analytics group when the Log Analytics alerts share one or more relationships related to time, metadata, message text, and trend. The alert analysis for Log Analytics alert groups is based on the analysis of anomaly information provided by Health Log Analytics, and on the descriptions, CIs, and tags of the alerts in the group.

Network Traffic-based alert groups

The Network Traffic-based alert grouping method groups alerts by analyzing network traffic connections between processes across hosts. It leverages service candidates identified by ML Service Mapping to group the alerts. Alert analysis for network traffic-based alert groups gives a description for all the alerts in the group and the connections between them.

Mixed alert groups

The Mixed grouping method combines alerts using multiple grouping strategies, such as those used in CMDB alert groups and tag-based groups, in a single, cohesive group. This method leverages the strengths of each strategy to reduce alert noise, improve alert correlation, and highlight the true root cause of incidents.

Automated alert groups

Automated alert grouping uses aggregation algorithms to identify and group related alerts that share the same alert identifier, such as the CI and metric identifier, and that occurred multiple times within a similar time frame. The algorithms rely on historical data to detect recurring patterns and organize similar alerts. Alert analysis for automated alert groups provides details about the CI or time-based

patterns that contributed to the grouping. The analysis also includes a summary of historical incidents related to the group, including frequency, criticality, and resolution strategies.

View an alert group analysis by Now Assist in Express List

View an alert group analysis created by Now Assist using generative AI. The analysis offers a simplified, human-readable description of the alert group and technical information to help you investigate it more efficiently.

Before you begin

- Install the ITOM plugin in the Now Assist feature. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- View important information about the Now Assist for IT Operations Management (ITOM) application in Now Assist for IT Operations Management (ITOM).

Note: Currently, Now Assist for ITOM only supports tag-based, CMDB, Log Analytics, Mixed, Automated, and Network Traffic-based alert groups. For all other alert group types, it only analyzes the parent alert.

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the navigation bar, select the Express List icon ( ).
3. In the Active alerts list, select the information icon ( ) next to an alert group to display the preview panel.
4. On the preview panel **Info** tab, select **Analyze** in Alert analysis by Now Assist.
5. View the information provided in the Alert analysis.
6. **Optional:** Use the Alert analysis icons to perform related tasks.

Alert analysis icons

Icon	Description
	Copy the content of the alert analysis to the clipboard.
	Refresh the alert analysis. **Note:** Refreshing regenerates the results. Past results are deleted.

Related topics

Viewing an alert group analysis by Now Assist in Express List

Update an alert description in Express List based on a Now Assist analysis summary

Update alert descriptions in alert groups or single alerts in Express List, to a human-readable summary generated by Now Assist.

About this task

Updating the alert description is available for the alert types:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Tag-based alert group.
- CMDB correlation alert group.
- Network Traffic correlation alert group.
- Log Analytics single alerts and alert group.
- Mixed alert group.
- Automated alert group.

Before you begin
Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the navigation bar, select the Express List icon ( ).
3. In the Active alerts list, select the information icon ( ) of an alert.
4. On the preview panel **Info** tab, select **Analyze** in Alert analysis by Now Assist.
5. Review the human-readable, AI-generated summary in the Alert analysis.
6. On the preview panel **Info** tab, select **Update description** to update the description based on the summary content of the alert group.
   The AI-generated summary content replaces the original description of the alert group.

Create an incident with Now Assist in Express List

Create an incident with a human-readable, AI-generated description using Now Assist.

Before you begin
Currently, this feature is available for CMDB, Log Analytics, tag-based, and component-based alerts.

Role required: evt_mgmt_operator, evt_mgmt_admin

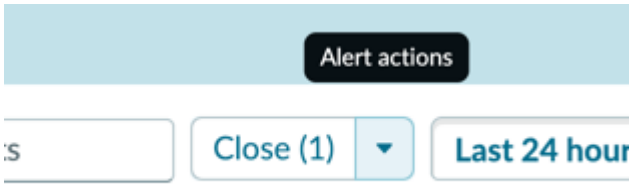
Note: The evt_mgmt_user role is view-only and doesn't have permission to perform this action.

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Create an incident from a selected alert.
   a. In the Express List pane, select the check box for the desired alert.

      Note: To display the individual alerts inside a group, select the chevron icon ( ) at the beginning of the alert group row.

   b. Select the **Alert actions** drop-down list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Under **Response actions**, select **Create Incident with Now Assist**.

An incident with a human-readable, AI-generated description is created from the selected alert and a confirmation message is displayed.

Dependency View maps

Explore the Dependency Views in Express List and the Event Management Alert form.

Dependency View maps are visual tools that illustrate the relationships between configuration items (CIs), helping you understand how different components are connected. These maps rely on the Configuration Management Database (CMDB) as a foundational data source, which stores detailed information about each CI and their interdependencies. By leveraging the CMDB, dependency maps provide a comprehensive view of the IT environment, enabling better impact analysis and decision-making in IT operations.

View data on configuration items on the preview panel in Express List

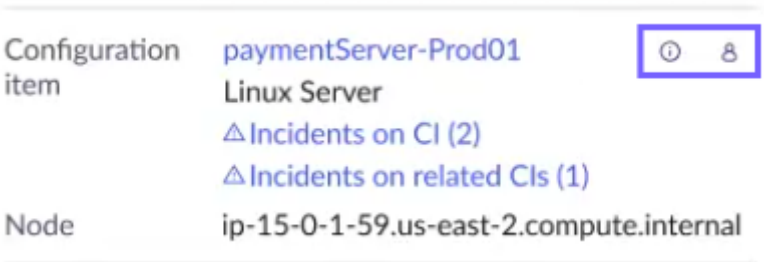
View additional details about configuration items (CIs) that are bound to alerts on the Express List preview panel.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. In the **Active Alerts** list, select an alert check box.
4. On the preview panel, select the **Info** tab to view it.
5. Hover over the Configuration item name to display information icons.



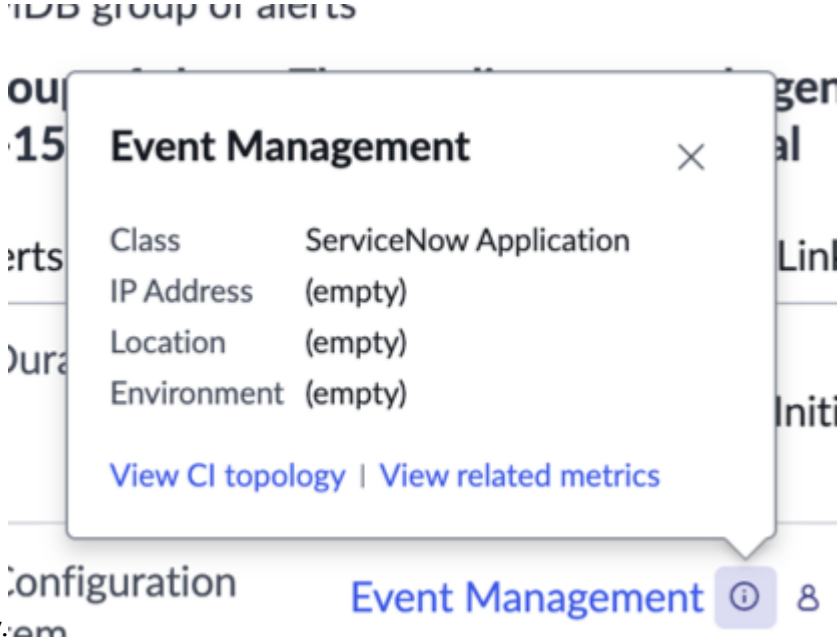
6. Display additional information on a CI by selecting the relevant icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration item information icons

Icon	Name	Description
ⓘ	Additional information	Shows the class, IP address, location, and environment of the CI. From the pop-up, you can open the CI topology map in Service Operations Workspace by selecting **View CI topology**. If metrics data exists for this service, you can open the Metric Explorer from the pop-up by selecting **View related metrics**.
8	Contact person/group	Shows the name of the owner of the CI, the support group assigned to it, and avatars of the individual team members.

7. **Optional:** Select the Additional information icon ⓘ and then select **View CI topology**.



The **Dependency View** map opens. The map visually represents the relationships between CIs, helping you understand how different components are interconnected.

View the Dependency View map for an alert from Express List

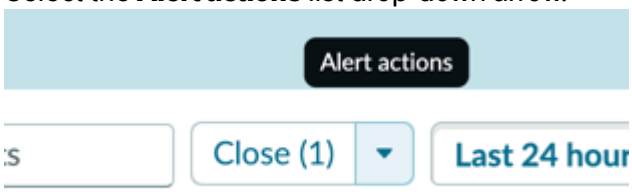
View the **Dependency View** map for an alert from the **Alert actions** list in Express List.

Before you begin
Role required: evt_mgmt_operator, evt_mgmt_admin

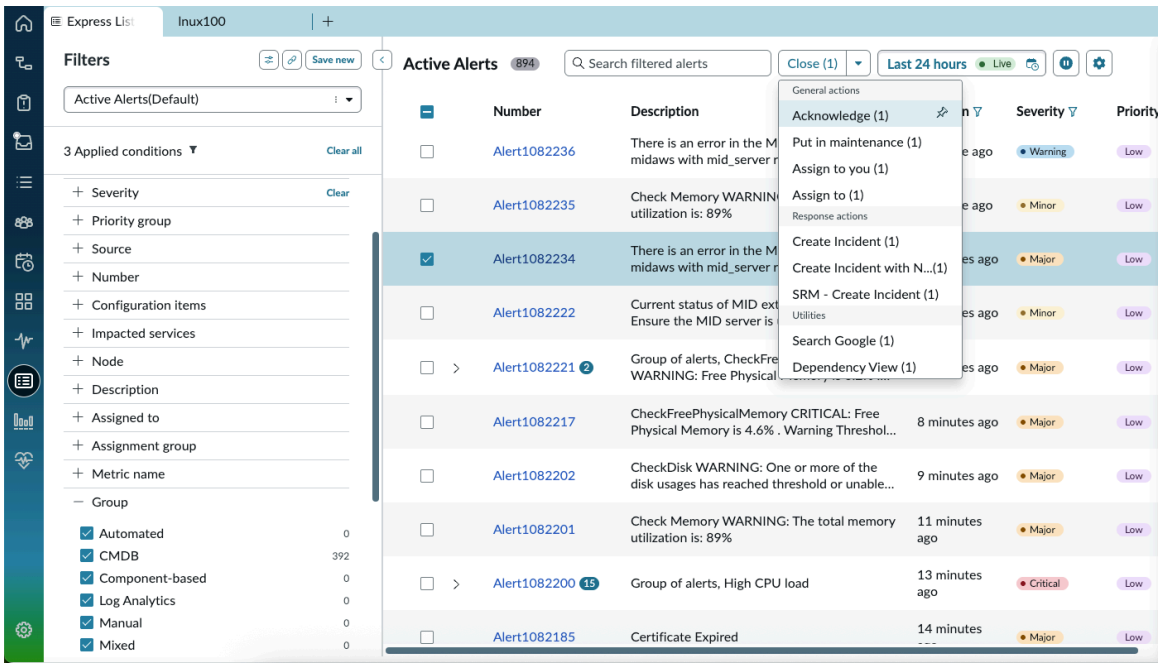
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. In the alert list, select the check box of the alert for which you want to view the **Dependency View**.
4. Select the **Alert actions** list drop-down arrow.



5. From **Utilities**, select **Dependency View** map.



The **Dependency View** map opens.

View the Dependency View map from the alert record page

View the **Dependency View** map for an alert from the alert record page.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. In the alert list, select the number of the alert for which you want to view the dependency view. The alert record opens. The **Overview** tab is selected by default.
4. From the **Utilities** panel, select **Dependency View**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

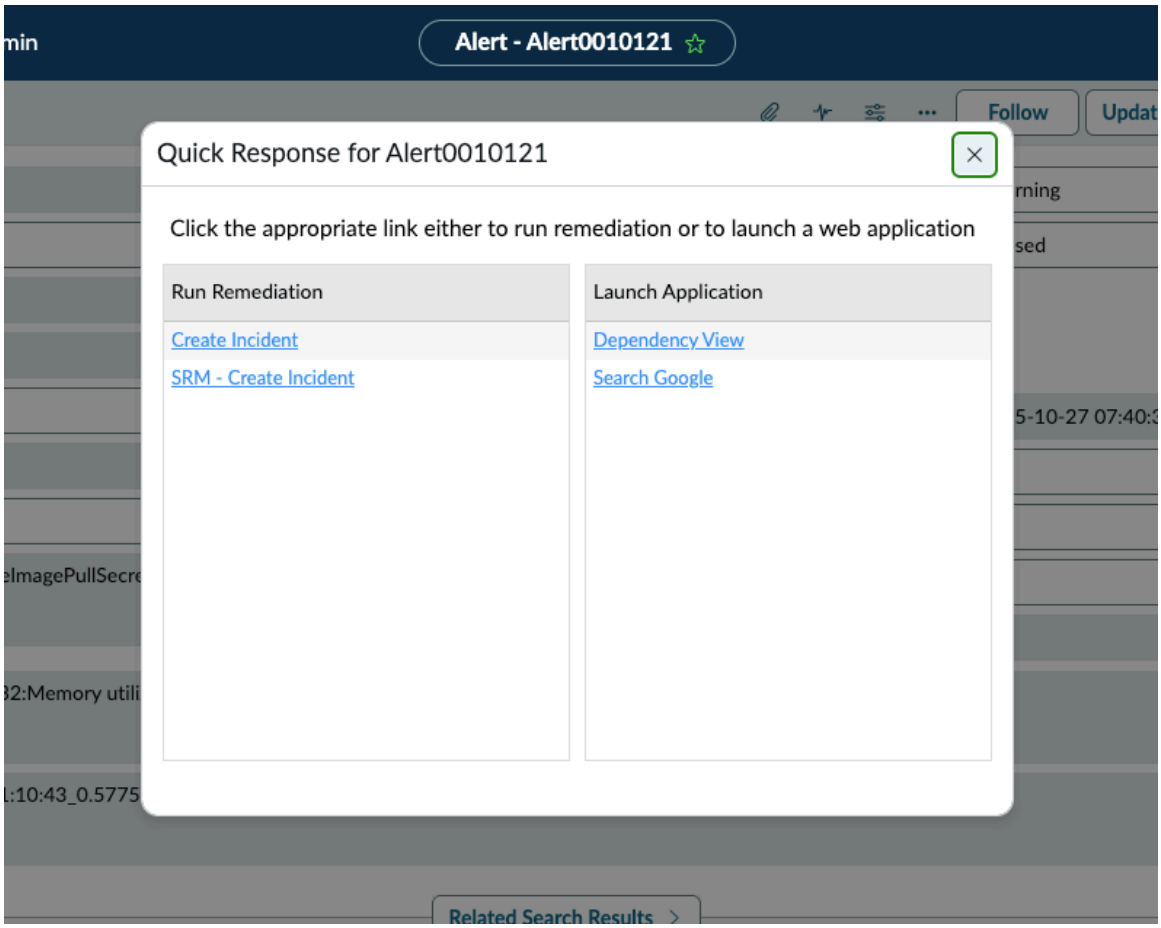
The **Quick Response** menu opens.



4. Under **Launch Application**, select **Dependency View**.
   The map opens in Service Operations Workspace.

Alert automation in Service Operations Workspace for ITOM

Alert automation is crucial as organizations deal with increasing number of alerts and complex IT infrastructures. Manual alert handling is slow, error-prone and inefficient, underscoring the need for automated systems. Automation can improve the mean time to resolve alerts, improve service reliability and better scale staff resources.

Alert automations also support both centralized administrator and distributed team roles. This enables qualified teams to self-serve and create their own alert automations. For example, you may consider granting access to site reliability engineers (SREs). Members of teams can manage automations for their own team and their own alerts without impacting other teams.

For users familiar with our classic experience, alert automation offers an easier user interface and better team support for event rules, tag-based clustering definitions and alert management rules. Some advanced features are currently only available to admins in the classic experience. These two experiences use the same backend tables. You can use whichever experience is most convenient, and changes in one will also update the other.

https://player.vimeo.com/video/1068873181?h=b03003c9bf&badge=0&autopause=0&player_id=0&app_id=58479

Alert automation types

Currently, Service Operations Workspace ITOM provides the following types of automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Ignore automation: Reduce irrelevant or false-positive alerts, efficiently manage alert fatigue by filtering out noisy notifications, and allow teams to focus on critical issues.
2. Enrich automation: Enhance raw alerts with contextual information to make them more informative and actionable. In simple terms, this involves taking the raw events generated by monitoring tools and transforming them into a common and standard format to aid automated grouping and response.
3. Group automation: Group multiple related alerts into a single primary alert to reduce alert noise and identify the root cause.
4. Create Respond automation: Respond to alerts automatically by notifying appropriate stakeholders, escalate them as needed or run remediation actions. Determine how and when alerts are escalated based on severity or type. Integrate with third party systems to create cases, notifications or run remediation actions.

Alert automation process flow

You may start by sending alerts or events from monitoring systems to ServiceNow using the Integrations Launchpad. This is where administrators establish connections between ServiceNow and monitoring tools. These integrations enable the collection of monitored data, generating events from third-party sources.

When alerts are received by ServiceNow, alert automations run in the order shown on the page. First, we ignore alerts to reduce noise. Next, we enrich alerts with extra context, then group the alerts using the added context. Finally, we respond to alerts by escalating or running remediations. There can be several automations for each type. Each automation runs based on specific trigger conditions and executes specific actions. Alerts are only automated when they are received; we do not apply automations to past alerts.

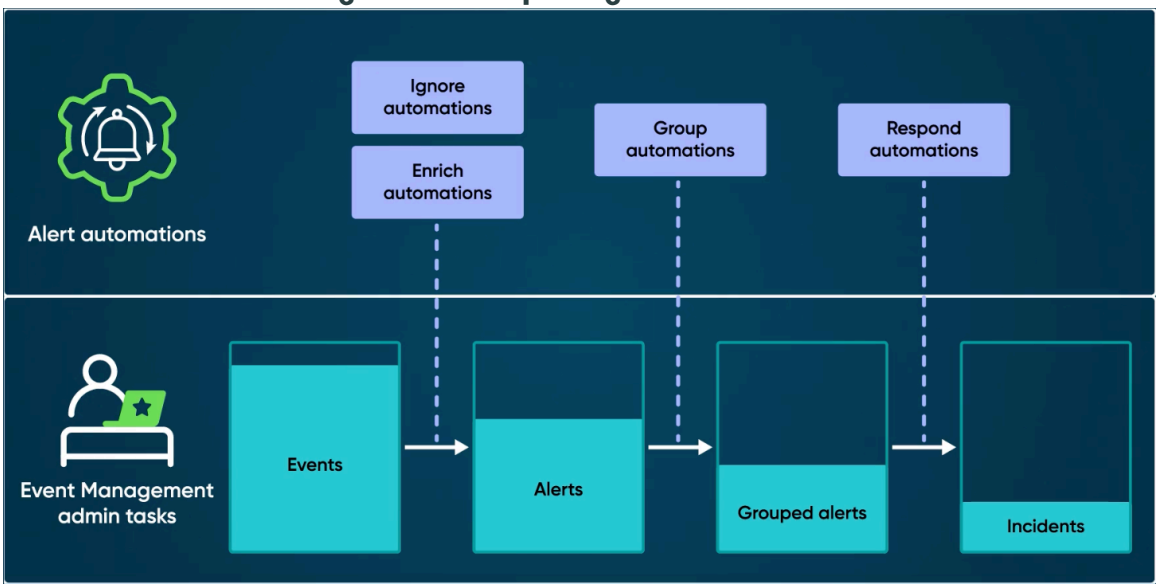
In the alert enrichment phase, administrators add or extract necessary fields from alerts to provide essential information for swift resolution. This ensures that alerts contain all relevant details required for effective incident response. Administrators add context to alerts by modifying and normalizing them. This enhances the correlation of alerts, making it easier to identify patterns and potential threats.

The enriched and composed alerts are then grouped based on predefined criteria, consolidating related alerts. This reduces alert fatigue and facilitates efficient remediation. Finally, escalated alerts trigger notifications to stakeholders through various channels, ensuring timely communication and response to critical alerts.

The following diagram illustrates this process flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert automation: Reducing noise and improving resolution time



This comprehensive alert automation process can reduce alert noise, improve mean time to resolution (MTTR), enhance service reliability, and boost staff productivity.

Create Ignore automation

Ignore automation streamlines the process of disregarding irrelevant or false-positive alerts from monitoring systems, efficiently managing alert fatigue by filtering out unnecessary notifications. This allows teams to focus on critical issues.

Before you begin

Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

About this task

Ignore automations filter out alerts from source monitoring systems that match specific conditions. Separately, Event Management ignores alerts that have a duplicated message key field or where the severity is **Clear**.

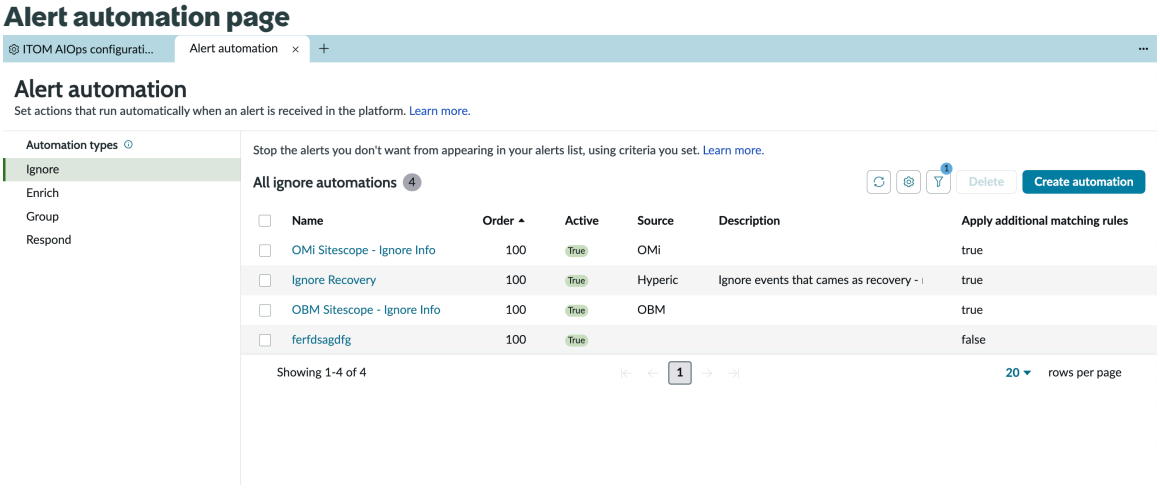
For users familiar with the classic Event Management experience, ignore automations provide a simpler interface with enhanced team support for the event filter section of event rules.

Note: Ignoring alerts before enriching them improves performance and simplifies the processing flow. The condition filter in ignore automations applies only to the original event, not the enriched one. Enrich automations can prevent ignore automations from running when **Don't run other enrich alert automations** is set to false, they apply to the same source, have a lower order, and match the filter conditions. To avoid conflicts, it is best to consider this when creating enrichments or event rules.

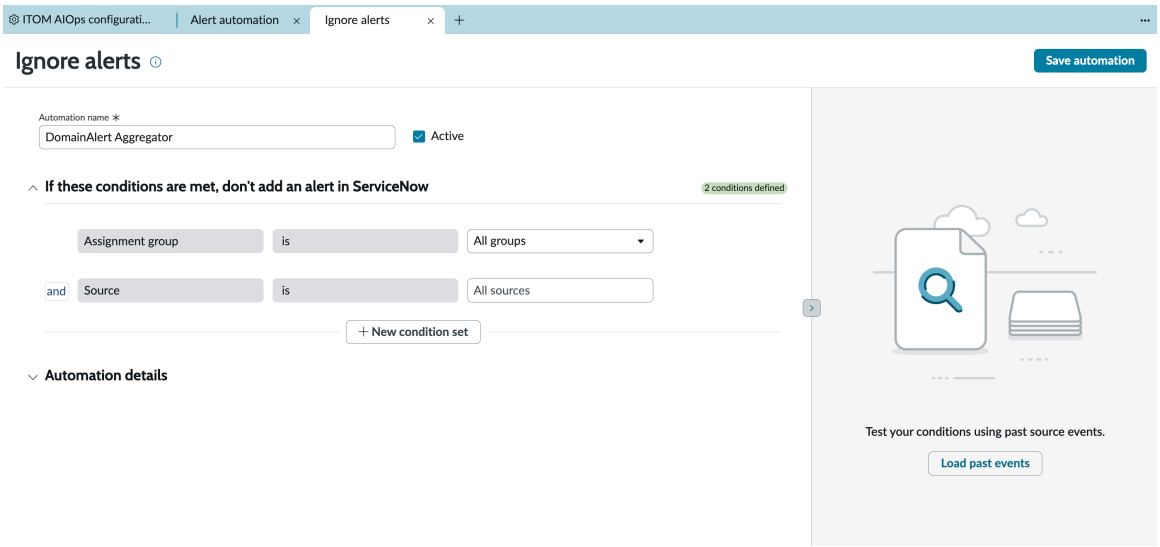
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the Optimize section, select **Ignore alerts**
   The Ignore alerts page is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Create automation**.



5. In the **Automation name** field, enter the name of the automation for ignoring alerts.
6. Activate the automation by enabling the **Active** toggle switch.
7. In the **If these conditions are met, don't add an alert in ServiceNow** section, set up filter criteria to identify the events you want to capture.
   a. From the **Assignment group** field menu, select the assignment group to determine which team's alerts will trigger the automation.

      The **Assignment group** represents a specific team responsible for handling certain alerts. By selecting an assignment group, you ensure that only the alerts assigned to that particular team will trigger the automation. This way, the automation is targeted and only activates for relevant alerts associated with the selected team.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- If you're logged in to the instance with an administrator role (evt_mgmt_admin), all of the assignment groups are available. Additionally, you can select **All groups** to enable generating alerts for any of the available groups.
- If you're an operator, only the group you're a part of is available.
- Only members of the selected group or administrators can update or delete the automation.

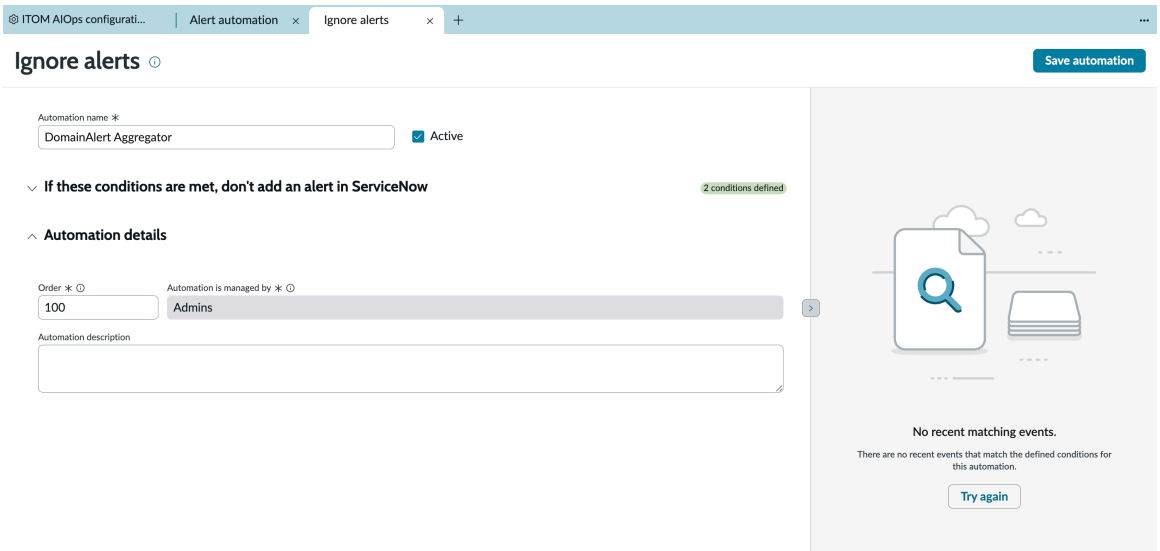
b. From the **Source** field menu, select the monitoring tool from where the alert is generated.

c. Set up the conditions by selecting the field, operator, and field value. Then, add more conditions using OR or AND operators.

To add another set of conditions, select **+ New condition set**. You can also manually add an additional info field if you don't see it in the drop-down list.

8. To verify that you are ignoring the correct events or to see examples of fields that can be used to set the conditions, select **Load past events**.
You can preview the details of some past events.

9. In the **Automation details** section, provide an order and automation description.



a. In the **Order** field, enter the automation order.

Note: Automations run in order from the lowest to the highest.

The **Automation is managed by** field displays the team or assignment group who owns, edits, and can delete this automation. The assignment group is the same as the one defined in the **If these conditions are met** section.

b. In the **Automation description** field, enter a brief description of the automation.

10. Select **Save automation**.
A notification appears when the automation is successfully saved. Otherwise, an error message is displayed. The ignore automation that you created appears on the **Ignore alerts** page where you can view, edit, or delete the existing automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

You can transform raw events into an understandable format by creating Create Enrich automation.

Create Enrich automation

Alert enrichment involves transforming raw events from monitoring tools into a standard format, aiding automated grouping and response. This includes extracting fields from lengthy alert payloads or composing them into a standardized format. Additionally, you can create tags, which are metadata added to alerts for easier filtering and grouping.

Before you begin

Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

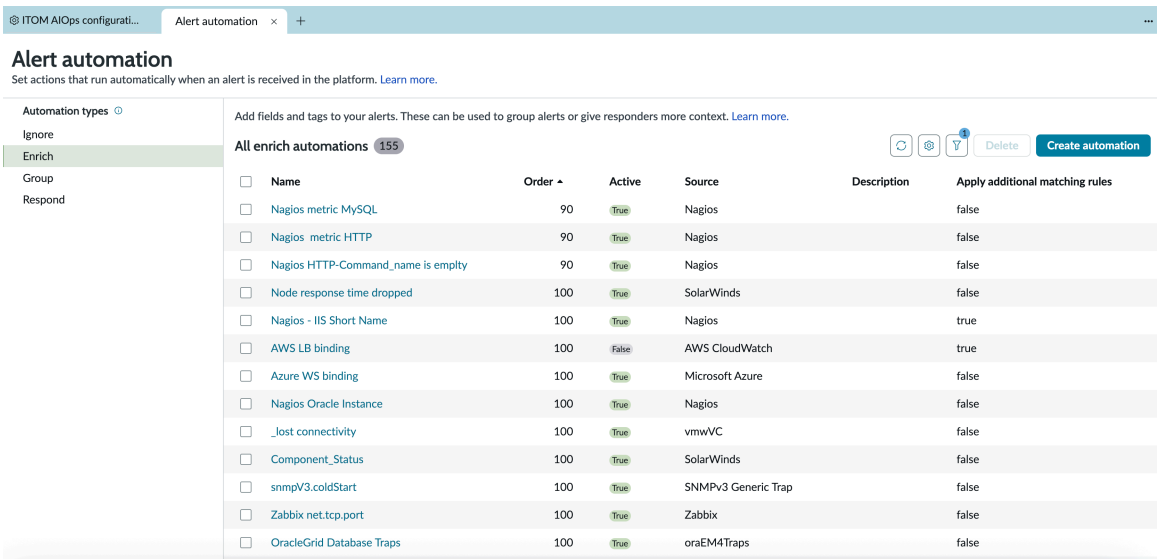
About this task

Extracting takes values from event payload fields and places them in alert output fields, while composing combines multiple alert fields into one. For more information, see Extracting and composing alert fields.

For users familiar with the classic Event Management experience, enrich automations create event rules but with an easier interface and with better teams support. Event rules offer a few advanced features like thresholds and CI identification using IRE that are not yet available in enrich automations. Admins may also enrich alerts with event field mapping rules. Changing alert values creates an event field mapping rule with the mapping type **Map field and transform value (Single field)**. This rule is linked to the event rule and runs simultaneously, allowing for streamlined mapping and transformation of event data to enrich alerts.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the Optimize section, select **Enrich alerts**.
   The Enrich alerts page is displayed.



4. Select **Create automation**.
   By default, the **Active** check box is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **Automation name** field, enter the name of the automation for enriching alerts.
6. In the **If these conditions are met** section, set up filter criteria to identify the alerts you want to enrich.

   The condition is evaluated against the raw event received from the source monitoring system and does not account for enriched fields.

   a. From the **Assignment group** field menu, select the assignment group to determine which team's alerts will trigger the automation.

      The **Assignment group** represents a specific team responsible for handling certain alerts. By selecting an assignment group, you ensure that only the alerts assigned to that particular team will trigger the automation. This way, the automation is targeted and only activates for relevant alerts associated with the selected team.

      Note:

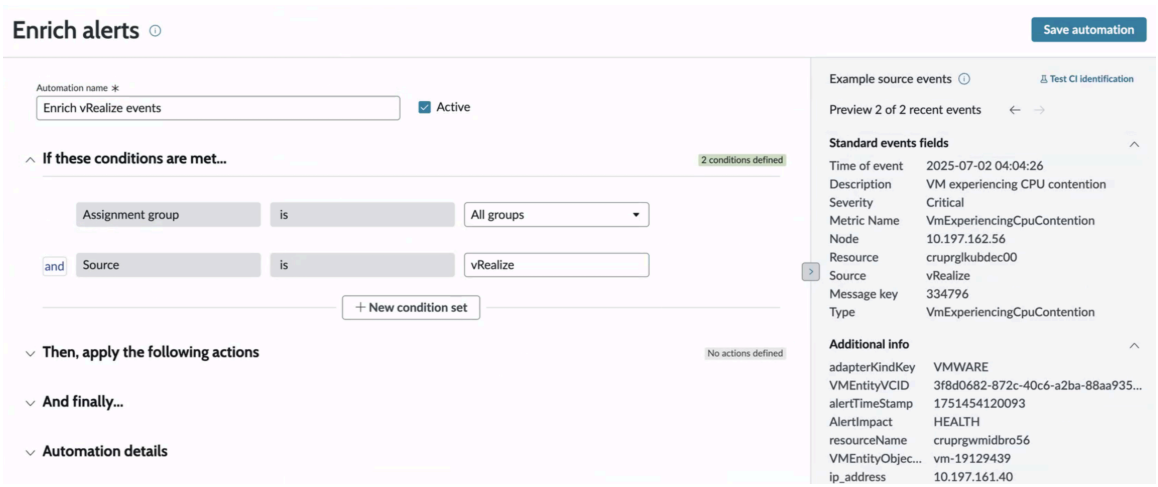
      - If you're logged in to the instance with an administrator role (evt_mgmt_admin), all of the assignment groups are available. Additionally, you can select **All groups** to enable generating alerts for any of the available groups.
      - If you're an team operator, only the groups you're a member of are available.
      - Only members of the selected group or administrators can update or delete the automation.

   b. From the **Source** field menu, select the monitoring tool from where the alert is generated.

   c. Set up the conditions by selecting the field, operator, and field value. Then, add more conditions using OR or AND operators.

      To add another set of conditions, select **+ New condition set**. You can also manually add an additional info field if you don't see it in the drop-down list.

      Note: Select **Load past events** to view previous events when creating the automation.



7. In the **Then, apply the following actions** section, select the automation actions that will be triggered by this automation.
   You must select at least one action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Extract alert fields**: Retrieves alert field values from the event payload and places them in an alert output field.
- **Copy or compose fields**: Merges various alert fields, tags and text to generate a composed alert output.
- **Change alert values**: Maps the current value of alert fields to specified new values.
- **Improve configuration item (CI) identification**: Identifies CIs other than a host for better alert grouping, team assignment, and service health.

Option	Action
Extract alert fields	**a.** Enable the **Extract alert fields** toggle switch. **b.** From the **Source input field** menu, select a value. The menu displays the standard event fields, additional info, and tags. The field value is then displayed. You can also manually enter a field name that is not displayed and add your own value. The example source events pane displays a sample of recent events in your system. If no events are displayed, you may cre ate an event, see Create or edit an event rule. **c.** In the **Regular expression** field, create a regular expression to extract the value that you want to extract. **Note:** You can compose text using regular expression (regex) format conventions. Use one or more capture groups with parentheses to extract parts of the input. Capture groups in the regular expression are assigned to alert outputs based on the order in which they appear. The regex must match the entire input, so consider sur rounding your regex with `.*` on each end. For example, `(\w+).acme.com.*` captures the host name in a fully qualified domain name. The parser for the regex engine is Perl Compatible Regular Expressions (PCRE) compat ible. Nested JSON data is preprocessed to strip quotes and replace colons with equal signs. **d.** In the **Alert output** field, select an alert field or an alert tag. You can also manually enter a new field name. If you want to add an alert tag, select the **Set as a tag** check box. **Tip:** Create alert tags that can be shared across sources for easier filtering and grouping, such as the out-of-the-box tags. 
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Action
	e. Select **Preview multiple events** to verify that the regular ex pression (regex) is general-purpose enough to correctly ex tract values across many examples. **Note:** This option is available only when example source events are available and matched with the regex filter.  To include additional fields for extraction, select **+ Add fields**.
Copy or compose fields	**a.** Enable the **Copy or compose fields** toggle switch. **b.** From the **Source input field** menu, select alert fields and/or alert tags, manually enter a field name or even add free text. Alert fields are displayed in the `${field}` syntax format. **c.** In the **Alert output** field, select an existing alert field or alert tag, or manually enter an alert field. The **Alert output** field is an enriched alert containing the composed alert data. For easier grouping, you can select a tag from the menu. If you want to use the new field name as a tag for grouping, select the **Set as a tag** check box. **Tip:** Create alert tags that can be shared across sources for easier filtering and grouping, such as the out-of-the-box tags.  To create additional alert data compositions, select **+ Add fields**.
Change alert values	**a.** Enable the **Change alert values** toggle switch. **b.** In **Alert field**, enter the field in the alert that you want to map values for. **c.** In the **From value** field, enter original value in the alert field that you want to change.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Action
	d. In the **To value** field, enter the new value that will replace the original value in the alert field. To add more field values, select **+ Add value** and to add more fields to map, select **+ Add field to map**. Improve configuration item (CI) identification	This option allows you to change how alerts are bound or linked to a Configuration Item (CI), ensuring alerts are associated with the correct IT components for better visibility and faster issue resolution. The default and most common way to bind alerts to CIs is based on the **Node** field. This works out of the box with no configura tion needed. Use it by populating the **Node** field in your alert with a CI's Name, Fully Qualified Domain Name (FQDN), IP, or MAC ad dress. This supports host CIs including Computers, Operating Systems (OS), Switches, Routers, or any CI type or any class that extends the [cmdb_ci_hardware] table. You may enable this action to improve the CI identification for other types of CIs such as processes or service instances. The system searches for a matching CI in the appropriate CMDB ta ble based on the selected CI type. For example, if you select VMware Virtual Machine Instance as the CI class, the system searches for a matching record in the [cmdb_ci_vmware_in stance] table using details from the event rule record, specifical ly the **Additional info** fields.  **a. Select which CI class you'd like to Identify**: Specify Configu ration Item (CI) class that the system should use for identifica tion. Example: Select Server to identify alerts related specifical ly to server CIs. Select **View items** to see the list of CIs of this type and their at tribute values.

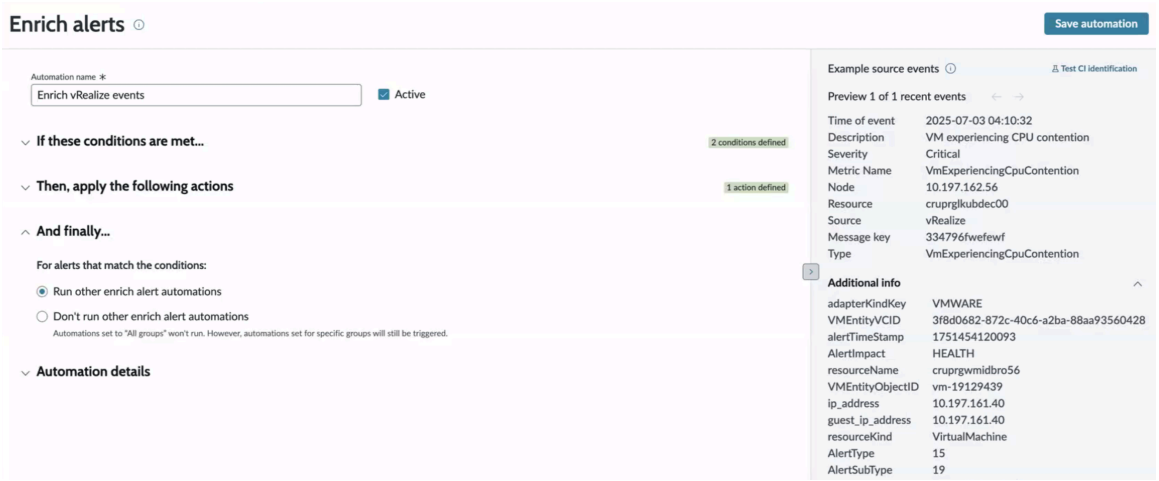
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Action
	Ensure that the **Node** field in the alert is populated correctly to identify a host CI. The CI you are identifying must have a runs on relationship to the host CI or be mapped to the host. **Note:** Also, if the value is **Node** in the **Alert output** field of the Extract fields section, or in the **Output to field** of the Copy or compose fields section, then select **Select which CI class you'd like to identify**. **b. Select which alert fields will be used to identify the CI**: Select the alert fields that help the system match alerts to the correct CI. ▪ **Alerts additional info field**: The alert property that contains extra information useful for CI identification. ▪ **CI attribute**: The CI property that the system compares against the selected alert field to establish a match. **c.** Ensure that at least one CI attribute is present in the **Additional info** field of the alert. For instructions on how to populate these fields, see Set additional info fields to match CI attribute format. The system attempts to match values from the **Additional info** field of the alert with the CI table. If a match is found, the alert is bound to the corresponding CI. **d.** Select **Test CI identification** to test the CI identification on sample events.  For more information on CI binding, see Binding alerts to CIs.

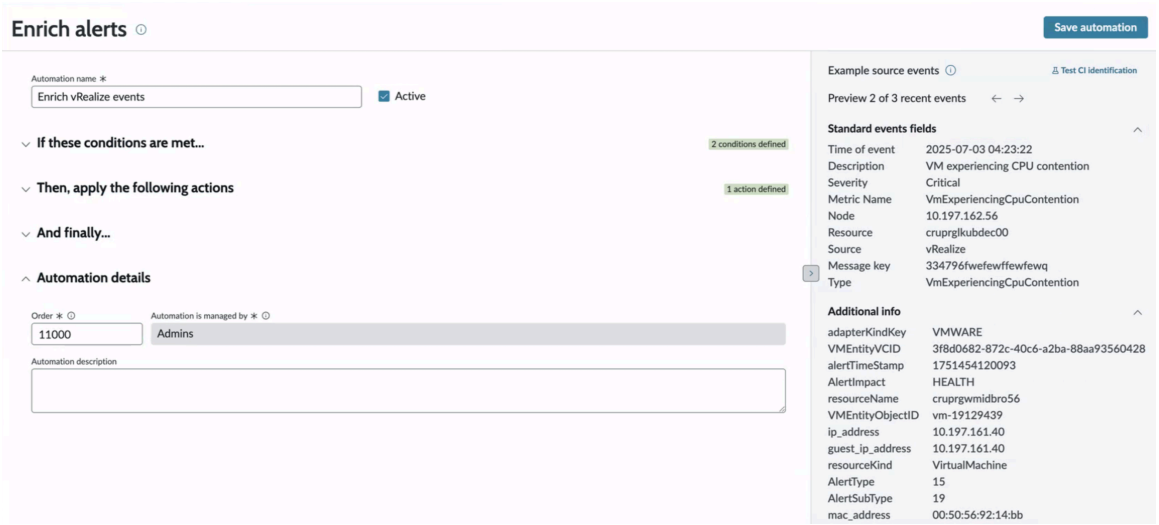
8. In the **And finally** section, to continue running other enrichment automations with same filter conditions after this automation is executed, select **Run other enrich alert automations**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you select **Don't run other enrich alert automations**, additional automations of this type will stop running after this automation is executed once. If the automation is managed by an administrator, it will stop running administrator-owned automations but will continue to run automations owned by other assignment groups.

9. In the **Automation details** section, provide an order and automation description.



a. In the **Order** field, enter the automation order.

> **Note:** Automations run in order from the lowest to the highest. Ensure there are no enrichment automations with a lower order number that have matching conditions and have **Apply additional automations of this type** set to false. Otherwise, this may prevent subsequent automations from running.

The **Automation is managed by** field displays the team or assignment group who owns, edits, and can delete this automation. The assignment group is the same as the one defined in the **If these conditions are met** section.

b. In the **Automation description** field, enter a brief description of the automation.

10. Select **Save automation**.
A notification appears when the automation is successfully saved. Otherwise, an error message is displayed. The enrich automation that you created appears on the Enrich alerts page where you can view, edit, or delete the existing automation.

© 2026 ServiceNow, Inc. All rights reserved.

What to do next

You can manage alerts more effectively by grouping similar alerts together with the help of Create Group automation.

Related topics

Extracting and composing alert fields

Extracting and composing alert fields

Extracting and composing are ways to manage what you see in the alert output, making it simpler to filter, group, and read. Alert automation enables you to extract values from event payload's alert field and place it in an alert output field. Composing allows you to merge multiple alert fields into a single output field.

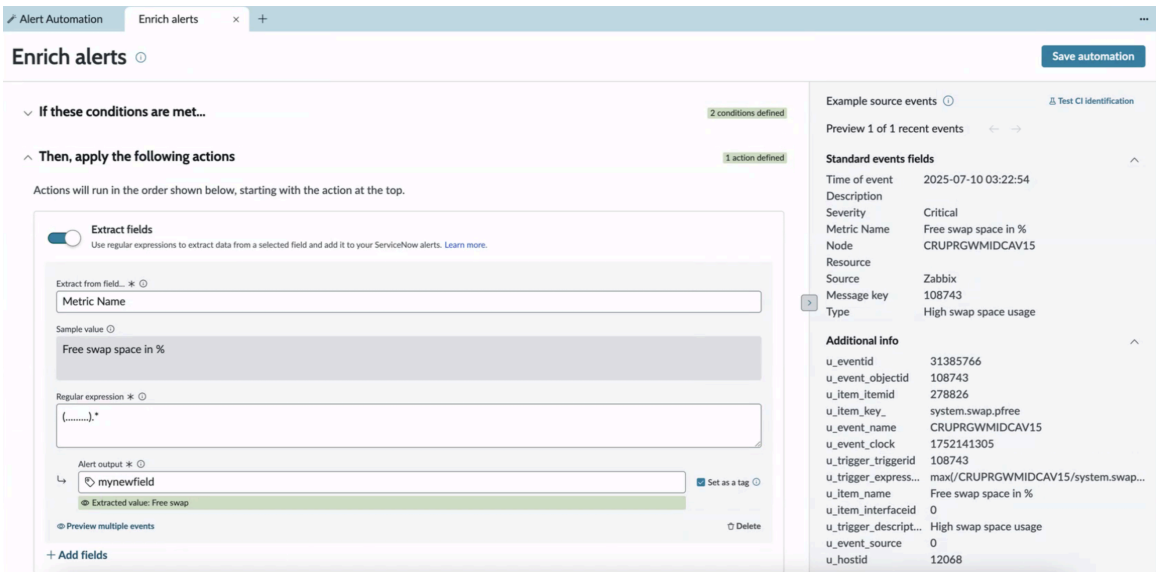
Extracting alert fields

Alert notifications often contain relevant context buried within event payloads. By enriching alert outputs with values from the existing payload, you can better understand the significance of alerts and determine the appropriate steps for resolution. For example, a host name typically includes crucial information such as service, node, cluster, datacenter, and domain. To automatically add the value for a cluster tag based on incoming host data, you can extract just the cluster data.

When extracting alert fields, use regular expressions (regex) to build value formulas. Regex allows you to precisely identify and capture the relevant portions of the payload, enabling the creation of meaningful and actionable alert notifications.

Note: You can compose text using regular expression (regex) format conventions. Use one or more capture groups with parentheses to extract parts of the input. Capture groups in the regular expression are assigned to alert outputs based on the order in which they appear. The regex must match the entire input, so consider surrounding your regex with `.*` on each end. For example, `(\w+).acme.com.*` captures the host name in a fully qualified domain name. The parser for the regex engine is Perl Compatible Regular Expressions (PCRE) compatible.

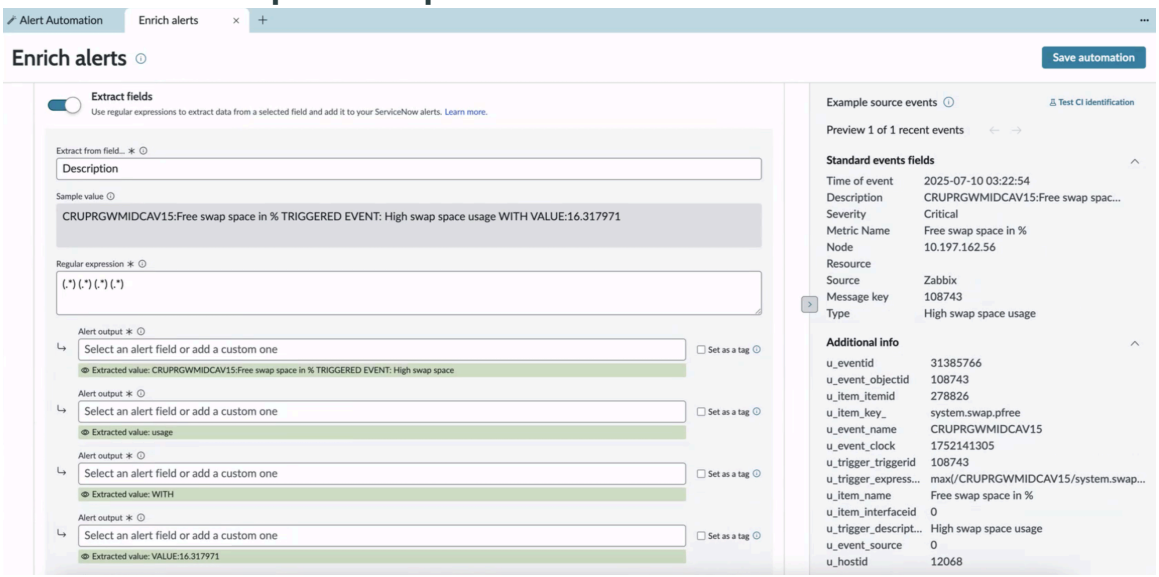
Extract alert fields



If you use multiple capture groups with parentheses, each extracted value appears in a separate output field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extract field for multiple alert outputs



Preview the alert output across example events to verify that the values are extracted as expected by selecting **Preview multiple events**.

Note: This option is available only when example source events are available and matched with the regex filter.

Example: Extracting alert fields

Suppose you need to extract only six letters from a specific field of an event and display them in a new alert field named `mynewfield`. You also want to tag this new alert field for later use in alert grouping. Here's how you can achieve this:

- **Source input field**: Select the event field from which you want to extract data. In this case, the field is **Metric Name**.
- **Regular expression**: Use a regular expression to extract the specific part you need from the selected field's value. For example, if the **Metric Name** field value contains "Free swap space in %" and you want to extract "Free swap", your regular expression must be (.....).*.
- **Alert output**:
  - Choose an existing alert field, an existing alert tag, or manually enter a new field name. In this case, let's enter a new field name `mynewfield`.
  - Set `mynewfield` as a tag for later use in tag-based grouping. Notice the tag displayed before the field name.

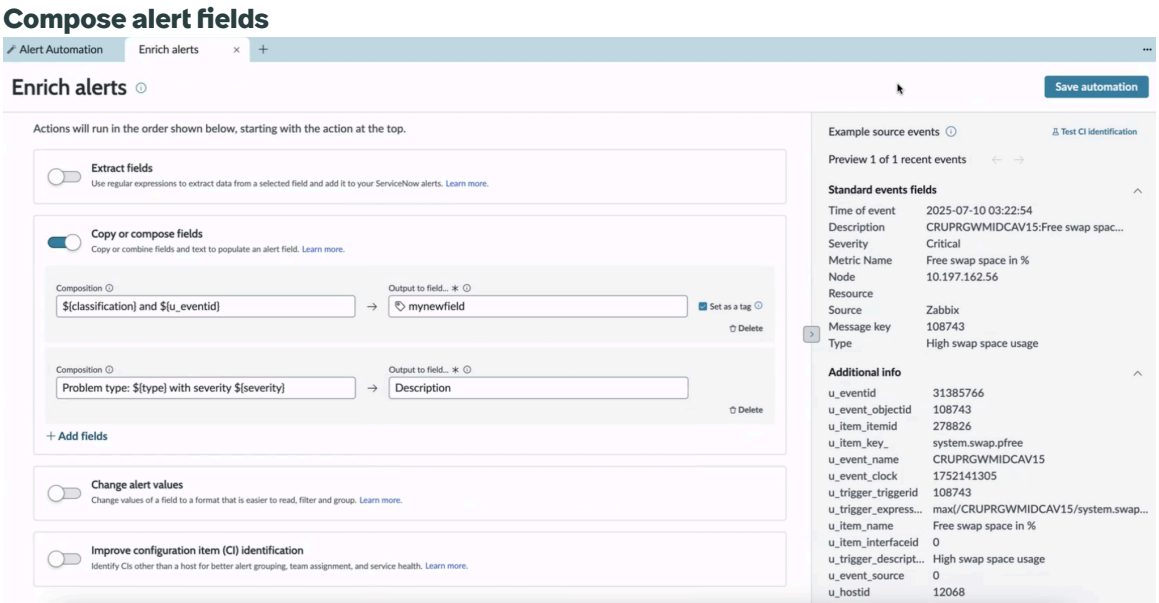
  After applying the regular expression to the selected field's value (in this case the **Metric Name** field value), verify the extracted word displayed below the **Alert output** field. For instance, it should show "Free swap" if the regular expression matches correctly.

- **Preview multiple events**: Previewing multiple events allows you to verify if the regular expression accurately extracts data from a range of example events. This helps determine if any adjustments to the regular expression are needed.

Composing alert fields

When creating an alert output, you can select or manually enter fields, tags, or free text to include. This data can be easily read, filtered, and grouped for better management and understanding of the alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Example: Composing alert fields

Suppose you want to have two input fields that compose data and display it in two different alert output field. In one scenario, you want the source value to come from an existing alert field along with a new field, showing the composed value in a new alert output field. You also plan to tag the new alert output field for later use in tag-based grouping. In the other scenario, you combine existing fields with free text and select the alert output to display in an existing alert field. Here's how you can achieve this:

- Scenario 1:
  1. **Source input field**: Select an existing alert field and add the text "and", followed by entering another field **u_eventid**. For example: ${classification} and ${u_eventid}.

     Note that alert fields are displayed in the `${field}` syntax format. You can also select the field name from the drop-down list, and the syntax will be added automatically.

  2. **Alert output**: Enter the name of the new alert field where you want to display the values from the input fields. For example, let's name it `mynewfield`.

     Set `mynewfield` as a tag for later use in tag-based grouping. Notice the tag displayed before the field name.

- Scenario 2:
  1. **Source input field**: Select existing alert fields and include any desired free text for how you want them to appear in the alert output field. For example: Problem type: ${type} with severity ${severity}.

     Alert fields are displayed in the `${field}` syntax format. You can also select the field name from the drop-down box, and the syntax will be added automatically.

  2. **Alert output**: Select an existing alert field where you want to display the values from the input fields. For instance, select **Description**.

Set additional info fields to match CI attribute format

Set additional info fields in alerts to match the field and value format of CI attributes in CI records. This ensures accurate alert-to-CI binding, improving alert tracking and reducing manual effort.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Ensure that you are on the Enrich Alerts page and the **Improve configuration item (CI) identification** toggle switch is enabled.

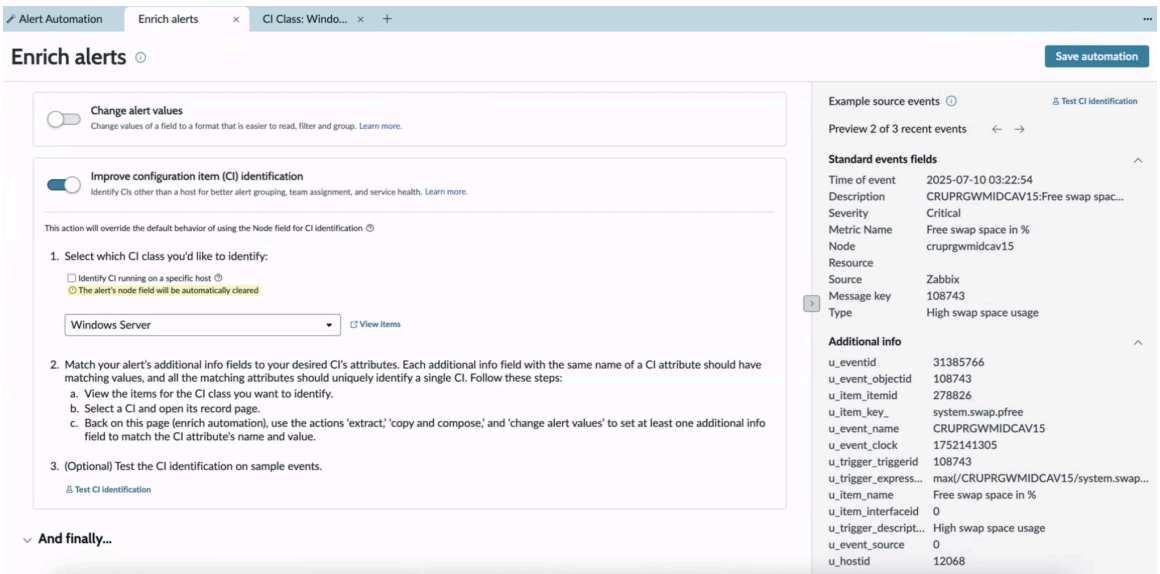
Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

About this task

The system attempts to match the **Additional Info** fields of the alert with attributes in the CI table. If exactly one matching CI is found, the alert is linked to that CI. For CI identification to be successful, add new fields or ensure that your alert has additional info fields corresponding to column name for CI attributes. For example, use column name **ip_address** instead of the column label **IP Address**. Each matching key name must have matching values. If there are matching fields in your alert that you don't wish to use for binding, copy them to another field then clear the original field.

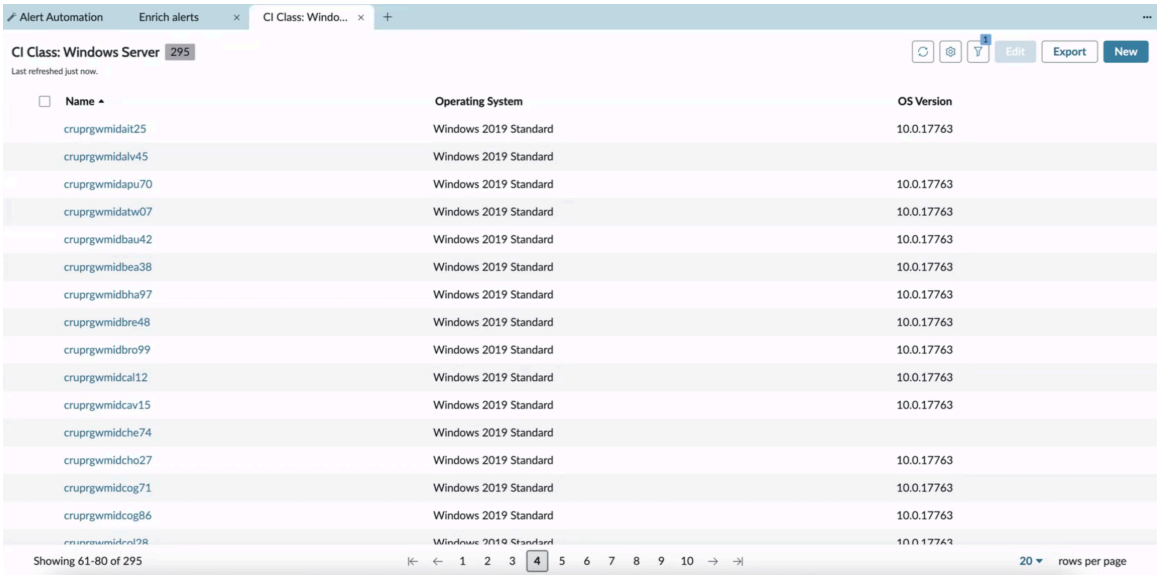
Procedure

1. Under **Improve configuration item (CI) identification**, in the **Select which CI class you'd like to identify** field, select the CI class.



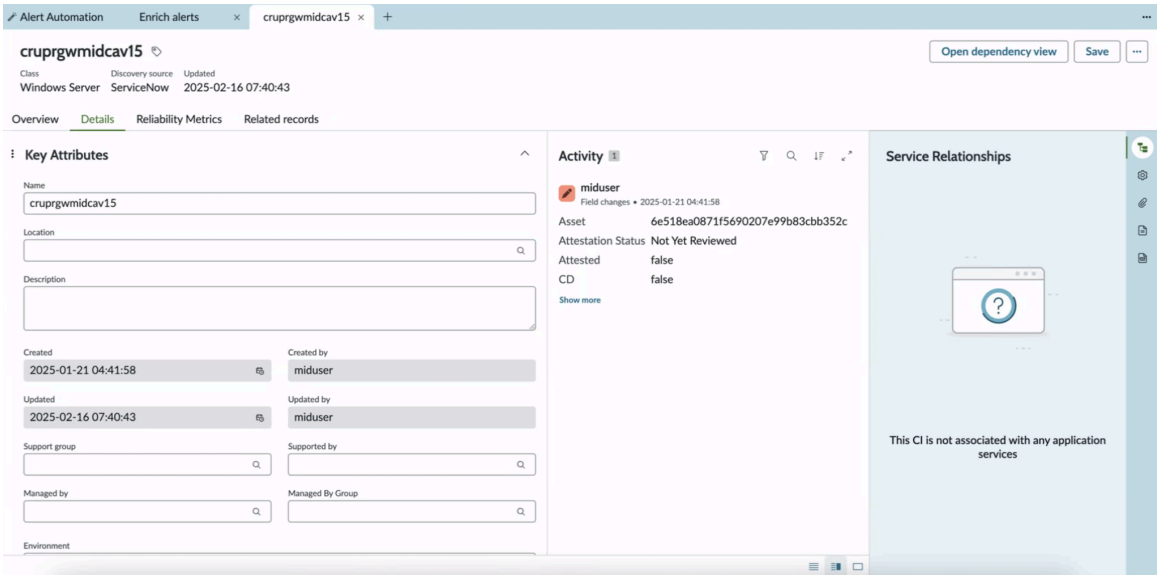
2. Select **View items** next to the **Select which CI class you'd like to identify** field to open the list of CIs of the selected CI class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select a CI name to open its details or record page.

At least one field and its corresponding value from the CI details page must appear in the **Additional info** field of the alert.

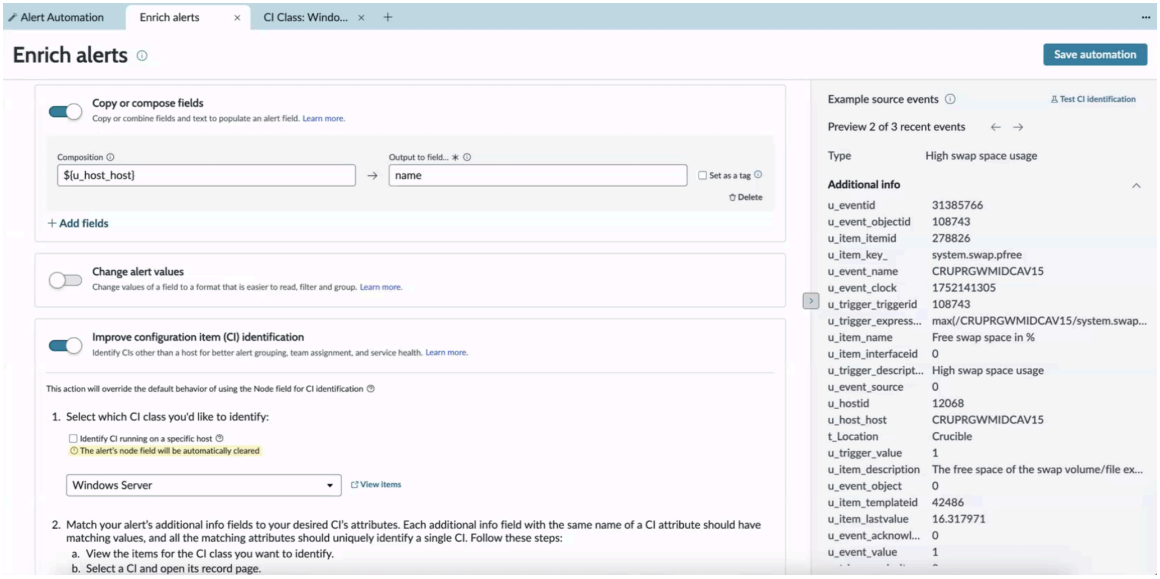


4. In the Enrich Alerts page, use **Extract fields**, **Copy or Compose fields**, and **Change alert values** to set at least one **Additional info** field in your alert to precisely match the field and value format of the CI attributes in the CI record.

Example: Suppose the CI record page has the **name** field with the value **CRUPRGWMIDCAV15**. To include these fields and their values in the **Additional info** field of the alert, set the fields as shown in the image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Map the `${u_host_host}` field to a new field called **name**. This field is added to the **Additional info** and is used for CI identification during the binding stage.



Create Group automation

Grouping automation helps you manage alerts more effectively by collecting similar alerts together. This makes it easier to see patterns, quickly identify issues, and respond efficiently. By organizing alerts in this way, you can reduce alert noise, identify root causes, and assign them to the appropriate teams.

Before you begin

Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

About this task

Grouping of this method is most useful when alerts share common data or tags, such as a node or location. You can use fields or tags populated via an enrich automation. It's the best way to group alerts when your CMDB or service maps are immature. This complements our other grouping algorithms, including alert correlation rules, CMDB, ML, and text-based grouping. Alerts are grouped with their first match, and you can control the priority order of these algorithms via system property. For information on correlation logic order, see Configure alert correlation logic order.

Alert automation also provides a simulation feature allowing you to test how many alert groups would be formed, how many are left ungrouped, and the compression rate. A higher compression rate means your team will be more productive and may be able to identify root causes faster. However, consider whether the groups are accurate, operationally correct, and assigned to the right teams. You may adjust the group criteria until you are satisfied with the resulting groups.

For users familiar with the classic Event Management experience, this feature offers an easier interface with improved team support for creating tag-based alert clustering definitions.

Procedure

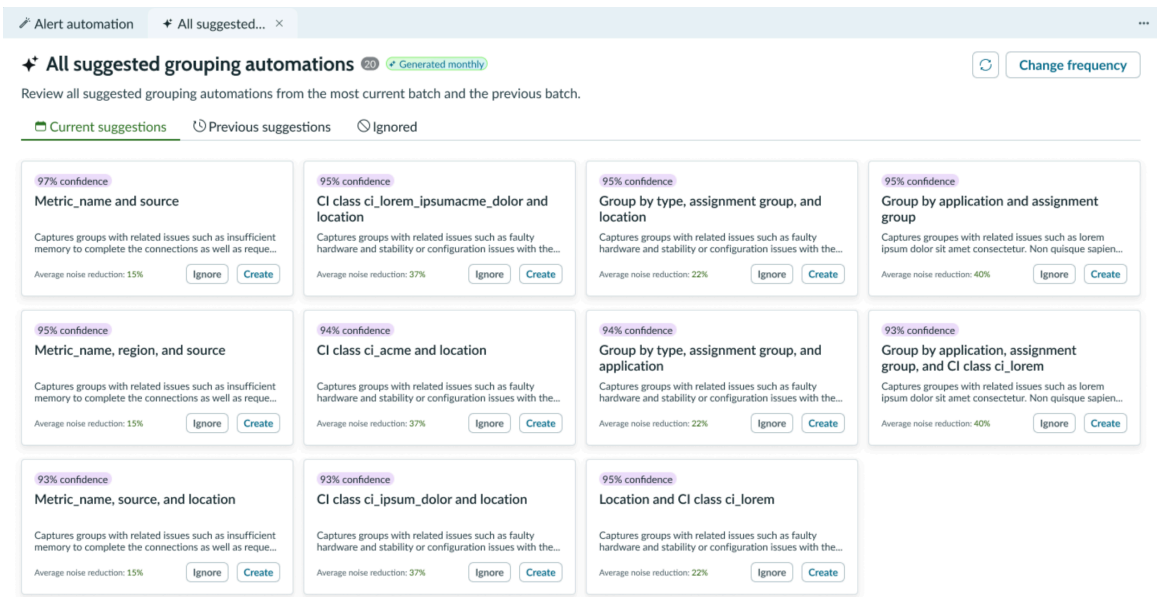
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the ITOM AIOps configuration center page, under the Optimize section, select **Group alerts**

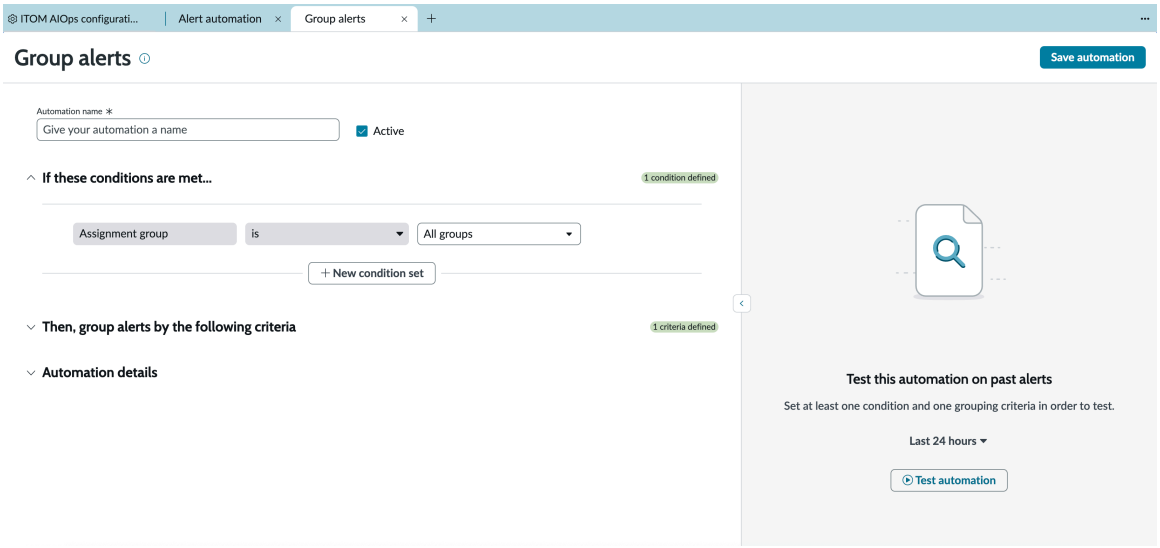
   The Group Alerts page appears. In the Suggested Grouping Automations section, review the suggested automations. If you want to proceed with one, select **Create** on the corresponding automation tile.

   If you want to see all suggested automations—including previously suggested and ignored ones—select **View all** in the Suggested Grouping Automations section.



4. Select **Create automation**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. In the **Automation name** field, enter the name of the automation for grouping alerts. By default, the **Active** check box is selected.
6. In the **If these conditions are met** section, set up filter criteria to identify the alerts that you want to group.

   a. From the **Assignment group** field menu, select the assignment group to determine which team's alerts will trigger the automation.

      The **Assignment group** represents a specific team responsible for handling certain alerts. By selecting an assignment group, you ensure that only the alerts assigned to that particular team will trigger the automation. This way, the automation is targeted and only activates for relevant alerts associated with the selected team.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- If you're logged in to the instance with an administrator role (evt_mgmt_admin), all of the assignment groups are available. Additionally, you can select **All groups** to enable generating alerts for any of the available groups.
- If you're an operator, only the group you're a part of is available.
- Only members of the selected group or administrators can update or delete the automation.

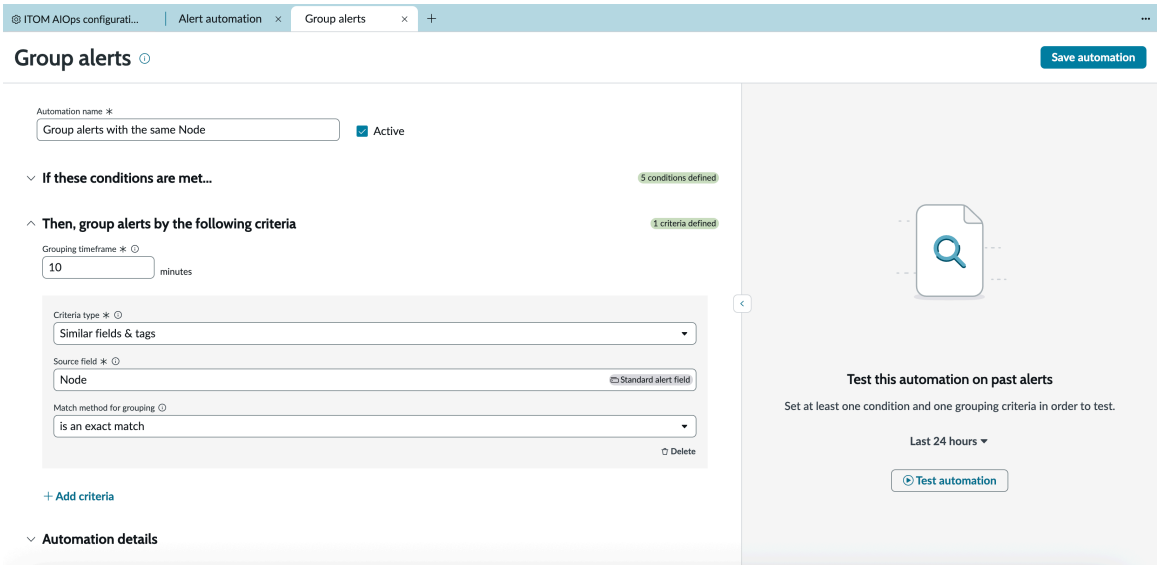
b. Set up the conditions by selecting the field, operator, and field value. Then, add more conditions using OR or AND operators. You must add at least one more filter besides the assignment group.

Tip: Select a more specific filter to enhance performance.

To add another set of conditions, select **+ New condition set**. You can also manually add an additional info field if you don't see it in the drop-down list.

Note: Select **Load past events** to view previous events when creating the automation.

7. In the **Then, group alerts by the following criteria** section, perform the following steps.



a. In the **Grouping timeframe** field, specify the duration (in minutes) when alerts must be collected and grouped together.

b. In the **Criteria type** menu, select how you want to group the alerts.

Currently, there are two options:

- **Similar fields & tags**: Group alerts based on similar fields and tags.
- **Related CIs**: Group alerts based on CI (Configuration Item) relationships—child, parent, or sibling—along with containment and applicative flows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Impacted service instances**: Groups alerts affecting the same service instances. You can choose either **All Service Instances** or a **Specific Service Instance**. For **Specific Service Instance**, use the **Service Instance** field to select the services you want.
- **Related logs properties**: Groups alerts generated from logs using the Health Log Analytics grouping algorithm. The **Related logs properties** option appears only when you install the Health Log Analytics plugin.

c. In the **Source field** menu, select the source from which you want the alerts to be grouped.

> **Note:** You can manually add a field name and select the type of the field. The available options include additional info field, alert tag, and CI tag. This flexibility allows you to customize the information being captured according to your specific needs.

d. In the **Match method for grouping** field, select one of the following options: group alerts based on an exact match, fuzzy match, or pattern match.

When you select a value for the fuzzy match method in the grouping field, the **Similarity threshold (percentage)** field becomes visible. Alerts are grouped when their similarity is greater than or equal to the specified percentage based on edit distance.

For example, if you have alerts from USA, CA, and USA, NY, and you want to group the alerts by country, you would set the **Source** field to USA. If the **Match Method for Grouping** is a fuzzy match and the **Similarity threshold (percentage)** is 50%, then alerts will be grouped if they are at least 50% similar, meaning they share the country "USA" as a common attribute.

e. When you select a value for the pattern match method in the grouping field, the **Pattern matching** field becomes visible. Alerts are grouped when the specified pattern matches. For more information, see Pattern matching.

Use asterisks (*) in the search string to match any number of characters or a question mark (?) to match any single character. Everything else in the search string matches itself. For example, use "HTTP Error 5??" to match all HTTP 500 errors.

To include additional fields for grouping, select **+ Add criteria**.

8. In the **Advanced options** section, you have two toggle options.

- **Set the minimum number of alerts to form a group**: Defines the least number of alerts required to create a group.

  Example: During a flash sale, you may want to group alerts only if at least 5 similar errors occur to avoid noise from single occurrences.

- **Form group only if at least one alert meets specific conditions you define**: When enabled, the system groups alerts only if at least one alert satisfies your defined criteria that you have mentioned in the **Then, group alerts by the following criteria** section.

  Example: Useful for critical services where you want to group alerts only if a high-severity alert is present, ignoring low-priority alerts.

  When this option is enabled, additional fields appear:

  - **Select field**: The alert property to check, e.g., Severity, Host Name, Service Name, Metric Value, Region, or Status.
  - **Select operator**: The comparison logic for the selected field, e.g., is, is not, contains, starts with, greater than, less than.
  - **Enter value**: The specific data the alert's field must match or be compared against, e.g., Critical, prod-web-01, US-East-1, or 100.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Operators:
  - **or**: Combines multiple conditions; the result is true if at least one condition is true.
  - **and**: Combines multiple conditions; all conditions must be true for the result to be true.
- **Add condition set**: Adds a new, independent set of conditions.

9. In the **Automation details** section, provide an order and automation description.

   a. In the **Order** field, enter the automation order.

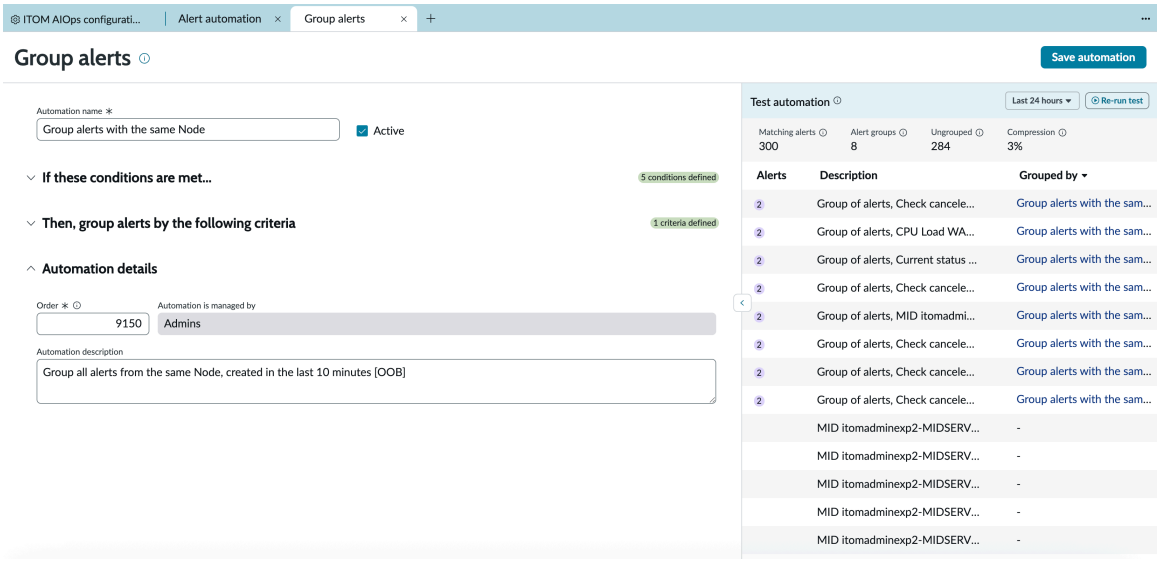
   Note: Alerts are grouped based on the first match, executed in order from the lowest to the highest number. The **Automation is managed by** field displays the team or assignment group who owns, edits, and can delete this automation. The assignment group is the same as the one defined in the **If these conditions are met** section.

   b. In the **Automation description** field, enter a brief description of the automation.

10. To test if the alert grouping is working correctly, navigate to **Test this automation on past alerts**, select the timeframe for the simulation from the drop-down list and then select **Test automation**.

    You can also modify any alert grouping conditions or field values and initiate the process again by selecting **Re-run test**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The header of the Test Automation section also displays the following: matching alerts, alert groups, ungrouped alerts, and compression.

- **Matching alerts**: The total number of matching alerts before grouping that match the conditions defined for this automation.
- **Alert groups**: The number of groups containing more than one alerts matching the automation conditions. The smaller number in parentheses represents the number of groups created by this automation.
- **Ungrouped**: The number of alerts matching the automation conditions that remain ungrouped.
- **Compression**: The percentage reduction in the number of total alerts achieved by grouping, calculated as 1 - (Alert groups + Ungrouped) / Total alerts. You can improve the compression rate by grouping your alerts into related problems. The smaller number in parentheses indicates the percentage of matching alerts compressed by this automation.
- When the criteria type is **Related CIs**:
  - The **Open CIs dependency map** link appears in the Test Automation section.
  - The **Configuration Item** field is displayed.

The Test Automation section displays key columns: **Alerts**, **Description**, **Grouped by**, **Node**, and **Time**. The **Description** column outlines the alert group details. Preceding the **Description** column, a number indicates the total alerts contained within that group. **Grouped by** specifies the category of grouping, such as **Group alerts with the same Node** and **CMDB**. You can sort the **Grouped by** column which is by default in the descending order. The value for other automation group displays the name of the corresponding automation group and includes a link to it. For a single alert, the value is displayed as **–**. The **Time** column shows when the test was conducted.

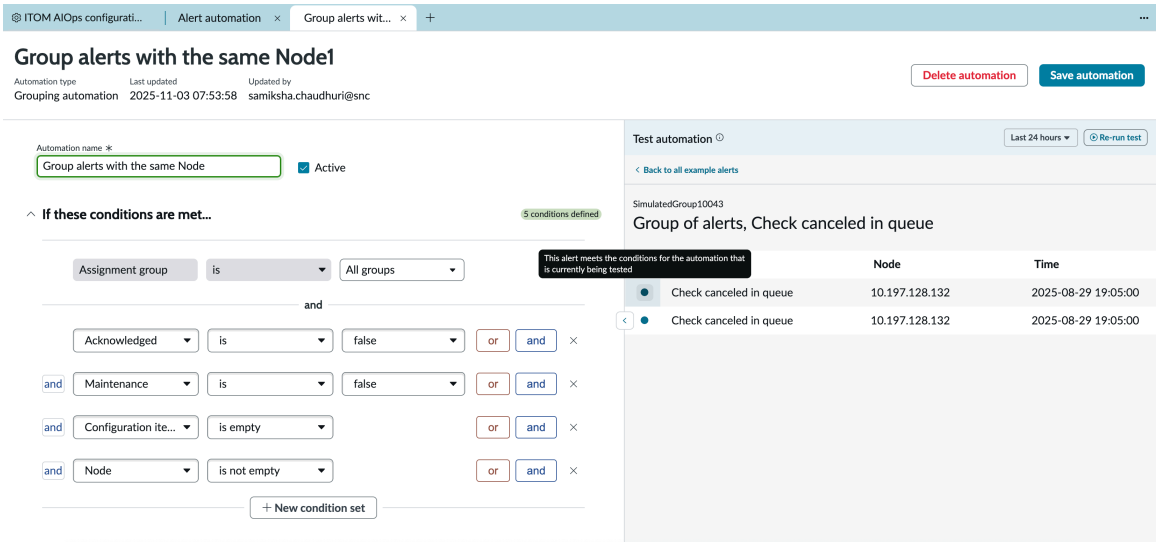
Important: You can run the simulation of alerts on your test as well as production instance. The test automation simulates the automation using up to 200 recent alerts that match the specified conditions. It only considers groups where all alerts meet the conditions for this automation, although additional grouping algorithms may be applied during actual runtime.

11. Select **Save automation**.

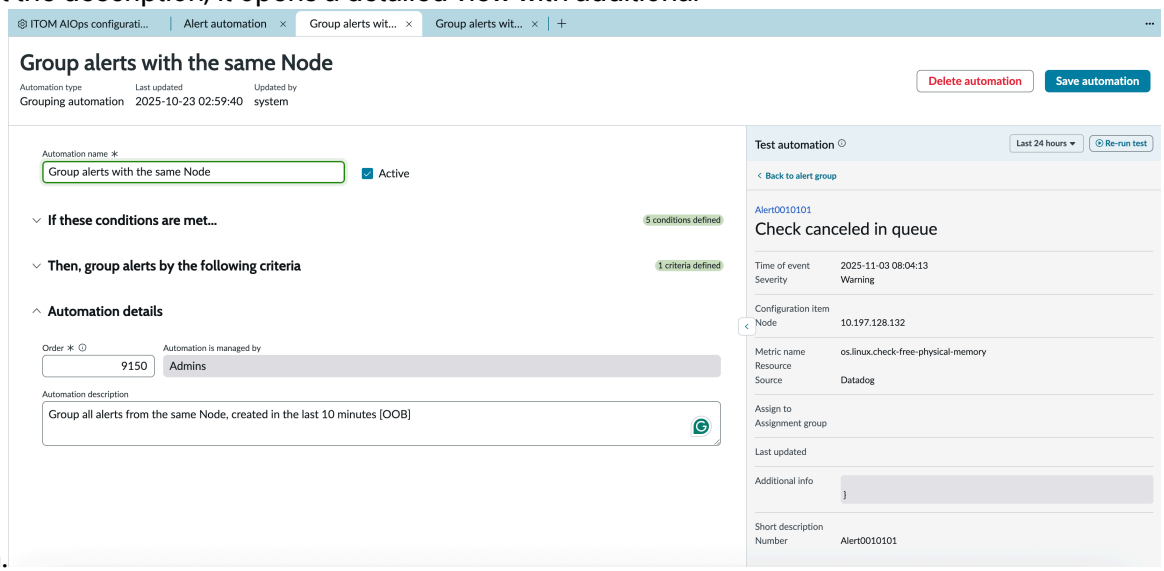
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A notification appears when the automation is successfully saved. Otherwise, an error message is displayed. The group automation that you created appears on the Group alerts page where you can view, edit, or delete the existing automation.

Note: After you save the automation, when you select an automation result and hover over the green dot next to an alert, a tooltip appears explaining its meaning.



If you select the description, it opens a detailed view with additional information.



What to do next

You can escalate alerts needing quicker responses from teams or individuals by implementing Create Respond automation.

Create Respond automation

Respond to alerts automatically by notifying appropriate stakeholders, escalating them as needed based on severity and type, or other executing response actions. This process ensures that alerts are managed promptly and effectively.

Before you begin

Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

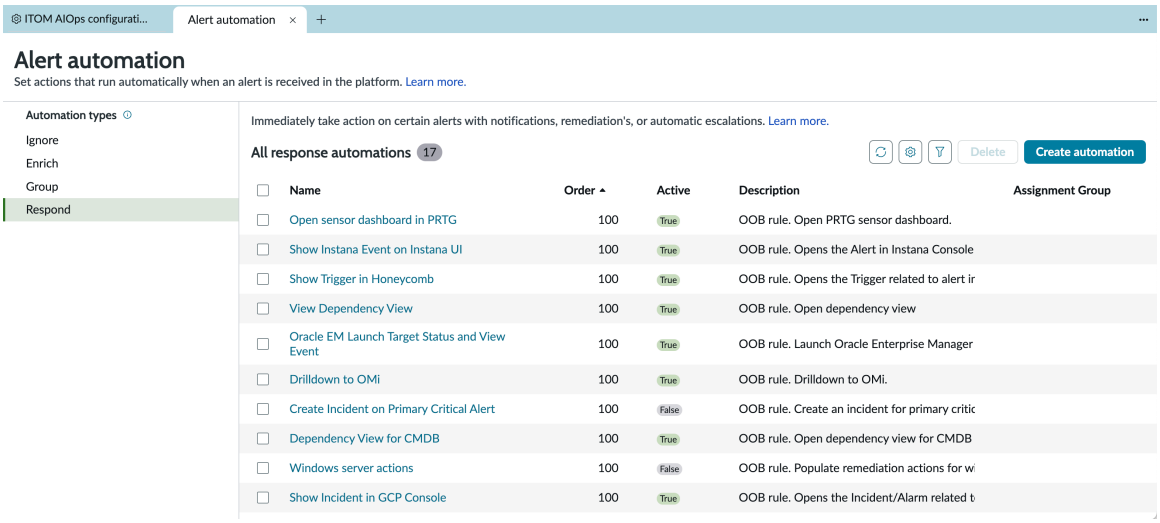
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

For users familiar with the classic Event Management experience, this provides an easy interface with enhanced team support for creating response automations or alert management rules. Alert management rules or response automations are configurable automated actions triggered in response to alerts which match specific conditions, helping IT teams resolve issues faster and with minimal manual effort. These advanced features are currently only available to administrators and other personas mentioned in the role required section.

Procedure

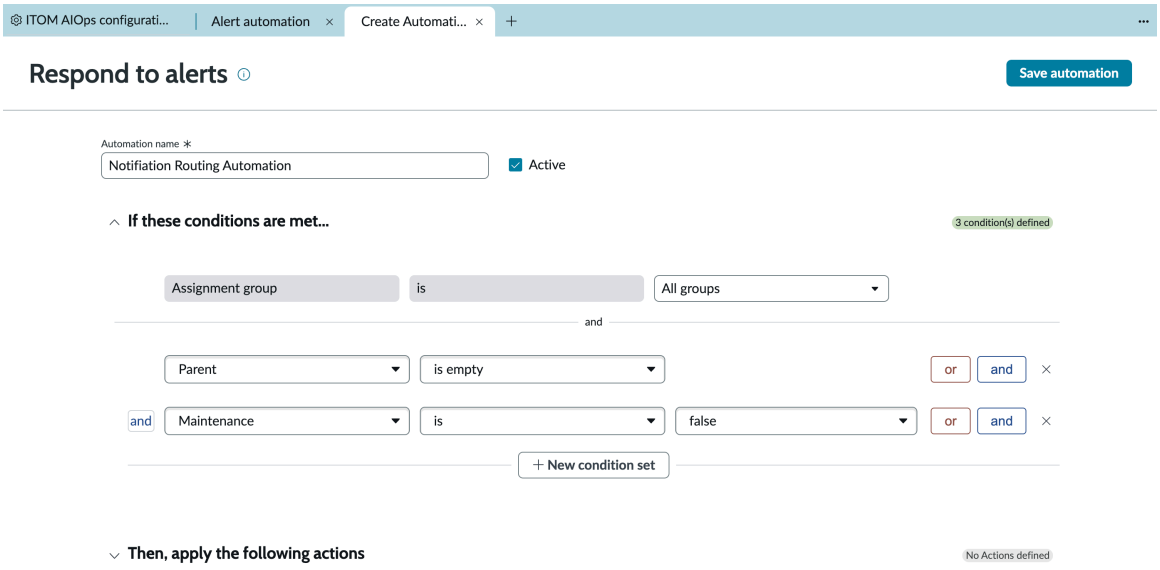
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the Optimize section, select **Respond alerts**.
4. Select **Create automation**.
   The Respond page appears.



5. In the **Automation name** field, enter the name of the automation.
   By default, the **Active** check box is selected.
6. In the **If these conditions are met** section, create filter criteria to identify the alerts you want to capture.

> **Important:** You can limit respond automations to primary alerts to prevent secondary alerts from being overwhelmed by unnecessary noise. Ensure these automations are applied only to alerts associated with CIs that are not currently undergoing maintenance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



a. From the **Assignment group** field menu, select the assignment group to determine which team's alerts will trigger the automation.

The **Assignment group** represents a specific team responsible for handling certain alerts. By selecting an assignment group, you ensure that only the alerts assigned to that particular team will trigger the automation. This way, the automation is targeted and only activates for relevant alerts associated with the selected team.

Note:

- If you're logged in to the instance with an administrator role (evt_mgmt_admin), all of the assignment groups are available. Additionally, you can select **All groups** to enable generating alerts for any of the available groups.
- If you're an operator, only the group you're a part of is available.
- Only members of the selected group or administrators can update or delete the automation.

b. For the **Parent** field value, select whether the alert for which you want a response is grouped under a parent alert.

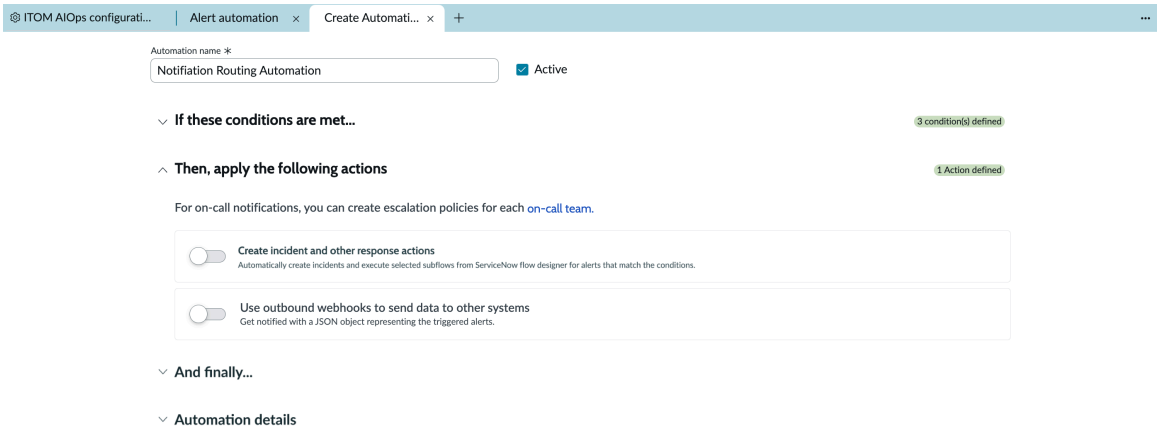
c. For the **Maintenance** field value, select whether the alert for which you want a response is under maintenance.

d. To add another set of conditions, select **+ New condition set**. You can also manually add an additional info field if you don't see it in the drop-down list.

Set up the conditions by selecting the field, operator, and field value. Then, add more conditions using OR or AND operators.

7. In the **Then, apply the following actions** section, select one or more of the two automation actions that can be triggered by the automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Action	Description
Create incident and other response actions	Creates an incident for the alerts that match the specified filter. For details on mapping the alert fields to the incident fields, see Alert field mapping on the Respond page. **Note:** If you want incident fields to be automatically populated with default values, consider using **Create Incident (advanced)** in the **Response subflows** field. **Create Incident (advanced)** pre-populates incident fields even when you don't explicitly customize them, which helps ensure consistent incident data and reduces configuration effort. The **Create incident and other response ac tions** option also executes selected subflows from Workflow Studio for alerts that match the specified condition. For example, you may select out-of-the-box subflows to restart ser vices. You can also create your own custom subflows, leveraging hundreds of integrations available in Integration Hub.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
	a. In the **Response subflow** field, select the subflow. Selecting the Information icon ( ) takes you to the workflow of the subflow. For example, if you select the Information icon ( ) next to Close Alert, the Close Alert workflow opens. **Close Alerts workflow**  **b.** In the **How should the subflow execute?** field, select **Automatically**, **Manually** or **Automatically and Manually**. **Note:** If you select a subflow with an execution type of **Manually** or **Automatically and Manually**, and then save the automation, it appears in the Express List.  **c.** In the **Execution limit** field, specify the maximum number of times the subflow can run. After reaching the limit, the subflow will not execute again. **d.** In the **Response subflow** field, when you select **Create Incident (advanced)**, two check boxes appear. ▪ **Customize incident fields** ▪ **Add wait time**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
	When you select the **Customize incident fields** check box, a mapping section ap pears with the following fields: ▪ **Alert input value**: Generates the value us ing Now Assist or takes it from the alert. ▪ **Incident field name**: Maps the selected alert value to the specified incident field. **Note:** At least one field mapping is required when you select the **Cus tomize incident fields** check box. **Cre ate Incident (advanced)** automatical ly fills incident fields with default val ues, even if you don't customize them. **e.** Select the **Add wait time** check box to de lay incident creation and allow alerts time to auto-resolve or downgrade. You can define conditions that are eval uated after the wait period to determine whether an incident still needs to be cre ated. This helps prevent unnecessary inci dents for alerts that resolve on their own or reduce in severity. To add another response action, select **+ Add response action**.
Use outbound webhooks to send data to oth er systems	Sends notifications to other systems using outbound webhooks. For example, this capa bility can be used to send a chat notification, create a case, or trigger an external runbook to remediate the issue. For details on configuring an outbound web hook, see Outbound webhook parameters. To create an additional property, select **+ Add property**. The property can be any custom key-value pair that you want to include in the webhook payload, such as "Content-Type: ap plication/json" or "Authorization: Bearer <to ken>".

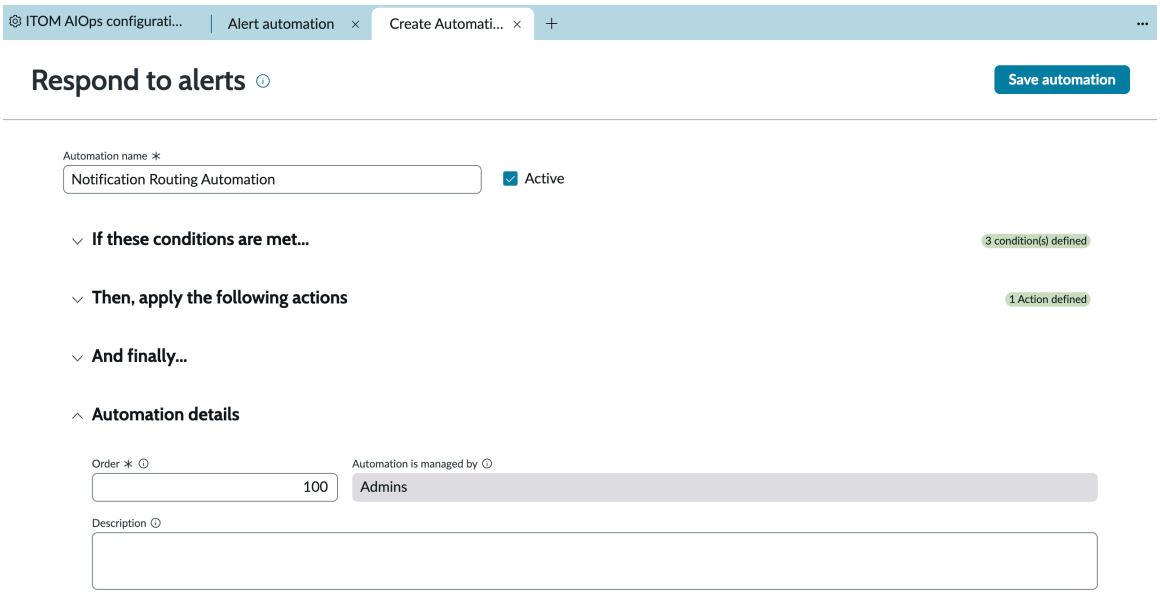
Note: If you don't select at least one action, the automation is deactivated.

8. In the **And finally** section, to continue running other response automations with same filter conditions after this automation is executed, select **Run other response automations**. If you select **Don't run response automations**, additional automations of this type will stop running after this automation is executed once. If the automation is managed by an

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

administrator, it will stop running administrator-owned automations but will continue to run automations owned by other assignment groups.

9. In the **Automation details** section, provide an order and automation description.



For information on the Automation details fields, see #unique_2535.

10. Select **Save automation**.

A notification appears when the automation is successfully saved. Otherwise, an error message is displayed.

The response automation that you created appears on the All response automations page where you can view, edit, or delete the existing automations.

Delete an automation

Delete an automation to permanently remove an automated alert handling rule from your system.

Before you begin

Role required: evt_mgmt_admin, evt_team_operator, or srm_responder

Procedure

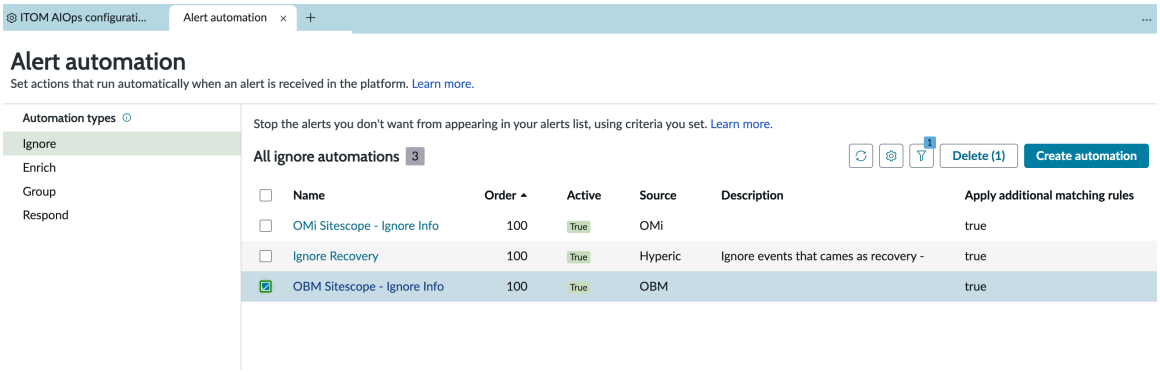
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon .
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps Configuration Center page, under the Optimize section, select the automation, such as Enrich alerts or Group alerts, from which you want to delete an automation.

   The page for that automation type opens, showing a list of all existing automations.
4. On the Alert Automation page, under Automation types, select the automation type that you want to delete, such as Ignore, Enrich, Group, or Respond.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The page for that automation type opens, displaying all the existing automations.

5. Select the check box next to the automation you want to delete, and then select **Delete**.



6. In the confirmation window, select **Delete**.
The alert is permanently deleted.

AIOps Dashboards in Service Operations Workspace for ITOM

The AIOps dashboards offer comprehensive visualizations of critical operational data. You can monitor key performance indicators (KPIs), track service health, and gain valuable context on the overall IT environment. These dashboards provide actionable insights that facilitate proactive responses to potential issues.

Access to dashboards

You can access ITOM AIOps configuration center by navigating to **Workspaces** > **Service Operations Workspace** and then selecting the ITOM AIOps configuration center icon ( ) that is available at the bottom of the left navigation pane.

The ITOM AIOps configuration center page appears. On the ITOM AIOps configuration center page, under the **Optimize** > **Dashboards** section, select the dashboard.

Note: The ITOM AIops configuration center is accessible only to evt_mgmt_admin.

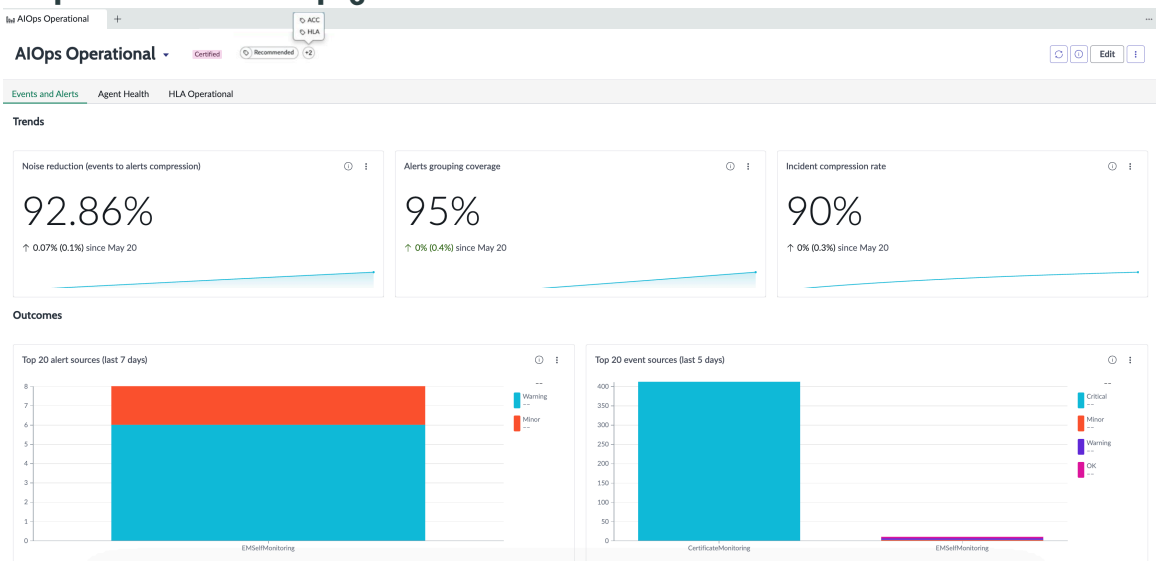
Key benefits of using the AIOps dashboards:

- Configure the dashboards to focus on the metrics and data most relevant to your role.
- Enjoy interactive visual representations of critical operational data.
- Monitor KPIs, service health metrics, and other important performance data at a glance.
- Leverage actionable insights derived from data analysis for better decision-making.

Note: Opening a set of dashboards shows the most recently accessed dashboard in that category.

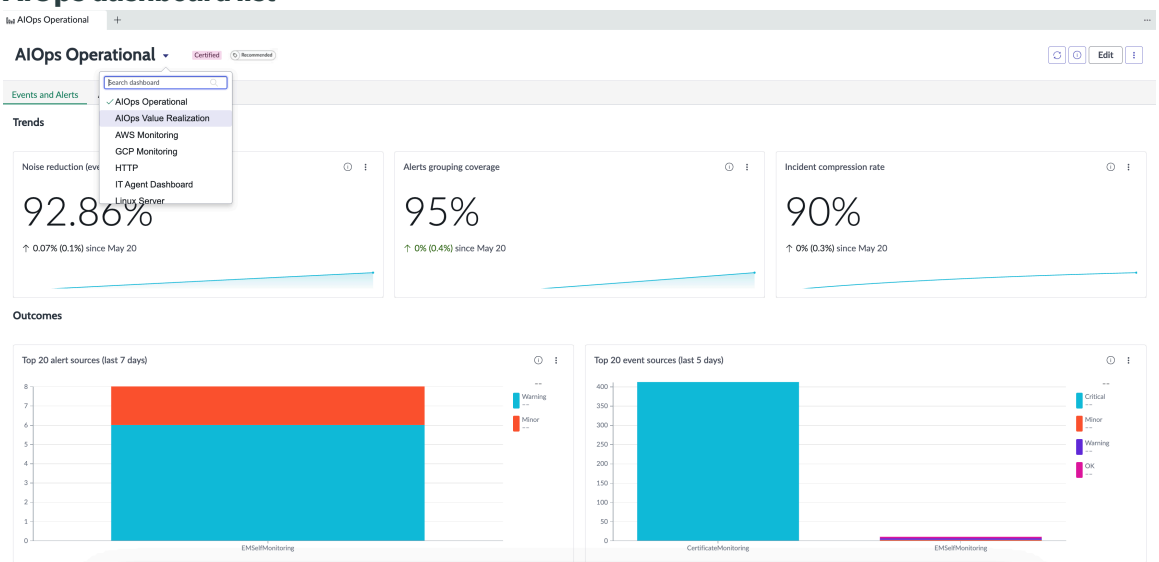
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AIOps Dashboard home page



To view AIOps Operational dashboards, such as AIOps Value Realization, select the AIOps Operational list and then select the dashboard name.

AIOps dashboard list



AIOps 360 overview dashboard

The AIOps 360 Overview dashboard offers a unified view of value and performance across IT operations, helping teams track efficiency, monitor alert handling, and assess automation outcomes. It enhances visibility into AIOps impact, supports informed decisions, and drives faster, smarter operations.

Prerequisites

Ensure that the Event Management application is installed.

Required ServiceNow AI Platform roles

- evt_mgmt_admin
- evt_mgmt_operator

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Breakdowns

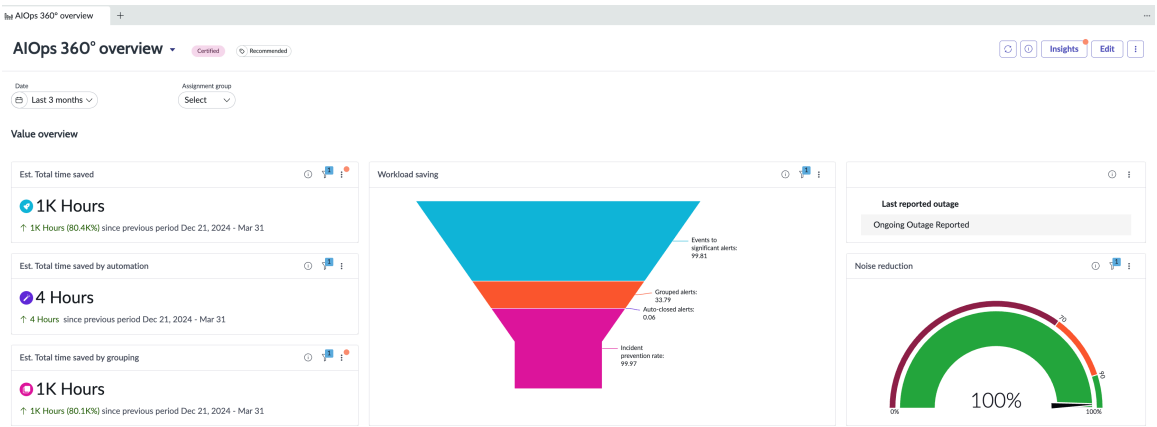
Breakdowns available in the AIOps 360 overview dashboard are:

- Value overview
- Performance overview

Value overview section

Use filters such as **Date** and **Assignment Group** to customize the dashboard view and focus on specific time periods and teams. This helps you pinpoint trends, identify areas for improvement, and make data-driven decisions tailored to your operational needs.

The Value overview section highlights the overall impact of AIOps on operational efficiency. It showcases how much manual effort has been reduced through automation and intelligent alert grouping. It also reflects noise reduction levels, outage history, and overall workload savings—giving a clear picture of time and cost benefits realized.



Metrics	Description
Est. Total time saved	Sum of time saved through alert automation and alert grouping, calculated in hours.
Est. Total time saved by automation	Time saved based on the number of alert automation rules executed multiplied by the mean resolution time per alert, calculated in hours. The mean resolution time can be adjusted by administrators in **All** > **System Properties** > **All Properties**. Use the *sn_aiops_dashboard.ITOM.Dashboard.Avg_time_* property to get the actual time saved by automation, in minutes, as used by the Automation Time Saved indicator. By default, it's set to 5 minutes.
Est. Total time saved by grouping	Time saved based on the number of alerts grouped versus the time required to triage each alert individually, calculated in hours.

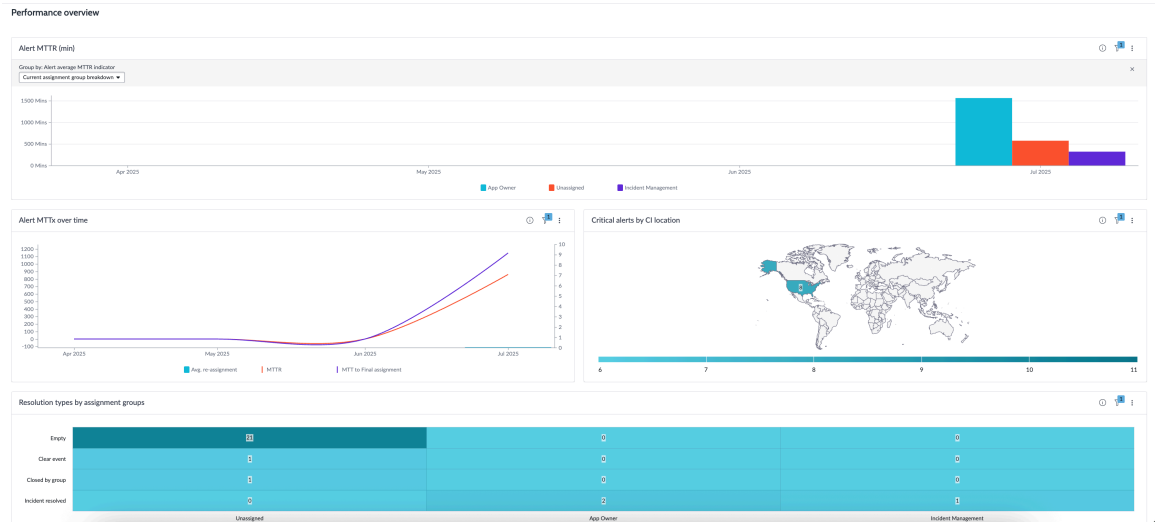
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metrics	Description
	The mean resolution time can be adjusted by administrators in **All** > **System Properties** > **All Properties**. Use the *sn_aiops_dashboard.ITOM.Dashboard.MTTR_for_* property to define the MTTR (in minutes) used in the alert grouping time saved calculation. By default, it's set to 5 minutes.
Workload saving	Measures the reduction in manual effort by filtering, grouping, automating alert closures, and preventing incident escalations. • Events to significant alerts: Percentage of events that were filtered out and did not convert into alerts, reduced through AIOps settings like ignore automations. • Grouped alerts: Percentage reduction in the number of stand-alone alerts due to grouping rules defined in alert grouping automations. • Auto-closed alerts: Percentage of alerts automatically closed by Respond automation, Clear event actions, or closed as part of alert group resolution. • Incident prevention rate: Percentage of alerts resolved successfully without needing escalation to incidents.
Last reported outage	Most recent date of a major outage (e.g., CMDB) affecting a service or server, based on reported outages on all classes inherited from cmdb_ci_service or cmdb_ci_server.
Noise reduction	Percentage effectiveness in ignoring duplicate and meaningless events. Typical customer value exceeds 90%.

Performance Overview section

This section focuses on how effectively alerts and incidents are being handled. It includes metrics like resolution times across groups, trends in detection and response, automation usage, and the distribution of resolution ownership. It helps identify performance gaps, track improvements, and optimize response strategies across the organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Metrics	Description
Alert MTTR	Alert resolution time by assignment group to identify slower-responding teams and enforce SLAs. Can also be grouped by severity using the grouping drop-down menu.
Alert MTTx over time	MTTR (mean time to resolve), MTTA (mean time to final group assignment), and average group reassignment count tracked over time. Indicates assignment efficiency and the ability to resolve alerts within a single group.
Critical alert by CI location	Critical alerts on a geographic map based on the physical or logical location of Configuration Items (CIs). Helps identify recurring hotspots for retrospective analysis and to spot regional trends.
Resolution types by assignment groups	Closure reasons by top assignment groups, highlighting automation closures (within 10 minutes of execution) to encourage quick resolution, and time threshold closures (after the auto-close interval), which indicate unattended alerts. You should consider the number of alerts that are automatically closed when they reach their time limit. This figure can reveal if your team is unable to resolve or close all alerts, leaving some unaddressed.

Note: If you're starting with Zurich, some charts, graphs, or metrics in the dashboard may appear blank or show limited data. This is expected if there's no historical data or only a few weeks or months of data available. As your system continues to collect and process alerts, the dashboard will populate with more complete insights over time.

If you want to know about funnel visualization, see Create a funnel visualization.

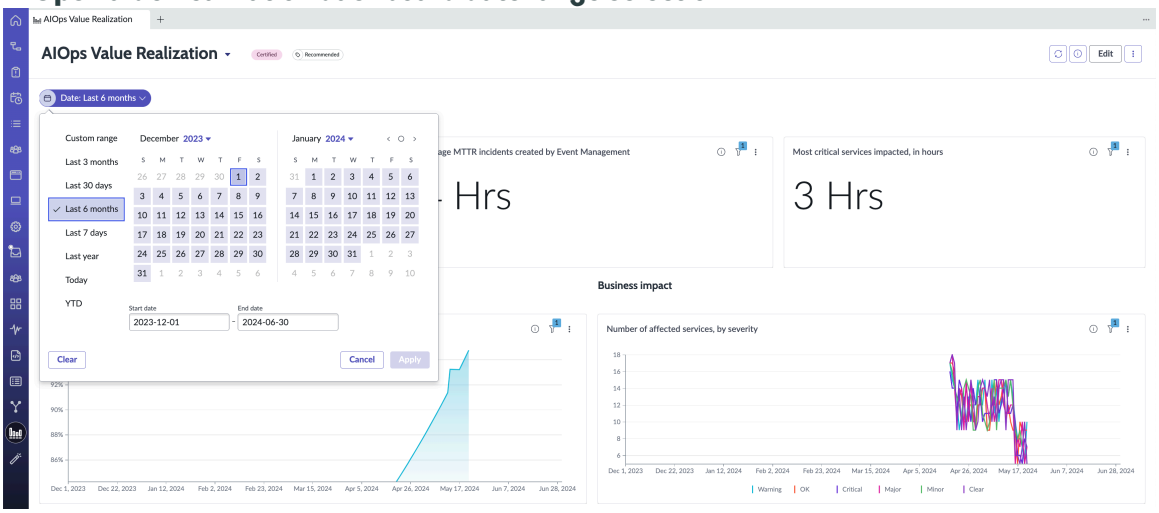
AIOps Value Realization dashboard

The AIOps Value Realization dashboard uses Performance Analytics to offer comprehensive visibility into the business outcomes of alerts, events, and incidents. It features metrics such as noise reduction (events to alerts compression), average MTTR for incidents created by Event Management[var.event-mgmt], and the most critical services impacted by hours.

The AIOps Value Realization dashboard includes a calendar feature that enables users to select various date ranges such as custom dates, the last 3 months, the last 30 days, the last 6 months, the last 7 days, the last year, today, and year-to-date (YTD). You can specify a custom start and end date and apply these selections to view reports specifically for the chosen date range. This feature facilitates tailored analysis and reporting based on specific time periods of interest.

AIOps Value Realization dashboard date range selection



The AIOps Value Realization dashboard offers key insights and metrics crucial for operational efficiency and business impact assessment. It includes features such as noise reduction to enhance focus on critical issues by reducing event-to-alert conversions. Tracking average MTTR for incidents and measuring downtime on critical services aids in improving operational efficiency and prioritizing resolutions. Categorized into Operational Excellence and Business Impact sections, the dashboard provides detailed coverage on alerts grouping, swift resolution of critical incidents reported by users, and quantifying service impacts by severity to optimize operational stability.

Run the [PA EM] Historic Data Collection job once to enable the partial collection of historical Event Management data:

1. Navigate to **All** > **Performance Analytics** > **Data Collector** > **Jobs**.
2. Select [PA EM] Historic Data Collection.
3. Select **Execute Now**.

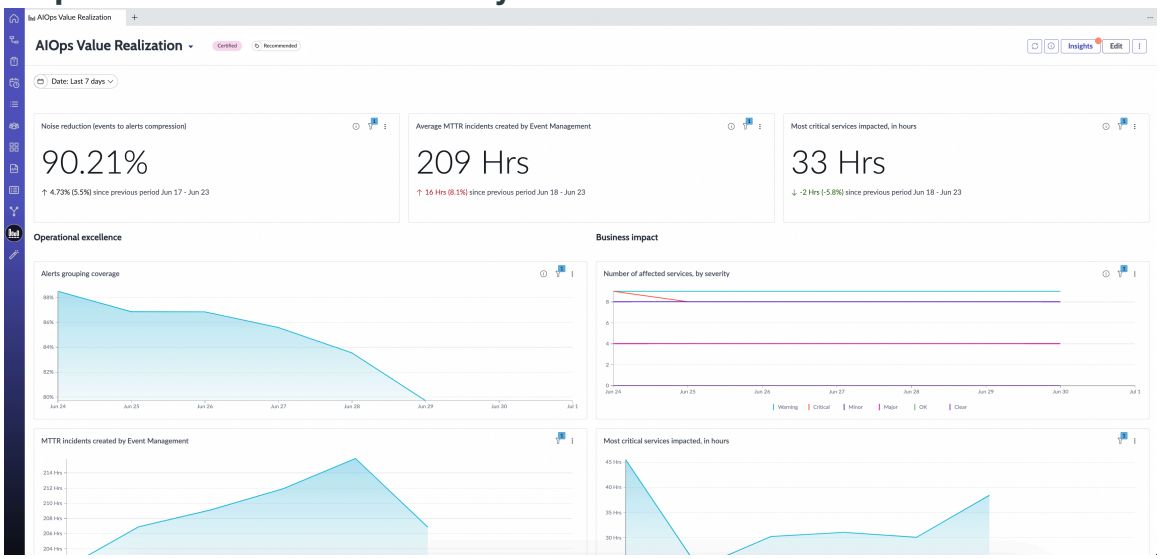
AIOps Value Realization dashboard key features overview



Prerequisites

Ensure that the Event Management application is installed.

Required ServiceNow AI Platform roles

- evt_mgmt_admin
- evt_mgmt_operator

Use cases

For examples of how different people in your organization would use this dashboard, refer to these use cases.

User	Dashboard use
evt_mgmt_admin or admin	Edit the dashboard and grant view and share permissions.
evt_mgmt_operator or admin	View the dashboard and review record details to visualize and track the business impact of alerts, events, and incidents.

Breakdowns

Breakdowns available in the AIOps Value Realization dashboard are:

- Operational Excellence
- Business Impact

Reports

Title	Type	Description
Noise reduction (events to alerts compression)	Line graph	The compression rate from events to alert creation: a

Title	Type	Description
		higher number indicates fewer alerts are being created.
Average MTTR incidents created by Event Management	Line graph	The average Mean Time to Repair (MTTR) of an incident created by Event Management: a lower number indicates greater efficiency of your IT team.
Most critical services impacted, in hours	Line graph	The total time your organization's most critical business services are impacted: a higher number indicates more time critical services are affected by open alerts.
Alerts grouping coverage	Line graph	The percentage of total alerts that are grouped: a higher number indicates more alerts are being correlated and grouped within an alert group.
Number of affected services, by severity	Line graph	The number of services impacted by alerts, grouped by severity, such as the count of services experiencing critical issues per day.
Number of new P1 incidents on monitored services created by users	Line graph	The number of incidents created on services monitored by Event Management: a lower number indicates fewer users are being impacted by a service outage or performance degradation.

Event and Alert dashboard

The Event and Alert dashboard uses Performance Analytics to provide real-time visibility into events and alerts in Event Management, showcasing key trends, outcomes, and the most impacted configuration items. It highlights metrics such as noise reduction, alert grouping coverage, and top alert sources.

© 2026 ServiceNow, Inc. All rights reserved.

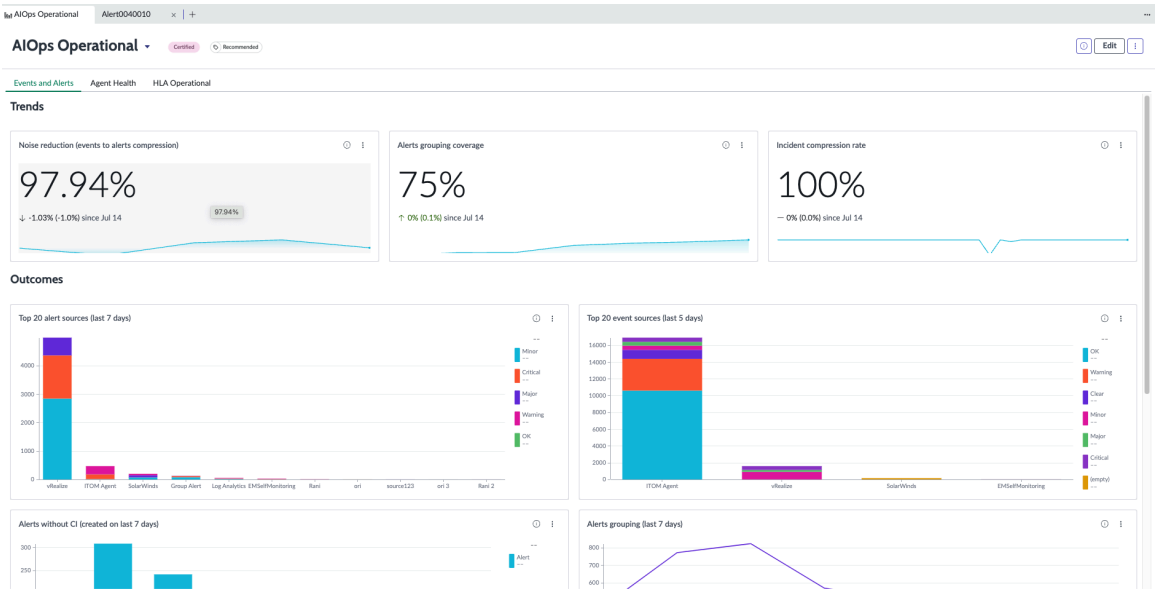
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Run the [PA EM] Historic Data Collection job once to enable the partial collection of historical Event Management data:

1. Navigate to **All** > **Performance Analytics** > **Data Collector** > **Jobs**.
2. Select [PA EM] Historic Data Collection.
3. Select **Execute Now**.

Prerequisites

Ensure that the Event Management application is installed.

Required ServiceNow AI Platform roles

- evt_mgmt_admin
- evt_mgmt_operator

Access the Events and alerts dashboard

To open the dashboard, use one of the following methods:

- Navigate to **All** > **AIOps Dashboards** > **AIOps Operational** > **Events and Alerts**.
- Navigate to **Workspaces** > **Service Operations Workspace** and select the AIOps Dashboards icon ( ).

  By default, the **Events and Alerts** tab is selected.

Use cases

For examples of how different people in your organization would use this dashboard, see these use cases.

User	Dashboard use
evt_mgmt_admin or admin	Edit the dashboard and grant view and share permissions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User	Dashboard use
evt_mgmt_operator or admin	View the dashboard and details of the records contained in it to visualize and track events, alerts, trends, outcomes, and the most impacted Configuration Items in your organization.

Breakdowns

Breakdowns available in the Event and Alert dashboard are:

- Trends
- Outcomes

Reports

Title	Type	Description
Noise reduction (events to alerts compression)	Line graph	The compression rate from events to alert creation. The higher the number, the fewer alerts are being created.
Alerts grouping coverage	Line graph	The percentage of alerts aggregated into grouped alerts over time.
Incident compression rate	Line graph	The percentage of alerts that did not result in incident creation. A higher percentage means more alerts were resolved without generating incidents.
Top 20 alert sources (last 7 days)	Bar chart	The number of alerts per source categorized by severity over the last 7 days.
Top 20 event sources (last 5 days)	Bar chart	The number of events per source categorized by severity over the last 5 days.
Alerts without CI (created on last 7 days)	Line graph	The number of alerts without CI binding created over the last 7 days.
Alerts grouping (last 7 days)	Bar chart	The distribution of grouped alerts over the last 7 days.

Most impacted Configuration Items

The Most Impacted Configuration Items section of the Event and Alert dashboard provides a comprehensive overview of the configuration items (CIs) that are most impacted by the issue. This section lists key details such as the name of each CI, the number of associated alerts, their classification (such as application service), and location. Additionally, it identifies the owner and

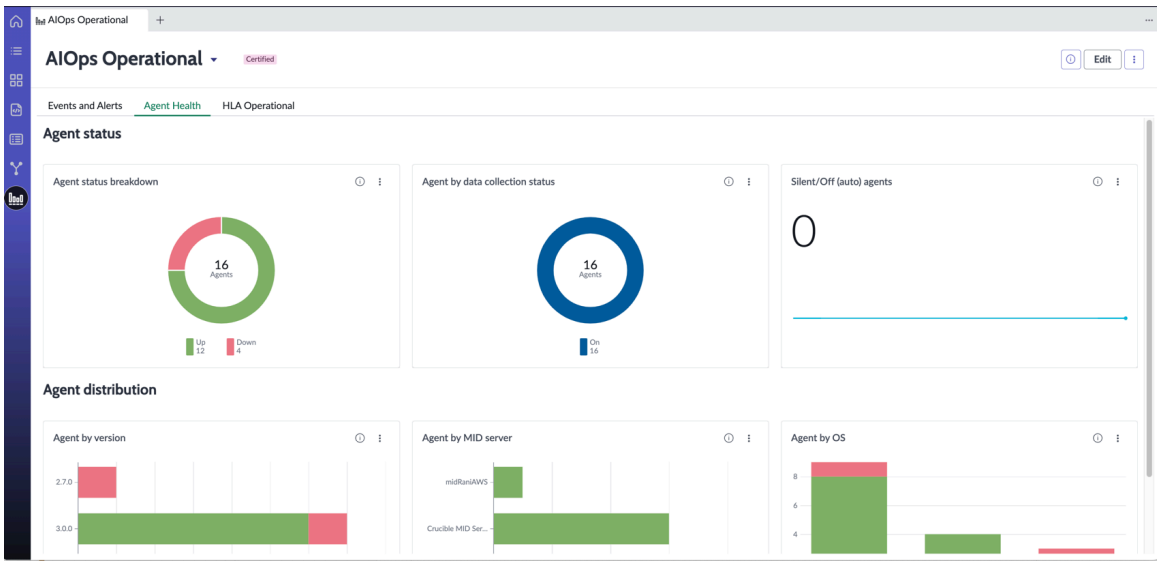
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

support group responsible for each CI, facilitating targeted and efficient incident resolution. By highlighting the most impacted CIs, this section helps prioritize critical assets and resources, ensuring that the most significant issues are addressed promptly to maintain system stability and performance.

Agent Health dashboard

The Agent Health dashboard provides visibility into the status and distribution of agents installed in your system. It allows you to quickly assess the number of deployed agents and their distribution, helping you prioritize your work more efficiently.

The following example shows the agents in your system that are currently up, which agents are configured to collect data, and which agents have stopped data collection due to having reached their CPU threshold (Silent/Off). It also displays the agents according to their version, OS, and connected MID Server.



Prerequisites

The Agent Client Collector application must be installed.

Required ServiceNow AI Platform roles

A user must have the agent_client_collector_admin role to see all the widgets in the dashboard.

Access the Events and alerts dashboard

To open the dashboard, use one of the following methods:

- Navigate to **All** > **AIOps Dashboards** > **AIOps Operational** > **Agent Health**.
- Navigate to **Workspaces** > **Service Operations Workspace** and select the AIOps Dashboards icon ( ) and then select the **Agent Health** tab.
- After upgrading to Discovery Admin Workspace version 1.3.1 (August 2024 Store), you can navigate to **Workspaces** > **Discovery Admin Workspace** > **Insights** and use the enhanced dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use case

For examples of how different people in your organization would use this dashboard, see the use case in the following table.

Dashboard use case

User	Dashboard use
admin	Visibility into the status of the agents.

Breakdowns

Breakdowns available in the Agent Health are:

- Agent status: The status of the agents currently deployed in your system.
- Agent distribution: The distribution of the agents by the agent version number, the MID Server that the agent is assigned to, and the OS that the agent is working on.

Reports

Title	Type	Description
Agent status breakdown	Pie chart	Agents deployed in your system that are up and down. Select the relevant color in the widget to display a list of up or down agents.
Agent by data collection status	Pie chart	Agents deployed in your system with data collection turned on and off. Select the relevant color in the widget to display a list of agents with data collection on or off.
Silent/Off (auto) agents	Line graph	Agents that automatically stopped collecting data after crossing the CPU usage threshold. The CPU usage threshold is configurable in the `acc.yml` configuration file. For more information on the `acc.yml` configuration file, see Configuration file options.
Agent by version	Bar chart	Breakdown of your deployed agents by their version numbers.
Agent by *MID Server*	Bar chart	Breakdown of the deployed agents according to the *MID Server* they're assigned to.

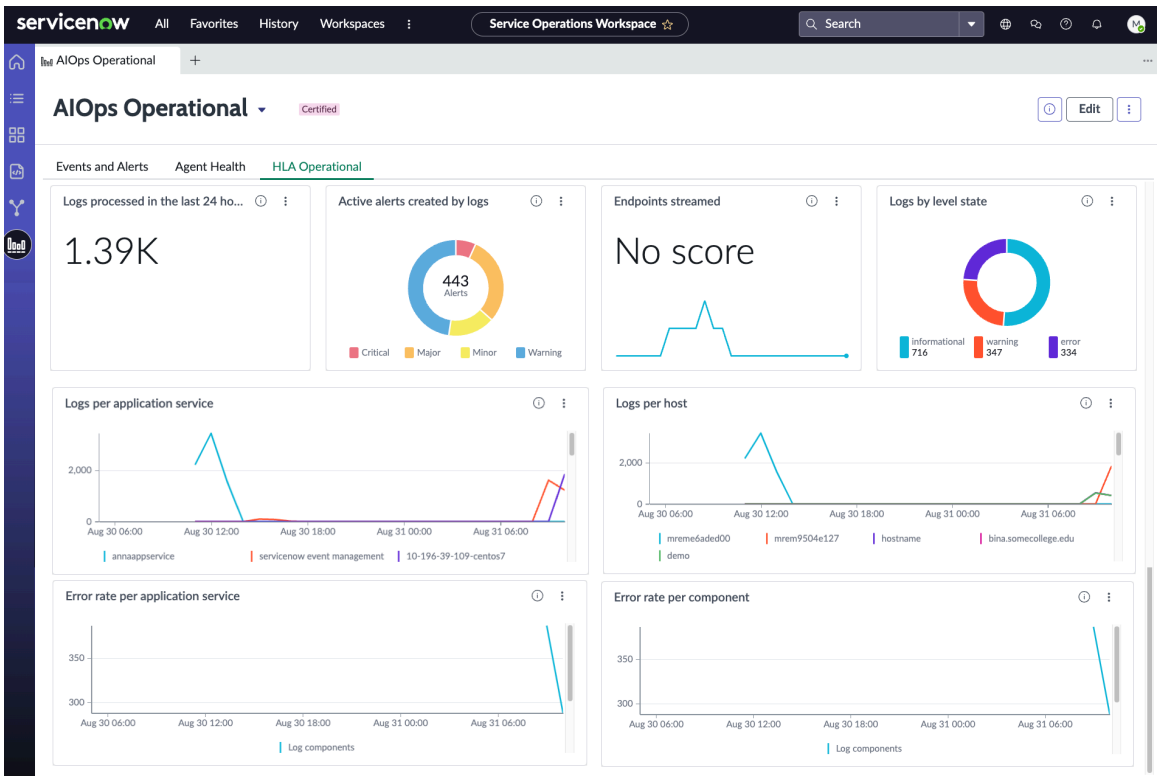
Agent by OS	Bar chart	Breakdown of your deployed agents according to the operating systems they are working on.

HLA Operational dashboard

The Health Log Analytics Operational dashboard uses Performance Analytics to enable you to monitor log data, alerts, and error rate information in Service Operations Workspace and address issues as they occur in the system.



Prerequisites

Ensure that the Health Log Analytics application is installed.

Required ServiceNow AI Platform roles

- evt_mgmt_admin
- evt_mgmt_operator

Access the HLA Operational dashboard

To open the dashboard, use one of the following methods:

- Navigate to **All** > **AIOps Dashboards** > **AIOps Operational** > **HLA Operational**.
- Navigate to **Workspaces** > **Service Operations Workspace** and select the AIOps Dashboards icon ( ), then display the HLA Operational dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use cases

These use cases provide examples of how different people in your organization would use this dashboard.

User	Dashboard use
evt_mgmt_admin	Edits the dashboard and grants view and share permissions.
evt_mgmt_operator or evt_mgmt_admin	Monitors the dashboard to visualize and track HLA log and alerts data, error rates, and other relevant information.

Breakdowns

Breakdowns available in the HLA Operational dashboard are:

- HLA Overview
- Error rate

Reports

Title	Type	Description
Logs processed	Bar chart	The number of logs that were processed and analyzed in the selected period. By default, the dashboard visualizes log data that was ingested in the last 24 hours.
Active alerts created by logs	Table	Detailed data on all currently active alerts.
Endpoints streamed	Line graph	The number of endpoints (IPs, networks, and devices) that are streaming into Health Log Analytics, by application service.
Logs by level state	Bar chart	The severity level of the logs for the streaming sources.
Logs per application service	Line graph	The number of logs streamed for each application service in the selected period. Monitor this data to ensure that log data is streaming as

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Title	Type	Description
		expected for each application service.
Logs per host	Line graph	The number of processed logs for each host in the selected period. Monitor this data to detect hosts that are logging more or less data than expected.
Error rate per application service	Line graph	The number of logs with errors for each application service analyzed in the selected period. Monitor this data to further investigate the errors. **Note:** Health Log Analytics automatically creates alerts for Error anomalies.
Error rate per component	Line graph	The number of logs with errors for each component analyzed in the selected period. Monitor this data to ensure that the error rate for each component is normal.

Data visualization in ITOM

Gain insights faster with data visualization in IT Operations Management (ITOM). Visualize metrics, logs, events, and alerts through intuitive dashboards and charts to identify trends, monitor performance, and resolve issues proactively.

Anyone with access to data can create a visualization of that data on a dashboard that they own.

Create a funnel visualization

A funnel visualization shows how data progresses through sequential stages, helping you identify drop-offs or bottlenecks at each step. Use it to track conversions, workflows, or process completion rates. You can add a funnel visualization to an existing dashboard or to a new dashboard.

Before you begin

Role required: report_user, admin, or viz_creator

Ensure you have an admin role or permission from the dashboard owner to edit the dashboard.

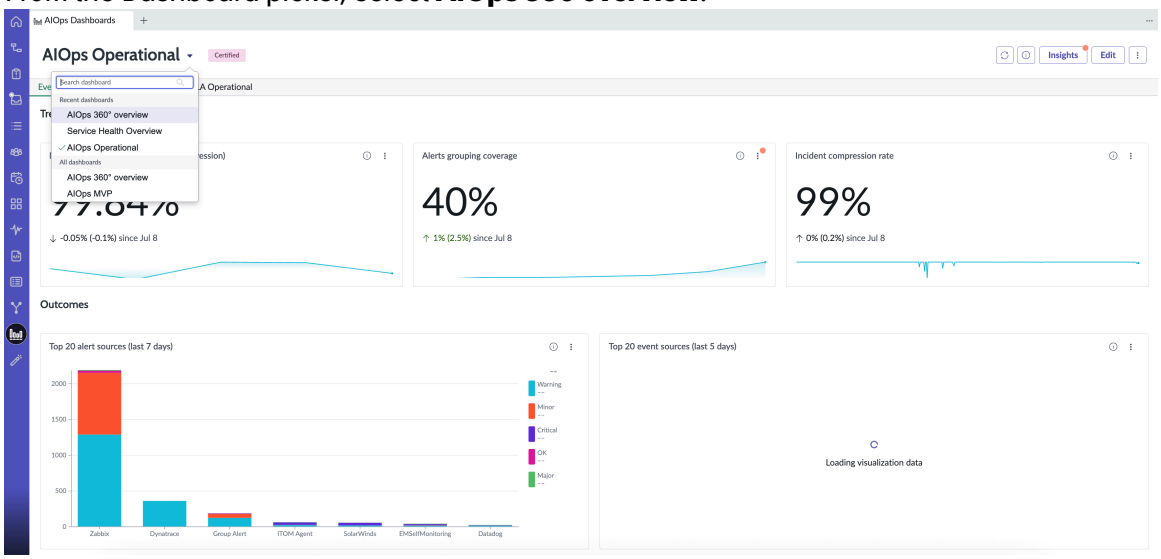
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

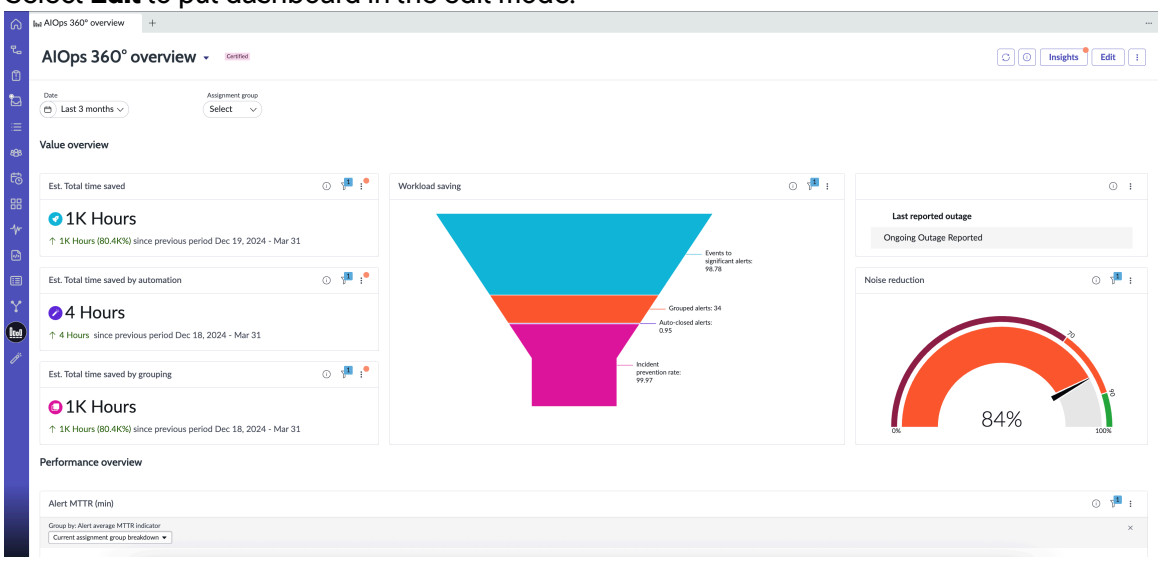
If you have the appropriate role, you can add and edit funnel reports on a dashboard. The **Edit** button is not available on the ITOM dashboards unless the user has rights to edit it. For more details on creating dashboards, see Common dashboard tasks in the in-line editor.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and select the AIOps Dashboards icon ( ).
2. From the Dashboard picker, select **AIOps 360 overview**.

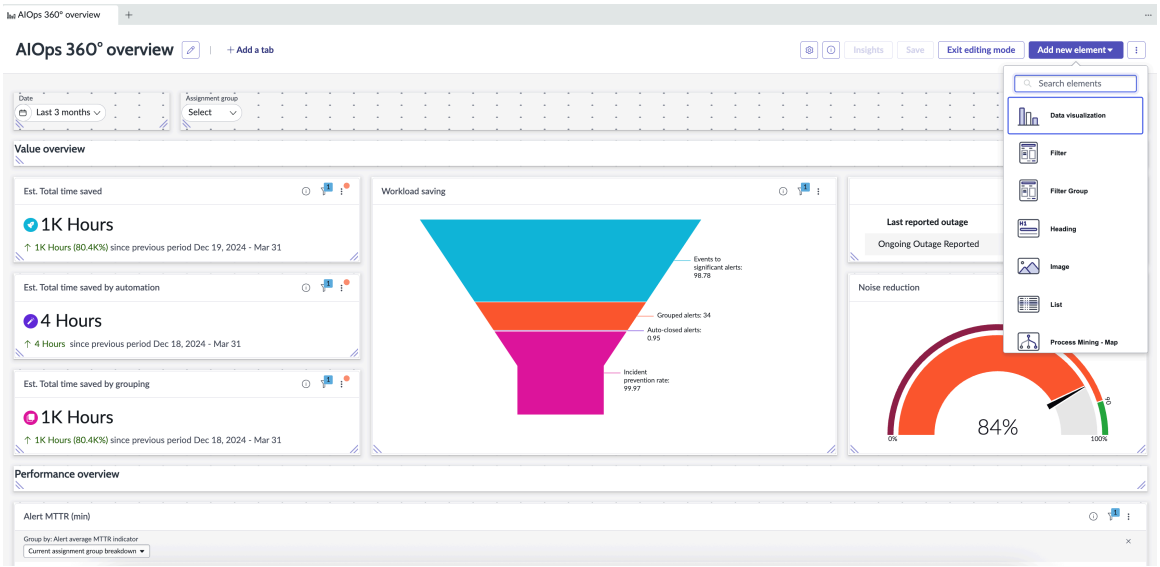


3. Select **Edit** to put dashboard in the edit mode.

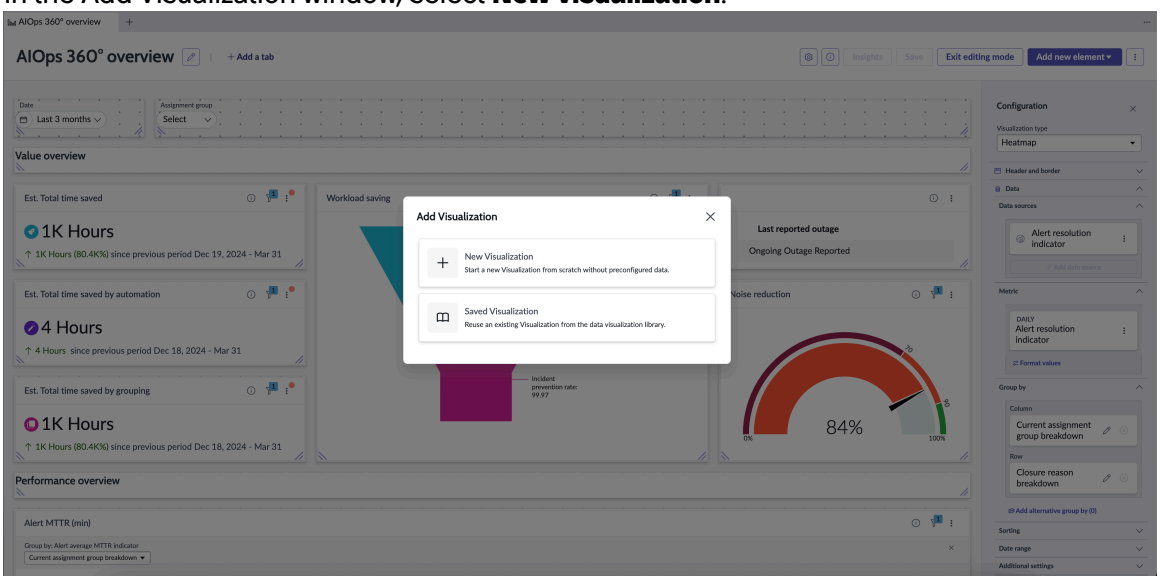


4. From the **Add new element** drop-down menu, select **Data visualization**.

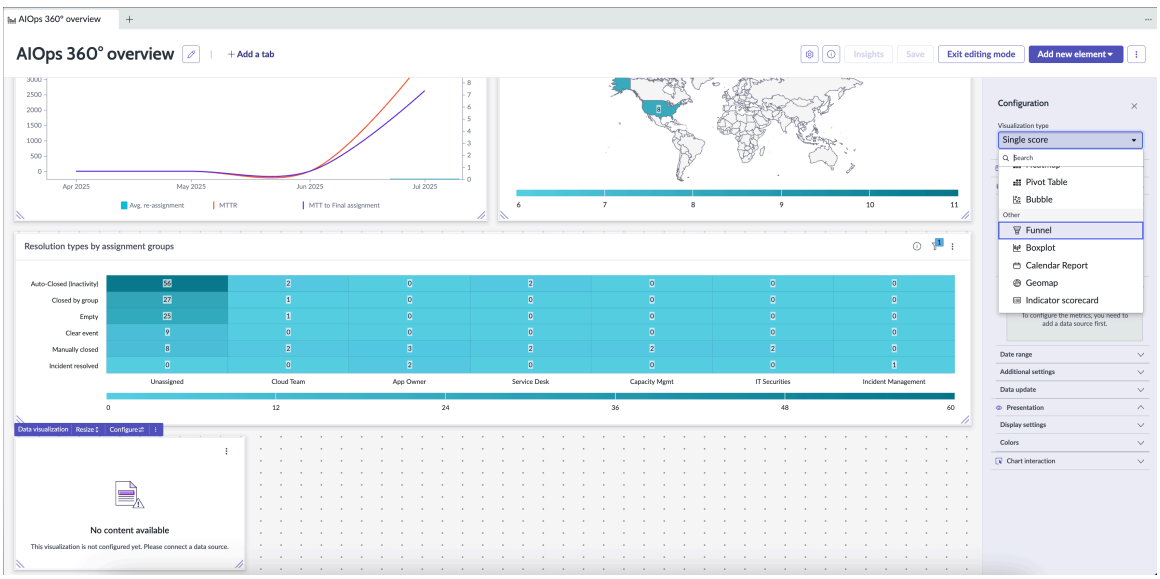
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. In the Add Visualization window, select **New visualization**.



6. From the **Visualization type** field, select **Funnel**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The **Funnel** visualization type is currently available only to customers who have the ITOM plugin installed.

7. Under **Data sources**, select **+ Add data source**.
   There are two kinds of data sources avail for the **Funnel** visualization type: Table and Indicator. Visualizations based on table data show a snapshot of the state of that data. Indicator visualizations reflect data over time based on data collection jobs. You can configure funnel stages using indicators in one of the following ways:

   You can configure funnel stages using indicators in one of the following ways:

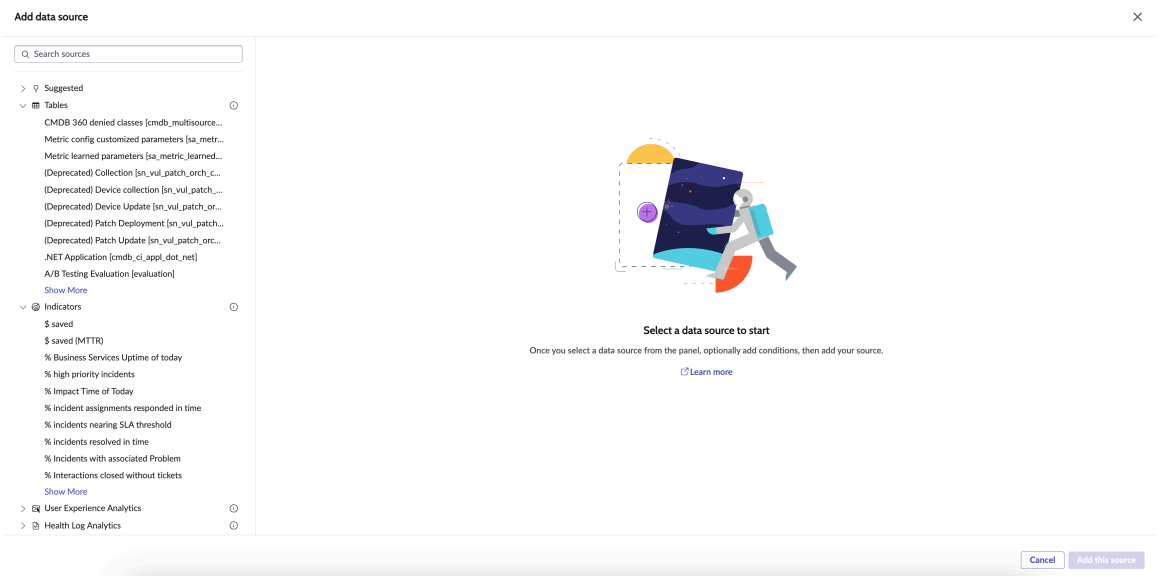
   - Option 1: Use a single indicator or table with a breakdown

     Select a single indicator or table, and then define the breakdown using the Group by field. The breakdown values are used as the funnel stages.

     Note: If you select only one indicator without a breakdown, the visualization displays an error: `Invalid configuration. A 'Group By' must be selected for the visualization to render.`

   - Option 2: Use multiple indicators without a breakdown

     Select multiple indicators without setting a breakdown. In this case, each indicator's value represents a stage in the funnel.



8. Select the required data source and select **Add this source**.

   When you select a table or indicator data source for a funnel visualization, refer to the following topics for the available data configuration options:

   - Table data options for funnel visualizations
   - Indicator data options for funnel visualizations

9. Select **Save**.

Table data options for funnel visualizations

When you select a table data source for the funnel visualization, the following data configuration options are available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data configuration options

Field	Description
Predefined conditions	Preset filters to quickly narrow down data based on common criteria.
+ Add custom conditions	Custom filters based on user-defined criteria.
Header and border	
Show header	The visualization header, including title and icons.
Show header separator	Option to display a line separating the header from the rest of the component.
Chart title	Text shown as the title of the chart.
Description	Optional explanatory text shown below the title.
Wrap title	Option to wrap long titles onto multiple lines.
Show border	Option for border visibility setting for the widget container.
Header background color	Background color setting for the header area.
Data	
Data sources	Available inputs that supply data to the visualization.
Metric	
Label	Custom name for the selected metric. By default, the label matches the data source name.
Select an aggregation	Aggregation type applied to the metric (e.g., sum, average). The default is Count, which displays the number of records selected. **Note:** Select **Count Distinct** to count only unique records. For example, when generating a report of users with one or more roles from a list, you count each user only once. Without this option, users with multiple roles are counted more than once.
Field	Source field from the data set for the selected metric. **Note:** The data appears in a format that matches the field type. For example, an integer field like **Priority** is shown as a number. A duration field like **Business duration** from the [Incident] table is displayed in days, hours, and minutes. If function fields were created in Report Designer for the table, they are available in the drop-down list. For more information, see Report on function fields.
Format values	Formatting style for displaying metric values. Select to open the Formatting values dialog. For more information, see Value formatting in reports.
Group	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data configuration options (continued)

Field	Description
Field for incident	Field used specifically to group incident data.
Max number of groups	Limit on the number of groups shown in the visualization.
Show others	Option to group excess data into an **Others** category.
Data update	
Follow filter	Follows filters set at the page level. When selected, the visualization reflects workspace filters. When not selected, the visualization ignores all page-level filters.
Show filter icon	Option to display the filter icon and the number of filters affecting the visualization. If the check box is not selected, the icon and filter count are hidden.
Refresh after being away for X min	Trigger based on time spent away from the dashboard within the same workspace, including the Platform Analytics experience. Defines the number of minutes after which the visualization automatically refreshes when you return. Do not confuse this setting with **Scheduled repetition** on inline dashboards, which refreshes the entire dashboard only while it remains open.
Info messages	
Set custom message when no data	Custom text displayed when no data is available for the visualization.
Colors	
Set color type	Color scheme applied to different data values or ranges.
Chart interaction	User actions supported within the chart, such as hover or select.

Indicator data options for funnel visualizations

When you select an indicator data source for the funnel visualization, the following data configuration options are available.

You can either select a single indicator and use the **Group by** field to calculate stage values, or select multiple indicators without a breakdown, where each indicator's value represents a funnel stage.

Data configuration options

Field	Description
Breakdown	Provides a way to segment data using fields like Alert Severity or Alert Status. Each condition includes a **Breakdown** field, an **Operator**, and an **Element** that defines the target value. All

Log Analytics in Service Operations Workspace for ITOM

View and address the alerts that Health Log Analytics generates in the Service Operations Workspace.

Take action on a Log Analytics alert from the Overview tab

Start the Log Analytics alert remediation process from the **Overview** tab in the Service Operations Workspace. This tab provides information on the alerts, log data associated with the anomalous behavior, CIs that generated the triggering metric, and services impacted by the alerts.

Before you begin

Role required: evt_mgmt_operator, or evt_mgmt_user, or evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Service Operations Workspace, select the lists icon ( ).
2. Select the appropriate list in the Alerts sublist and navigate to the desired alert or group.

   All alerts generated by Health Log Analytics have the value **Log Analytics** in the **Source** column. The value in the **Group** column identifies the type of Log Analytics alert. See Types of Health Log Analytics alerts for a more detailed description of each type of alert or group.

   Tip: To preview an alert in the list, click its info icon ( ).

3. Select the alert number.

   The **Overview** tab displays.

4. View the section of the **Overview** tab that provides the information that you need.

   For a description of the sections and cards, see Sections and cards on the alert Overview tab in Health Log Analytics.

   Note: Because some sections on the **Overview** tab show only a portion of the information, many sections include a link that displays different or more complete information.

5. **Optional:** Run predefined remediation tasks to resolve alert issues.
   a. Select **Launch playbook**.
   b. Select the **Playbook** tab.

      The **Run remediation** card displays the available remediation actions.

   c. Select the tile corresponding to the action you want to run.
   When the action is complete, it appears in the **Completed** card.

Sections and cards on the Overview tab for a Component-based alert in Health Log Analytics

The **Overview** tab in the Service Operations Workspace helps you understand Component-based alerts.

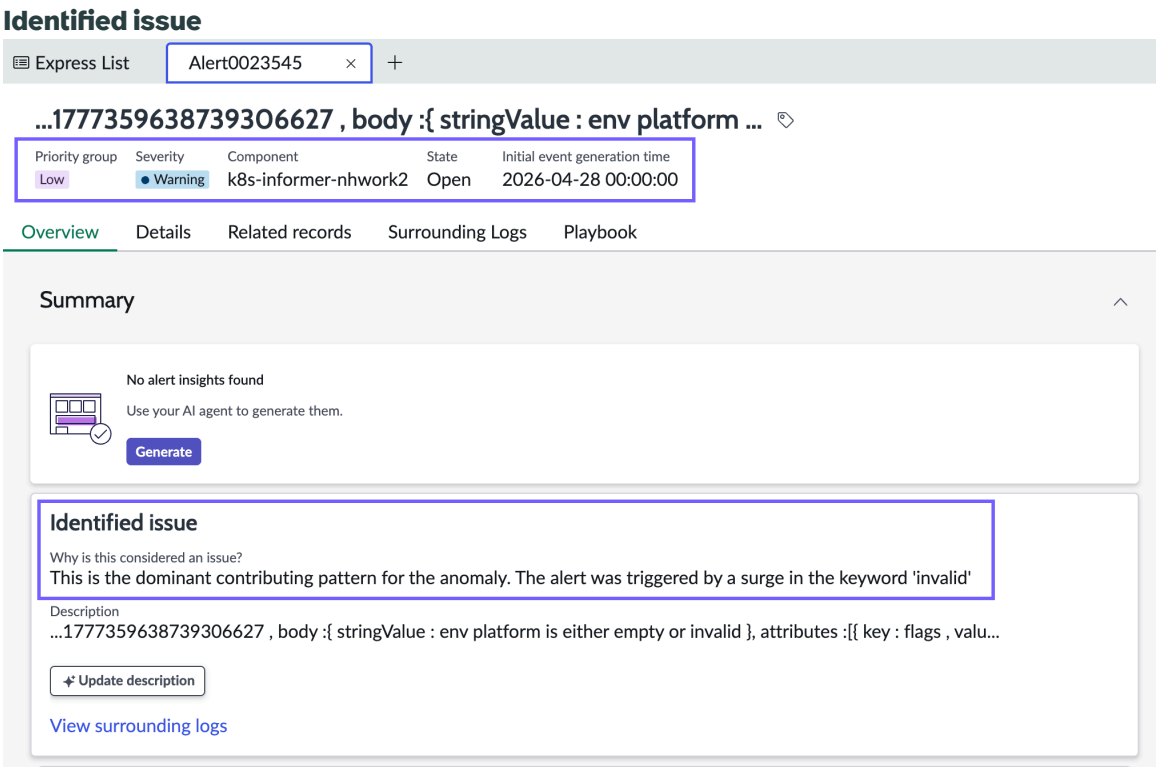
For a detailed description of Component-based alerts, see Types of Health Log Analytics alerts.

Summary

Identified issue

This card describes the issue that led to the alert. The identified issue appears on the card and in the title for the alert. Information about the alert appears in the banner.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Select **View surrounding logs** to view log messages that are relevant to the alert. See Analyze log lines that surround an anomaly in Health Log Analytics.

Anomaly

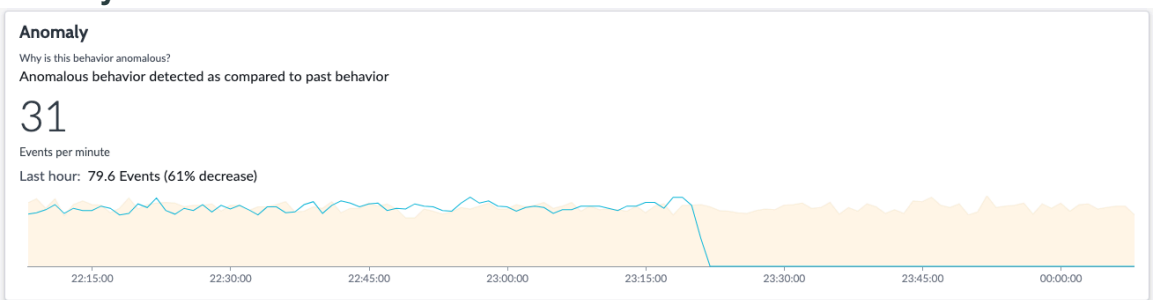
This card illustrates the anomalous activity that led to the alert.

- The blue line shows the recent anomalous activity.
- On some charts, the lightly shaded area indicates the expected (learned baseline) behavior.

  A peach-shaded area represents the baseline values for the same hour one day earlier. A pink-shaded area shows the values for the same period in the previous week.

In this example, the peach-shaded area shows the data for the same hour one day earlier. The drop in the metric value (events per minute) is clearly visible.

Anomaly card



For more information on the kinds of anomalies that you might encounter, see Types of anomalous behavior in Health Log Analytics.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact

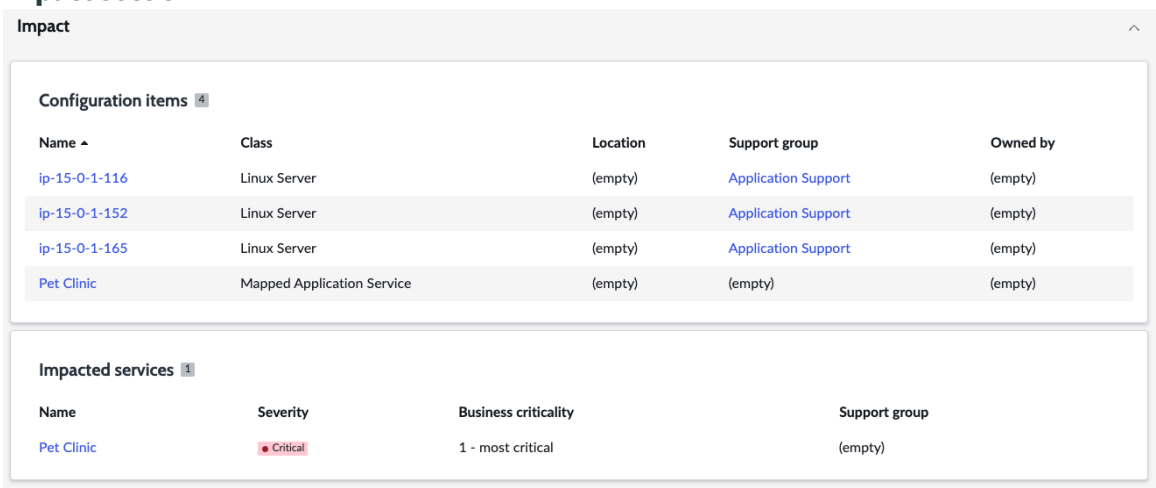
Configuration Items

This card provides information about the CIs that are impacted by the alert.

Impacted services

This card provides information about the services that are impacted by the alert.

Impact section

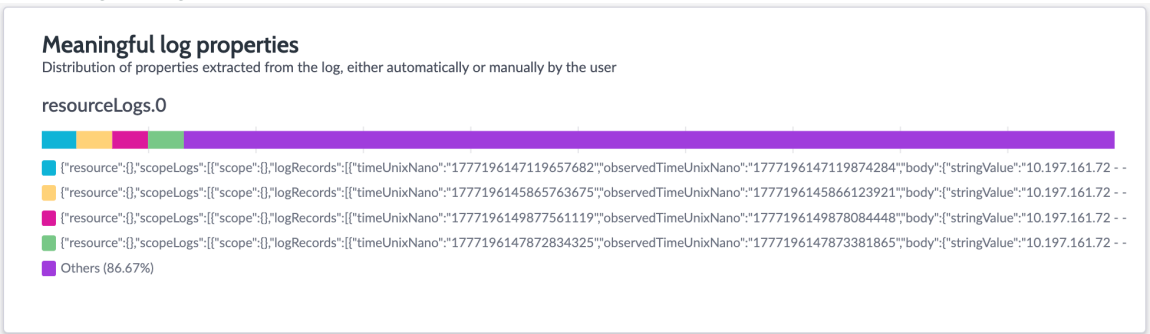


Cause

Meaningful log properties

On this card, each bar chart shows the distribution of values for a single log property that contributed to the anomaly. Each property value is associated with a color. The length of a color bar correlates to the percentage that the property value holds in comparison with all other values for the property.

Meaningful log properties



Sections and cards on the Overview tab for a Log Analytics group in Health Log Analytics

The **Overview** tab in the Service Operations Workspace helps you understand Log Analytics groups.

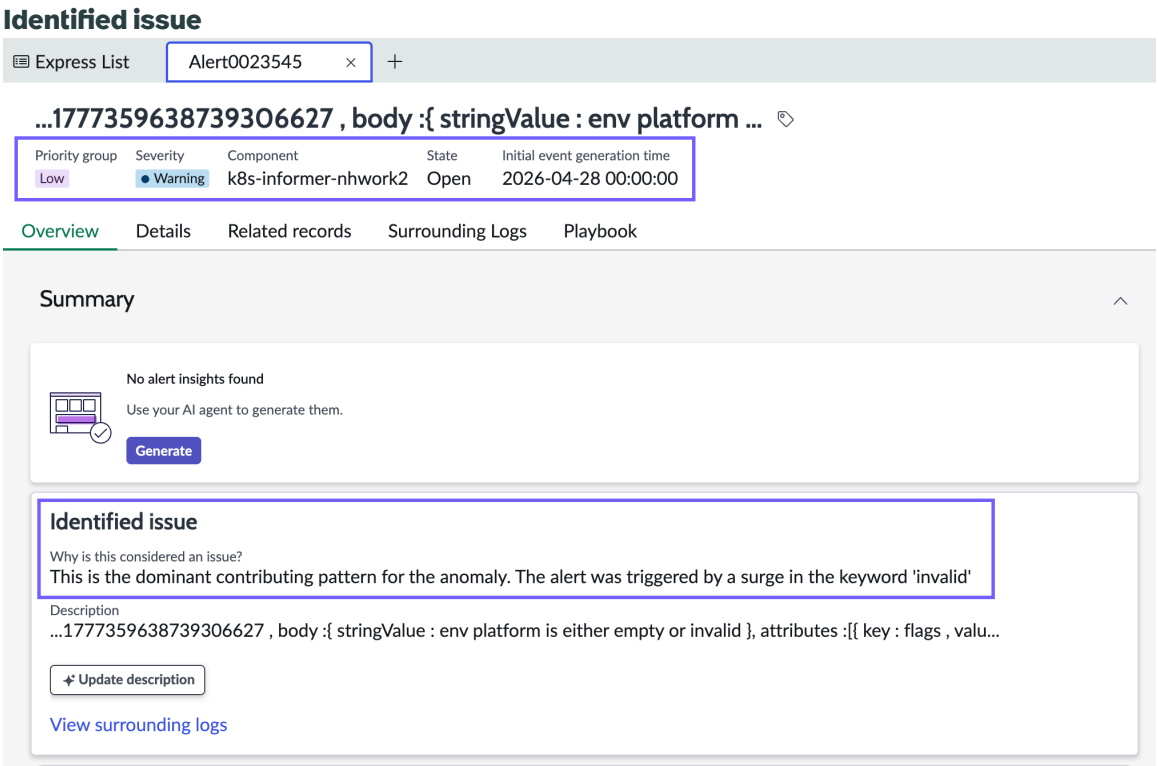
For a detailed description of Log Analytics groups, see Types of Health Log Analytics alerts.

Summary

Identified issue

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This card describes the issue that led to the alert. The identified issue appears on the card and in the title for the alert. Information about the alert appears in the banner.



Select **View correlations** to view the list of correlations that relate the Log Analytics alerts.

Correlations list

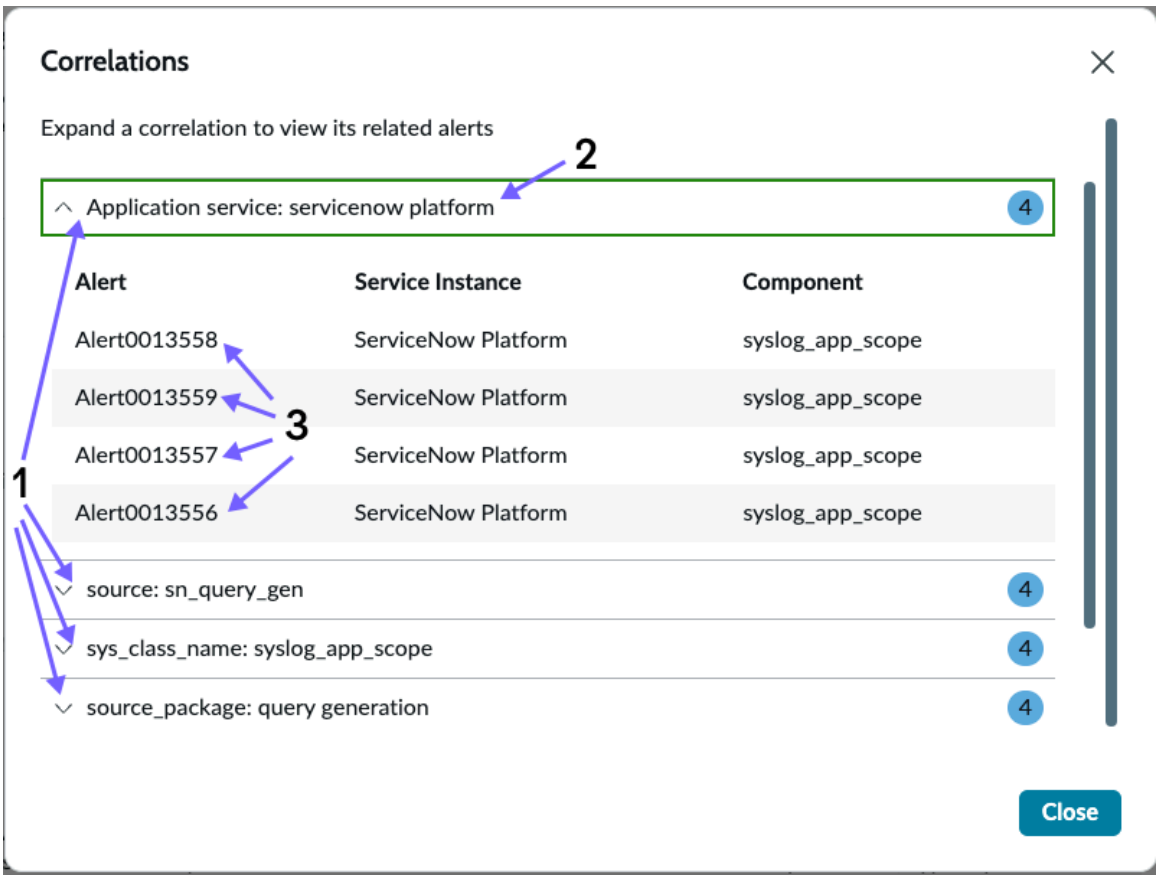
During initial analysis, alerts are scored. Each correlation in the alert's log data with another alert contributes to the score. The higher the score, the more likely the alert is to be included as a Log Analytics alert in a Log Analytics group.

The following kinds of data are considered when determining whether alerts are correlated:

- Time: The events all occurred within a configured time interval.
- Metadata: The alerts have matching values in log-line metadata. For example, all alerts involve the same host.
- Message text: The message text in the log data is similar or identical between alerts.
- Trend: The alerts show a similar tendency in values or rates. For example, a particular metric value is increasing in all alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Correlations



1. List of correlations: The first correlation in the list is expanded to show the individual Log Analytics alerts that are correlated and the log correlator that the alerts share.
2. An individual log correlator: The identifier for a group of correlated Log Analytics alerts. The alerts are grouped by the log-line data or metadata that is common to the alerts (for example, IP address, host name, or user name). The number in the blue square indicates the number of correlated alerts.
3. Log Analytics alerts that are correlated.

Alerts in group

For a Log Analytics alert, the Alerts in group card shows the Log Analytics alerts that are grouped under the Log Analytics alert. Select a Log Analytics alert to view its details.

Alerts in group

View the Log Analytics alerts in a Log Analytics group in Health Log Analytics

View a list of all Log Analytics alerts in a Log Analytics group on the **Related records** tab.

Before you begin

Role required: evt_mgmt_operator, or evt_mgmt_user, or evt_mgmt_admin

About this task

For a detailed description of Log Analytics groups and Log Analytics alerts, see Types of Health Log Analytics alerts.

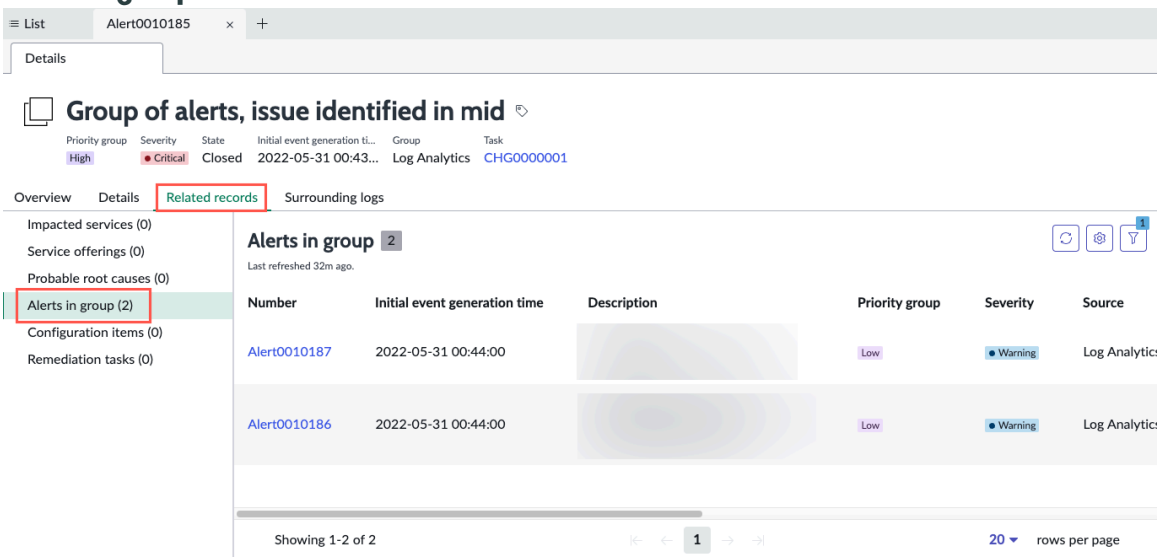
Procedure

1. On the **Overview** tab for a Log Analytics alert, go to the **Alerts in group** card and select the **View all** link.

   The **Alerts in group** section on the **Related records** tab displays.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alerts in group section on the Related records tab



2. For each Log Analytics alert in the Log Analytics group, the information described in the table is available.

Alerts in group

Column	Description
Number	The number of the alert. Select the number to view detailed information for an alert. This field is automatically set.
Initial event generation time	The time when the event that generated the alert first occurred. **Note:** Time here is the ServiceNow processing time, not the source system time.
Group	Type of group that the alert belongs to: a standalone Log Analytics alert or a Component-based alert.
Description	Anomalous pattern or metric that caused the alert to be generated.
Severity	Severity value for the alert. The available values are: ○ **Critical**: Immediate action is required. Either the resource is not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	○ **Minor**: Either performance has degraded or there is a partial, non-critical loss of functionality. ○ **Warning**: Attention is required even though the resource is still functional. ○ **Info**: An informational message. An alert is created, but the resource is still functional. ○ **Clear or Resolved**: No action is required. An alert is not created from this event. Existing alerts are closed.
Priority group	Priority group that indicates the order in which to resolve alerts. Choices are as follows: ○ **Urgent** ○ **High** ○ **Moderate** ○ **Low** The priority group value is more important than severity alone. For example, a high priority and low severity alert should be addressed before a low priority and high severity alert. For information on how priority is calculated, see Alert priority.
State	Processing state of the alert. A newly generated alert is in the **Open** state. Other states are as follows: ○ **Reopen**: A previously closed alert is open again, and it requires your attention. ○ **Flapping**: The alert is receiving identical events from the same source at high frequency. This state can cause an alert to re-open from the Closed state, resulting in a high frequency of changes between Open and Closed states. ○ **Closed**: The alert is closed and does not require any further action. You close an alert when it is remediated.
Configuration item	CI in the CMDB. The CI is applied to by the alert.
Node	Node field that is received in the log message. The event described in the log message occurred on this node. Often, the node is the name of the CI that is associated with the alert. For example, a computer name, IP address, FQDN, or MAC address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Source	All Health Log Analytics alerts have the value **Log Analytics** in the **Source** column to indicate that the Health Log Analytics app generated the alert.
Metric name	Name of the metric whose anomalous behavior led to the alert. For example, the *I/O request* in the case that the I/O request took longer than 15000 ms to complete.
Updated	Most recent time when the alert information or state was updated.

Meaningful log properties

Analyzing the logs around an anomaly to help find the alert's root cause in Health Log Analytics

When Health Log Analytics identifies an anomaly, viewing the logs that surround the anomaly provides clues about the state of faulting systems. This information can help you narrow down the root cause of an alert.

While viewing a Log Analytics alert, the **Surrounding logs** tab lists the log lines that were generated one minute before and one second after the anomaly occurred. The log lines are related to the metric or pattern that triggered the alert. The list is filtered to the relevant component.

Logs generated immediately before the anomaly might point to warning signs or conditions that led to the issue. By reviewing these logs, you can trace the sequence of events that led to the anomaly, helping you understand what went wrong. Logs created right after the anomaly can help you evaluate the impact of the event by analyzing how the system responded and whether other components were affected. The timeline of the logs around the anomaly can help clarify what might have caused the issue, for example a configuration change or a software update.

You can modify the time range of the displayed log lines, for example to investigate logs from more than one minute before the anomaly, or more than a second afterward.

Note: Logs that surround the anomaly are retained and available for 30 days after the creation of the alert. The system does not delete these logs when the global retention period of logs expires. When the retention period expires, the surrounding logs are available only on the **Surrounding logs** tab and not in the Log viewer.

Health Log Analytics enables you to view the anomalous log data graphically on the Log viewer, accessed from the Service Operations Workspace. The Log viewer displays a chart of the frequency of anomalous log lines during one minute before and one minute after the Log Analytics alert and lists the associated log lines. It automatically shows the query that relates to the anomaly, the selected component, and the appropriate time filter. For more information, see Reviewing the logs that are connected with an alert on the Log Viewer in Health Log Analytics.

Analyze log lines that surround an anomaly in Health Log Analytics

View the log lines around an anomaly to help you identify the root cause of a Log Analytics alert.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. In the Service Operations Workspace, open a Log Analytics alert.
2. Select the **Surrounding logs** tab and review the information.
   The tab displays the list of log lines that were generated one minute before and one second after the Log Analytics alert. For an explanation of the information on the tab, see Surrounding logs tab fields.
3. **Optional:** View a different timespan of the log lines using one of the following methods:
   - Update the time range relative to the alert to a predefined time range in the **Select range** list.
   - Specify a **Start time** or **End time** using the time picker.
4. **Optional:** View the anomalous log data graphically as a function of time by selecting **Log viewer**.
   For more information, see Reviewing the logs for an alert on the Log Viewer in Health Log Analytics.

Reviewing the logs for an alert on the Log Viewer in Health Log Analytics

The **Log Viewer** tab lets you browse the logs for an alert by timestamp or time range, and visualize anomaly frequency within a specific time period. Customizing the displayed data and adjusting time filters enables you to better understand the framework in which the anomaly occurred, helping you find the root cause faster.

The Log Viewer presents all data connected with the Log Analytics alert. It shows the query that relates to the anomaly, the selected component, and the appropriate time filter. You can personalize the displayed data, and manually adjust the time range without affecting the other settings. The applied filters appear in the **Filters** pane. You can add or remove filters as needed to show only the data you want to view.

The **Log Viewer** displays a chart of the frequency of anomalous log lines during one minute before and one minute after the Log Analytics alert and lists the associated log data. This information helps you identify trends leading up to and following the event, providing context for root cause analysis.

As you analyze the logs for an alert on the **Log Viewer**, you can modify the query to fine-tune the search, save useful searches, and share them with others. For a description of the information displayed in the **Log Viewer** table, see Log Viewer table fields.

You can perform the following tasks on the **Log Viewer**:

- View log data for an alert in Health Log Analytics

  View a chart of the frequency of anomalous log lines and the associated log data.

- Define, save, and share a search of log data in Health Log Analytics

  Fine-tune the search query to help determine the causes of the issue, and save and share useful searches.

- Use or modify a saved log data search in Health Log Analytics

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use a saved search. As the owner of a saved search, you can modify the search values and save your changes.

- Filter search results on the Log Viewer in Health Log Analytics

  Apply filters to show only the data you want to view.

- Customize the Log Viewer table in Health Log Analytics

  Add or remove columns in the table to show only the data you want to view.

If you discover an important metric in the log data, you can use it to define a new Log Analytics alert rule. For more information, see Define a custom Log Analytics alert rule in Health Log Analytics.

Related topics

Analyzing the logs around an anomaly to help find the alert's root cause in Health Log Analytics

View log data for an alert in Health Log Analytics

View a chart of the frequency of anomalous log lines and the associated log data on the Log Viewer.

Before you begin

Role required: evt_mgmt_operator, or evt_mgmt_admin

Procedure

1. Open the **Log Viewer** tab using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. **Optional:** Personalize the displayed data and how it is presented on the Log Viewer.
   - Filter search results on the Log Viewer in Health Log Analytics to show only the data you want to view.
   - Customize the Log Viewer table in Health Log Analytics by adding or removing columns.

   These features are supported in the Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store.
3. Analyze log-based anomalies and added context to help you achieve faster mean time to repair (MTTR).
   For example, say you find a log line with errors found in a configuration file. On the **Anomaly** card, a sudden spike on the chart indicates where the configuration file is generating the errors. You can view additional key-value pairs extracted from the logs on the **Meaningful log properties** card and find the affected application services and their related service offerings on the **Impacted services** card. For greater context, you may want to investigate the logs that surround the anomaly, locate the configuration file, and find the time frame where the issues occurred.

What to do next

Use additional features on the Log Viewer to refine your search or define alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Modify the search query to fine-tune the search and save useful searches. See Define, save, and share a search of log data in Health Log Analytics.
- If you discover important relationships in the log data, select **Define alert** to define the kind of alert that should be triggered by the data. See Define a custom Log Analytics alert rule in Health Log Analytics for instructions.

Related topics

Reviewing the logs for an alert on the Log Viewer in Health Log Analytics

Define, save, and share a search of log data in Health Log Analytics

Define, save, and share searches of log data to help determine the causes of Log Analytics alerts.

Before you begin

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Define a search.
   a. Select the selection icon ( ) and then select **New search**.
   b. Set the values of the search parameters in the search fields.

Search fields

Search field	Description
Query	Search query. **Tip:** The Log viewer uses the Elasticsearch search engine, so you can use any supported search term structure in the **Query** field.
Component	Logical component of the service instance that generated the event. Multiple CIs can sometimes perform the same function.
Time range	Time range to apply to the X-axis when displaying the returned data. The setting that you specify appears in the **Start time** and **End time** fields. Use one of the following methods: ▪ Select a time period from the list. ▪ Click **Custom range** to use the date and time picker to specify a range.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search field	Description
	Note: You can modify the settings in the **Start time** and **End time** fields manually. The selected time range shown in **Select range** then changes to Custom range. This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store. **Note:** Saved searches don't include time range settings.

c. Select **Search**.

The system returns the full list of log lines that match the search values. The information is displayed in the Results over time chart.

3. **Optional:** Save the search.
The saved search includes any selected filters. For information about filters, see Filter search results on the Log Viewer in Health Log Analytics.

Note: Saved searches don't include time range settings.

a. Select **Save As**.

b. In the **Search name** field, specify a unique and descriptive name for the search and then select **Save**.

Note: If you're using Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store, you can define an alert rule without saving the search. For more information, see Alert rules in Health Log Analytics.

4. **Optional:** Share the saved search with an assignment group.

a. Select **Share**.

b. Select an assignment group from the list.

c. Select **Save**.

4. **Optional:** Remove a filter in one of the following ways.
   - In the **Filters** pane:
     a. Locate the filter you want to remove.
     b. Select **Remove**.
   - In a column header:
     a. Select the more actions icon (⋮).
     b. Select the filter you want to remove.
     c. Select **Remove filter**.

Customize the Log Viewer table in Health Log Analytics

Add or remove columns in the **Log viewer** table to show only the data you want to view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_operator, or evt_mgmt_admin

About this task
This feature is supported in the Health Log Analytics application, Version 20.0.11 - July 2021, and the Health Log Analytics Viewer application, Version 20.0.4 - July 2021, available from the ServiceNow Store.

Procedure
1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Select the filter icon ( ) to display the **Filters** pane.
   The Selected fields list includes the fields that currently display as columns in the **Log viewer** table. By default, the table includes the following columns: Application service, Component, Host, Level, Message, Raw message, and Time. The Available fields include all remaining fields that the system has extracted from the log.

   In the Service Operations Workspace Log Analytics application, Version 21.2.7 - November 2022 and later, available from the ServiceNow Store, the Log message column is added and the Raw message column no longer displays by default. You can add the Raw message column to the table by selecting it from the **Filters** pane.
3. Add or remove columns in the **Log viewer** table.
   - To add a column to the table, select the field of the same name in the Available fields list and then select the add icon ( ).

     The added field displays as a column in the table. It is now listed in the Selected fields list.
   - To remove a column, select the field of the same name in the Selected fields list and then select the remove icon ( ).

     The corresponding column is removed from the table. The removed field is added to the Available fields list.

     If you have filtered the data for specific values in a field, that data still displays even when the field is no longer selected. For more information about filtering data, see Filter search results on the Log Viewer in Health Log Analytics.

     Note: The Time column can't be removed from the table.
4. **Optional:** Adjust the maximum number of characters per field in the table.
   a. Navigate to **Health Log Analytics** > **Health Log Analytics Administration** > **System Properties**.
   b. Open the *sn_occ.log_viewer.max.characters* property record.
   c. In the **Value** field, edit the default value.
   d. Select **Update**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The **Log viewer** table shows the customized view from the current session onward until you change your preferences.

Assigning higher or lower significance to an alert in Health Log Analytics

Label an alert as meaningful or insignificant, or restore normal importance to the metric involved in generating it.

Mark an alert as significant in Health Log Analytics

Make an alert more likely to be included in a Log Analytics group when the associated metric behaves anomalously by labeling the alert as meaningful.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. In the Service Operations Workspace, open a Log Analytics alert and then select **Apply ML feedback** > **Mark as significant**.
2. Confirm the action in the dialog box.

   Note: Processing this feedback might take a few seconds.

3. **Optional:** Restore the significant alert.
   If you no longer want the significant alert to be treated specially, you can restore normal significance to the alert metric. For more information, see Restore normal importance to an alert metric in Health Log Analytics.

Mute an unimportant alert in Health Log Analytics

Eliminate distracting new alerts for insignificant issues by muting them.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

About this task
When you mute an alert that is based on the keyword metric or the pattern severity metric, the system mutes the metric in the dominant pattern. The dominant pattern is the main pattern that contributes to the anomaly. For the specified source only, anomalous behavior for the metric that is associated with the muted alert no longer generates alerts. You can also mute the metric that is associated with an unimportant alert for all components of the Application Service. A component can be multiple CIs that perform the same function.

Procedure

1. In the Service Operations Workspace, open the Log Analytics alert that you don't want to see again.
2. Select **Apply ML feedback**
3. Mute the metric associated with the alert by doing one of the following:
   - Select **Mute alert metric** to mute the metric for the specified source only.
   - Select **Mute alert metric for all components** to mute the metric for all components of the Application Service.
4. Confirm the action in the dialog box.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Processing this feedback might take a few seconds.

5. **Optional:** Restore the muted alert.
   If you no longer want the muted alert to be treated specially, you can restore normal significance to the alert metric. For more information, see Restore normal importance to an alert metric in Health Log Analytics.

View the list of muted metrics in Health Log Analytics

Decrease sensitivity to similar anomalies in Health Log Analytics

Make anomaly detection less sensitive to anomalies like the one that triggered the current Log Analytics alert.

Before you begin

Note: This functionality is not available for customer alerts and new signal alerts.

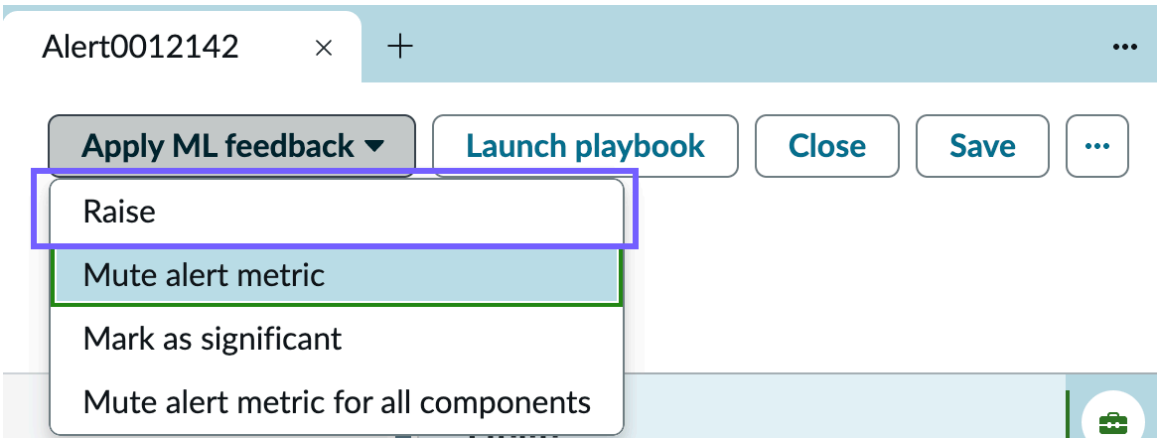
Role required: evt_mgmt_operator or evt_mgmt_admin

About this task

Selecting the Raise feedback option raises the threshold for generating alerts when Health Log Analytics identifies future anomalies similar to the one that led to this alert.

Procedure

1. In the Service Operations Workspace, open a Log Analytics alert and then select **Apply ML feedback** > **Raise**.



2. Confirm the action in the dialog box.

Note: Processing this feedback might take a few seconds.

3. **Optional:** Restore normal sensitivity to anomalies like the one that triggered this alert.
   a. While viewing the alert, select **Remove feedback**.
   b. Confirm the action in the dialog box.

Restore normal importance to an alert metric in Health Log Analytics

Return normal significance to the metric involved in generating a Log Analytics alert. Use this option if you no longer want an alert to be treated specially that was muted, marked as significant, or made less sensitive to similar anomalies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure
1. While viewing a Log Analytics alert in the Service Operations Workspace, select **Restore ML feedback**.
2. Confirm the action in the dialog box.

Result
The metric that is associated with the alert returns to normal importance.

Dashboards for real-time visualization of log data in Health Log Analytics

Health Log Analytics enables you to create log data dashboards and visualizations in real time for enhanced data monitoring and faster identification of deviations.

Log data dashboards and visualizations can give you a high-level visual understanding of important issues as they occur in the system. The Health Log Analytics data source of your choice is used to ingest the data that is provided to the visualization. The log data is taken directly from your stored logs, enabling you to create dashboards for any aspect of the data that interests you. For example, by visualizing the components that are generating logs, you can get an indication of the number of components that are fully integrated.

The data can be presented in various types of graphs and charts. You can adjust the time range and the other settings of the visualization as needed.

This functionality is supported in the Service Operations Workspace Log Analytics application, Version 21.2.7 - November 2022 and later, and has a dependency on the Platform Analytics Workspace, available from the ServiceNow Store.

As an alternative to defining your own dashboard, you can use the AIOps dashboards, which offer comprehensive visualizations of critical operational data. For more information, see AIOps Dashboards in Service Operations Workspace for ITOM.

Example of a log data dashboard

Create log data dashboards and visualizations in Health Log Analytics

Build Health Log Analytics log data dashboards and visualizations in real time for easier identification and understanding of issues.

Before you begin

This functionality is supported in the Service Operations Workspace Log Analytics application, Version 21.2.7 - November 2022 and later, and has a dependency on the Platform Analytics Workspace, available from the ServiceNow Store.

For detailed information about creating and working with dashboards, see Dashboards in the Analytics Center.

Note: As an alternative to defining your own dashboard, you can use the AIOps dashboards, which offer comprehensive visualizations of critical operational data. For more information, see AIOps Dashboards in Service Operations Workspace for ITOM.

Role required: evt_mgmt_operator or viz_admin

Procedure

1. Navigate to **Workspaces** > **Platform Analytics Workspace**.
2. On the Analytics Center page, select the **Dashboards** tab.
   This tab enables you to view all the dashboards you have rights to access on your instance. You can filter the dashboard tiles to limit the number that are visible.

   Note: If you want to use an existing dashboard, select the dashboard here to open it. Otherwise, create a dashboard as explained in the remainder of this procedure.

3. Create a dashboard.
   a. Select **Create new dashboard**.
   b. In the New dashboard dialog, choose **In-line editor** and specify a name and optional description for the dashboard.

      Note: The in-line editor does not automatically save your work. Ensure that you save regularly.

   c. Select **Create new dashboard**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Add an element to the dashboard.
   Various elements are available to help you organize and populate the information on the dashboard. For more information, see Analytics Center dashboard elements.

   a. Select **Add new element**.

   b. Select **Data visualization** from the available elements.
   The **Data visualization** element appears on the dashboard, where you can edit it.

   Note: You can click and drag the corners of the element to resize it.

5. Edit the element.

   a. On the element, select the Settings icon:

   The Configuration panel opens.

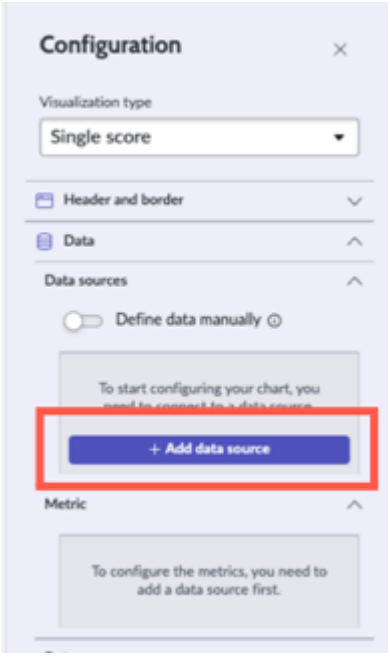
   b. From the **Visualization type** list, choose the type of visual representation you want for the log data.
   You can choose from various types of graphs and charts.

   For detailed information, see Data visualizations in the Analytics Center.

   c. In the Data section, select **+ Add data source**.

   The Health Log Analytics data source that you select is used to ingest the log data that is provided to the visualization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

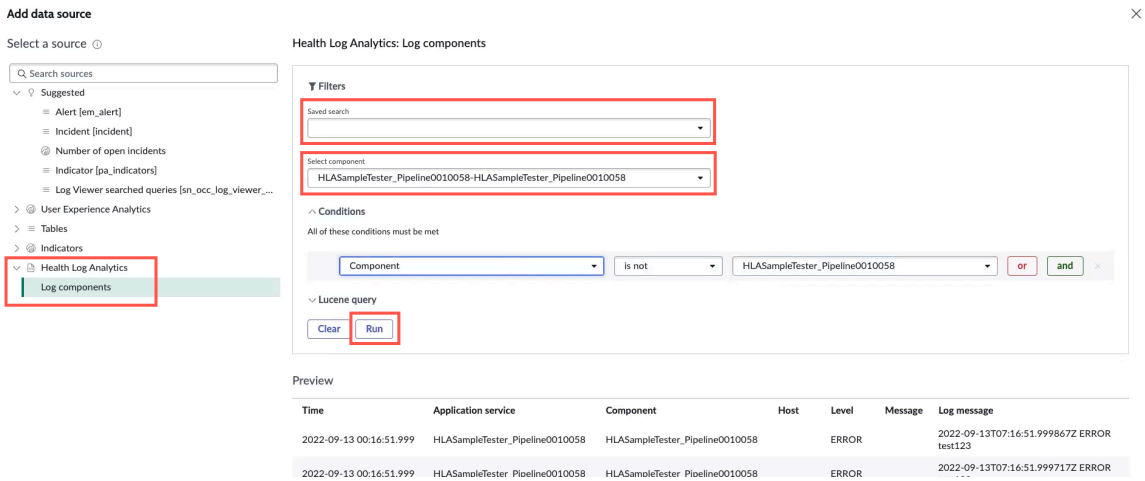


d. Select the Health Log Analytics Log components data source.

e. Choose the required data source from these options:

- Saved searches – a list of all the searches you saved in the Log viewer.
- Select component – a list of all the components that stream data to Health Log Analytics.

f. Use Conditions, a Lucene query, or both to specify the data segment you're interested in and then select **Run**.



g. Select **Add this source** to add the selected Health Log Analytics data source. The specified visualization displays in the **Data visualization** element.

h. Optional: Set fixed start and end dates to customize the time range of the presented data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional) 
i. In the Date range section, select **Set absolute period**.

ii. Specify the start and end date for the absolute period in the appropriate calendars.

i. **Optional:** Adjust the other settings of the visualization as needed.

(Optional) For detailed information on settings for all the visualization types, select the link for the relevant type in Data visualizations in the Analytics Center.

j. **Optional:** Add more elements as needed.

k. Select **Save** to save your changes and continue editing.

l. Select **Exit editing mode** to stop editing and display the dashboard.

Monitor visualized log data on a predefined dashboard in Health Log Analytics

Use visualizations to monitor log data on the built-in Operational Dashboard in Service Operations Workspace Log Analytics and address issues as they occur in the system.

Before you begin

Role required: evt_mgmt_operator or viz_admin

Important: From the Vancouver release onward, this feature is deprecated and replaced with the AIOps HLA Operational dashboard. For more information about AIOps dashboards, see AIOps Dashboards in Service Operations Workspace for ITOM. You can also build a custom dashboard per your needs. For more information, see Create log data dashboards and visualizations in Health Log Analytics.

Procedure

1. Open the **Log Viewer** using one of the following methods:
   - Navigate to **Workspaces** > **Service Operations Workspace** and select the Log Viewer icon ( ).
   - While viewing log entries for an alert on the **Surrounding logs** tab, select **Log Viewer**.
2. Select the selection icon at the top right of the **Log viewer** tab, and then choose **Manage my dashboards** from the drop-down list.
   The **Operational Dashboard** tab displays.

   By default, the dashboard visualizes log data that was ingested in the last 24 hours.

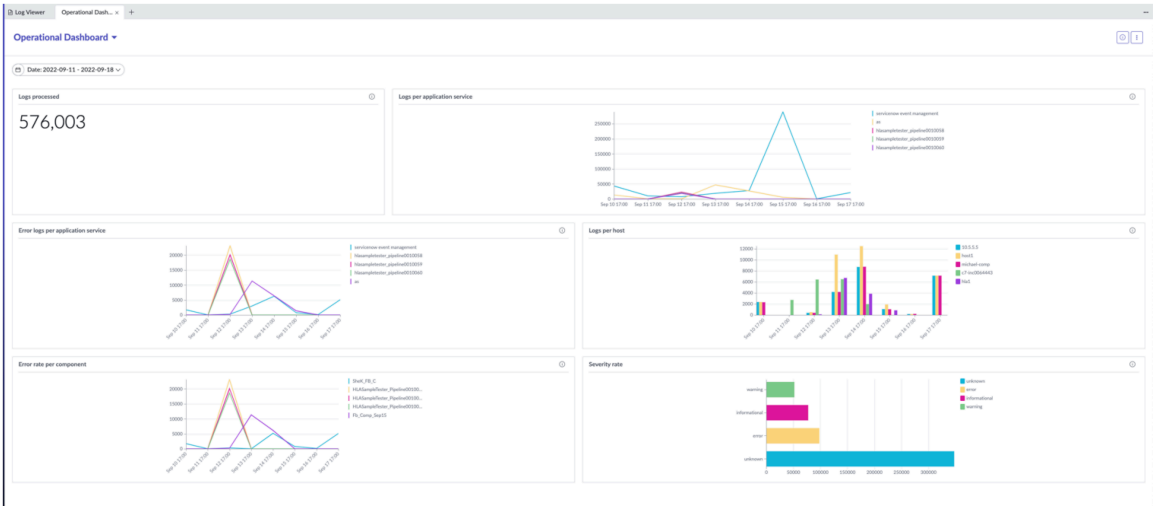
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. **Optional:** Change the time range for which data is shown by selecting the required range from the **Date** drop-down.
   You can specify a custom range by selecting **Custom** and then selecting the required start and end dates.
4. Monitor the visualized log data and use it to identify and address issues.

Operational Dashboard

Name	Description	How to use the data
Logs processed	The number of logs that were processed and analyzed in the selected period.	Ensure that the log data is streaming as expected.
Logs per Application Service	The number of logs streamed for each application service in the selected period.	Ensure that log data is streaming as expected for each application service.
Error rate per Application Service	The number of logs with errors for each application service in the selected period. **Note:** Health Log Analytics automatically creates alerts for Error anomalies.	Identify errors in the logs.
Logs per Host	The number of processed logs for each host in the selected period.	Identify hosts that are logging more data, or less data, than expected.
Error rate per Component	The number of logs with errors for each component in the selected period.	Ensure that the components have a normal Error rate.
Severity rate	The severity level rate of the logs for the streaming sources.	Ensure that Critical and Error level rates are as expected.

Add a KB article to a Log Analytics alert

Add your own knowledge base (KB) article to an alert that was generated by Health Log Analytics. For example, you can provide additional information that might help to resolve the underlying issue.

Before you begin

This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, and the Health Log Analytics Viewer application, Version 21.0.0 - December 2021 and later. These applications are available from the ServiceNow Store.

Role required: evt_mgmt_operator or evt_mgmt_admin

Procedure

1. Open a Log Analytics alert.

   a. In the Service Operations Workspace, select the lists icon ( ).

   b. Select the appropriate list in the Alerts sub-list and navigate to the desired alert.
   In the **All Alerts** list, alerts that were generated by Health Log Analytics have the value **Log Analytics** in the **Source** column.

   c. Select the alert number.

2. Select the more actions icon ( ) at the top right of the **Details** tab and then choose **Create KB article for this issue** from the list.
3. On the form, fill in the fields.

Create New Knowledge form

Field	Description
Knowledge base	The knowledge base where the new KB article is stored. By default, this value is the Health Log Analytics knowledge base.
Workflow	(Read-only) The status of the KB article. When you publish the article, its status automatically changes from Draft to Published.
Category	The category of the component that caused the alert.
Short description	Summary of the KB article.
Article body	Content of the KB article.

4. Select **Save**.
5. When the content of the article is final, select **Publish**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The KB article is added to the selected alert. You can search for and display the article in the Agent assist side panel. Health Log Analytics also uses your article to enhance similar alerts with the same Event ID property or alert pattern.

Service Operations Workspace for ITOM reference

Reference topics provide additional information about ServiceNow Service Operations Workspace.

Components installed with AIOps Experience

Several types of components are installed with activation of the AIOps Experience [sn_sow_aiops] application, including user role and plugins.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

Roles installed

Role title [name]	Description	Contains roles
evt_mgmt_user	Manages the alert lifecycle and performs basic operations, such as viewing alerts.	itil
evt_mgmt_operator	Manages alerts, including tasks such as closing and acknowledging them.	evt_mgmt_user
evt_team_operator	Manages Event Management operations within a specific team as defined in the **Assignment Group** field. This role allows the operator to read and write alerts exclusively for their assigned team. Additionally, the operator can make configuration changes specific to their team, including updates to Alert Automation and the Integrations Launchpad.	sn_sow_alert_rules.automation_create_nonglobal sn_sow_alert_rules.automation_delete_nonglobal

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
	Note: The evt_team_operator role must be assigned to an assignment group to view and manage alerts for that group. If the role is created but not associated with any groups that have alerts assigned, the operator cannot see any alerts.	
evt_mgmt_admin	Configures and sets up Event Management properties and rules.	evt_mgmt_user and evt_mgmt_operator

Plugins installed

Plugin	Description
Event Management [com.glideapp.itom.snac]	Provides service-oriented availability and monitor events through an intuitive console.
Performance Analytics - Premium [com.snc.pa.em]	Provides core out-of-the-box Key Performance Indicators (KPIs) to help monitor and enhance event management processes. Please note that activating this plugin on production instances may require a separate Performance Analytics license.
Performance Analytics - Content Pack - Event Management [com.snc.pa.premium]	Includes core out-of-the-box Key Performance Indicators (KPIs). Activating this plugin on production instances may require a separate Performance Analytics license.

To return to the procedure, see Install Service Operations Workspace for ITOM application.

Attributes in Express List Link View

The table lists the node attributes available in Link View with their icon and description.

Note: "Attribute" is a generic term that represents fields and tags found on the alerts or configuration items (CI).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attributes in Link View

Attribute name	Icon	Description
Impacted service		Service in the Configuration Management Database (CMDB) impacted by an alert on a CI.
Resource		Node resource that is relevant to the event. For example, Disk C, CPU-1, the name of a process, or service. Maximum length: 100 characters.
Source		Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Region		Predefined attribute extracted from connector payload.
Location		Predefined attribute extracted from connector payload.
Assignment group		Alert assignment group.
Environment		Predefined attribute extracted from connector payload.
Metric		Unique name that describes which metric data is collected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attributes in Link View (continued)

Attribute name	Icon	Description
IP address		Predefined attribute extracted from connector payload.
CI		JSON string that represents a configuration item. For example, `{"name":"SAP ORA01","type":"Oracle"}`. The CI identifier that generated the event appears in the Additional information field. Maximum length: 1000 characters.
Node		Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.
Application		Predefined attribute extracted from connector payload.
Process		A process or a cluster of processes running on the host that are identified by the horizontal discovery.
Component		A logical part of a service instance where the alert was detected, with one component shown for each child alert.
Service		Attribute extracted from the log file. The impact of this alert on the service might not be clear or defined.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attributes in Link View (continued)

Attribute name	Icon	Description
Host		Attribute extracted from the log file. It might not be identified in the CMBD.
User		Attribute extracted from the log file.
Account		Attribute extracted from the log file.
Path		Path or route extracted from the log file.
Request id		The request ID extracted from the log file.
URL		Web address or URL extracted from the log file.
Detection		An identified anomaly on a metric measured by Health Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attributes in Link View (continued)

Attribute name	Icon	Description
Other **Note:** This attribute is user-defined. All the other attributes are predefined in the system.		User-defined attribute. **Note:** All the other attributes are predefined in the system.

Lines linking attributes

Link	Visual representation	Description
Solid line	—	Solid line linking attributes in Link View, indicating that the attributes share one or more alerts.
Dotted line	•••	Dotted line linking attributes in Link View, indicating that the attributes are correlated by grouping criteria.

Alert field mapping on the Respond page

The fields to be configured on the Respond page, when selecting an action to be triggered by an alert automation.

Select automation actions fields

Field	Description
Incident field name	Name of the field that will appear in the incident.
Map field	Option that indicates how the incident field is to be mapped: • **Same as**: The selected incident field will have the same value as the indicated alert field. • **To**: The selected incident field will be set to a specified value.
Alert field value	Value that will be set in the alert field: • If you select **Same as** in the Map field column, the alert field value that you want to appear in the incident field also appears in the Incident field name column. • If you select **To** in the Map field column, enter the alert field value that you want to appear in the specified incident field.

To return to the procedure, see Create Respond automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Outbound webhook parameters

The parameters to be configured when sending data to other systems using an outbound webhook.

Outbound webhook parameters

Parameter	Definition
Destination URL field	The webhook endpoint (URL) where the alert is to be sent.
JSON payload data tab	The alert data, composed in JSON format, being sent to the indicated URL. Enter the details you want to be notified about in the JSON object when the automation is triggered. You can insert alert fields by selecting **Insert Field Values** or add custom fields by typing {custom_field.JSON_path}. To add additional alert fields, select **Insert alert fields**.
Payload headers	Add predefined or custom metadata headers in the **Key** and **Value** fields. A key is the name of a header field, and a value is the corresponding data assigned to that header field.
Test payload	Select to verify that the webhook is functioning correctly and that the receiving system can process the data as expected.

To return to the procedure, see Create Respond automation.

Application service details page

Provides comprehensive information about an application service, including its name, business criticality, ownership, process and operational status, traffic-based discovery details, discovery status, and relevant comments. This enables thorough analysis of the application service's current state and usage, provides clarity on ownership and criticality, and aids in prioritizing resources and actions effectively.

Application service details page fields

Field	Description
Name	Name of the application service.
Business criticality	Importance level of the service to business operations.
Owned by	Person or team responsible for managing and overseeing the service.
Process Status	Current stage or status of the service's operational processes.
Operational status	Current stage or condition of the service's operational processes, showing whether it is functioning smoothly or encountering issues.
Traffic based discovery	Option to identify service instances based on network traffic patterns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application service details page fields (continued)

Field	Description
Discovery status	System's ability to locate and recognize the service within its network.
Comments	Additional notes or pertinent information regarding the service that may be helpful for understanding its management or usage.

To return to the procedure, see View application service details in Service Operations Workspace.

Create list fields

Create customized lists with fields tailored to your needs.

The form you complete varies depending on whether you choose to base your list on an existing one (**Start from existing**) or create a new list (**Create your own**).

Start From Existing form

Field	Description
List	Existing list that you want to modify.
List Name	Name for your list. The default name in this field is the name of the existing list in the **List** field with `- Copy` appended.
Select columns	Record fields to include in list view. The columns from the list you selected appear. You can add or remove columns to modify the list.
Add Filters	Condition used to filter the list. By default the conditions applied to the list selected appear. You can modify this condition.

Create Your Own form

Field	Description
List Name	Name for your list.
Select Source	Source table for the records.
Select columns	The columns to display in the list. This field is populated with columns from a Workspace list view if one exists. If a Workspace list doesn't exist, the columns are populated with the Default list view of the table selected.
Add filters	Condition used to filter the list.

To return to the procedure, see Create a list in Service Operations Workspace for ITOM

Metrics View Configuration form fields

Define how metrics are displayed within Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metrics View Configuration form

Field	Description
Title	Name of the metric.
Active	Option to activate the metric.
Order	Numerical value indicating the order of the metric on the page.
Configuration Item Type	Configuration item type. Available options are: • cmdb_ci_app_server_tomcat • cmdb_ci_metric_extension • cmdb_ci_app_win_server
Source Metrics Types	Metric types you want the metric to monitor. Select the Lock icon ( ) to unlock the list of source metric types and select metric types to be monitored.
Chart Type	Type of chart in which the metric is presented in Service Operations Workspace, either **Line** or **Stacked Bar**.

To return to the procedure, see Configure alert metrics.

Integration and configuration health event fields

Populate the event fields to capture details such as the event time, description, alert number, state, severity, metric name, node, message key, and error message, enabling precise tracking, effective incident management, and improved error analysis.

Event fields

Field	Description
Time of Event	Indicates when the event occurred.
Description	Provides details about the event or incident.
Alert	Specifies the alert number that is triggered based on the event.
State	Describes the current state of the event (e.g., open, closed).
Severity	Indicates the severity level of the event (e.g., critical, warning).
Metric Name	Identifies the specific metric associated with the event.
Node	Specifies the node or device related to the event.
Message Key	Unique identifier for the event message.
Error Message	Provides additional information about any errors associated with the event.

To return to the procedure, see Review integration and configuration health.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dynatrace advanced settings fields

Populate the pull connector advanced settings fields to optimize event retrieval and synchronization based on specific requirements such as connection preferences, event frequency, and time zone settings.

Dynatrace advanced settings fields

Field	Description
Base API path	Root URL or endpoint used to connect to the Dynatrace Metrics API. All API requests are made relative to this base path.
Initial sync in mins	Time, in minutes, that the system takes to complete the first synchronization of data with the Dynatrace Metrics API. For example, if the value is 15, the connector fetches metrics from the past 15 minutes. Default: 15
Max metrics per query	Maximum number of metrics that can be requested in a single query to the Dynatrace Metrics API. The value cannot exceed 32, the maximum limit allowed by Dynatrace. Requests exceeding this limit must be split into multiple queries. Default: 32
Page Size	Number of records returned in a single response when querying the Dynatrace Metrics API. If the total results exceed this number, multiple pages are returned. Default: 500
Port	Port number used for connecting to the Dynatrace server.
Request per minute	Maximum number of API requests that can be sent to the Dynatrace Metrics API within one minute. Exceeding this limit may result in throttling or temporary blocking of requests. **Note:** Relevant only when you enable **Throttle API calls**. Default: 1000
Throttle API calls	Limits the rate of API requests to the Dynatrace Metrics API, preventing overload, request failures, or temporary blocking. Enable this option to automatically limit the rate of API requests, preventing overloading the Dynatrace Metrics API and avoiding request failures. Default: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dynatrace advanced settings fields (continued)

Field	Description
Protocol	Communication protocol used for retrieving events from Dynatrace server. Default: https
Debugging	• Debug: Provides detailed logs for troubleshooting. • Log payload: Displays raw log data. Use only for debugging, as it can quickly fill the MID Server logs.

To return to the procedure, see Configure Dynatrace metric pull connector.

Pull connector fields

Populate the pull connector advanced settings fields to optimize event retrieval and synchronization based on specific requirements such as connection preferences, event frequency, and time zone settings.

Advanced settings fields

Field	Description
Connected MID Server	Determine whether you want to have the system choose the optimal MID Server or choose a specific MID Server yourself. Perform only if you must make modifications to the MID Server otherwise leave it empty and let the system choose the optimal MID Server.
Event collection schedule (seconds)	Enter the frequency in seconds that indicates how often the system should check for new events from the external event source. The value can't be lower than the minimum schedule property, which by default is 120 seconds.
Protocol	Defines the communication protocol used for retrieving events from external devices.
severity_by_state_type	Determines the severity level assigned to events based on their state type.
time_zone	Specifies the time zone used for recording and displaying event timestamps.
offset_min	Sets the time offset for event retrieval to ensure accurate synchronization.
Port	Verify the default values for your connector type such as port details or time formats and modify them as necessary. Default values from your connector are filled-in. Specifies the port number used for communication with external devices.
max_fetch_interval_min	Limits the maximum interval between event fetch operations.
initial_sync_in_days	Sets the duration for the initial synchronization process when retrieving historical data.

To return to the procedure, see Configure an event pull connector.

Synthetic monitoring

The ServiceNow® synthetic monitoring application empowers organizations to proactively manage and enhance the performance and availability of critical services. By simulating user transactions on API endpoints, this solution identifies performance bottlenecks, helps ensure up-time, and optimizes user experiences.

Get started

Explore Learn about synthetic monitoring	Configure Add users and create and manage a synthetic monitor
Identify Use synthetic monitoring to identify performance issues	Reference Find reference information about synthetic monitoring

Exploring synthetic monitoring

Learn how synthetic monitoring provides proactive, automated testing of service endpoints. By simulating user interactions, it can identify bugs, performance issues, and outages before they impact real users.

Synthetic monitoring overview

Synthetic monitors continually call HTTP endpoints in the Configuration Management Database (CMDB) to test availability, response times, or the presence of a defined string in the response body. When a test fails the configured criteria, it can alert you to endpoint issues before your users do.

For example, you might create a monitor that tests the *GET* HTTP endpoint of a service. You could configure that monitor to check for a status code of 200 and a response time of under 500 ms. If any code other than 200 is returned or the request takes longer than 500 ms, the test fails. An alert can then be generated and sent through Event Management.

The synthetic monitoring tests can be run by an Agent Client Collector (ACC) deployed in your network, on a MID Server, or on the ServiceNow platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The HTTP endpoints must exist in the HTTP Endpoints [cmdb_ci_endpoint_http] table. Endpoints tested from the ServiceNow platform must be publicly accessible.

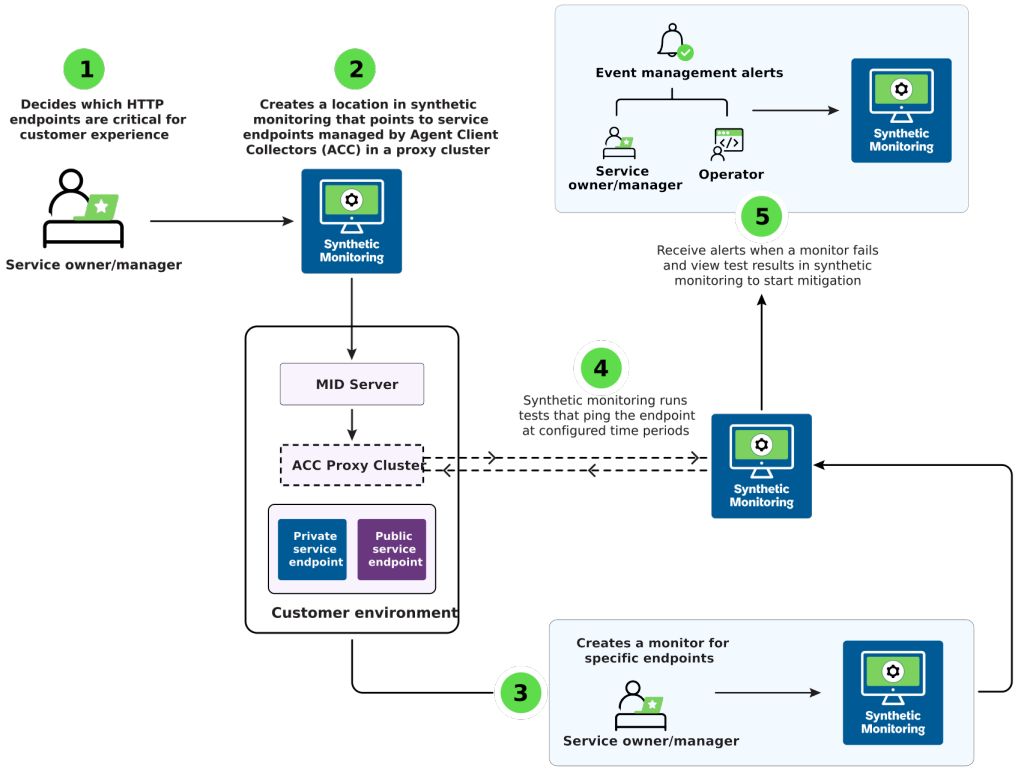
Synthetic monitoring users

Synthetic monitoring users

User	Description
Synthetic monitoring administrator (admin role)	Assigns roles, creates and edits monitors, and views monitor tests and their results.
Service owner (Editor role)	Creates and edits monitors and can also view monitor tests and their results.
Network operation center (NOC) operator (Viewer role)	Monitors tests and their results.

Synthetic monitoring customer-hosted workflow

Synthetic monitoring workflow



Admins, service owners, and NOC operators use synthetic monitoring in the following way:

1. As a service owner, you determine which endpoints to monitor based on business criticality.
2. As an admin or service owner, you configure locations to run the monitor from.

Note: The ServiceNow hosted location is available by default and does not have to be configured. However, endpoints tested by that location must be publicly available. You can also run the monitor from an ACC Proxy cluster or a MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. As an admin or service owner, you configure the monitor and then after it runs once, review the results of the tests. If the results aren't successful, you troubleshoot the configuration. You can also create an alert that fires when a test fails.
4. Synthetic monitoring runs tests based on the monitor's configuration and reports the results of each test.
5. As a service owner or operator, you monitor the test results and also respond to any generated alerts.

Synthetic monitoring benefits

Configuring synthetic monitoring

Plan and configure your implementation of synthetic monitoring.

Configuration overview

Install synthetic monitoring

You can install the synthetic monitoring application (`com.snc.uib.sow_synthetics`) with the admin role.

Before you begin

- Confirm that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the synthetic monitoring application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Confirm that the Configuration items (CI) that you want to monitor exist in the CMDB HTTP Endpoints [cmdb_ci_endpoint_http] table.
- Confirm that configured credentials exist in the Credentials [discovery_credentials] table if your endpoint requires authentication.

> **Note:** Synthetic monitoring supports API key credentials, basic authentication credentials, and OAuth.

Role required: sn_sow_synthetics.synthetics_admin

About this task

The following items are installed with synthetic monitoring:

- Plugins
- Roles
- Tables

For more information, see Components installed with synthetic monitoring.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the synthetic monitoring application (com.snc.uib.sow_synthetics) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

What to do next

Create synthetic monitoring locations

Create synthetic monitoring locations

Create a synthetic monitoring location to run a synthetic monitor. If you plan to run monitors from a ServiceNow hosted location, you can skip this procedure.

Before you begin

You need at least one of the following:

- A MID Server
- One or more Agent Client Collector (ACC) agent that monitors the health and performance of the HTTP endpoints to be monitored using synthetic monitoring. If you plan to run tests only from the ServiceNow hosted location, you don't need to set up a location.

Note:

- If your synthetic monitor is testing a private HTTP endpoint, your location must only include ACC agents that are within the same network boundaries as the HTTP endpoint.
- If your monitor is testing an HTTP endpoint from different datacenters, cloud providers, or geographic regions, a different location must be used for each.

Role required: sn_sow_synthetics.synthetics_admin

About this task

Synthetic monitors can be hosted from:

- A MID Server
- A cluster of Agent Client Collector agents
- A ServiceNow hosted location, as long as all monitored endpoints are publicly available. You don't need to configure a local instance as a location. It's available by default.

You can create as many locations as needed, but you must have at least one location to create a synthetic monitor.

Procedure

1. Navigate to **All** > *Service Operations Workspace* > **Configurations**.
2. Navigate to **Synthetic monitoring setup** > **Manage Locations**.
3. Select **Create a new location**.
4. Expand the Location details card and enter a unique name and an optional description for this location.
   The description should clearly state where the servers or agents in this location are running. For example, `US-1-east-cluster`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **Location type** field, select either **MID Server** or **Agent Client Collector**, depending on where you want the monitor to be hosted.
6. Expand the **Select** card and select one or more MID Servers or ACC agents.
7. Select **Save**.

> **Note:** You can delete locations from the Synthetic Locations menu, which you can navigate to by selecting **All** > **Synthetic Monitoring** > **Synthetic Locations**. However, you must first remove any monitors running on that location, either by editing the monitors to use a different location or deleting the monitors. See Create and edit a synthetic monitor for more information.

What to do next

Create and edit a synthetic monitor

Create and edit a synthetic monitor

Create or edit a synthetic monitor to test the availability and performance of your HTTP endpoints before your users discover issues.

Before you begin

- A configuration item (CI) for the endpoint you want to test.
- If you're testing private endpoints or want to run the monitors from your environment, one or more locations must be created to host the monitor. To create a location, see Create synthetic monitoring locations.

> **Note:** For information about how to bulk create synthetic monitors, see the Synthetic Monitoring Developer Guide.

Role required: sn_sow_synthetics.synthetics_editor or sn_sow_synthetics.synthetics_admin

Procedure

1. Navigate to **All** > *Service Operations Workspace* and select the synthetic monitoring icon ( ).
2. On the Overview page, either create a synthetic monitor or edit an existing one.
   - To create a synthetic monitor, select **New**.
   - To edit an existing one, select the link for the monitor you want to edit and then select the **Details** tab.
3. On the form, fill in the fields.

   a. In the Monitor details section, enter a unique name for the monitor and a description.

   b. In the HTTP settings section, fill in the fields.

HTTP settings section

Field	Description
HTTP method	HTTP method that you want to monitor for the endpoint. **Note:** HEAD and OPTIONS methods aren't supported from a MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
HTTP endpoint CI	CI for the endpoint that you want the monitor to test. If the endpoint doesn't exist, choose **Manage HTTP endpoints in CMDB** to create a CI.
Related service CI	Application service CI related to the HTTP endpoint. The entered value is used to create or update the CI relationship between the HTTP endpoint and the application service.
Support group	Group who is notified and assigned alerts when this monitor fails. **Note:** To view this field in the HTTP Endpoints table, use the Synthetic Monitoring view.
Query parameters	String of query parameters to include in the request URL. **Note:** The string shouldn't include the leading question mark. For example, use `id=xyz&customer=myco` instead of `?id=xyz&customer=myco`.
Credentials	Credential needed if the endpoint requires authentication. OAuth, Basic Auth, and API keys are supported.
Headers	Key-value pairs for the HTTP request headers. You can add multiple pairs.
Body	Text that is used if the API expects a message body, such as a JSON snippet.

c. In the Locations section, select one or more locations.

Choose a MID Server or Agent Client Collector location, or to run this monitor's test from your ServiceNow instance, choose ServiceNow hosted location.

Note: When running tests from your instance, only six tests can be run every minute for performance reasons.

Choose **Create new location** to create a location.

For more information on how to create a location, see Create synthetic monitoring locations.

d. In the Assertion section, define a successful test by selecting one or more criteria, an operator, and a value.

Note: Multiple criteria are joined with an `AND` phrase, so the test must pass all criteria to be successful.

Criteria type	Description of success
Status code	Endpoint returns the given status code.
Response time (in ms)	Endpoint response time is less than the given value.
Response body	Endpoint sends a string value in the response body that matches the selected operator and given value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. In the Frequency section, enter the number of minutes between each test run.

f. **Optional:** To have an alert sent through Event Management when a test fails:

- In the Alert settings section, activate the toggle switch.
- Select an alert severity for a test failure.
- Add tags to the alert. For more information about using tags in alerts, see Tag cluster alert grouping.

4. Select **Save**.

Result

The Overview page for the synthetic monitor displays the results of the tests that the monitor runs. See Identifying system issues with synthetic monitoring for more information.

Manage synthetic monitors

Edit or delete synthetic monitors after creating them.

Before you begin

Role required: sn_sow_synthetics.synthetics_editor

Procedure

1. Navigate to **All** > *Service Operations Workspace* and select the synthetic monitoring icon ( ).
2. Follow these instructions to edit a monitor.

Option	Description
Edit multiple monitor configurations	From the synthetic monitoring landing page, select one or more monitors and select **Edit**. See Create and edit a synthetic monitor. **Note:** Current values aren't shown in the fields. If you don't edit a field, the original values remain. If you want to edit properties other than cre dentials, location, or alert settings, you must edit a single monitor at a time from the **De tails** tab.
Edit a single monitor configuration	From the synthetic monitoring landing page, select a monitor to open it and then select the **Details** tab to edit. See Create and edit a syn thetic monitor for more information.
Delete monitors	From the Synthetic monitoring landing page, choose one or more monitors to delete and select **Delete**.

Create synthetic monitors from incidents

Create synthetic monitors from incidents to proactively track endpoint failures and reduce repeat occurrences.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_sow_synthetics.synthetics_admin

- Recommended Action for ITSM and Synthetic Monitoring application is installed on your ServiceNow instance
- Incident should have a valid configuration item (CI) and a service associated with it
- At least one execution location (self hosted MID Server) is available and configured

About this task

This feature helps operations teams quickly assess and respond to incidents by automatically correlating incidents with the impacted business service and related Configuration Items (CIs). It provides instant visibility into all affected endpoints and clearly highlights monitoring coverage, enabling teams to understand impact, identify gaps, and take action. Administrators currently need to use the Synthetic monitoring application to configure monitors. The application now recommends and enables synthetic monitor creation directly from the Incidents page, helping improve incident actionability and strengthening service resilience.

When incident analysis shows failing endpoints were not monitored, synthetic admin users access the incident and set up synthetic monitors to prevent the occurrence in the future.

While creating these synthetic monitors from a post-incident recommended action, the system automatically discovers HTTP endpoints associated with the incident's affected services. Users can select from the discovered endpoints to create monitors without manually entering URLs. The system automatically selects the mid server location based on the endpoints as part of the recommendations from incidents.

Procedure

1. Navigate to **All** > *Service Operations Workspace*, and to the incidents page.
2. Select the incident that has a valid configuration item (CI) and a service associated with the incident.
3. On the incident details page, locate the Recommendations panel.
   If Synthetic monitoring is available and there are no monitors for the affected endpoints, the **Add monitors** action card is displayed.

   Note:

   You must have either the administrator role or admin privileges to install the applications. If you don't, contact your system administrator to install the application.

4. Select **Add monitors** to open the monitor creation form.
5. Select the endpoints for which you want to create synthetic monitors.

   Synthetic Monitoring automatically selects an available MID server as the execution location when creating monitors. To configure a default MID server for auto-selection, set the following system property:

   sn_sow_synthetics.default_mid_location

   Note: Default values are configured for response code, frequency, and trigger status for an alert on the incident.

6. Select **Create monitor**.
   The following template is used to create synthetic monitors from Recommendations.
   `name: autogenerated type: "single_api", interval: 5,`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
should_create_alert: true, alert_severity: 1, method: "GET",
valid_http_code: "200", valid_http_code_type: "equals",
locations: Randomly selected from available Synthetics locations
of type Self hosted MID
```

Note: If you select the same endpoints and click **Create monitor** again, the application prevents duplicate monitors from being created.

7. Select the link on the success message to view the monitors created in Synthetic monitoring landing page.

Identifying system issues with synthetic monitoring

Tests run by synthetic monitors enable service owners and operators to view service endpoint performance at scale.

Overview of using synthetic monitoring

As a service owner, you can use synthetic monitoring to monitor your service's endpoints, verifying that they're available and performing as expected. You can be notified when synthetic tests fail, enabling you to mitigate issues quickly. You can see trends in HTTP API success rates and response times.

As an operator, you can use synthetic monitoring as part of triaging issues. When you learn a service is reported to have issues, you can view test results for that service's endpoints. If tests are failing or response times are slow, that might be something to investigate.

View aggregate information about the monitors

The synthetic monitoring landing page shows an overview of all created monitors, including inactive monitors.

From here, you can see the status for all your monitors. Selecting a card at the top filters the list of monitors. For example, you can view only the monitors that have failed or that are in an unknown state.

By default, the list of monitors is sorted by the timestamp in the **Updated** column. You can select a different column header to sort by that category.

Selecting a monitor lets you view details about the monitor's tests, including details, configuration, and associated alerts.

View a monitor and its tests

To view a monitor's details and the results of its tests, select a monitor from the synthetic monitoring landing page. The Monitor details page provides key information needed to understand how the monitor is performing.

Use the information in the header to understand the basic health of the monitor, including its status and when it last ran a test.

View individual tests

The Metrics card displays two charts to help you understand the health of each test the monitor has run. The **Failed tests** chart displays each test with a value of 0 when it was successful and a value of `1` when it failed. Hover over a point on the chart to view further details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Response time** chart shows the amount of time in milliseconds that it took to receive a response from the endpoint. Hover over a point on the chart to view details.

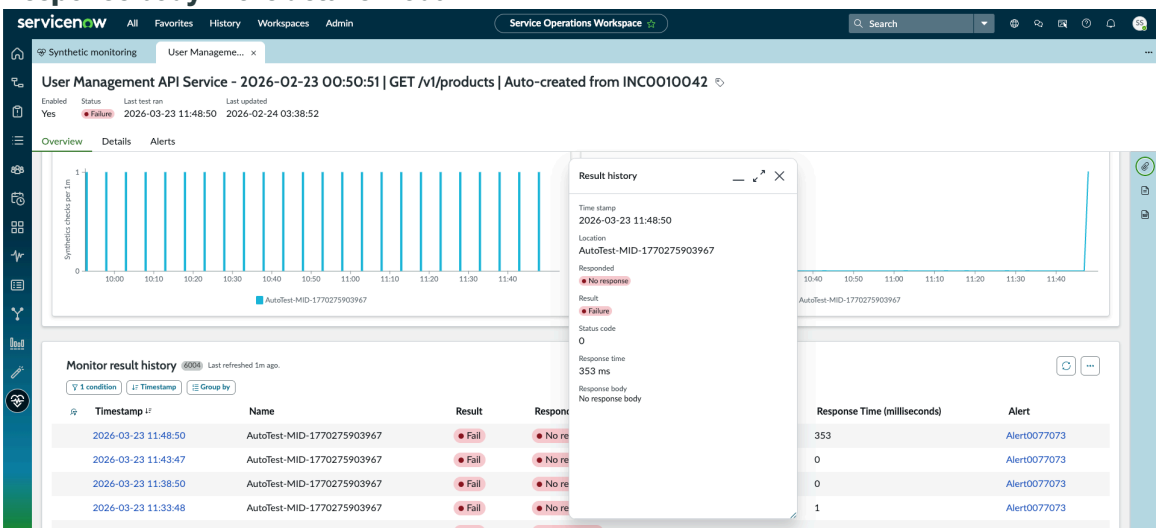
Note: Test results are retained for 21 days.

The **Monitor result history** table lists each test. By default, the table is sorted from newest to oldest by the timestamp. You can sort by any column to help find issues. For example, you can sort by **Result** to see all failures together or you can sort by **Response time** to view the tests with the highest latency.

If a monitor was configured to generate an alert when it fails, a link to the alert displays in the **Alert** column. Select an alert link to view its details.

When you see a failure or high latency, select a test to view details, including the response body, which might help explain any issues.

Response body in the details modal



View aggregate monitor information

View information about all your synthetic monitors.

Before you begin

Role required: sn_sow_synthetics.synthetics_viewer, sn_sow_synthetics.synthetics_editor, sn_sow_synthetics.synthetics_admin

Procedure

1. Navigate to **All** > *Service Operations Workspace* and select the synthetic monitoring icon ( ).
2. To filter the list of monitors, select a card at the top of the page.
   For example, to view only monitors that have failed tests, select the **Failed** card.
3. To view details about each test run by the monitor, select a monitor name.
   The monitor's Overview tab opens. For more information about this page, see View a monitor's test results.
4. To export the list of monitors, select **Export**.
   You can export to the following file formats:
   - XLSX
   - CSV

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- JSON
- PDF

View a monitor's test results

View the results of tests run by a monitor, along with configuration details, and related configuration items (CIs).

Before you begin

Role required: sn_sow_synthetics.synthetics_viewer, sn_sow_synthetics.synthetics_editor, sn_sow_synthetics.synthetics_admin

Procedure

1. Navigate to **All** > *Service Operations Workspace* and select the synthetic monitoring icon ( ).
2. Select a monitor from the list of all monitors.
3. View the overall health of the monitor in the header, which shows its status, and when it was last run and updated.
4. View health metrics for the monitor from the **Metrics** card.
   The **Failed tests** chart displays each test with a value of `0` when successful and a value of `1` when it failed. The **Response time** chart shows the amount of time in milliseconds that it took to receive a response from the endpoint. Hover over a point on the charts to view details.
   - To change the time period, use the drop-down menu.
   - To refresh the chars, use the context menu.
5. View the status of each test in the **Monitor result history** card.
   To view the details for a test, select its timestamp. For more information about the test details, see View test details.

   Note: If your monitor uses OAuth and a test fails with a 4xx error, it may be because your refresh token expired. Re-authenticate by visiting the OAuth credential page and clicking the credential link.

   To view active alerts created by the monitor, select the Alert link to open its details.

   Note: Filtering the list affects the data displayed in the metric charts.

View test details

View the results of an individual synthetic test run by a monitor.

Before you begin

Role required: sn_sow_synthetics.synthetics_viewer, sn_sow_synthetics.synthetics_editor, sn_sow_synthetics.synthetics_admin

Procedure

1. Navigate to **All** > *Service Operations Workspace* and select the synthetic monitoring icon ( ).
2. Select a monitor from the list of all monitors.
3. Select a test from the list of tests.
   The modal displays information about the test including a response body. In this example, it shows that the request was sent to a bad gateway.

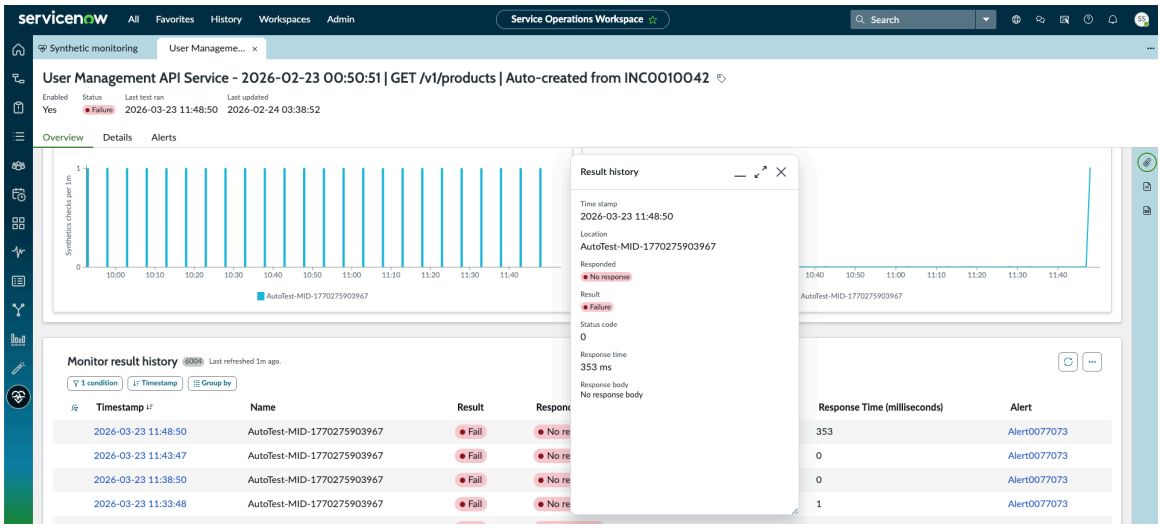
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If your monitor uses OAuth and a test fails with a 4xx error, it may be because your refresh token expired. Re-authenticate by visiting the OAuth credential page and clicking the credential link.



View alerts for a synthetic monitor

View all the current active alerts for your monitors.

Before you begin

Role required: sn_sow_synthetics.synthetics_viewer, sn_sow_synthetics.synthetics_editor, sn_sow_synthetics.synthetics_admin

About this task

You can view open alerts from all your monitors by selecting the **Open Alerts** card on the synthetic monitoring home page. To view a single alert, select the alert link from the resulting list.

To view alerts for a specific monitor, follow this procedure.

Procedure

1. Navigate to **All** > *`Service Operations Workspace`* and select the synthetic monitoring icon ( ).
2. Select a monitor from the list of all monitors and then select the **Alerts** tab.
   The **Alerts** tab shows the alerts for the monitor. Select an alert to view details.

Note: The alert shows the impacted service associated with the monitor. If for some reason this field isn't populated, see Impacted Service not appearing in alerts.

Synthetic monitoring reference

Reference topics provide additional information about the synthetic monitoring application, such as components installed and page details.

Components installed with synthetic monitoring

Several types of components are installed with activation of the synthetic monitoring plugin, including tables and user roles.

Roles installed

Role	Description	Contains roles
Synthetic monitor viewer [sn_sow_synthetics.synthetics_viewer]	Views test configurations and their results.	• cmdb_read • sn_sow.sow_user • agent_client_collector_user • sn_sow_synthetics.credential_reader
Synthetic monitor editor [sn_sow_synthetics.synthetics_editor]	Creates and edits tests. Views test configurations and their results.	• credential_admin • sn_cmdb_editor • sn_sow_synthetics.synthetics_viewer
Synthetic monitor admin [sn_sow_synthetics.synthetics_admin]	Assigns roles. Creates and edits tests. Views test configurations and their results.	• agent_client_collector_admin • sn_sow_synthetics.synthetics_editor • sn_sow_itsm_admin.sow_admin_user
Synthetic monitor credential reader [sn_sow_synthetics.credential_reader]	Used internally to read from the Credentials [discovery_credentials] table.	None
Synthetic monitor event writer [sn_sow_synthetics.synthetics_event_writer]	Used internally to communicate with the MID Server.	None

Tables installed

Table	Description
Check [sn_sow_synthetics_check]	Configuration information for synthetic checks.
Check Execution Location [sn__sow_synthetics_check_execution_location]	Execution location configuration for synthetic checks.
Single API [sn_sow_synthetics_check_single_api]	Additional configuration information and last run results for single API synthetic checks.
Single API Header [sn_sow_synthetics_check_single_api_header]	Key value pairs of requests headers for single API synthetic checks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Single API to Policy [sn_sow_synthetics_check_single_api_policy]	Single API synthetic test data and its corresponding Agent Client Collector (ACC) policies.
Single API Result [sn_sow_synthetics_check_single_api_result]	Results from each synthetic check run.
sn_sow_synthetics_recommendation_state	Per-endpoint creation state, idempotency_key, error tracking
sn_sow_synthetics_recommendation_telemetry	Aggregate workflow metrics: card_shown, endpoints_discovered, monitors_created, workflow_status
Synthetic Private Locations [sn_sow_synthetics_private_location]	Definitions of the ACC Agent Proxy Clusters available for synthetic monitoring. Extends the Proxy Agent Cluster [sn_agent_cluster] table.
sn_sow_synthetics_bulk_job	Provides async bulk job tracking.
sn_sow_synthetics_bulk_job_governance	Defines governance metadata for rate limiting and auditing for bulk jobs.

Synthetic monitoring properties

Synthetic monitoring includes the following properties.

These properties are available for synthetic monitoring.

Note: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Properties for synthetic monitoring

Property	Description
sn_sow_synthetics.logger	Controls logging output. Valid values are: • debug • info • notice (default) • warning • err • crit
sn_sow_synthetics.auto_mid_selection.skip_phases	Determines the number of comma-separated phases to skip in selection cascade. Default value is empty.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for synthetic monitoring (continued)

Property	Description
sow.recommendation.enabled	Feature flag to enable recommendation tile on incidents and by default it is set to 'false'.
sow.recommendation.max_endpoints	Determines the max endpoints to be shown in recommendation panel. The default value is 50.
sn_sow_synthetics.default_mid_location	Displays default location sys_id for auto MID selection phase 5. The default value is 'null'.
sn_sow_synthetics.auto_mid_selection.enabled	Flag to enable/disable auto MID selection and be default it is set to 'true'.
sn_sow_synthetics.auto_mid_selection.dns_cache_ttl	Determines the DNS cache time for IP affinity phase. The default value is 300 seconds.

Domain separation and synthetic monitoring

Domain separation is supported for synthetic monitoring. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Domain separation and synthetic monitoring overview

Domain separation is present in all aspects of the synthetic monitoring application. Users belonging to a specific domain see only the data existing in their own domain.

How domain separation works in synthetic monitoring

When data is separated by domains in synthetic monitoring, users can only configure and see the monitoring data in their own domain. By default, all users and records are set to the parent domain unless the admin assigns them to a specific domain.

You define the domain-separated environment when you configure your data inputs. All relevant records and data processing in the synthetic monitoring program flow reside in the same domain

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

as the data input. The domain name of a data input appears in the Domain column that is displayed in the tables in your instance.

Using domain separation in your instance is transparent to synthetic monitoring. The application manages all aspects of the data, such as the monitor configurations and results. When a property is changed, the new value affects new sources only in the specific domain.

When setting up Agent Client Collector (ACC) for non-hosted synthetic checks, each domain that supports non-hosted synthetics requires its own ACC cluster and MID Server. The ACC cluster and MID Server must be created in a leaf domain.

Domain separation for service providers

Troubleshoot synthetic monitors

Read these topics to understand how to fix common issues in synthetic monitoring.

Upgrade issues

What to do when monitors don't work after upgrading synthetic monitoring.

Condition

After upgrading synthetic monitoring, monitors remain in unknown state.

Cause

After upgrading synthetic monitoring, if the monitor is hosted on a MID Server, the server must be restarted to re-recognize the hosted monitors.

Remedy

Restart the MID Server. See Manually start, stop, and restart a MID Server.

OAuth issues

Learn how to fix OAuth token refresh issues.

Condition

OAuth token doesn't refresh as expected.

Cause

Your OAuth provider and server have different refresh time periods. Refresh time periods are based on the OAuth provider. When creating an OAuth connection, you configure it to have an x-amount of time before needing reauthentication. If that configured amount of time isn't the same as your provider's, your token might require a refresh sooner or later than expected.

Remedy

Refer to your OAuth provider's documentation when configuring OAuth. See OAuth Inbound and Outbound authentication for more information.

Impacted Service not appearing in alerts

When a test fails for a monitor and you have configured an alert to trigger, the alert record should show the impacted service. There are a few reasons why this field might not be populated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Condition

The Impacted Services field isn't populated on an alert record from a failed synthetic monitor. Following are the causes and remedies for the different reasons the field isn't populated.

Cause: Service isn't a mapped service

The service isn't a mapped service.

Remedy

This field only populates when the associated service is configured as a mapped application service in the Configuration Management Database (CMDB).

Cause: The field didn't have time to populate

Impacted Services are populated at alert creation.

Remedy

Close and reopen the alert so new mappings are applied.

Cause: Race condition encountered

If an alert triggers immediately, the platform might not have time to establish the necessary CMDB relationships before the alert attempts to populate impacted services.

Remedy

Try reloading the page or consider running tests from the MID Server.

Cause: Delayed population

The relationship might take up to a minute to appear, which means the field might not populate until after the initial alert creation event.

Remedy

Check back after a few minutes.

Bulk monitor import issues

Learn to fix issues that might occur when you create monitors in bulk.

Common bulk monitor import issues

Issue	Cause	Solution
cmdb_ci is required	Missing HTTP endpoint	Create endpoint in CMDB first
Location not found	Invalid location sys_id	Verify location exists
Authentication failed	Invalid credentials	Check username/password
Job stuck in "pending"	Event queue backed up	Wait or contact admin
Timeout errors	Large payload, slow processing	Increase timeout, reduce batch size

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Synthetic monitoring Landing Page

Read the following to understand what is displayed on the Synthetic monitoring landing page where you can view aggregate information about your synthetic monitors.

Aggregate information

The cards show aggregate information for all monitors, whether they're active or not. Select a card to filter the Monitors list.

Aggregate cards

Card title	Description
Total monitors	Total number of monitors created.
Passed	Number of total monitors that have returned the value that was set as the monitor's assertion, for example a status code of 200.
Failed	Number of total monitors that returned a value other than what was configured as the assertion.
Pending	Number of total monitors that are in the Pending state. Monitors are set to **Pending** before the first test runs.
Paused	Number of total monitors that are in the Paused state. Paused monitors are monitors that have been set to **Monitor disabled** on the Configuration page.
Unknown	Number of total monitors that aren't running due to an issue with the related Agent Client Collector (ACC) proxy.

Monitor list

By default, this list displays all monitors that have been created. You can select a card at the top of the page to filter to a list of monitors with that state. Select a monitor to view its details page.

Details page of a synthetic monitor

Read the following to understand how to use the Details page of a synthetic monitor to view the results of its tests.

Header

The header provides an overview of the monitor.

Item	Description
Monitor name	Name given to the monitor when it was created.
Enabled	Indication of whether the monitor is active.
Status	Status of the latest test run. Values can be one of the following: • Pending: The monitor is waiting for the first test to run, based on the configured frequency. • Success: The test ran and passed the assertion criteria that you set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Item	Description
	• Unknown: The test failed to run, likely due to an issue with the related Agent Client Collector (ACC) proxy. • Failure: The test ran but didn't pass the assertion criteria. Select a timestamp link to view the response body for more information about the test.
Last test ran	Timestamp for when the latest test finished running.
Last updated	Timestamp for when the monitor was most recently edited and saved.

Overview tab

The **Overview** tab provides an aggregated view of all the tests that the monitor has run. This tab shows the following:

- Metrics card: Charts that provide performance of each test for the time period selected in the time picker.
- Monitor result history: All tests run by the monitor and its results.

Details tab

You can use the **Details** tab to create a monitor or edit an existing one. See Create and edit a synthetic monitor for more information.

Alerts tab

You can use the Alerts tab to view alerts generated by a monitor.

Applying the CSDM guidelines to ITOM AIOps

ITOM AIOps helps you track and maintain the health of services in your organization. ITOM AIOps CSDM reference serves as a foundational blueprint for maintaining optimal IT operations by standardizing data models and processes. The main goal is to help you understand the two main capabilities that work together within the CSDM framework.

ITOM AIOps consists of two main capabilities that use the CSDM framework.

Event Management

Event Management gathers alerts from infrastructure events captured by third-party monitoring tools. Event Management uses IT-related information gathered by Discovery to map alerts to CIs. Based on the collected information, Event Management then provides dashboards showing a consolidated view of all service-impact events.

Metric Anomaly Detection

Proactively analyzes your IT infrastructure to spot issues and prevent service outages. Using advanced machine learning to analyze information about your IT infrastructure, the application automatically determines dynamic thresholds and identifies anomalies that may indicate potential service outages.

For CSDM set-up information, see Implementing the CSDM framework in stages.

For more information on CSDM framework, see Exploring the CSDM model.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ITOM AIOps considerations for CSDM framework

ITOM AIOps aligns with CSDM framework to ensure standardized data management and optimize IT operations.

Key considerations for implementing ITOM AIOps for CSDM framework include the following.

Identifying necessary Configuration Items (CIs) for optimal Event Management benefits

Event Management utilizes Configuration Items (CIs) monitored by the operations team to correlate alerts with the appropriate CI and assess their impact on the monitored service.

Defining Technical Services within Event Management

Dynamic CI Group services, formerly known as Technical Services, leverage the CMDB CI Group capability to query the CMDB, enabling efficient grouping of Configuration Items (CIs) for various operational purposes.

Recognizing common use cases for the Dynamic CI Group service

In Event Management (EM), the Dynamic CI Group service functions as a logical grouping mechanism for Configuration Items (CIs), offering technology or service owners insight into the health status of the grouped entities.

ITOM AIOps and CSDM tables

ITOM AIOps leverages and maintains CSDM tables, while various ServiceNow products enhance and contribute value to its operations.

CSDM tables in the CMDB that are managed by ITOM Health

ITOM AIOps manages the following tables:

- Mapped Application Service table [cmdb_ci_service_discovered] (With CSDM v5, the label for the table has changed from application service to service instance.)
- Configuration Item table [ci_*]
- Dynamic CI Group table [cmdb_ci_query_based_service]

CSDM tables managed by ITOM

Plugins or applications installed with ITOM AIOps

Tables that list the plugins or applications that are installed with ITOM AIOps applications. When you update your application, any newly required application dependencies are installed.

Event Management

Plugins or applications installed with Event Management (com.glideapp.itom.snac)

Plugin or application name	Description
Alert Management Content (com.em-alert-mgmt-content)	Contains all the necessary base system subflows that can be used for alert remediation.
ITOM Licensing (com.snc.itom.license)	Central components for the ITOM Licensing Model, which calculates and displays how many subscriptions for ITOM applications your organization purchases and consumes.
Mid Web Server (com.snc.sa.mid.webserver)	A MID Server extension that enables developing REST APIs to send events and metrics to the MID Server. The plugin also enables the communication between the MID Server and Agent Client Collector.
Service Analytics (com.snc.sa.analytics)	Provides alert analytics based on machine learning (ML) and topology learning.
Event Management and Service Mapping Core (com.snc.service-watch)	Comprises the common components of Event Management and Service Mapping.
Tag Based Alert Clustering Engine (sn_em_tbac)	Provides a zero-code method that helps simplify alert grouping and performs alert correlation without the need for CMDB, model training, or fine-tuning.
Alert Rules Management (sn_em_arm)	Enables Event Management users to respond automatically to alerts. An alert management rule determines the required alert response.

Health Log Analytics

Plugins or applications installed with Health Log Analytics (sn_occ)

Plugin or application name	Description
Integration Commons for CMDB (sn_cmdb_int_util)	Contains a collection of utility functions that provide a common methodology for the processing of key CMDB attributes and is available to all CMDB certified integrations.
ITOM Cloud Services Core (sn_itom_cloud_svc)	Generates relevant topics for tenants, enabling them to transmit data from their customer infrastructure to ServiceNow automatically. These topics are predominantly intended for use with the Hermes Messaging Service.
Service Operations Workspace ITOM Apps (sn_sow_itom_cont)	A configurable workspace that provides a unified experience for multiple IT Operations

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins or applications installed with Health Log Analytics (sn_occ) (continued)

Plugin or application name	Description
	Management workflows. You can manage the life cycle of alerts in IT Operations Management workflows through simple, intuitive, and clear user interface, automated recommendations, and targeted experience.
Health Log Analytics Core (com.glideapp.itom.occultus)	Essential components for the Health Log Analytics scoped application.
Microsoft Teams Spoke for ServiceNow IntegrationHub (com.sn.ms_teams.ah)	Provides actions that a process analyst can use when designing flows to automate sending messages about ServiceNow incident and problem records to a Microsoft Teams channel.
Slack Webhooks Spoke for ServiceNow IntegrationHub (com.sn.slack.ah)	Use Slack webhooks to post messages and record details for ServiceNow incidents, problems, and changes to Slack channels.
Normalization Data Services Client (com.glide.data_services_canonicalization.client)	Helps maintain consistency by checking that records for a given company match the list of standard company names. If the plugin finds a company-name field with a variant of that name, it substitutes the standard name in its place.

Service Reliability Management

Plugins or applications installed with Service Reliability Management (sn_sow_srm)

Plugin or application name	Description
Service Operations Workspace Service Reliability Management (SRM) Common (sn_sow_srm_common)	Delivers common utilities and configuration settings used by Service Reliability Management such as core functionality related to managing teams and services, and metric calculation for services.
Service Reliability Management (Global dependencies) (com.snc.srm)	Supports global scripts and utilities for Service Reliability Management for Service Operations Workspace.
Event Management (com.glideapp.itom.snac)	Helps you to identify health issues across business services and infrastructure on a single management console. Event Management provides intelligent event and alert processing, including automatic alert remediation, aggregation, and root cause analysis (RCA)
Service Operations Workspace ITOM Apps (sn_sow_itom_cont)	A configurable workspace that provides a unified experience for multiple IT Operations Management workflows. You can manage the life cycle of alerts in IT Operations Management workflows through simple, intuitive, and clear user interface, automated recommendations, and targeted experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins or applications installed with Service Reliability Management (sn_sow_srm) (continued)

Plugin or application name	Description
On-Call Scheduling (com.snc.on_call_rotation)	Provides the ability to create on-call schedules and escalation trees. When an incident is created, you can dynamically route the escalation to an on-call resource.
SOW - Alert Automation (sn_sow_alert_rules)	Provides operators in Service Operations Workspace with the ability to create and manage alert automation for their team. This automation can be used to enrich, process, and group alerts.
Service Level Objective Management for Service Operations Workspace (sn_sow_slo)	Includes features to monitor and manage service health using Service Level Indicators (SLIs), Service Level Objectives (SLOs), and error budgets.

Service Operations Workspace for ITOM

Plugins or applications installed with Service Operations Workspace ITOM Apps (sn_sow_itom_cont)

Plugin or application name	Description
Service Operations Workspace Core (sn_sow)	Core capabilities and workspace configurations for Service Operations Workspace.
Event Management Core (sn_em_ai)	Enables you to track and monitor alerts in the ServiceNow Agent Workspace.
Service Operations Workspace Integrations launchpad (sn_itom_integ_app)	Provides a new and enhanced experience for viewing, configuring, and managing all your available ITOM AIOps integrations.
Service Operations Workspace Alert Mngmt (sn_sow_em)	A detailed alert record page with supplementary data such as Quick Overview, Playbook, and Metrics tabs.
Service Operations Workspace Express List (sn_itom_aiops_list)	A centralized and consolidated platform that enables operators to triage, analyze, and remediate alerts, all in one place. Express List provides a live view of alerts, dynamic filtering, a preview panel with additional context and essential details about each alert, and automated technical analysis using Now Assist.
Service Operations Workspace Log Analytics (sn_sow_hla)	A log viewer in Service Operations Workspace. The application also includes the custom Elasticsearch data source for Performance Analytics (PA) dashboards.
AIOps Dashboards (sn_aiops_dashboard)	Offers comprehensive visualizations of critical operational data and actionable insights that facilitate proactive responses to potential issues. The application targets multiple ITOM personas with different needs, enabling you to monitor key performance indicators (KPIs),

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins or applications installed with Service Operations Workspace ITOM Apps (sn_sow_itom_cont) (continued)

Plugin or application name	Description
	track service health, and gain valuable context on the overall IT environment.
Event Management Connectors (sn_em_connector)	A collection of predefined interfaces (connectors) for ingesting events from third-party monitoring tools or Agent Client Collector into a ServiceNow instance.
Service Operations Workspace UI Components (sn_itom_uib_comp)	A joined repository for holding common internal UI components.

Metric Intelligence

Plugins activated with Metric Intelligence (com.snc.sa.metric)

Plugin name	Description
Operational Intelligence - Extension Health Monitoring (com.snc.sa.metric.health)	Contains some features that enable self-monitoring capabilities for the Metric Intelligence components in the MID Server.
Highcharts Reporting (com.glide.highcharts)	Provides some UI functionality to Metric Intelligence.
Event Management (com.glideapp.itom.snac)	Helps you to identify health issues across business services and infrastructure on a single management console. Event Management provides intelligent event and alert processing, including automatic alert remediation, aggregation, and root cause analysis (RCA)
ITOM UI Components (com.snc.itom.ui)	Shared UI components for ITOM products that provide some UI functionality to Metric Intelligence.
MID Server Distributed Cluster (com.snc.agent.distributed.cluster)	Enables management of the mid cache component of Metric Intelligence from the ServiceNow instance.
List v3 Components (com.glide.ui.list_v3_components)	Provides some UI functionality to Metric Intelligence and components required for List v3, including REST endpoints, directives, and templates.
MetricBase (com.snc.clotho)	The database where the raw metric data such as CPU usage and Disk Free is saved and where model fitting for anomaly detection occurs.
Mid Web Server (com.snc.sa.mid.webserver)	A MID Server extension that enables developing REST APIs to send events and metrics to the MID Server. The plugin also enables the communication between the MID Server and Agent Client Collector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector

Plugins or applications installed with Agent Client Collector Framework (sn_agent)

Plugin or application name	Description
Agent Client Collector Global Utilities (com.snc.sa.accutils)	A set of globally scoped utilities that facilitates cross-scope transactions between Agent Client Collector Framework and a ServiceNow instance.
Configuration Management For Scoped Apps (CMDB) (com.snc.cmdb.scoped)	Provides scoped applications with access to Identification Engine APIs.
Mid Web Server (com.snc.sa.mid.webserver)	A MID Server extension that enables developing REST APIs to send events and metrics to the MID Server. The plugin also enables the communication between the MID Server and Agent Client Collector.

Plugins or applications installed with Agent Client Collector Monitoring (sn_itmon)

Plugin or application name	Description
Agent Client Collector Framework (sn_agent)	Manages Agent Client Collector on the ServiceNow instance and the MID Server.
Metric Intelligence (sn_metrics_ng)	A companion application to the family Metric Intelligence plugin that provides additional functionality and enhancements.
Service Operations Workspace Metric Explorer (sn_itom_metric_exp)	Enables operators to investigate metric behavior and compare and correlate different metrics across hosts, applications, and services so they can troubleshoot issues and find the root cause.
Event Management (com.glideapp.itom.snac)	Helps you to identify health issues across business services and infrastructure on a single management console. Event Management provides intelligent event and alert processing, including automatic alert remediation, aggregation, and root cause analysis (RCA)
Metric Intelligence (com.snc.sa.metric)	Provides the ability to capture, explore and analyze application metrics data, identifying and indicating anomalies. Metric Intelligence generates anomaly alerts, which can be promoted to IT alerts and appear on the Service Operations Workspace and Service Health dashboard.

Plugins or applications installed with Agent Client Collector for Visibility - Content (sn_acc_visibility)

Plugin or application name	Description
Agent Client Collector for Visibility - Content Content (sn_acc_vis_content)	Provides agent-based infrastructure discovery and collects Software Asset Management (SAM) metrics to support Discovery and Digital End-User Experience (DEX) applications.
Discovery (com.snc.discovery)	Finds applications and devices on your network, and then updates the CMDB with the information it finds.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins or applications installed with Agent Client Collector for Visibility - Content (sn_acc_visibility) (continued)

Plugin or application name	Description
Agent Client Collector Framework (sn_agent)	Manages Agent Client Collector on the ServiceNow instance and the MID Server.
CMDB CI Class Models (sn_cmdb_ci_class)	Adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Applications such as Discovery and Service Mapping can use these class extensions to populate configuration items (CIs) and discover various technologies and software.

Applications installed with Agent Client Collector Log Analytics (sn_accl)

Application name	Description
Agent Client Collector Monitoring (sn_itmon)	Provides the ability to monitor your configuration items (CIs). This application comes with predefined monitoring checks and policies that are applied on the agent.
Health Log Analytics (sn_occ)	Helps you solve issues faster by ingesting, analyzing, and correlating machine-generated log data in real-time to predict IT issues before they affect you.

Plugins or applications installed with Agent Client Collector Security Incident Response (sn_secops_acc)

Plugin or application name	Description
Security Incident Response (sn_si)	Enables you to manage and automate the life cycle of your security incidents from initial prioritization to containment and resolution. Use the automated workflows to respond quickly and consistently, and understand trends and bottlenecks through the data provided by analytics-driven dashboards and comprehensive reporting systems.
Security Support Orchestration (sn_sec_cmn_orch)	Dependency for the Vulnerability Response and Security Incident Response applications.
Threat Intelligence Support Common (sn_ti)	Enables you to find Indicators of Compromise (IoCs) and enrich security incidents with threat intelligence data. Threat Intelligence enables you to access and provide a reference point for your company's Structured Threat Information Expression (STIX) data.
Agent Client Collector Spoke (sn_acc_spoke)	Provides a framework to write customized workflows or automations to execute on agents or CIs.
Security Support Core (com.snc.security_support.core)	Provides a robust core data model and UI framework specifically for security operations integrations. This comprehensive model serves as the backbone for seamlessly integrating various security tools and systems, promoting smooth data flow and efficient operations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins or applications installed with Agent Client Collector Security Incident Response (sn_secops_acc) (continued)

Plugin or application name	Description
Security Support Common (sn_sec_cmn)	Enables core functionality used by the Security Operations applications.
Security Integration Framework (sn_sec_int)	Manages the common functionality for Security Operations integrations including both Security Incident Response and Vulnerability Response. Security Integration Framework enables you to use existing features and functionality without having to reimplement them.
Agent Client Collector Framework (sn_agent)	Manages Agent Client Collector on the ServiceNow instance and the MID Server.
Vulnerability Response Dependencies (com.snc.si_dep)	Activates all the dependent plugins required to support the Vulnerability Response application.

Service Observability

Plugins or applications installed with Service Observability (sn_service_obs)

Plugin or application name	Description
Service Observability UI (sn_service_obs_ui)	Enables you to use Service Observability in the Service Operations Workspace (SOW) and the SOW Admin Center.
Service Reliability Management (sn_sow_srm)	Service Reliability Management and Service Observability display service performance metrics together to give a holistic view into service health.
Platform Analytics (sn_app_analytics_w)	Enables customizing the dashboards.

Agent Client Collector

The Agent Client Collector is an agent that is installed on infrastructure components. The Agent Client Collector is built on a Sensu framework which enables you to adopt and extend monitoring checks from the community. It executes commands on the machines it is installed on and sends output data to the ServiceNow® instance via the MID Server, storing events and metrics in the relevant database.

Watch this video for an overview of how the Agent Client Collector works.

https://player.vimeo.com/video/1096666842?h=77a5520958&badge=0&autopause=0&player_id=0&app_id=58479

Agent Client Collector planning

Step number	Action	Description
1	Define use cases, targeted devices, and success metrics	Typical ACC use cases include ITOM Visibility, ITAM (SAM/HAM), ITSM (DEX), ITOM Health (HLA/ Metric Intelligence). Many customers have success metrics targeting a percentage of devices with successful data collection for a use case over a 7 to 14-day window (for example, “95% of endpoints report software usage over a 14-day period”).
2	Identify Key Stakeholders	Involve network, security, and device/ software management teams (such as jamf/Intune experts) as early as possible during planning.
3	Assess ServiceNow License, Store App and Instance Requirements	Ensure that you have all license entitlements for your use cases. Determine which software updates or configuration changes to your production and sub-production instances are needed to support your targeted number of devices.
4	Assess Software Requirements	**1.** Ensure that all CPU architectures and operating systems for your use cases are supported. If not, determine whether non-ACC solutions such as Service Graph Connector or Discovery Patterns can be used. **2.** Determine whether your use cases require elevated system privileges on endpoints or servers (for example, root access on Linux for device serial number tracking).
5	Assess Network Requirements	Verify whether there are VPN, firewall, or proxy restrictions that prevent ACC from sending data to your ServiceNow instance.
6	Assess Device Management Requirements	Verify which internal solutions are available for deploying software within your organization on all targeted devices. For example, Intune and Jamf for endpoints; Chef, Puppet, or Ansible for servers.
7	Draft ACC Solution Architecture	Work with your ServiceNow account team to define how ACC agents send data to the ServiceNow instance, based on your use cases and

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector planning (continued)

Step number	Action	Description
		differences in server and endpoint deployment techniques. Verify whether direct connections are made using ITOM Cloud Services or MID Servers.
8	Define and Segment your ACC Deployment Plan	Define evaluation, pilot, and broad rollout stages and the number of devices targeted in each phase. Align each segment with risk tolerance and business goals. ACC must be rolled out gradually, with no more than 5,000 agents per hour.
9	Internal Compliance and Security Review	Work with internal teams and your stakeholders to review your deployment plan, solution architecture, and to obtain approvals.

Agent Client Collector deployment checklist

Successful Agent Client Collector (ACC) implementations, especially involving large numbers of endpoints or servers, require careful deployment. When proceeding with a large-scale ACC deployment, follow the steps described in the deployment checklist.

Agent Client Collector deployment

Step number	Action	Description
1	Update production and sub-production instances	Ensure that all instances are updated to the most recent store applications, family releases, or both.
2	Assess instance capacity	Open support tickets if additional instance capacity is needed for the projected number of ACC agents.
3	Deploy and configure MID Servers when required	If connecting over 1,000 ACC agents to a single MID Server, assess performance and whether a load balancer in front of a MID Server is needed.
4	Verify whether ITOM Cloud Services (ICS) is required and, if so, whether it is configured	Some use cases (such as DEX) always require ICS.
5	Download appropriate installer files from the instance	Installer files may be in one of the following formats:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector deployment (continued)

Step number	Action	Description
		• .rpm • .msi • .pkg
6	Define a deployment calendar	Share deployment groups and group size, assignments, start/stop, success gates, go/no-go signers, and rollback criteria with stakeholders.
7	Package ACC in appropriate software management tools	Software management tools include: • Intune • jamf
8	Deploy pilot and test environments on sub-production instances using your preferred software management tool	In test and pilot environments, you can test multiple operating systems and hardware combinations (such as server vs. laptop).
9	Monitor the ServiceNow instance and the software management solution	• On the instance, monitor the performance and rate limit violations. • On the software management solution, monitor the deployment success rate.
10	Assess data collection, install success rate, and instance performance over the next 2-3 business days	Workloads and data collection can vary significantly, depending on the time of day; therefore, monitor deployment success over several days.
11	Update deployment calendar and continue with next install cohorts	After successful deployment, continue with data collection.

Exploring Agent Client Collector Framework

The Agent Client Collector Framework (ACC-F) is a powerful solution for monitoring the performance and health of infrastructure components by using agents installed on servers and devices. It collects and sends critical system data to ServiceNow for analysis, enabling proactive management and troubleshooting of Configuration Items (CIs).

Agent Client Collector Framework overview

The Agent Client Collector Framework enables organizations to monitor and manage the health of their infrastructure through agents installed on key systems. These agents execute

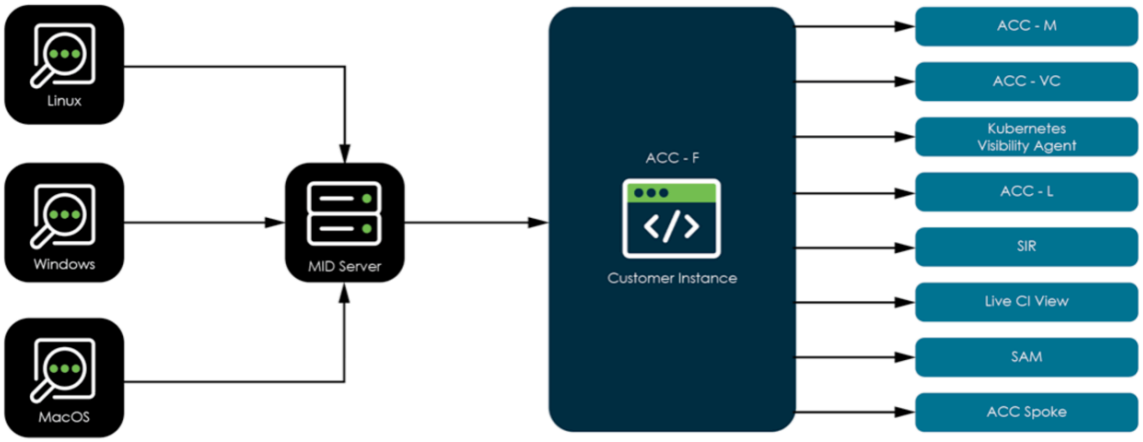
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

predefined commands on the machines they are installed on, sending the resulting data back to the ServiceNow® instance via a dedicated MID Server. The framework enables seamless management of both the Agent Client Collector and MID Server, storing event data and performance metrics in the appropriate database. By providing insights into CI performance, ACC-F helps organizations identify and resolve issues quickly, improving operational efficiency and system reliability.

Agent Client Collector Framework workflow

The following illustration describes the layout and data flow within the Agent Client Collector Framework application.

Collecting and distributing data with ACC-F



1. Agent Installation: The agent is installed on infrastructure components, such as servers, devices, and network equipment. These agents are responsible for executing system commands and gathering performance data from the host machine. ACC-F is deployed on the customer's ServiceNow® instance.
2. Data collection: The agent runs predefined scripts or queries (checks) on the infrastructure components to collect various system metrics and events. This includes performance data such as CPU usage, memory utilization, disk space, and network activity. The agent also collects error logs and system alerts.
3. MID Server communication: The agent sends the collected data to the ServiceNow instance through a dedicated MID Server. The MID Server acts as a secure communication bridge between the infrastructure and the ServiceNow platform, ensuring data is transmitted reliably and securely.
4. Data Storage: Upon receiving the data, the ServiceNow instance stores the events and performance metrics in the relevant database. This data is then associated with the respective Configuration Items (CIs) within the ServiceNow CMDB Configuration Management Database (CMDB), enabling efficient tracking and reporting.
5. Data Analysis and Reporting: The collected data is analyzed within the ServiceNow instance, where it is used for monitoring, troubleshooting, and reporting purposes. This analysis helps identify potential issues or areas of improvement, triggering alerts or actions to resolve problems proactively.
6. Feedback Loop: Based on the analysis, the system can trigger remediation actions, such as running corrective scripts, reconfiguring settings, or notifying responsible teams for further investigation. The feedback is looped back into the system, allowing for continuous monitoring and optimization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector Framework benefits

Agent Client Collector Framework provides data to other Agent Client Collector components.

Benefit	Feature	Users
Monitor your system's health, performance, and availability through automated collection of events and metrics, leveraging automated configurations.	Enable metrics collection and evaluation	NOC User, Event Management administrator
Track server inventory, software installations and usage continuously with non-admin access and minimal network communication.	How Agent Client Collector for Visibility - Content works	CMDB/Discovery administrator
Gather detailed inventory data of devices not connected to your network or running in isolated environments (air-gapped).	Agent Client Collector Framework Air Gapped Configuration Item Management Solution	CMDB/Discovery administrator
Minimize triage time of incidents by direct access of live device details and interactions to remediate.	View live CI data with Agent Client Collector	ITSM user
Stream log data into your instance to predict problems and solve them before they happen, to minimize user impact.	Agent Client Collector Log Analytics	Agent Client Collector administrator

Agent Client Collector Framework use case

The Agent Client Collector Framework use case demonstrates how a financial organization can use Agent Client Collector Framework to assist in IT asset discovery.

Use case overview

A leading financial organization needed a robust IT discovery solution to maintain compliance, secure critical systems, and manage a growing remote workforce. While the organization initially relied on agentless discovery methods — where MID Servers interrogate systems and populate the CMDB—it faced significant challenges. These limitations affected their ability to monitor secure environments and remote endpoints effectively, leading to potential security and compliance risks.

Challenges

- Restricted server access: The financial organization's security policies restricted MID Servers from initiating connections to core banking servers and sensitive financial databases. This made agentless discovery insufficient for these high-security assets.
- Remote workforce visibility: The company's growing remote workforce meant many employee laptops and mobile devices operated outside the corporate network. Agentless discovery couldn't capture data from these endpoints, creating blind spots in asset tracking and compliance monitoring.
- Regulatory compliance: Financial institutions face stringent regulations (such as PCI, DSS and SOX) requiring detailed and auditable asset data. Agentless discovery struggled to meet these requirements, especially for in-depth monitoring and policy enforcement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Solutions

To address these challenges, the financial organization implemented an agent-based discovery approach.

- Agent deployment on critical servers: Agents were installed on core banking servers and sensitive financial databases. This allowed continuous, secure monitoring without violating access restrictions.
- Remote endpoint management: Agents deployed on remote employee laptops provided real-time data collection and monitoring, regardless of location. This ensured that all devices, even those outside the corporate network, were included in asset discovery.
- Enhanced data collection: The agents collected detailed system information and enforced security policies directly on each asset, ensuring compliance with regulatory standards and improving audit readiness.

Outcomes

- Comprehensive asset visibility: The organization achieved full visibility across its IT environment, including secure data centers and remote endpoints. This reduced blind spots and improved decision-making for IT operations and security teams.
- Improved compliance and audit readiness: Agent-based discovery provided granular, auditable data that met stringent regulatory requirements. This streamlined compliance reporting and reduced the risk of regulatory penalties.
- Enhanced security posture: By enforcing policies at the endpoint level, the organization strengthened its cybersecurity defenses, protecting sensitive financial data from potential threats.

This approach enabled the financial institution to maintain control over its IT environment, support its remote workforce effectively, and ensure compliance with industry regulations - critical factors in safeguarding sensitive financial operations and maintaining customer trust.

Agent Client Collector architecture

The Agent Client Collector is a ServiceNow agent installed on your Windows, Linux, and macOS devices to monitor your company's infrastructure and installed applications.

Agent Client Collector architecture - overview

The Agent Client Collector is built on a Sensu framework and comes installed with monitoring capabilities for servers, databases, application servers, and middleware. It also supports extending monitoring through additional checks from the Sensu community or Nagios-compatible plugins, allowing you to customize monitoring to your needs.

Monitoring with checks and policies

The agent runs checks on the host to gather relevant data, transforming it into events or metrics. These checks are defined within ServiceNow and are associated with monitoring policies. A policy is a combination of the Configuration Items (CIs) being monitored and the checks that run on those CIs. The checks are associated with policies to monitor different aspects of the system.

You can customize check instances - such as adjusting the frequency or specifying parameters like login credentials for databases - without affecting the original check definition. Customization of a check instance takes effect only on the check instance associated with the policy and does not change the global check definition. This customization ensures flexibility in monitoring various CIs under different scenarios.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collection and transmission

After installation, the agent collects information on its host and processes. The agent pushes the collected data to the ServiceNow instance through the MID Server. The MID Server serves as a bridge between the agent and the ServiceNow instance, ensuring the data is transformed and securely sent for processing.

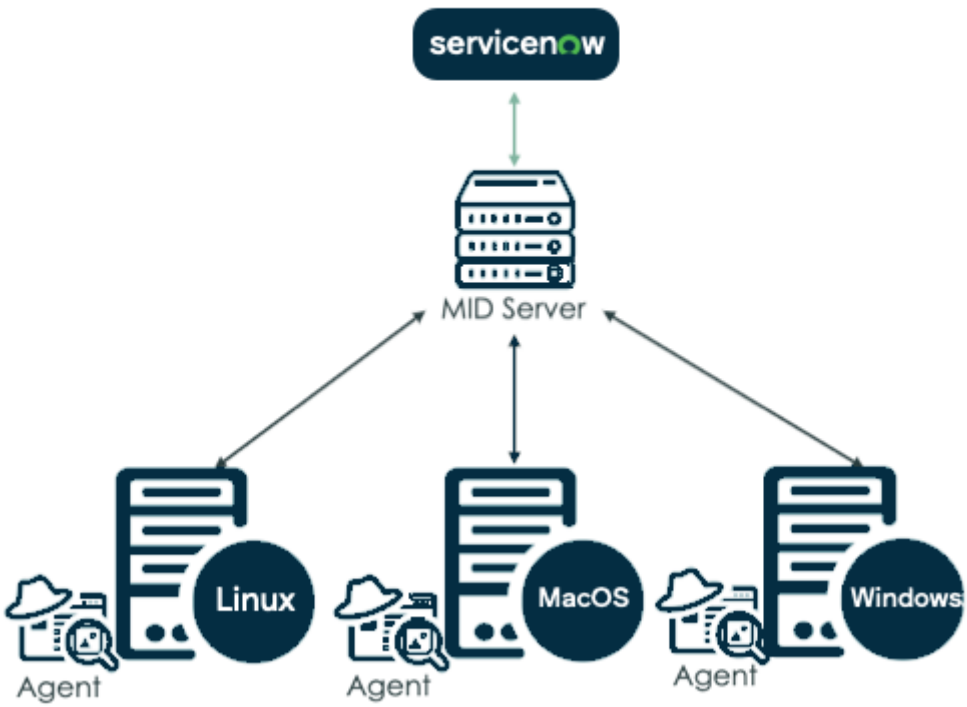
On the instance, CIs are created for the host and applications classified from the running processes (such as Microsoft SQL Server). Once these CIs are created, the active monitoring policies associated with the CIs are downloaded to the agent's MID Server, which then pushes the policies to the agent for execution.

Data storage and use

The results from the checks are stored in the ServiceNow instance:

- CI data: CMDB for Configuration Items.
- Event data: Events table (for example, alerts triggered by threshold breaches).

This data can be leveraged for monitoring, alerting, and reporting. Integration ensures real-time visibility into the health of your infrastructure and applications, while also enabling proactive issue detection and remediation.



1. Define a monitoring policy in the ServiceNow instance.
2. The MID Server fetches the check instances from the instance and passes them to the agent.
3. The agent runs the checks, collects data, and sends the results back to the MID Server.
4. The MID Server sends the collected data to the ServiceNow instance, where it is stored in the CMDB or events tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The commands and their configurations that run on the Agent are called **checks**. The Agent comes by default with **check definitions**, which determine a specific command and the default frequency with which it runs. Checks are defined on the instance and are passed to the Agent via the MID Server.

A **policy** is a combination of the CIs being monitored by the Agent Client Collector and the checks that run on those CIs. You associate check definitions with policies. Those check definitions are then referred to as **check instances**. You can customize check instances to meet your needs. For example, customize the running interval or the parameters specific to the policy, such as the login credentials to access a MySQL database. Customization of a check instance takes effect only on the check instance associated with the policy, which does not affect the original check definition or already created check instances in other policies.

Domain separation and Agent Client Collector

Domain separation is supported for Agent Client Collector (ACC). Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

How domain separation works in Agent Client Collector

Domain separation in ACC allows the isolation of data collected by the Agent Client Collector to a particular domain. As a result, only users within that domain can access and view this data. Similarly, agents and their associated configurations are tied to specific domains, ensuring that operations within one domain do not affect or leak into others. This creates a more organized and secure environment for managing multiple groups, business units, or regions.

- Data Security and Privacy: Restricting data access based on domains reduces the risk of unauthorized access and cross-domain data leakage, ensuring that sensitive information stays within its designated domain.
- Access Control: By isolating domains, organizations can enforce strict access controls, allowing only designated users or teams to view or interact with the data relevant to their domain.

Use cases for domain separation in Agent Client Collector

- Multi-department collaboration with data isolation: IT and Finance departments can independently monitor their respective systems without data overlap. For example, if there's an issue with a server in the payment processing system, Finance can run specific checks in their domain without interference from IT.
- Regulatory compliance: Domain separation helps comply with regulations like GDPR or SOX by ensuring that only authorized personnel can access sensitive data. For instance, the Compliance department can monitor regulatory checks while being restricted from accessing IT infrastructure data.
- Incident management and troubleshooting: IT can troubleshoot network issues, while Finance monitors transaction systems. Domain separation allows both departments to work independently, ensuring faster resolution and preventing data exposure.

Domain separation for service providers

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use case: Optimizing data isolation and monitoring with domain separation

Optimizing data isolation and monitoring with domain separation ensures financial institutions protect sensitive information, improve operational efficiency, and maintain compliance by securely segregating departmental data.

Use case overview

In a large financial institution, departments like IT, Finance, Compliance, and HR need to manage their systems independently while keeping sensitive data protected. The Agent Client Collector (ACC) collects data from various agents on servers and devices, and domain separation ensures that each department's data is securely isolated. This allows departments to manage their own monitoring, troubleshooting, and reporting, greatly reducing the risk of cross-domain interference or unauthorized access.

Challenges without domain separation

- Data privacy and security risks: Sensitive data could be exposed to unauthorized users. For example, IT staff could inadvertently access financial or payroll data, violating privacy policies.
- Operational inefficiency: Departments would have to share configurations, making it harder to manage and troubleshoot issues, leading to confusion and inefficiencies.
- Compliance issues: Meeting regulatory requirements for data isolation would be difficult, risking compliance violations.
- Increased risk of data corruption: Shared environments can lead to accidental data corruption, as changes in one department could affect others.

Solution

- Data isolation: Each department has a dedicated domain, ensuring that data collected by agents is accessible only within that domain.
- Independent configuration and monitoring: Departments set their own checks, policies, and tasks without affecting others.
- Access control: Role-based access control (RBAC) restricts user access to data within their domain. For example, IT can access only infrastructure data, while Finance can access only financial transaction data.
- Enhanced security: Domain separation ensures that users in one department cannot access data from other departments, reducing the risk of unauthorized access.

Outcome

- Improved data security: Sensitive data is protected, reducing unauthorized access risks.
- Operational efficiency: Departments operate independently, managing configurations and monitoring without conflicts.
- Regulatory compliance: Easier adherence to data privacy regulations (GDPR, SOX) due to secure data segregation.
- Reduced data corruption: Isolated environments prevent unintended cross-departmental impacts, enhancing system stability.

Use case: Regulatory compliance in a financial services solution

A financial institution needs to ensure that its data is accessible only to the departments that have authorization for the indicated data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Challenge

The financial institution must comply with regulations that require strict data separation between departments (such as HR, IT, or Finance).

Solution

1. Create separate domains for each department (IT, Finance, HR, Compliance, and so forth) in the Agent Client Collector (ACC) configuration.
2. Apply access controls so that sensitive data (such as employee records and financial transactions) is accessible only to authorized departments.
3. Use ACC health instance scans to ensure that data separation is maintained, especially when updating or troubleshooting systems.
4. Periodically audit domain separation settings to ensure compliance with data privacy regulations such as GDPR, SOX, or PCI-DSS.

Outcome

Compliance with legal and regulatory requirements is ensured, and sensitive data is protected from unauthorized access.

Agent Client Collector plugins

An Agent Client Collector (ACC) plugin is a script or group of scripts that extend the Agent Client Collector's capabilities. Plugins enhance monitoring by collecting metrics, performing specialized checks, and triggering events based on conditions, like monitoring an application's queue size when it reaches 60% or 80%. Plugins ensure scalable, customizable monitoring to adapt to evolving infrastructure or application needs.

Plugin-check dependency

Plugins are tightly integrated with checks in the Agent Client Collector Framework. A dependency is created between the plugin and the check to ensure that the plugin is executed alongside the associated check.

- Plugin Dependency: A plugin can be associated with one or more checks, and vice versa, where checks can depend on multiple plugins.
- Execution: Plugins and checks run on the same agent, working in unison to gather data, perform specialized tasks, or trigger necessary events

Plugin-agent compatibility

ACC agents must be within two store releases (N-2) of your installed Agent Client Collector Framework (ACC-F) version. Each release includes security and performance improvements. ACC-F release notes highlight any changes or critical fixes requiring immediate action.

Creating and managing plugins

You can create Agent Client Collector plugins as needed to customize the monitoring to your specific environment. These plugins are typically formatted as tar.gz files, which contain the scripts that define the plugin's functionality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Plugin creation: Custom plugins are developed and packaged into tar.gz files.
- Integration with checks: Once created, the plugin is integrated with checks by establishing the appropriate dependencies, ensuring that the plugin and check run together.
- Customization: Plugins can be customized to meet the specific requirements of your monitoring needs, whether it's adding more detailed metrics, checking system thresholds, or generating custom events.

Pre-installed plugins

Agent Client Collector Framework includes a set of pre-installed plugins that provide basic functionalities for common monitoring tasks, such as gathering standard metrics or monitoring key system parameters. For more detailed information on the plugins that come with the Agent Client Collector as part of ITOM AIOps, see Plugins or applications installed with ITOM AIOps.

Secure parameters in Agent Client Collector

Secure parameters in Agent Client Collector (ACC) refers to securely passing sensitive data, such as user names, passwords, and API keys, during check execution, without exposing the sensitive data in the command line. Parameters are passed to the script through standard input (STDIN), hiding them from logs or any process that might capture command-line arguments.

Depending on the coding language in use, implementation of secure parameters may vary. For example, in Linux's Bash, the *read* command (*read <variable_name>*) is used, populating *<variable_name>* with the value entered in STDIN.

Secure parameters data flow

1. Create secure parameters: Define secure parameters in the instance, referencing credentials that need protection (such as usernames and passwords). For details, see Create secure parameters for a check.
2. Configure secure parameters: Set an **Order** value to determine the sequence in which credentials are passed to the standard input.
3. Pass credentials: Transfer credentials from the MID Server to the agent, based on the check to which they are assigned. When the check executes, the agent passes the secured parameters to the script using STDIN, in the order specified by the **Order** value configured in the instance.
4. Execute the check: Upon execution, the agents send the secure parameters to the script via STDIN, following the specified order.
5. Run the script: The script retrieves and uses the secure parameters from STDIN to execute with the secured credentials.

Secure parameters benefits

- Enhanced security: Passing sensitive data like usernames and passwords directly in the command line is a security threat, as they could be exposed to unauthorized access or malicious users. Secure parameters ensure that such data is securely handled and hidden from view.
- Prevent data exposure: When using secure parameters, the credentials are not written in plain text in the command line, avoiding the risk of them being captured in logs or process listings.
- Data flow control: Secure parameters enable controlled and customizable passing of credentials to the script, ensuring the correct handling and timing of sensitive information.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector logs

Agent Client Collector (ACC) logs play a critical role in monitoring the activity and performance of the agent. Logs offer valuable feedback that helps identify potential issues, especially when the agent's performance is suboptimal. By providing insights into areas of concern, these logs are essential for troubleshooting and resolving issues, ultimately improving the overall effectiveness of the agent.

Agent Client Collector (ACC) logs offer key benefits for monitoring and maintaining agent performance.

- Configurable severity levels: Agent Client Collector logs enables you to configure the severity levels for monitoring, including *Error*, *Debug*, and *Info*. This flexibility helps focus on specific areas, such as tracking errors or diagnosing issues.
- Log retention management: You can set up log retention policies, determining how often to delete logs to preserve system resources. This ensures that the logs remain manageable and do not negatively impact system performance.
- Performance issue identification: Logs provide valuable insights to identify areas where the agent may be experiencing issues, helping to improve agent performance.

For details on locating and managing Agent Client Collector logs, see View the Agent Client Collector logs.

Operating system and application monitoring using Agent Client Collector

IT Operations Management (ITOM) monitoring for the Agent Client Collector is installed on the ServiceNow® instance. It monitors the specific operating system and applications that are installed on the host machine.

The Agent Client Collector monitors the following applications.

ACC Applications

Operating System/Application	Configuration description
Windows	No special configuration required.
Linux	No special configuration required.
Apache HTTP Server	See Configure Agent Client Collector Apache HTTP server monitoring.
Apache Tomcat	See Configure Agent Client Collector Apache Tomcat monitoring.
IBM WebSphere	No special configuration required. Accessed through JMX. Default management port is **9100**.
IIS	No special configuration required.
JBoss/WildFly	No special configuration required. Default port is **9990**. For troubleshooting information, see Monitoring performance in the Red Hat customer portal.
Microsoft SQL Server	No special configuration required. Ensure that the instance name is populated in the CI record, either by running Discovery or by manually populating the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACC Applications (continued)

Operating System/Application	Configuration description
My SQL	No special configuration required. Default port is **3306**.
Oracle Database	No special configuration required. Ensure that the SID and Oracle Home path are populated in the CI record, either by running Discovery or by manually populating the record. Default port is **1521**.
Oracle WebLogic	No special configuration required. Accessed via a JMX port. Default port is **7001**. Ensure that the WebLogic home (wls_home) parameter is populated in the CI record, either by running Discovery or by manually populating the record. Ensure that the user running the agent has sufficient permissions to access the JAR files in the **Weblogic** installation directories.

When using the **Microsoft SQL Server**, **Oracle Database**, and **Oracle WebLogic** applications, you must run Discovery to configure CI fields on the instance. Ensure that the Discovery plugin (com.snc.discovery) is installed to enable running Discovery.

When the application is running on a port other than the default, ensure that you update the port number in the check instance's parameters.

Configure Agent Client Collector Apache HTTP server monitoring

To configure the Agent Client Collector to perform Apache HTTP server monitoring, set the following configurations in the Apache HTTP server application.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. On the Apache HTTP Server host, navigate to one of the following locations:
   - In a Linux environment:
     - `/etc/httpd`
     - `/etc/httpd/conf`
     - `/etc/apache2`
     - `/etc/apache2/conf`
   - In a Windows environment: The `conf` directory in the Apache installation location.
2. Locate either the `httpd.conf` or `apache2.conf` file.
3. Ensure that the following line is uncommented:
   `LoadModule status_module modules/mod_status.so`
4. Configure the check instance port to be identical to the port on which Apache is listening (default for both is **80**).
5. To ensure a secure connection, configure SSL, as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Ensure that the following line is uncommented:
`LoadModule ssl_module modules/mod_ssl.so`

b. Activate the *ssl_secure_connection* parameter in the check instance.

c. Configure the check instance port to be identical to the port on which Apache is listening to secure connections (default is **443**).

Apache SLL/TLS Strong Encryption: How-to

Configure Agent Client Collector Apache Tomcat monitoring

To configure the Agent Client Collector to perform Apache Tomcat monitoring, set the following configurations in the Apache Tomcat application.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Open a management JMX port when starting the server:

a. In a Linux environment:

i. In `bin` directory in the Tomcat home directory, create a `setenv.sh` file.

ii. Ensure that the file contains the following:

```
export CATALINA_OPTS=$CATALINA_OPTS"
-Dcom.sun.management.jmxremote=true
-Dcom.sun.management.jmxremote.port={PORT NUMBER}
-Dcom.sun.management.jmxremote.rmi.port={PORT NUMBER}
-Dcom.sun.management.jmxremote.ssl=false
-Dcom.sun.management.jmxremote.authenticate=false
-Djava.rmi.server.hostname=127.0.0.1"
```

iii. Run `chmod 755 setenv.sh` to give the `setenv.sh` file executable permissions.

b. In a Windows environment:

i. In `bin` directory in the Tomcat home directory, create a `setenv.bat` file.

ii. Ensure that the file contains the following:

```
@echo=off
if defined CATALINA_OPTS (
set CATALINA_OPTS=%CATALINA_OPTS% -
Dcom.sun.management.jmxremote=true
) else (
set CATALINA_OPTS=-
Dcom.sun.management.jmxremote=true
)
set CATALINA_OPTS=%CATALINA_OPTS% -
Dcom.sun.management.jmxremote.port={PORT NUMBER}
set CATALINA_OPTS=%CATALINA_OPTS% -
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Dcom.sun.management.jmxremote.rmi.port={PORT NUMBER}
set CATALINA_OPTS=%CATALINA_OPTS% -
Dcom.sun.management.jmxremote.authenticate=false
set CATALINA_OPTS=%CATALINA_OPTS% -
Dcom.sun.management.jmxremote.ssl=false
set CATALINA_OPTS=%CATALINA_OPTS% -
Djava.rmi.server.hostname=127.0.0.1
```

{PORT NUMBER} represents the number of the port you open for JMX RMI monitoring. The default value created by the check definition is **9000**.

2. Restart Tomcat.
   a. In a Linux environment: Run the `shutdown.sh` script, followed by the `startup.sh` script.
   b. In a Windows environment: Run the `shutdown.bat` script, followed by the `startup.bat` script.

Monitor HTTP points

Use the **Monitoring HTTP Entry Points** and **Monitoring HTTP Entry Points Metrics** policies that come with the ITOM Monitoring scoped app to monitor `http` and `https` entry points and entry points metrics. You can customize these policies as needed, or you can configure a new policy to monitor service entry points.

Before you begin

Role required: agent_client_collector_admin

About this task

An entry point is the access point for a service. In an Agent Client Collector policy, you specify the service you want to monitor, and the policy monitors the service's entry points.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Select either the **Monitoring HTTP Entry Points** or **Monitoring HTTP Entry Points Metrics** policy.
   The relevant **Policy - Monitoring HTTP Entry Points** page opens.
3. On the **Monitored CIs** tab:
   a. In the **Table** field, ensure that the **sn_itmon_http_entrypoint** database view table is selected for the Agent Client Collector to retrieve http and https entry points for monitoring.
   b. In the **Filter** section, configure a filter for the services and entry points to be taken from the **sn_itmon_http_entrypoint** database view table.
4. Click the **Proxy Settings** tab and select the type of proxy you want to enable for the entry point monitoring.
   - **Single proxy agent**: Select to enable monitoring a single agent, which you select in the **Proxy agent** field that appears after selecting this option.
   - **Multi-proxy agents by filter**: Select to enable monitoring multiple agents. Configure a filter in the **Proxy filter** section that appears after selecting this option to monitor only the agents that match the filter's conditions.
   - **Script based proxy**: Select to enable monitoring an agent based on a script.

   You must configure a proxy to run an HTTP policy.
5. Click the **Checks** tab and in the **Filter checks by groups** field, select **HTTP** to display all of the http checks in the **Available** cell.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

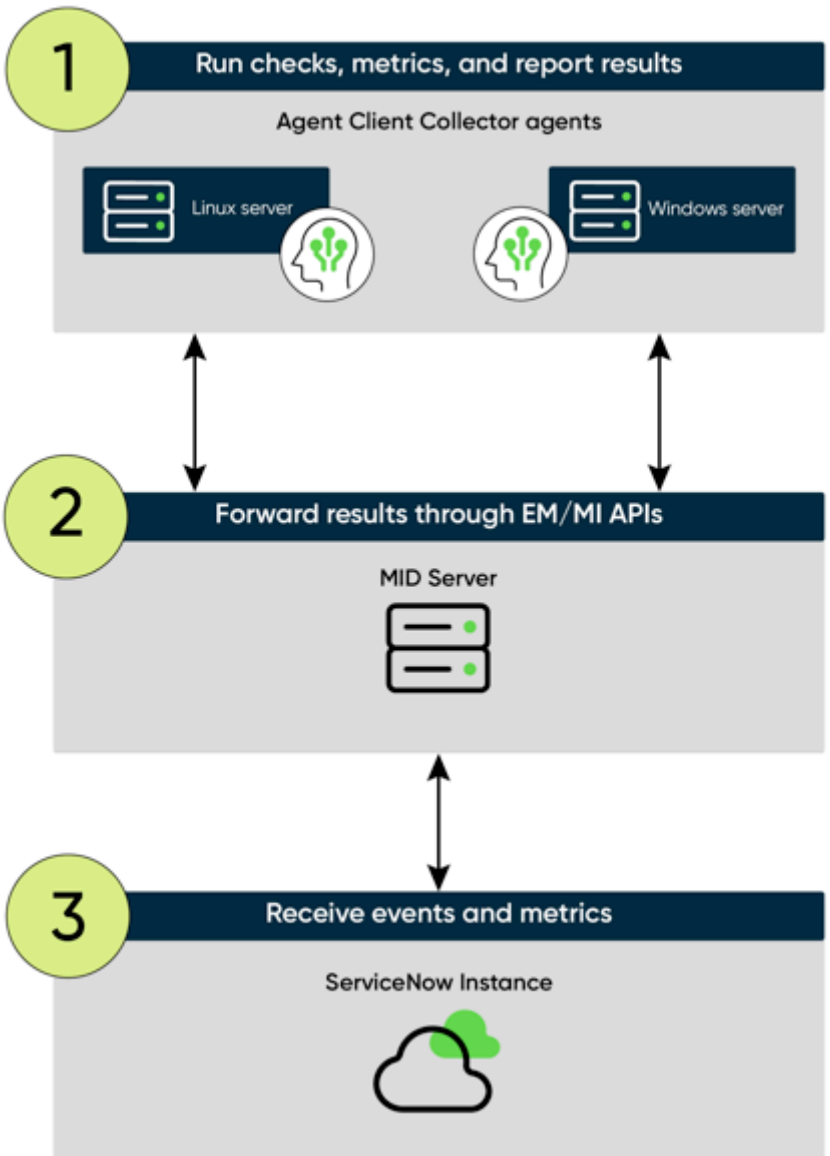
6. Select the relevant checks and click the right arrow button to move them to the **Selected** cell.
7. Select the **Active** check box at the top of the page to activate the policy.
8. Click **Update**.
   The policy monitors the entry points specified by the policy's configurations.

Agent-based data flow

The Agent Client Collector gathers information on the health of the CI that the Agent is installed on, and the applications that run on the hosts. The Agent runs several checks and pushes the checks' results to the MID Server, where they are converted into events or metrics.

Events are stored in the instance's Events database, while metrics are stored in the Metrics database.

The following image displays the data flow from the Agent Client Collector to the instance.



The numbered entries in the flow indicate the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Specified checks run on the agent. Data, including metrics, is pushed to the MID Server.
2. The MID Server analyzes the data and classifies the results as events or metrics. MID Server uses REST API to send the results to the instance.
3. The instance receives the data and stores it in the relevant database.

Agent Client Collector Monitoring use case

The Agent Client Collector Monitoring use case demonstrates how organizations can achieve unified monitoring across hybrid IT environments.

Use case overview

Many enterprises today operate in a hybrid IT environment, where some resources are hosted on-premises, while others reside in the cloud. This complexity often leads to fragmented monitoring, making it difficult to obtain a unified view of IT service health. Agent Client Collector Monitoring (ACC-M) bridges this gap by providing a comprehensive and converged picture of the organization's services, regardless of where they're hosted. ACC-M is a lightweight monitoring solution that integrates seamlessly into its existing ServiceNow platform.

Challenge

An IT operations team struggled to cohesively monitor service health, due to the disparate nature of its infrastructure. On-premises resources, such as databases and ERP systems, were monitored using traditional methods, while cloud services had separate monitoring tools. This fragmentation resulted in:

- A lack of real-time visibility into overall service health.
- Delayed issue identification and troubleshooting.
- Multiple monitoring dashboards, increasing complexity for the IT team.
- Difficulty in correlating on-premises and cloud alerts, leading to inefficiencies.

Solution

ACC-M enables real-time, unified visibility across a hybrid IT environment. It improves operational efficiency, reduces downtime, and creates a more resilient IT infrastructure capable of supporting both on-premises and cloud-based services.

ACC-M streamlines the monitoring of on-premises and cloud resources into a single, unified display by offering the following solutions:

Solutions implemented by ACC-M

Solution	Description	Outcome
Unified monitoring across environments	ACC-M collects health metrics, performance data, and alert statuses from both on-premises and cloud infrastructure components. ACC-M uses lightweight agents installed on servers, VMs, and cloud resources to gather relevant data, providing:	Improved response: With a unified view of all resources, the IT operations team can quickly identify where issues are occurring and prioritize them based on overall service impact, reducing their mean-time-to-resolution (MTTR).

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Solutions implemented by ACC-M (continued)

Solution	Description	Outcome
	• CPU and memory utilization for on-premises servers. • Network performance metrics. • Availability and performance metrics for cloud services, such as databases and storage.	
Converged health view	ACC-M provides the company's IT team with a converged health dashboard within the ServiceNow platform, providing: • A unified view of both on-premises and cloud resources. • Real-time updates on service health, ensuring that hybrid services are monitored together and not in isolation. • Integrated insights into service dependencies, correlating incidents that impact both on-premises and cloud systems.	Proactive monitoring and maintenance: ACC-M's real-time health metrics enable proactive monitoring of services, avoiding outages by identifying and resolving issues before they escalate.
Hybrid Alerting and Automation	ACC-M enables setting up automated alerts for both on-premises and cloud environments, streamlining their incident response processes. When a service in the hybrid environment experiences an issue, ACC-M does the following: • Automatically generates alerts with enriched context, identifying whether the issue originated from the on-premises infrastructure or cloud services. • Triggers automated workflows for remediation	Operational efficiency: The convergence of on-premises and cloud monitoring into a single platform eliminates the need for multiple monitoring tools. This reduces complexity and frees IT resources to focus on more strategic tasks.

Solutions implemented by ACC-M (continued)

Solution	Description	Outcome
	based on the alert type, reducing manual intervention.	
Service Health Visualization	Using the ServiceNow Service Map enables visualizing how services are performing across the entire hybrid infrastructure. ACC-M feeds this with continuous, real-time data, helping the IT team do the following: • Track dependencies between on-premises and cloud services. • Identify potential points of failure before they impact the business. • See at a glance which services are healthy, degraded, or at risk, wherever they're hosted.	Enhanced Business Continuity: With a full view of the hybrid infrastructure health, IT can ensure that critical business services are up and running, improving overall business continuity.

Windows event log monitoring

Windows event log monitoring tracks, analyzes, and manages event logs generated by various Windows OS components.

The Windows OS Events policy includes the os.windows.check-event-log check, which measures the Windows event log against thresholds specified in the check's parameters. For details on the configurable check parameters, see Windows event log filter parameters.

How Agent Client Collector for Visibility - Content works

Agent Client Collector for Visibility - Content (ACC-VC) requires installation of ServiceNow Agent Client Collector (ACC) on the target host. ACC is a derivative of Sensu-Go, an open-source software.

ACC-VC use cases

ACC-VC applies Checks and Policies to schedule and collect host data. ACC-VC is triggered in the following cases:

- Periodic scheduling: A policy-based approach where Discovery is triggered on a periodic basis.
- On CI delete: When the computer or server CI record is deleted.
- MID Server cycle: When the MID Server goes down and comes back up.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Target host cycle: When the target host goes down and comes back up.
- Network break: When there is a break in the network link to the target.

Note: Discovery is triggered for those agents whose hosts are already present. Agents whose hosts are not present are discovered through ACC-F.

ACC-VC checks and policies

The ACC-VC assets are stored as Agent plugins with the main entry point [acc_visibility_main] and other modules for OS families. There is one main system Discovery Check definition, called *`Enhanced Discovery`*, which is used by the *`Enhanced Discovery Policy`*. This ACC-VC policy runs off a schedule, which is defaulted to 24 hours (86,400 seconds). This policy configuration is synced to all agents as defined in the ACC-VC policy.

When the payload is returned from the MID Server to the instance, the ACC-VC Check Type, *`EnhancedDiscovery`*, delegates tasks to the EnhancedDiscoveryHandler script include provided by ACC-VC. The script contains logic to process the data from the check and handles tasks such as:

- Data transformation into an identification and reconciliation engine (IRE) compatible payload
- Non-CI data reconciliation (cmdb_running_processes, cmdb_tcp_connections, and so on)

The ACC-VC Check Definition, *`Enhanced Discovery`*, is initiated by the ServiceNow Instance. Then, an ECC Queue record with topic, MonitoringProbe, is created on the output queue with relevant Check information. The MID Server then processes the check by sending a message to the ACC via WebSocket over TLS.

During this time, the MID Server also serves any relevant Assets or Plugins that the ACC requests, making sure it is relevant to the particular Operating System, platform, OS version, and architecture on which the ACC is running.

You can edit and modify all parts of the ACC-VC application including check type, policy, and check definition. See Checks and policies for more information.

Virtual machines and cloud instances

ACC-VC associates a target, discovered via Discovery, with a pre-existing virtual machine (VM) Instance CIs. ACC-VC associates the discovered CI record with any pre-existing VM Instance record or Cloud Server Instance record with appropriate CMDB relationships.

The following variants of virtualization and cloud server vendors are supported for ACC-VC:

- vCenter
- Amazon AWS Cloud
- Google (GCP)
- Microsoft Azure

Agent Client Collector deployment - servers

When deploying the Agent Client Collector, perform deployment and management tasks on your environment's servers.

Server deployment uses MID Servers to connect your agents to a ServiceNow instance. Agents deployed on data center servers open WebSocket connections to your MID Servers, which relay data to your instance. You manage the sizing, certificates, and load balancing of the MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use server deployment when your agents are in controlled environments such as data centers, where you are already running MID Servers and want to keep traffic on your network. Agent Client Collector Monitoring (ACC-M) and Agent Client Collector Log Analytics (ACC-L) require server deployment, and you can deploy Agent Client Collector for Visibility - Content (ACC-VC) with servers as well.

Configuring Agent Client Collector with a MID Server

Configure the Agent Client Collector with a MID Server to enable communication between network servers and the ServiceNow instance.

Configure an Agent Client Collector with a MID Server using a single-line command

Use a single-line command to set up an Agent Client Collector with a MID Server. You can also use the single-line command to migrate agents with MID-less configuration to be used with a MID Server.

Before you begin

Role required:

- In a Linux or macOS environment: root
- In a Windows environment: agent_client_collector_admin

About this task

Running the single-line command includes flags, which indicate the options to be added to the `acc.yml` configuration file. These options dictate the configuration of the Agent Client Collector with the MID Server. If you don't specify an option in the command, the existing option in the `acc.yml` file is used. If there's no existing option, an error message indicates that the parameter is required to enable connecting to an endpoint.

Running a command validates that a connection can be made with the specified parameter (for example, the specified api-key value). However, the command doesn't verify if the value of the parameter is valid.

Procedure

1. Run the following command in a terminal window: `acc gateway mid <flags>`.
   The available flags appear in the following table:

MID Server configuration flags

Flag	Type	Description
-y, <--acc-yml>	String	Location of the `acc.yml` being configured. Can also be used to modify and validate parameters if the file is in a different location that the default. Optional. If no value is entered, the default location of the `acc.yml` file is used.
-a, <--api-key>	String	The API key to be used by the MID Server.
-b, <--backend-url>	String	One or more backend connection URLs specifying

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flag	Type	Description
		a websocket endpoint to a MID Server. Multiple values are specified using commas between entries with no spaces separating the values; for example, `<url1>,<url2>`.
-h, help	N/A	Explains what the specified command does.

2. Restart the agent for the configuration settings to be entered into the `acc.yml` file.

Configure the websocket server on the MID Server

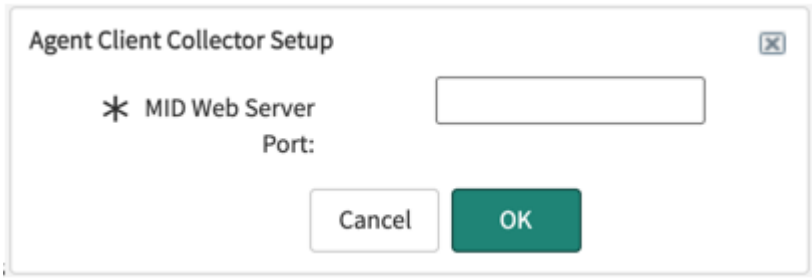
Configure the websocket server on MID Servers to enable connections from agents to the MID Server. You can configure only one websocket server per MID Server.

Before you begin

- Ensure that you download and install curl (or similar software) on your MID Server Windows machine.
- Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
2. Select the relevant MID Server name.
3. In the **Related Links** section, click **Setup ACC Listener**.
   The **Agent Client Collector Setup** dialog box appears.



4. Enter the MID web server port (**8800**) in the displayed field.

   Note: You can change the default port, **8800**, as needed.

   - To invoke secure TLS configuration, configure the following in the `acc.yml` file: `wss://<mid_ip>:<websocket_port>/ws/events`
   - To invoke TLS 1.3 support on the MID Web Server, set the following parameter in the `wrapper-override.conf` file on the MID Server: `-Djdk.tls.server.protocols="TLSv1.3"`
   - In a Linux environment, port numbers under 1024 can be used only with superuser privileges.

5. Click **OK**.
   A confirmation message with the URL for the agent configuration file appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The web server and websocket extension are configured for the MID Server. To verify that the configuration is working, you must navigate to the following menu options:

- **Agent Client Collector** > **MID Web Server**. When editing the fields on the resulting form, you must restart the MID web server extension to save your changes.
- **Agent Client Collector** > **Websocket Endpoint**

6. Verify the validity of the websocket, using curl:

   a. Enter the following command into a cmd or terminal window: *curl -Lk -H "Authorization: Key <API_KEY>" https://<mid_server_address>:<port>/api/mid/mon*

   b. Verify that you receive a valid JSON response (and not an error message), such as the following:

Successful installation JSON script

```
{
  "uptime" : "53d 23h 50m 3s",
  "memory" : "used 127MB, total 503MB",
  "connectedAgentsNum" : 1,

  } ]
```

Configure a websocket endpoint

Configure a websocket to enable the endpoint to provide web access from the MID Server to the Agent Client Collector (ACC).

Before you begin

Role required: agent_client_collector_admin

About this task

For added security, ensure that MID Servers deployed for the Agent Client Collector aren't deployed for other components.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **MID Servers**.
2. Select a MID Server.
3. Select the **ACC Websocket Endpoints** tab on the bottom of the page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **New**.
5. Configure the fields on the page.

ACC Websocket Endpoint page

Field	Description
Name	Enter a descriptive name for the websocket endpoint.
MID Server	The name of the selected MID Server.
Short description	Optionally, enter a short description for the websocket endpoint.
Accessible IP address	Apply an external/public IP when the MID Server has an internal IP that is not accessible from an agent. Used for cloud solutions with an agent that has access only to the MID Server's public IP. If the MID Server and all agents are in the same Virtual private cloud (VPC), this field can be left empty.

6. In the **Related Links** section, select **Start** to activate the websocket endpoint.

Configure the frequency of updating the agent MID Server list

By default, the list of MID servers connected to agents is updated once daily. If you have a dynamic environment that adds MID servers frequently, you may want to schedule updates more often, or execute the job on demand.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Locate the **Update Mid List for All Agents** job.
3. To run the job immediately, click **Execute Now**.
4. To edit the frequency by which the job runs:

   a. In the **Run** field, select **Periodically**.
   The **Repeat Interval** field appears.

   Repeat interval field

   b. Configure the frequency by which you want the job to run.
   The cells next to the **Hours** cell represent minutes and seconds, respectively.

   c. Click **Update** to update the job frequency.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enable Agent Client Collector monitoring on the MID Server

Enable Agent Client Collector monitoring on the MID Server by configuring the Agent Client Collector framework (ACC-F) and Metric Intelligence extensions in a single action. Enabling Agent Client Collector monitoring also enables monitoring on agents connected to the MID Server.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **MID Servers**.
2. On the MID Server page, select a MID Server to view the MID Server's details.
3. In the **Related Links** section, select **Setup ACC Monitoring** and enter the relevant port number in the **MID Web Server Port** field of the dialog box.

Result

The MID Server is configured to support both the Agent Client Collector and Metric Intelligence.

Note: You are prompted to enter a port number only on initial ACC Monitoring setup.

Automatic MID Server selection

Automatic selection of MID Servers ensures that each agent uses the most efficient available MID Server.

The Agent Client Collector automatic MID Server selection feature set is disabled by default. There are several factors to consider before determining if automatic MID Server selection is right for your use cases.

Use case considerations

Automatic MID Server selection provides several benefits. MID Server capabilities can narrow the list of MID Servers an agent can potential connect to. Automatic MID Server selection keeps the back-end URL configuration list up to date on the agent host without additional work flows.

When automatic MID Server selection is enabled, the agent performs a connectivity test against the list of available MID Servers and determines the best connection based on latency and number of currently connected agents.

However, there are several additional considerations that may make automatic MID Server selection wrong for your use case.

The ACC automatic MID Server selection is not a true load balancer and should be considered a fail-over mechanism. There is higher complexity for choosing a back-end URL as it is derived from multiple input sources. If, instead, an application load balancer is used only one back-end URL needs to be specified. See Enable the Agent Client Collector load balancer for more information.

By default, each agent is sent the list of all MID Servers listening for ACC connections. Since that list includes MID Servers running in restricted areas, the agents can try to connect to them which can generate security alerts.

Your DNS configuration should be considered before using automatic MID Server selection because the resolution can lead to unexpected results. The DNS resolution is done periodically. End User Compute systems that alternate between internal corporate, Wi-Fi, VPN, or external networks may not be able to reconnect if the network context has changed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automatic selection process

When automatic selection is enabled, the ServiceNow instance sends periodic MID Server updates to existing agents. The agent selects a MID Server based on information it receives from the ServiceNow instance.

During automatic MID Server selection, the agent selects a primary MID and a secondary MID list, and writes them to the agent's config file. The agent uses this list for fail-over protection when the primary MID/secondary MID in the list loses connection.

When an agent detects that its IP address has changed, it automatically connects with the most efficient MID Server available from the agent's list of MID Servers.

To secure communication between the MID Server and the agent, use the MID Server's unified key store. For details on using the MID Server unified key store, see MID Server unified key store.

Related topics

Enable automatic MID Server selection

Enable automatic MID Server selection

Enabling automatic MID Server selection lets the agent perform a connectivity test against the list of available MID Servers and determine the best connection based on latency and number of currently connected agents. Automatic MID Server selection is disabled by default.

Before you begin
Role required: agent_client_collector_admin

Procedure

- To enable sending periodic MID Server updates from the ServiceNow instance to existing agents, set the *sn_agent.enable_auto_mid_selection* system property to **true**.
- To enable automatic MID Server selection for individual agents:
  1. Set the *enable-auto-mid-selection* property in the agent's `acc.yml` file to **true**.
  2. Enable and execute the Update MID List for All Agents and Update MID List for All New Agents scheduled jobs.

What to do next
To disable automatic MID Server selection again, set each of the properties back to **false**.

To schedule updates more often than once daily, or execute the job on demand, see Configure the frequency of updating the agent MID Server list.

Configure the Agent Client Collector capabilities for MID Servers

Configure the MID Servers with Agent Client Collector capabilities to enable the MID Servers to work with agents. Agents that have identical MID Server capabilities are eligible for automatic MID Server selection.

Before you begin
Role required: agent_client_collector_admin

About this task
A capability defines MID Server functions. Any MID Server that is assigned with a capability that has **Is ACC Capability=true** is enabled to work with an agent. For details on the MID Server capabilities, see MID Server capabilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **MID Server** > **Capabilities**.
2. Select a capability to enable the MID Server to work with the agent.
   a. Select the ACC Capability column next to the AgentClientCollector entry.
   b. Set the value to **true**.
3. Enable other capabilities for Agent Client Collector MID Servers by selecting the Is ACC Capability column next to the AgentClientCollector entry and setting the value to **true**.

Result

MID Servers with the same capabilities are eligible to be used during automatic MID Server selection.

Configure the automatic MID Server selection based on the Agent Client Collector capabilities

Configure the MID Servers that are ineligible for automatic MID Server selection with the agent. For example, you may want to block a MID Server from connecting to your agent due to firewall constraints.

Before you begin

Role required: agent_client_collector_admin

About this task

Agents with different levels of Agent Client Collector (ACC) capability can't be considered for automatic MID Server selection. If you want to block a MID Server from automatic MID Server selection, you can assign the MID Server different ACC capabilities from all MID Servers, but not the primary MID Server, in your environment.

Procedure

1. Configure the Agent Client Collector capabilities for MID Servers, as described in Configure the Agent Client Collector capabilities for MID Servers.
2. Navigate to **All** > **Agent Client Collector** > **MID Servers**.
3. Select the MID Server that you want to be ineligible for automatic MID Server selection.
4. Select the additional actions icon ≡ and select **View** > **Default View**.
5. Select the **Capabilities** tab.
6. Ensure that the MID Server isn't assigned with the capabilities that have **Is ACC Capability=true** on the **Capabilities** tab.

Example: Configuring MID Servers to be ineligible for automatic MID Server selection

1. Assign the **AgentClientCollector** capability to MID Server A and MID Server C, but not to MID Server B.
2. On the MID Server Capabilities page:
   a. Assign a capability to MID Server A and MID Server C.
   b. Assign a different capability to MID Server B.
3. Install Agent Client Collector Framework and specify MID Server A as the MID Server during installation.

   After installation, the agent has **Status=Up** and its MID Server is MID Server A.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Execute the MID Server Selection scheduled job to determine which MID Servers are eligible for automatic MID Server selection.

   MID Server B is ineligible for automatic selection, because it doesn't have the same ACC capability as MID Server A. MID Server C is eligible, because it has the same ACC capability as MID Server A.

Agent Client Collector installation

You can install the Agent Client Collector on any supported host machine. The Agent Client Collector connects to a MID Server using the HTTP/S protocol, and the connection remains active after being established. One MID Server may handle several agents simultaneously, while a single agent works with one MID Server at a time and switches to a different MID Server when necessary to provide failover protection.

When an agent's IP address changes, it selects a MID Server to connect to based on the agent's MID Server list.

The maximum number of agents that can be connected to a single MID Server is configurable in the *sn_agent.mid.max_allowed_agents* MID Server property. The default value is 4,000.

For ACC-VC, a default 1 GiB MID Server can support 700 agents concurrently. An 8 GiB configuration for a MID Server can support 8,000 agents concurrently. You can also scale out. For example, 5 MID Servers with 8 GiB of heap size can handle up to 40k agents.

The default user account is a local user called **servicenow**. This user has basic level permissions.

The following table describes the permissions required to work with various features associated with the agent, per OS. An asterisk (*) indicates that no special permissions are required.

Agent on Endpoints Deployment

Feature	Windows	Linux	macOS
Basic inventory	*	*	*
Serial number(s)	*	sudo dmidecode	*
Running processes	Debug programs	*	*
Mapping TCP connections to running processes	*	sudo ss	*
Storage devices	LOCAL SYSTEM	*	*
Logged-in users	LOCAL SYSTEM	*	*
Package self-upgrade	LOCAL SYSTEM	sudo rpm/dpkg	Not supported

If you completely reinstall the agent on a single host server, a second agent record registers on the instance. Delete the original agent on the **Agent Client Collectors** page (**All** > **Agent Client Collector** > **Agents**).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agents whose **Status = Down** or **Disconnected** which haven't been deleted are deleted automatically after 30 days. You can modify this setting on the Autoflush form page (see Autoflush form).

Use the Manual Transport Layer Security protocol (mTLS) for secure authentication between your MID Web Server and the agent (the client). For details, see Connect the agent to the MID Server using mTLS.

For details on using Agent Client Collector in an air-gapped environment, see the Agent Client Collector Framework Air Gapped Configuration Item Management Solution [KB1585753] article in the Now Support Knowledge Base.

Golden image mode enables cloning of additional instances. Setting golden image mode is described in the installation procedure prerequisites for each OS. For information on the structure and modularity of the golden image plugin by operating system, see Golden image structure and modularity.

Agent Client Collector supports domain separation. The domain of the agent and the CIs it creates is determined by the domain of the MID Server that the agent is connected to. The user's domain must be the lowest domain level (known as a leaf domain) to enable creating a Websocket endpoint extension for the MID Server.

Related topics

Agent Client Collector installation on a Linux OS system

Install Agent Client Collector on a Windows machine manually

Agent Client Collector installation on a macOS system

Agent Client Collector system requirements

System requirements are the fundamental specifications and configuration needed to install and run Agent Client Collector (ACC) effectively.

Before installing the Agent Client Collector, you must do the following:

- When working with a MID Server:
  - Ensure that one or more MID Servers are properly registered and validated with your instance, to be available for an agent connection request. For details, see Configuring MID Servers. In a staging environment, you need only one MID Server. However, in a production environment, configure at least two MID Servers to support zero-touch configuration and ensure that a MID Server is always available if one fails.
  - Ensure that there's a validated connection from the designated server where you're installing the agent to the MID Server.
  - Ensure that the MID Server port on which the Agent Client Collector listener runs is accessible.
- When working with MID-less deployment, follow the instructions described in Configuring MID-less Agent Client Collector.
- Ensure that the following plugins are installed on your instance:

Application	Plugin
ACC-F	○ MID Server ○ CMDB for scoped applications ○ Agent Client Collector global utilities

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application	Plugin
	○ MID Web Server ○ Service Error Management
ACC-VC	○ Agent Client Collector for Visibility - Content ○ Agent Client Collector Framework ○ Discovery [com.snc.discovery] plugin
ACC-M	○ Agent Client Collector Framework ○ Agent Client Collector Monitoring ○ Event Management and Service Mapping Core ○ Metric Intelligence - [com.snc.sa.metric] plugin
ACC-L	○ Agent Client Collector Framework ○ Agent Client Collector Log Analytics ○ Health Log Analytics
DEX	○ Agent Client Collector Framework ○ ITOM Cloud Services Core [sn_itom_cloud_svc]

You can verify that these plugins are installed on the **System Definitions** > **Plugins** page.

All plugins that come with the base system are signed with the ServiceNow certificate. Optionally, you can use custom plugins and sign them using your own certificate, as described in Enable OpenSSL secure signing for plugins.

- Ensure that your system has the minimum requirements for agent installation.

Minimum installation requirements

Agent Client Collector component	Requirements
Agent Client Collector Framework	○ 1 GB RAM ○ 300 MB free disk space ○ 1 CPU core
Agent Client Collector Monitoring	○ 1 GB RAM ○ 1 GB free disk space ○ 1 CPU core

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector component	Requirements
Agent Client Collector for Visibility - Content	○ 1 GB RAM ○ 1 GB free disk space ○ 1 CPU core

- Ensure that you're installing Agent Client Collector on one of the supported operating system distributions. For details on the supported operating systems, see Agent Client Collector Framework in the ServiceNow® Store.

Important: All supported operating systems work only with the x86-64 CPU architecture type. ACC-F v3.1.1 also adds native support for ARM64 on Apple Silicon architectures. For the latest information, see the Agent Client Collection on non- x86-64 computers and embedded boards [KB1172387] article in the Now Support Knowledge Base.

When using ACC-L: The Agent Client Collector comes with the default *servicenow* user. Ensure that this user has read access to enable Agent Client Collector to view all the configured log paths. For example, the Agent Client Collector *servicenow* user that comes installed with the base system does not have permissions to view the paths to `/var/log/` in Linux and `C:\Windows\System32` in Windows. For information about configuring permissions for the *servicenow* user, see the ACC-L Permission Denied issues [KB1117271] article in the Now Support Knowledge Base.

When determining the number of machines and servers needed to support your agents (such as the number of machines requiring proxy agents), consider the agents' performance KPIs. For details on agent performance KPIs, see Agent Client Collector performance and footprint for URL monitoring.

Incorporating the Agent Client Collector into a custom base image for mass deployment

Deploy the Agent Client Collector on a virtual machine during mass deployment using the machine's base image. Mass deployment uses silent installation, which hides installation status.

Before you begin

Use Microsoft SCCM to manage the deployment and security of your devices, as described in the Create a Windows service account with Log on as a Service KB article.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agent Downloads**.
2. Download the installation file of the relevant OS.
3. Install the agent according to the relevant OS instructions.
4. Run the following command to stop the agent service:
   - In a Windows environment: Run the command `sc stop AgentClientCollector`
   - In a Linux environment: Run the command `sudo systemctl stop acc`
5. Ensure that the `acc.yml` file doesn't include an encrypted API key.
   For example: `api-key: "<insert plain text API key here>"`
6. Delete the contents of the agent's cache directory, keeping the directory structure intact:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In a Windows environment: `C:\ProgramData\ServiceNow\agent-client-collector\cache`
- In a Linux environment: `/var/cache/servicenow/agent-client-collector`

7. When installing on a Windows machine, ensure that the installation was successful by doing one of the following:
   - Enable logging in silent installation and verify that the log file ends with the string, `Windows Installer installed the product.`
   - Ensure that the **AgentClientCollector** service has the status `Running`.
8. When installing on a Linux machine, access the machine where the agent is installed and modify the `/usr/share/servicenow/agent-client-collector/serial_number.txt` file in one of the following ways:
   - Change its content with the host's serial number, by running the following command: `sudo -n dmidecode -s system-serial-number`
   - Assign sudo permissions to the ServiceNow user to enable running the following `osqueryi` command: `sudo -E env "PATH=$PATH" osqueryi --logger_min_status=3 --line "select hardware_serial from system_info"`

   Note: You must change the virtual machine's host name after deployment to a unique value, to avoid damaging the host's CI.

9. As a post-deployment step, restart the agent service.
   - In a Windows environment: Run the command `sc start AgentClientCollector`
   - In a Linux environment: Run the command `sudo systemctl start acc`

Enable the Agent Client Collector load balancer

Enable a load balancer to ensure that you have functional MID Servers. A load balancer distributes resources over multiple MID Servers to ensure that no single MID Server is overloaded.

Before you begin

1. Install the Agent Client Collector Framework.
2. Configure the Agent Client Collector web server.
3. Ensure that you have access to the internal application's load balancer configuration.
4. Verify that the file `<mid_server_install_path>/static/hello.txt` was created during MID Server setup.

   `hello.txt` is an empty file that is created manually, to retrieve an HTTP response 200.

Role required: agent_client_collector_admin

About this task

Load balancers are not configured by default. Follow this procedure to configure a load balancer in your environment.

Procedure

1. Configure the load balancer so that it can be used in the *`backend-url`* parameter in the `acc.yml` configuration file.
2. Perform the following setup actions on the load balancer:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Increase the idle timeout to 300 seconds.

b. Configure the load balancer target group with *https* and port 443.
Configure all MID Servers behind the load balancer as targets.

c. Configure the load balancer health check to monitor the `<mid_server_install_path>/static/hello.txt` file created during MID Server setup.
The health check ensures that there are no communication interruptions between the load balancer and the MID Server.

3. Add the `<mid_server_install_path>/static/hello.txt` file to the static folder for each MID Server.
You can place the file in another location that doesn't require credentials, to simplify the setup.
4. Update the acc.yml configuration file with the appropriate FQDN (*backend-url* value) and port number, and turn off automatic MID Server selection.

```
backend-url:
 - wss://<fqdn>:<port>/ws/events
enable-auto-mid-selection: false
```

5. Restart the Agent Client Collector.

Result
The Agent Client Collector data flow proceeds as described in Agent Client Collector architecture.

Note:

When working with SSL, all certificates or certificate chains used by the configured MID Servers must be signed by root certificate authorities whose certificates are bundled inside a single `.pem` file. To transfer the signed certificates to the agent, specify the `.pem` file in the *trusted-ca-file* property of the agent's `.yml` configuration file. For information on enhancing security with SSL/TLS configuration, see the ITOM Agent Client Collector documentation material article in the Now Support Knowledge Base.

Restart an agent manually

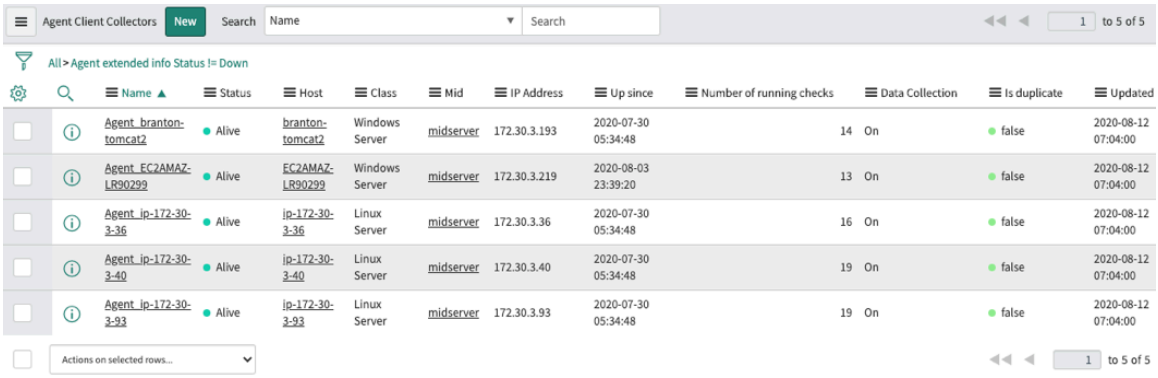
Perform manual restart of an agent when the agent configuration file has been refreshed, or if the agent is unstable. You can perform manual restart only on agents installed in a Windows environment and for Linux-based agents that use `systemd`.

Before you begin
Role required: agent_client_collector_admin

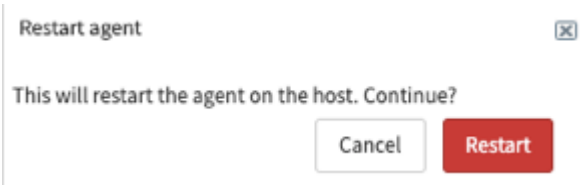
Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
The **Agent Client Collectors** page appears with the list of agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



2. Select the check box of the agent you want to restart.
   You can select multiple agents.
3. In the **Actions on selected rows...** list underneath the list of agents, select **Restart agent**.
   A confirmation dialog box appears.



4. Select **Restart**.
   Alternatively, you can restart the agent from within the agent record by selecting the agent name and, in the **Related Links** section, select **Restart agent**.

Golden image structure and modularity

The following table outlines the structure and modularity of the golden image mode for cloning agents, based on the operating system (OS) in use.

Golden image structure by OS

	Linux	macOS	Windows
Trigger type	marker file	plist key	msi property
Fresh install handling	none	supported	supported
Service control	stop and disable	skip load	stop and disable
Identity handling	cache wipe	skip restore	skip restore
Certificate handling	cert wip	skip restore	cert wipe
Runtime state	Cache and database wipe	skip restore	Cache and database wipe

Agent Client Collector installation on a Linux OS system

Install Agent Client Collector on a system that uses a Linux OS, either using a single-line command script, or following the installation procedure to embed in your own package

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

distribution mechanism. The installation procedure provides consistency when using package distribution solutions.

Install Agent Client Collector on a Linux system

Install Agent Client Collector using a package distribution tool. Before installing, you can manually install the Agent Client Collector on a few machines to ensure that your agents contain the correct policies and checks before installing a large number of agents.

Before you begin

- Ensure that the Agent Client Collector Listener is configured on your MID Servers, and the service is available from your target hosts.
- Verify that your server's OS and version is supported. For a list of supported OS's and versions, see Agent Client Collector installation.
- Verify whether there are restrictions or requirements to be aware of during deployment, such as specifying an account other than the default servicenow account. For more information about embedding the agent into your own automated system, see ITOM Agent Client Collector documentation material [KB1122613].
- Ensure that the MID Server and its MID Web Server and ACC Websocket Endpoint extensions are up and running.
- Enable golden image mode for cloning additional agents by setting the golden image marker located at `/tmp/acc-goldenimage`. The golden image marker takes no action during new Linux installations, as there is nothing which requires cleaning.
- Retrieve the MID Server ACC Listener information to be specified in the agent's *`backend-url`* parameter.
  1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **MID Servers**.
  2. Select a MID Server.
  3. Select the **ACC Websocket Endpoints** tab.
  4. Select a websocket endpoint.
  5. Copy the value in the **Endpoint URL** field.
- Retrieve the MID Server API key specified in the agent's *`api-key`* parameter.
  1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **MID Web Server API Key**.
  2. Select the API key you want to use.
  3. In the **Related Links** section, select **View API key**.
  4. Copy the API key value and close the pop-up window.

Role required: agent_client_collector_admin

About this task

During Linux installation (and upgrade), the agent executable file is enabled with Linux capabilities (CAP_SETFCAP, CAP_SETPCAP) by default. Store apps such as Agent Client Collector Log Analytics (ACC-L) can use this to grant capabilities to read the entire file system (CAP_DAC_READ_SEARCH). The system undergoes various security measures, such as double verification of the content origination, leveraging the plugin verification process and more, to ensure that granting capabilities does not pose a security risk. This procedure assumes that you are familiar with commands for Linux capabilities.

To opt out of these enhanced capabilities, run the following commands, based on your Linux OS/packaging system:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linux enhanced capability opt-out commands

OS/Packaging System	Commands

RPM	`ACC_SKIP_CAPS=true yum / dnf localinstall`
	
	`ACC_SKIP_CAPS=true rpm -vi agent-client-collector-<version number>-x86_64.rpm`

Debian	`ACC_SKIP_CAPS=true apt-get install`
	
	`ACC_SKIP_CAPS=true dpkg -i agent-client-collector-<version number>-<distro>_amd64.deb`

SLES	`ACC_SKIP_CAPS=true zypper install`

Procedure

1. Download the relevant installation packages.
   - For manual installation:
     a. Navigate to > **Agent Client Collector** > **Deployment** > **Agent Downloads**.
     b. Download the relevant .rpm or .deb installation file.
     c. Download the relevant signature files to validate the installation files.
   - For command-line installation, run the following commands to download both the signature and installation files to your local machine:

```
curl -LO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-<version_number>-x86_64.rpm
curl -LO
 https://install.service-now.com/glide/distribution/builds/package/app-signed/agent-client-collector-<version_number>-x86_64-rpm-rpm.zip
```

   Note: Each curl command must appear on a single line.

2. **Optional:** Verify the package signature.

   a. Extract the installation file (if it is compressed) by running the following command: `unzip agent_client-collector-<version_number>-x86_64-rpm-rpm.zip`

   b. Validate the installation file signature by running the indicated commands.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- On an RPM-based system:

```
openssl dgst -sha256 -verify {<ServiceNow
 DGST pem key>} -signature {<signature file>}
 agent-client-collector-<version number>-x86_64.rpm
```

Where `<ServiceNow DGST pem key>` is the `.pem` file extracted from the `.zip` file, and `<signature file>` is the `.bin` file extracted from the `.zip` file.

For example:

```
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/p
ackage/app-signed/agent-client-collector-3.0.0-x86_64.rpm
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/p
ackage/app-signed/agent-client-collector-3.0.0-x86_64-rpm-rp
m.zip
$ unzip agent-client-collector-3.0.0-x86_64-rpm-rpm.zip
Archive: agent-client-collector-3.0.0-x86_64-rpm-rpm.zip
inflating: ServiceNow_Digicert_DGST.pem
extracting: agent-client-collector-3.0.0-x86_64.bin
$ openssl dgst -sha256 -verify ServiceNow_Digicert_DGST.pem
 -signature agent-client-collector-3.0.0-x86_64.bin
 agent-client-collector-3.0.0-x86_64.rpm
Verified OK
```

Note: Each command must appear on a single line.

- On a Debian-based system:

(Optional) `gpg --import ServiceNow_Digicert_Public.gpg`

`sudo gpg --verify agent-client-collector-<version number>-<distro>_amd64.deb`

For example:

```
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/p
ackage/app-signed/agent-client-collector-3.0.0-debian-9_amd6
4.deb
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/p
ackage/app-signed/agent-client-collector-3.0.0-debian-9_amd
64-deb-deb.zip
$ unzip
 agent-client-collector-3.0.0-debian-9_amd64-deb-deb.zip
Archive:
 agent-client-collector-3.0.0-debian-9_amd64-deb-deb.zip
extracting: ServiceNow_Digicert_Public.gpg
$ gpg --import ServiceNow_Digicert_Public.gpg
gpg: /home/admin/.gnupg/trustdb.gpg: trustdb created
gpg: key 985DD52C6A0ABB45: public key "ServiceNow, Inc.
 (Signing) <seceng@servicenow.com>"
imported
gpg: Total number processed: 1
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gpg: imported: 1
$ dpkg-sig --verify
 agent-client-collector-3.0.0-debian-9_amd64.deb
Processing
 agent-client-collector-3.0.0-debian-9_amd64.deb...
GOODSIG _gpgbuilder 9B928FB49771DF6C047430DD985DD52C6A0ABB45
 1665054068
```

Note: Each command must appear on a single line.

3. Install the Agent Client Collector package using the package manager associated with Linux distribution.

OS	Command
RHEL-based	`yum / dnf localinstall`
SLES	`zypper install`
Debian-based	`apt-get install`

Alternatively, if these commands aren't configured correctly, you can use the core commands that are configured to run with the package manager commands.

- RPM-based system: `# rpm -vi agent-client-collector-<version number>-x86_64.rpm`
- Debian-based system: `# dpkg -i agent-client-collector-<version number>-<distro>_amd64.deb`

Verify that the package commands are configured correctly with your system administrator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Some file systems may have restrictions enabled; for example, `/var/` may be mounted with a *`noexec`* flag. Because the agent must execute Agent Client Collector plugins that are normally stored in the `/var/cache` directory, you must deploy the application into specific folders by customizing the installation paths using the `--relocate` option as an `.rpm` parameter.

For example: `rpm -i --relocate /var/cache=/opt/cache agent-client-collector-<version_number>-x86_64.rpm`

The following paths can be relocated:

Path	Notes
`/etc`	When updating, you must also update the *`allow-list`* parameter in the `acc.yml` file with the new path.
`<usr share location>/usr/share`	N/A
`<cache dir location>/var/cache`	Updating the `/var` directory retains all `/var` subdirectories, nested under the new directory.
`/var/log`	
`/var/run`	
`/var`	

After relocating an installation path, update the relevant `ACC_UPGRADE_CMD` string described in step 7.

Review the paths in `/usr/lib/systemd/system/acc.service` to ensure that they appear as expected.

4. When installing a .deb package, configure the agent's `acc.yml` configuration file.

   a. Copy the sample configuration file by running the following command.

   ```
   # cp -p /etc/servicenow/agent-client-collector/acc.yml.example /etc/servicenow/agent-client-collector/acc.yml
   ```

   b. Rename the allow list file.

   ```
   # cp -p /etc/servicenow/agent-client-collector/check-allow-list.json.default /etc/servicenow/agent-client-collector/check-allow-list.json
   ```

   Note: This step is not relevant for .rpm packages, which come with `acc.yml` and `check-allow-list.json` files included in the base system.

5. Update the configuration file, adding *`check-allow-list.json`* to `/etc/servicenow/agent-client-collector` and copying the `backend-url` and `api-key` from the instance.
   For example:

   ```
   ---
   # Agent Client Collector configuration
   ```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
backend-url:
 - "wss://YOUR_MID_ENDPOINT_HERE:YOUR_MID_PORT_HERE/ws/events"
api-key: "YOUR_API_KEY_HERE"
log-level: "info"
insecure-skip-tls-verify: false
allow-list: /
etc/servicenow/agent-client-collector/check-allow-list.json
verify-plugin-signature: true
max-running-checks: 10
disable-sockets: true
disable-api: true
statsd-disable: true
enable-auto-mid-selection: false
agent_cpu_threshold:
 cpu_percentage_limit: 25
 repeated_high_cpu_num: 3
 monitor_interval_sec: 60
 agent_cpu_threshold_disabled: false
```

The *allow-list* feature, indicating the commands permitted to be executed by the agent, is enabled.

6. Configure sudoers.

   Configuration is typically automated by your Linux sysadmin. To manually configure ensuring correctness before full configuration, run the following to create a new sudoers file for the agent service user:

   ```
   visudo -f /etc/sudoers.d/01_servicenow
   ```

7. Add the sudoers configuration according to your Linux distribution.

   - When installing agents on a deb/ubuntu system, run the following:

     ```
     User_Alias ACC_USERS = servicenow
     Cmnd_Alias ACC_CMD = /usr/sbin/dmidecode -s
      baseboard-serial-number,/usr/sbin/dmidecode
      -s chassis-serial-number,/usr/sbin/dmidecode
      -s system-serial-number,/usr/sbin/dmidecode -s
      system-uuid,/usr/sbin/ss -tanp,/usr/bin/systemctl start
     acc,/usr/bin/systemctl stop acc,/usr/bin/dpkg --install
      --refuse-downgrade
      --skip-same-version /
     var/cache/servicenow/agent-client-collector/upgrade/agent-cli
     ent-collector-upgrade*
     Cmnd_Alias ACC_CMD_SETENV = /usr/bin/netstat
      -ltnup,/usr/bin/ls -l /proc/*,/usr/bin/cat /proc/*
     ACC_USERS ALL = (root) NOPASSWD:ACC_CMD
     ACC_USERS ALL = (root) NOPASSWD:SETENV:ACC_CMD_SETENV
     Defaults:ACC_USERS !requiretty

     Cmnd_Alias ACC_UPGRADE_CMD = /usr/bin/systemd-run
      --unit=acc-upgrade
      --collect /
     usr/share/servicenow/agent-client-collector/embedded/bin/ru
     by /var/cache/servicenow/agent-client-collector/acc-f-
     commons/bin/linux_run_upgrade.rb /usr/bin/dpkg\ --install\
     ```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 --refuse-downgrade\
 --skip-same-version /
var/cache/servicenow/agent-client-collector/upgrade/agent-cli
ent-collector-upgrade.deb /usr/bin/systemctl\ start\
 acc /usr/bin/systemctl\ stop\ acc /usr/bin/systemctl\
 daemon-reload /
var/log/servicenow/agent-client-collector/upgrade.log *
ACC_USERS ALL = (root) NOPASSWD:ACC_UPGRADE_CMD
```

- When installing agents on an RPM system, run the following:

```
User_Alias ACC_USERS = servicenow
Cmnd_Alias ACC_CMD = /usr/sbin/dmidecode -s
 baseboard-serial-number,/usr/sbin/dmidecode
 -s chassis-serial-number,/usr/sbin/dmidecode
 -s system-serial-number,/usr/sbin/dmidecode -s
 system-uuid,/usr/sbin/ss -tanp,/usr/bin/systemctl start
acc,/usr/bin/systemctl stop acc,/usr/bin/rpm
 -Uv /
var/cache/servicenow/agent-client-collector/upgrade/agent-cli
ent-collector-upgrade.rpm
Cmnd_Alias ACC_CMD_SETENV = /usr/bin/netstat
 -ltnup,/usr/bin/ls -l /proc/*,/usr/bin/cat /proc/*
ACC_USERS ALL = (root) NOPASSWD:ACC_CMD
ACC_USERS ALL = (root) NOPASSWD:SETENV:ACC_CMD_SETENV
Defaults:ACC_USERS !requiretty

Cmnd_Alias ACC_UPGRADE_CMD = /usr/bin/systemd-run
 --unit=acc-upgrade
 --collect /
usr/share/servicenow/agent-client-collector/embedded/bin/ru
by /var/cache/servicenow/agent-client-collector/acc-f-
commons/bin/linux_run_upgrade.rb /usr/bin/rpm\
 -Uv /
var/cache/servicenow/agent-client-collector/upgrade/agent-cli
ent-collector-upgrade.rpm /usr/bin/systemctl\ start\
 acc /usr/bin/systemctl\ stop\ acc /usr/bin/systemctl\
 daemon-reload /
var/log/servicenow/agent-client-collector/upgrade.log *
ACC_USERS ALL = (root) NOPASSWD:ACC_UPGRADE_CMD
```

8. Configure the agent to run as a service.

   a. Safeguard resource consumption by adding the indicated values to the `/usr/lib/systemd/system/acc.service` file.

   - CPUShares=128
   - CPUQuota=10%
   - MemoryLimit=192M
   - BlockIOWeight=10
   - LimitNICE=15

   For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
# vi /usr/lib/systemd/system/acc.service
[Unit]
Description=Agent-Now acc
After=network-online.target
[Service]
Environment=AGENT_ROOT=/usr/share
Environment=AGENT_CACHE_ROOT=/var/cache
Environment=AGENT_CONFIG_ROOT=/etc
Environment=AGENT_LOG_ROOT=/var/log
Environment=AGENT_RUN_ROOT=/var/run
Environment=RUBYOPT=-Eutf-8
User=servicenow
Group=servicenow
ExecStart=/usr/share/servicenow/agent-client-collector/bin/a
cc-service start acc
KillMode=process
Restart=on-failure
RestartSec=1min
CPUShares=128
CPUQuota=10%
MemoryLimit=192M
BlockIOWeight=10
LimitNICE=+15
[Install]
WantedBy=network-online.target
```

b. Run the reload daemon command If you modified the service file after enabling the acc service.

```
# systemctl daemon-reload
```

c. Enable and start the service by running the following commands.

```
# systemctl enable acc
```

```
# systemctl start acc
```

Validate Linux installation

After installing the Agent Client Collector on a Linux system, validate the installation by ensuring it was completed properly.

Before you begin

Install the Agent Client Collector on a Linux system (see Install Agent Client Collector on a Linux system).

Role required: agent_client_collector_admin

Procedure

1. Run the `# systemctl status acc` command.
   The *`active (running)`* indicator appears when the service is running properly.

```
# systemctl status acc
● acc.service - Agent-Now ACC
Loaded: loaded (/usr/lib/systemd/system/acc.service; enabled;
 vendor preset: disabled)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Active: active (running) since Mon 2022-04-25 14:10:24 UTC; 6
 months 23 days ago
Main PID: 2693 (acc)
Tasks: 10 (limit: 512)
Memory: 143.4M (limit: 192.0M)
CPU: 12h 57min 50.442s
CGroup: /system.slice/acc.service
 └─2693 /usr/share/servicenow/agent-client-collector/bin/acc
 start --config-file
/etc/servicenow/agent-client-collect...
```

2. View the encrypted *api-key* and *agent-key-id* in use by running the `grep -E '^api-key|agent-key-id' /etc/servicenow/agent-client-collector/acc.yml` command.

```
# grep -E
 '^api-key|agent-key-id' /
etc/servicenow/agent-client-collector/acc.yml
api-key:
 "encrypted:adskfjldfjlasd+ajflksadjmoreunreadablestringasdfdfk
djksdjaasdfas"
agent-key-id:
 b4ac2ab4ac2b4ac2b4ac2b4ac2b4ac2b4ac2b4ac2b4ac2b4ac2b4ac2b4ac2
b4a
```

Note: The *grep* command must appear on a single line.

3. View the agent's connection with its backend URL by running the `grep 'successfully connected' /var/log/servicenow/agent-client-collector/acc.log` command.

```
# grep 'successfully
 connected' /var/log/servicenow/agent-client-collector/acc.log
2022-11-17T19:03:17.94 [INFO] [agent] successfully connected to
 the url:
wss://MY_BACKEND_FQDN:MY_BACKEND_PORT/ws/events
```

Note: The *grep* command must appear on a single line.

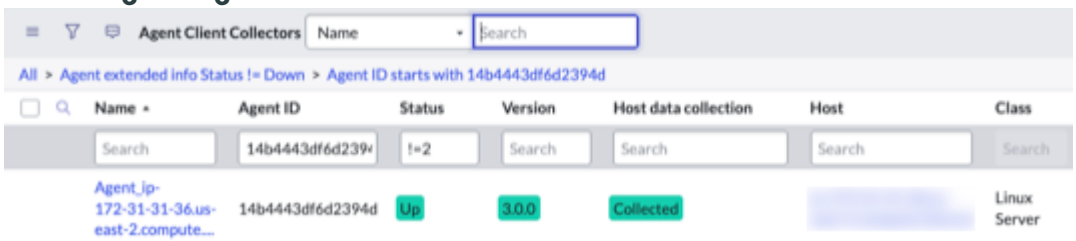
4. Verify the unique agent ID by running the `# echo $(hexdump -e '/1 "%02x"' /var/cache/servicenow/agent-client-collector/agent_now_id)` command.

```
# echo $(hexdump -e '/1
 "%02x"' /
var/cache/servicenow/agent-client-collector/agent_now_id)
14b4443df6d2394d
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The indicated agent ID appears on the Agents page in an instance (**All** > **Agent Client Collector** > **Agents**) with **Status = Up** and **Host data collection = Collected** (both appearing in green).

Linux agents - green status



Upgrade Agent Client Collector on a Linux system

Upgrade your existing Agent Client Collector version on a system running a Linux OS if the single-line command script is not connected to the instance or you want to use enhanced customization options.

Before you begin

- The upgrade procedure is the same for both MID Server and MID-less deployments.
- Enable golden image mode for cloning additional instances by setting the golden image marker located at `/tmp/acc-goldenimage`. The golden image marker is applied only during a Linux upgrade and not during new installations.
- Role required: agent_client_collector_admin

Procedure

1. **Optional:** Back up sensitive files by running the following command.

```
tar
 -Pcvzf /root/acc_backup.tar.gz /
etc/servicenow/agent-client-collector \
/var/cache/servicenow/agent-client-collector/agent_now_id \
/usr/lib/systemd/system/acc.service
```

2. Download the .rpm/.deb agent package and signature files, as described in Install Agent Client Collector on a Linux system.
3. Upgrade the package.
   - In an RPM-based system:

     ```
     rpm -Uv agent-client-collector-<version number>-x86_64.rpm
     ```

   - In a DEB-based system:

     ```
     dpkg -i agent-client-collector-<version number>-
     <distro>_amd64.deb
     ```

4. Restore the systemd service file (if you customized the file), using either an automation tool or by reloading systemd configuration.

```
tar -C / -Pxvzf /root/acc_backup.tar.gz
 usr/lib/systemd/system/acc.service
```

```
systemctl daemon-reload
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Change the *owner:group* setting to the correct one by running the following command.

```
chown -R
 servicenow:servicenow /
{etc,var/cache,var/log,usr/share}/servicenow/agent-client-colle
ctor
```

6. Restart the service and verify that it connects to its backend-url.

```
systemctl restart acc
tail -f /var/log/servicenow/agent-client-collector/acc.log
```

Uninstall Agent Client Collector from a Linux system manually

Uninstall the Agent Client Collector from a Linux machine manually if the command script is unavailable due to the specific agent not being connected to the instance.

Before you begin

- The uninstall procedure is the same for both MID Server and MID-less deployments.
- Role required: agent_client_collector_admin

About this task

By default, an uninstalled agent is removed from the system after 30 days. To modify this amount of time, update the *sn_agent_ci_extended_info* table, accessible from the Auto Flushes page (enter *sys_auto_flush.LIST* into the instance's search filter field).

Procedure

1. Stop the service.
   `sudo systemctl stop acc`
2. Use the relevant package management tool to remove the service.
   - yum remove agent-client-collector
   - apt-get remove agent-client-collector
   - zypper remove agent-client-collector

   Alternatively, you can run one of the following commands, based on the OS in use.

   - `rpm -e agent-client-collector`
   - `dpkg -r agent-client-collector`
3. If you ran either the `rpm` or `dpkg` command, remove any remaining files from your system.

```
# userdel -r servicenow
# groupdel servicenow
# rm
 -R /
{etc,var/cache,var/log,usr/share}/servicenow/agent-client-colle
ctor
```

Warning: Do not use the command rm -Rf, as this can cause data loss.

Perform a single-line Agent Client Collector installation on Linux

Use an efficient single-line command script to install Agent Client Collector on a machine that uses a Linux operating system. If a script is not connected to the instance or you want to use enhanced customization options, you might have to install Agent Client Collector manually.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that you have configured the Agent Client Collector web server.
- Verify that your server's OS and version matches the list of supported OS versions as described in Agent Client Collector installation.
- Ensure that the unzip program is installed on your Linux machine.
- Determine the resource limits for the agent to be configured in the `/usr/lib/systemd/system/acc.service` file after installation.
- Ensure that you have the `openssl` and `dgst` (for RHEL/Centos/SUSE installation) packages available, to be used by the install script.
- Ensure that you have the `gpg` package available for validation (for Ubuntu/Debian installation).
- Enable golden image mode for cloning additional instances by setting the golden image marker located at `/tmp/acc-goldenimage`. The golden image marker takes no action during new Linux installations, as there is nothing which requires cleaning.
- When performing single-line installation on more than one agent, download the agent package to your local machine. Place the package on your *ftp* server, using an Ansible script. For details on mass deployment of agents, see Incorporating the Agent Client Collector into a custom base image for mass deployment.
- In order for the Agent to retrieve the OS serial numbers and TCP connections along with associated running processes, sudo access for “dmidecode” and “ss” is required on Linux systems.

Role required: agent_client_collector_admin

Procedure

1. Retrieve MID Server websocket URL parameters.
   a. Navigate to **Agent Client Collector** > **Websocket Endpoint** and select the relevant websocket endpoint.
   b. Copy the value of the **Endpoint URL** field to be used in the installation command.
2. Copy and edit the following command line, substituting your own information for the command parameters.

```
ACC_API_KEY=<api_key> ACC_MID=wss://<mid_ip>:<websocket_port>/ws/events bash -c "$(curl -L https://<instance URL>/api/sn_agent/agents/install_agent)"
```

Command parameters

Parameter	Value
ACC_API_KEY	The API key used to access the MID Server websocket. If no ACC_API_KEY value is specified, you will be asked to enter the API key value during execution of the script.
ACC_MID	The URL of the MID Server websocket. If you are specifying multiple MID Servers, enter a string separated by commas for each MID Server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. **Optional:** If you need to create new check definitions to be included in the allow list that indicates the checks enabled to run on the agent, disable the allow list by adding *ACC_ALLOW_LIST=0* to the single-line command string.

   Note: This action compromises your system's security and is recommended only as a temporary measure until you finish updating the allow list. After completing the update, re-activate the allow list by removing *ACC_ALLOW_LIST=0* from the single-line command string.

4. **Optional:** If the certificate validation process is too time consuming or if you are using the agent for development purposes, you can bypass certificate validation by adding *ACC_VALIDATE_SIG=0* to the single-line command string.
5. Run the single-line command (specified in step 2, above) on the server where the Agent Client Collector is installed.
6. **Optional:** Configure resource limits for the agent in the `/usr/lib/systemd/system/acc.service` file, according to your business needs.

   (Optional) The default values in the file are:

   - *CPUShares*: 128
   - *CPUQuota*: 10%
   - *MemoryLimit*: 192M
   - *BlockIOWeight*: 10
   - *LimitNICE*: +15

Upgrade the Agent Client Collector manually on a Linux system

Perform a manual upgrade of your existing Agent Client Collector version on a system running a Linux OS if the single-line command script is not connected to the instance or you want to use enhanced customization options.

Before you begin

- Ensure that you have configured the Agent Client Collector web server. For more information, see Configure the websocket server on the MID Server.
- Restart the MID Web Server.
- Collect host data, to ensure that all files are up to date. For details, see Run host data collection for an agent.
- Ensure that you have installed a Linux version of the Agent Client Collector. For more information, see Agent Client Collector installation on a Linux OS system.
- Role required: agent_client_collector_admin

About this task

The upgrade procedure is the same for both MID Server and MID-less deployments.

Procedure

1. Back up the `agent-id` and configuration files.

```
mkdir -p /tmp/acc-upgrade-backup
sudo cp
 -rp /etc/servicenow/agent-client-collector/acc.yml /
tmp/acc-upgrade-backup
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
sudo cp
 -rp /
etc/servicenow/agent-client-collector/check-allow-list.json /
tmp/acc-upgrade-backup
sudo cp
 -rp /
var/cache/servicenow/agent-client-collector/agent_now_id /
tmp/acc-upgrade-backup
```

2. Uninstall the package.

   a. Stop the service.
   `sudo systemctl stop acc`

   b. Disable the service.
   `sudo systemctl disable acc`

   c. Uninstall the package:
   - For RHEL/CentOS/SUSE: `sudo rpm -e agent-client-collector`
   - For Ubuntu/Debian: `sudo dpkg -r agent-client-collector`

3. Download the installation file.
   For example, when working with an Ubuntu/Debian OS, use both of the following:

   ```
   curl -L -O https://<MID-WEBSERVER-URI:PORT>/static/
   acc_installers/agent-client-collector/glide/distribution/builds/
   package/app-signed/agent-client-collector-<version number>-
   <Ubuntu/Debian version>_amd64-deb-deb.zip -O
   ```

   ```
   https://<MID-WEBSERVER-URI:PORT>/static/acc_installers/agent-
   client-collector/glide/distribution/builds/package/app-signed/
   agent-client-collector/agent-client-collector-<version number>-
   <Ubuntu/Debian version>_amd64.deb
   ```

4. Verify and install the package.

   a. Unzip the compressed file.

   ```
   unzip agent-client-collector-2.3.0-debian-9_amd64-deb-deb.zip
   ```

   b. Validate the installer file signature.
   - RHEL/Centos/SUSE OS:

     ```
     openssl dgst -sha256 -verify {<ServiceNow DGST pem key>}
     -signature {<signature file>} agent-client-collector-<version
     number>-x86_64.rpm
     ```

   - Ubuntu/Debian OS:

     ```
     gpg --import ServiceNow_Digicert_Public.gpg
     dpkg-sig --verify agent-client_collector-<version
      number>-<Ubuntu/Debian version>_amd64.deb
     ```

   c. Install the package.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- RHEL/CentOS/SUSE: `sudo rpm -vi --force agent-client-collector-<version number>-x86_64.rpm`
- Ubuntu/Debian: `sudo dpkg -1 agent-client-collector-<version number>-<Ubuntu/Debian version>_amd64.deb`

5. Restore the `agent-id` and configuration files.

```
sudo -u servicenow cp
 -rp /tmp/acc-upgrade-backup/acc.yml /
etc/servicenow/agent-client-collector/acc.yml
sudo -u servicenow cp
 -rp /tmp/acc-upgrade-backup/check-allow-list.json /
etc/servicenow/agent-client-collector/check-allow-list.json
sudo -u servicenow cp
 -rp /tmp/acc-upgrade-backup/agent_now_id /
var/cache/servicenow/agent-client-collector/agent_now_id
```

6. Configure the agent to run as a service.
   `sudo systemctl enable acc`
7. Start the service.
   `sudo systemctl start acc`
8. View the logs to verify that the startup was successful.
   `sudo tail -f /var/log/servicenow/agent-client-collector/acc.log`

Uninstall Agent Client Collector from a Linux system using a single-line command

Uninstall the Agent Client Collector from a Linux machine by running an efficient single-line command. If the script is not connected to the instance, you might have to uninstall Agent Client Collector manually.

Before you begin

- The uninstall procedure is the same for both MID Server and MID-less deployments.
- Role required: agent_client_collector_admin

Procedure

Uninstall Agent Client Collector by running the following command in a command window where `<instance url>` is the URL of the ServiceNow instance.
`bash -c "$(curl -L https://<instance url>/api/sn_agent/agents/install_agent)" -s "--remove"`.

Note: Uninstalling the Agent Client Collector removes the `acc.yml` file and its directory from your machine.

Agent Client Collector installation on a Windows machine

When installing the Agent Client Collector on a Windows machine, either download an installation file and use a wizard to install the agent manually, or use silent installation to automate agent installation and configuration. Manual installation enables you to test the agent on a single system, while silent installation enables you to deploy the agent at scale.

Install Agent Client Collector on a Windows machine manually

Install Agent Client Collector on a Windows machine manually when you want to test the agent on a single system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

1. Ensure that you've configured the Agent Client Collector web server. For details, see Configure the websocket server on the MID Server.
2. Verify your server's OS and version.
3. When using Microsoft Internet Explorer, do the following to prepare the Agent Client Collector installation file:
   a. Navigate to **Server Manager** > **Local Server**.
   b. Turn off **IE Enhanced Security Configuration**.
   c. Download the installation file.
   d. Change the extension of the installation file from `.man` to `.msi`
4. Ensure that .NET Framework 4.6.2 or later is installed on the target machine.

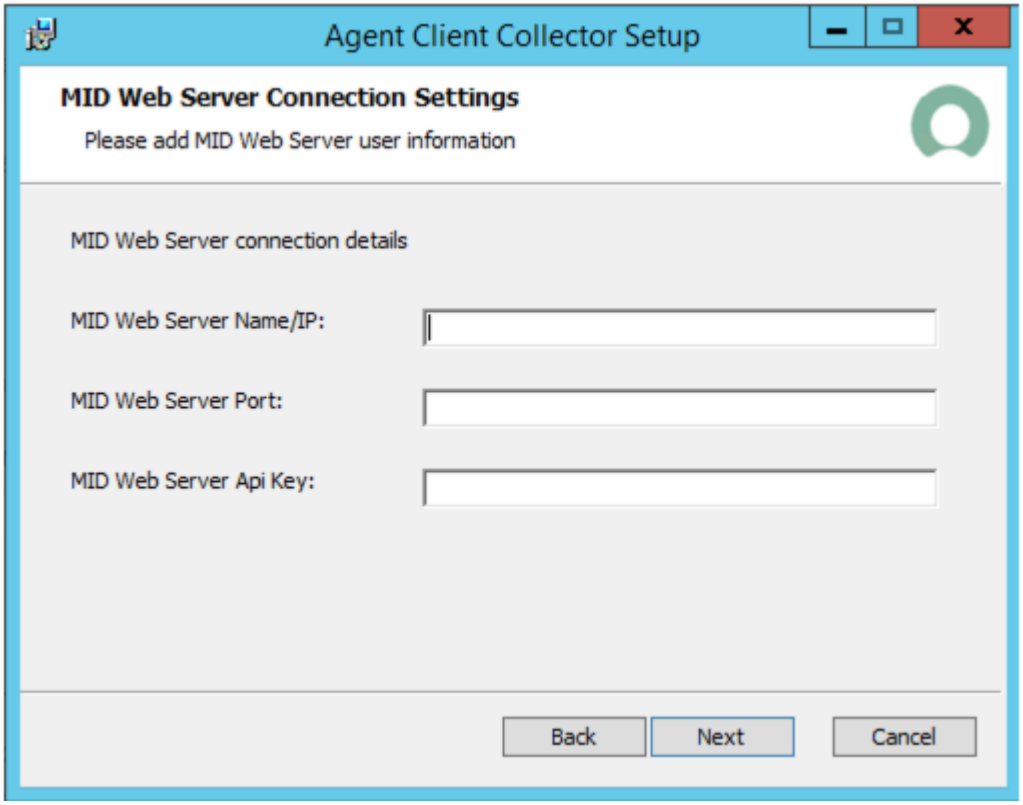
   Note: If the .NET Framework is not running effectively, use the legacy VBSript installer by running the following command on the target machine:
   ```
   msiexec /i <msi_file_path> /quiet /qn /norestart
   USE_VBS_CA=1 ACC_API_KEY=<key_value> ACC_MID=wss://
   <mid_ip>:<websocket_port>/ws/events ACC_ALLOW_LIST=False
   ```
5. Enable golden image mode for cloning additional agents by setting the msi property *`GOLDEN_IMAGE=true`*.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **Agent Client Collector** > **Agent Downloads**.
2. To perform installation using the wizard:
   a. Download the .msi file that is accessible from the link on the UI.
   The Installation Wizard opens.
   b. Select **Next** until you reach the **MID Web Server Connection Settings** page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



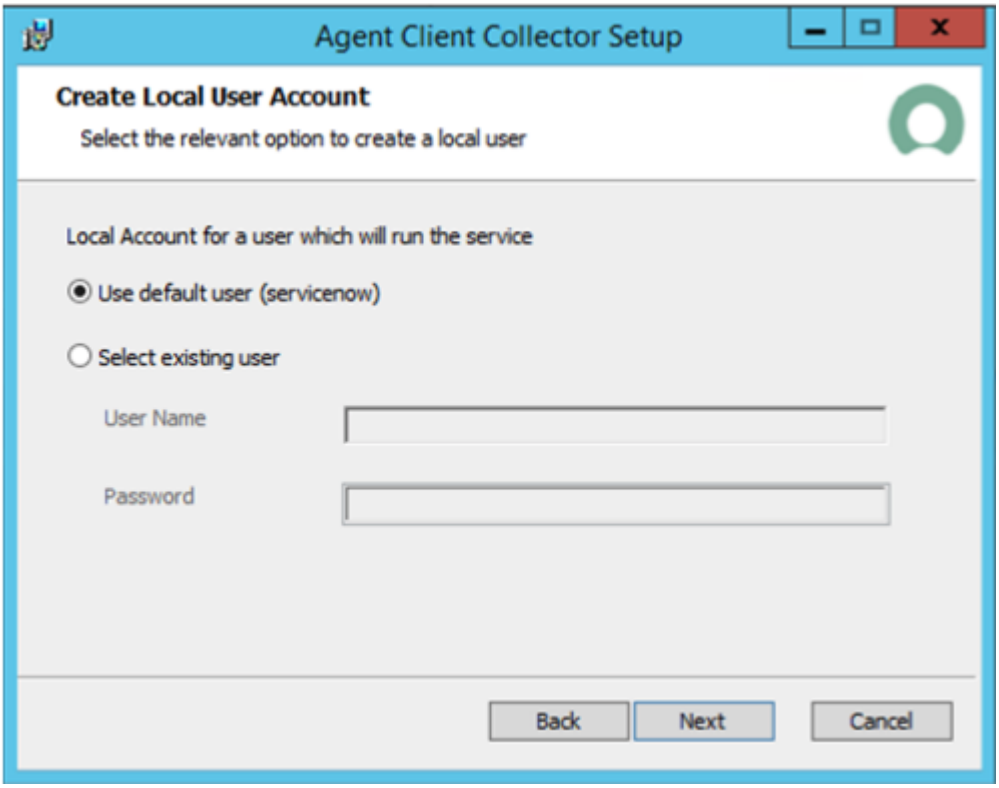
c. Enter the relevant parameters in the dialog box fields:

MID Web Server Connection Settings fields

Field name	Description
MID Web Server Name/IP	IP address of the MID Web server.
MID Web Server Port	Port number of the MID Web server. Use a number between 1024-49151.
MID Web Server API Key	API key to access the MID Web server.

d. Select **Next**.
The **Create Local User Account** page appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



e. Select the relevant option in the dialog box.

Create Local User Account dialog box

Option	Description
Use default user (servicenow)	Default user with which to run the Agent Client Collector on a Windows machine. Selecting this option creates a local user called **servicenow** as part of the installation. The servicenow user password is randomly generated and is not stored in the system. A security event is created on the host machine which, if repeated, requires opening a support case. For details, see KB1649116 article in the HI Knowledge Base.
Select existing user	When selecting this option, configure the following subfields: ▪ **User Name**: User name to log in to the Windows environment. ▪ **Password**: Password of the selected user. The user can be one of the following: ▪ Local user (created by the virtual machine owner; provides added resiliency). ▪ Domain user (created by IT personnel).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	▪ Group Managed Service Account (gMSA): Enter the name of the group managed service account in the **User Name** field and leave the **Password** field empty. ▪ Local Service Account: Enter *LOCALSERVICE* in the **User Name** field and leave the **Password** field empty. ▪ Local System Account: Enter *SYSTEM* in the **User Name** field and leave the **Password** field empty. Due to Windows UAC restrictions, running the agent as a local SYSTEM account is necessary to perform an upgrade via *msiexec*.

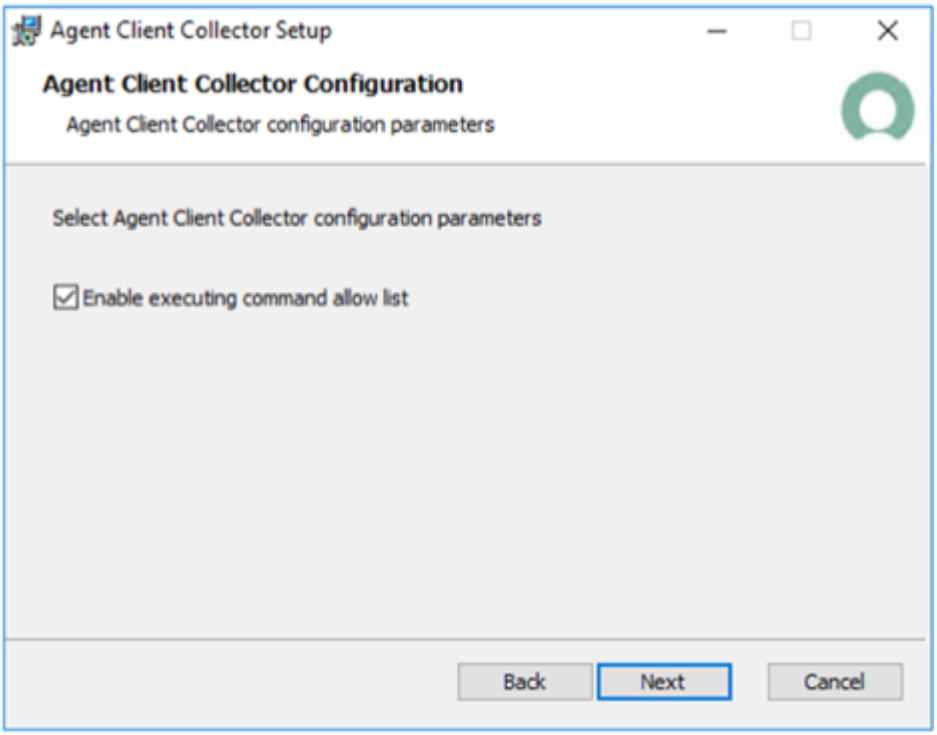
Note: Using a Local System account creates the local group *ServiceNow Users*, and adds the created user to the group. The ServiceNow Users group has access to Agent Client Collector directories and has the following privileges:

- **Performance Monitor**: Comes with the base system; enables viewing all performance counters in the system.
- **Log on as a service**: Enables starting network services and services that run continuously, even when no one is logged onto the console.
- **Debug programs**: Enables debugging processes and reading process details for users outside the ServiceNow user group.

f. Select **Create User**.
The system creates a Windows user with the specified credentials, and the Agent Client Collector Configuration page appears.

g. To enable the **Allow-List** containing the checks enabled to run after setup, select the **Enable executing command allow list** check box on the resulting page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



h. Select **Next** to open the installation page.

When installation completes, click **Next** to complete and exit the wizard.

After a successful installation, the service starts automatically and generates the following:

- User: Default = servicenow (an existing user can also be configured to manage the service). The servicenow user belongs to the local user group **ServiceNow Users**.
- Service: AgentClientCollector
- File location:
  - Default for installation = C:\Program Files\ServiceNow\agent-client-collector
  - Default for service files = C:\ProgramData\ServiceNow\agent-client-collector, which holds the cache, config, and log folders.

3. To run Silent installation to disable installation reports, run the command line appearing in the **Silent installation** section of the procedure, as follows:

```
msiexec /i <msi_file_path> /quiet /qn /norestart
ACC_API_KEY=<key_value> ACC_MID=wss://<mid_ip>:<websocket_port>/
ws/events ACC_ALLOW_LIST=False
```

To enable the allow list of specified checks when running Silent installation, set the *ACC_ALLOW_LIST* parameter to **True**.

4. To configure multiple MID Servers with Silent installation, run the command line appearing in the **Silent installation** section of the procedure with comma-separated values, as follows:

```
msiexec /i <msi_file_path> /quiet /qn /
norestart ACC_API_KEY=<key_value> ACC_MID="wss:/
/<mid1_ip>:<websocket1_port>/ws/events,wss://
<mid2_ip>:<websocket2_port>/ws/events"
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Insert the following parameter values in the command:

Command parameters

Parameter	Value
ACC_API_KEY	The API key used to access the MID Server websocket.
ACC_MID	The URL of the MID Server websocket.
DENY_LOCAL_LOGON	When set to *True*, prevents any user other than the default servicenow user from logging onto the service. Default value: False
HTTPS_PROXY	A fully qualified URL to a proxy server. For example: `https://proxy.url.net`
PAC_FILE	A readable filepath on the system. For example: `/path/to/servicenow/readable/file`
PASSWORD_NEVER_EXPIRES	When set to *True*, the password for the default servicenow user never expires. Default value: False
START_SERVICE	When set to *True*, the Agent Client Collector service automatically starts after installation. Default value: True
LOCALUSERNAME	Account running the Agent Client Collector as a Windows service. Possible values: ○ SYSTEM ○ LOCALSERVICE ○ DOMAIN\gMSA$ ○ string (local username) Default = `servicenow` When using the SYSTEM, LOCALSERVICE, or DOMAIN\gMSA$ accounts, you do not have to configure a password.
LOCALPASSWORD	Password for the user specified in the LOCALUSERNAME parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The configured MID Server values are automatically added to the `acc.yml` file. The agent connects to the first available MID Server in the list.

To configure a secondary MID server, enter the following syntax in the `backend-url` section of the `acc.yml` file, per the `.yml` standard: `- "wss://<MID IP>:<Web socket port>/ws/events"` (with the quotation marks).

Upgrade the Agent Client Collector manually on a Windows system

Perform a manual upgrade of your existing Agent Client Collector version on a system running a Windows OS.

Before you begin

Backup the Agent Client Collector configuration files, such as `acc.yml`, `check-allow-list.json`, `agent_now_id` and `agent_now_keystore`. The `agent_now_id` is located in the cache directory: `C:\ProgramData\Servicenow\agent-client-collector\cache`

Backing up configuration files is a safety precaution to safeguard the files during the upgrade. Configuration files need to be restored only if there are upgrade issues which require new installation.

Enable golden image mode for cloning additional agents by setting the msi property *`GOLDEN_IMAGE=true`*.

Role required: agent_client_collector_admin

Procedure

1. Select the Windows button on your keyboard and enter **Services** to open the Services page.
2. Locate the Agent Client Collector service.
3. Right click the Agent Client Collector service and select **Stop**.
4. On the Windows Control Panel, select **Uninstall a program**.
5. Select the Agent Client Collector program and select **Uninstall**.
6. Navigate to **Agent Client Collector** > **Agent Downloads** and download the MSI Installer in the **Windows Downloads** section.
7. Install the new agent, as described in Install Agent Client Collector on a Windows machine manually.
   You can use either the manual or single-line procedure. When restoring backup files, the system replaces the configuration file values.
8. After installation is complete, stop the service.
9. Restore the `agent_now_id` and `agent_now_keystore` configuration files.
10. Restart the Agent Client Collector service.

Uninstall the Agent Client Collector manually from a Windows machine

Uninstall the Agent Client Collector from a Windows machine manually instead of using the single-line procedure. Use the manual procedure if the command script is unavailable due to the specific agent not being connected to the instance.

Before you begin

Role required: agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

Uninstall the Agent Client Collector in the Windows Control Panel.

Install the Agent Client Collector on a Windows machine using silent installation

Install the Agent Client Collector on a Windows machine using silent installation when you want to deploy the agent at scale.

About this task

Silent installation automatically creates a local user called **servicenow** (unless another existing user is invoked with the *LOCALUSERNAME* parameter, as described in the command parameters table in the following procedure). The servicenow user password is randomly generated and is not stored in the system. A security event is created on the host machine which, if repeated, requires opening a support case. For details, see KB1649116 article in the Now Support Knowledge Base.

Before you begin

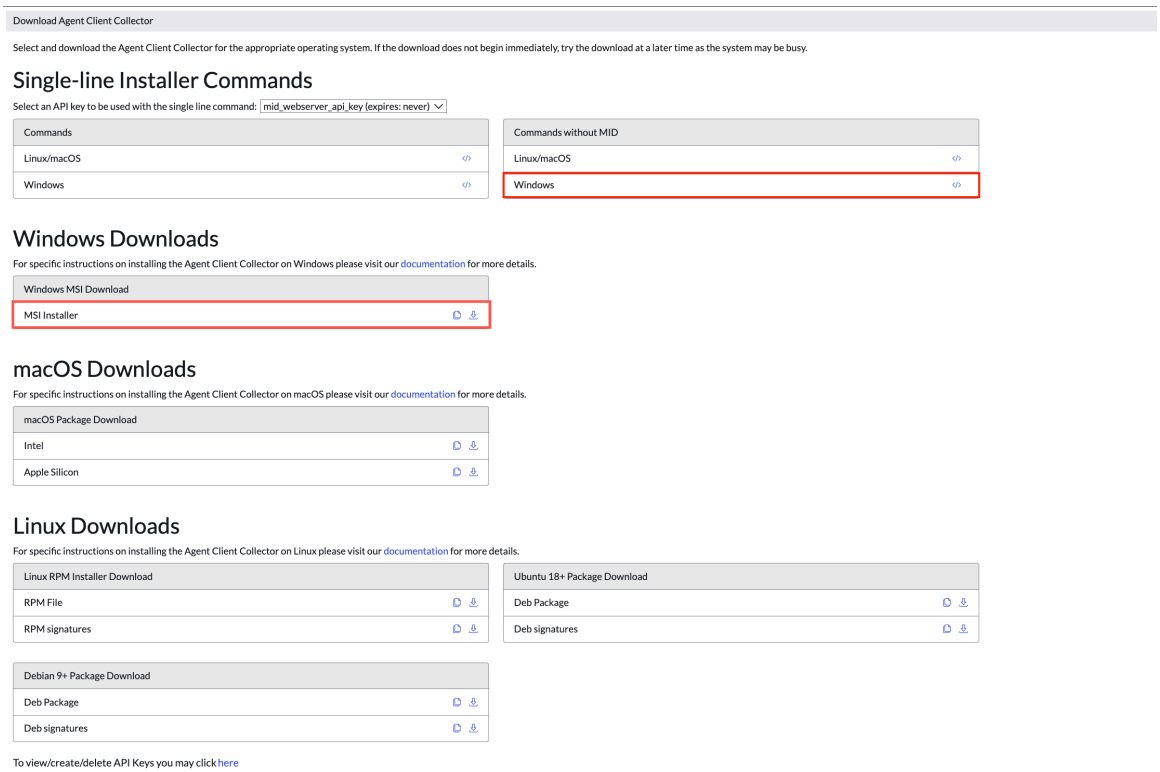
ACC installs need to access this URL: `https://install.service-now.com/`.

Enable golden image mode for cloning additional agents by setting the msi property *`GOLDEN_IMAGE=true`*.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Downloads**.
2. From the Windows Download section, download the MSI installer by selecting the Download icon ( ).



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. To run Silent installation to disable installation reports, run the command line appearing in the **Silent installation** section of the procedure, as follows:
   `msiexec /i <msi_file_path> /quiet /qn /norestart ACC_API_KEY=<key_value> ACC_MID=wss://<mid_ip>:<websocket_port>/ws/events ACC_ALLOW_LIST=False`

   To enable the allow list of specified checks when running silent installation, set the *ACC_ALLOW_LIST* parameter to **True**.

4. To configure multiple MID Servers with Silent installation, run the command line appearing in the **Silent installation** section of the procedure with comma separated values, as follows:
   `msiexec /i <msi_file_path> /quiet /qn /norestart ACC_API_KEY=<key_value> ACC_MID="wss://<mid1_ip>:<websocket1_port>/ws/events,wss://<mid2_ip>:<websocket2_port>/ws/events"`

   Insert the following parameter values in the command:

Command parameters

Parameter	Type	Value
ACC_API_KEY	String	The API key used to access the MID Server websocket.
ACC_MID	String	The URL of the MID Server websocket.
ACC_ALLOW_LIST	Boolean	Indicates whether the allow-list is enabled (True) or disabled (False). Default = True
START_SERVICE	Boolean	Indicates whether the agent starts automatically upon installation (true) or must be started manually (false). Default = True
LOCALUSERNAME	String	Account running the Agent Client Collector as a Windows service. Possible values: ○ SYSTEM ○ LOCALSERVICE ○ DOMAIN\gMSA$ ○ string (local username) Default = `servicenow` When using the SYSTEM, LOCALSERVICE, or DOMAIN\gMSA$ accounts:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Type	Value
		○ You do not have to configure a password. ○ You must run the relevant .msi command, as described in Account commands for LocalService, LocalSystem, and gMSA during Windows installation.
LOCALUSERPASSWORD	String	Password used to access the agent. Default = <randomly generated password>
ISDOMAIN	Boolean	Assigns a domain user account to the Windows service. Possible values: ○ 0 - DOMAIN is ignored ○ 1 - DOMAIN is used
DOMAIN	String	Indicates the user domain. Applies only to domain user accounts (not gMSA)
PASSWORD_NEVER_EXPIRES	Boolean	Indicates whether the user password expires (false) or never expires (true). Default = false
SN_PROG_ROOT	String	Indicates the installation path for the agent's application files. Enclose the path in quotes. For example: SN_PROG_ROOT="D:\ServiceNow\agent-client-collector"

The configured MID Server values are automatically added to the `acc.yml` file. The agent connects to the first available MID Server in the list.

To configure a secondary MID server, enter the following syntax in the `backend-url` section of the `acc.yml` file, per the `.yml` standard: `- "wss://<MID IP>:<Web socket port>/ws/events"` (with the quotation marks).

For the `<MID IP>` value, you can assign either the MID FQDN or CNAME. To enable high availability, use either the Auto MID Selection algorithm, or manage a virtual IP with a load balancer. For more information, see the ITOM Agent Client Collector documentation material [KB1122613] article in the HI Knowledge Base.

Uninstall Agent Client Collector from a Windows system using a single-line command

Uninstall the Agent Client Collector from a Windows machine by running an efficient single-line command. If the script is not connected to the instance, you might have to uninstall Agent Client Collector manually.

Before you begin
Role required: agent_client_collector_admin

Procedure

Uninstall Agent Client Collector by running the following command in a command window.
`msiexec /quiet /x <path_to_acc_msi_file>.`

Note: Uninstalling the Agent Client Collector removes the `acc.yml` file and its directory from your machine.

Agent Client Collector upgrade overview

The Agent Client Collector Framework manages agent upgrades directly from the instance, with no manual action required on individual agent hosts.

You can upgrade Agent Client Collector agents one at a time through the UI, or upgrade all eligible agents at once using the auto-upgrade feature. After an upgrade starts, each agent downloads the new version, installs it, restarts, and reports the result back to the instance.

Upgrade methods

Two upgrade methods are available:

Single agent upgrade

Upgrade one agent at a time from the agent record in the UI. Use this method to validate the upgrade process before a broader rollout. You can also select multiple agents from the list view to upgrade up to 50 agents at a time.

Mass upgrade

Upgrade all eligible agents automatically using the built-in scheduled job or a background script. The scheduled job applies rate limiting to control the rollout pace. The background script also uses rate limiting, and triggers an immediate upgrade without waiting for the next scheduled run.

Upgrade stages

Both single and mass upgrade attempts, progress through the following stages. Each stage creates a record in the Agent Upgrade Histories table.

InstanceVerification

The instance confirms the agent is eligible for upgrade. Checks include operating system support, agent version, agent status, and MID Server connectivity.

AgentVerification

The agent confirms it can perform the upgrade. Checks include permissions, available disk space, and dependencies.

Upgrade

The agent downloads the package, installs it, and restarts with the new version.

For details on the required properties for agent overview, see Agent Client Collector upgrade properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent eligibility

An agent is eligible for auto-upgrade when it meets all of the following conditions:

- Status is **Up**.
- Version is 2.7.0 or higher and lower than the target upgrade version.
- Agent is not flagged as a duplicate.
- Has a valid MID Server or Pod reference.
- Has not exceeded the retry limit for failed upgrades.
- Runs on a supported operating system.

Package download sources

During upgrade, each agent downloads the new package from one of the following sources, depending on its connection type:

- Agents connected via Cloud Services (ICS) download from the ServiceNow CDN at `https://cdn-install.sncapps.service-now.com`.
- Agents connected via MID Server download from the MID Server directly over the local network.
- If the MID Server is unavailable, agents fall back to the Install Server at `https://install.service-now.com`. To enable agent fallback, ensure that the install server is specified on the ServiceNow instance.

If your agents use a custom download server, configure the *`agent-upgrade-url-path`* key in the agent's `acc.yml` file. This setting takes priority over the default sources.

Rollout strategy

Use a phased approach to reduce risk when upgrading a large agent fleet:

1. Upgrade one agent from the UI to confirm the process works end-to-end.
2. Upgrade 5–10 agents from the list view, selecting agents across different operating systems.
3. Perform a full rollout by enabling the scheduled job or running the background script.

Upgrade an agent in an instance

Perform selective self-upgrade instead of bulk upgrade for enhanced efficiency when working with agents that are difficult to access, such as agents deployed in the cloud. You can perform selective upgrade on up to 50 agents at a time.

Before you begin

Note: Selective upgrade is available for the agents version 2.7.0 and above.

Supported Operating Systems: Windows, Linux and macOS.

Ensure that data files are up to date by restarting the MID Server and collecting host data. For details on collecting host data, see Run host data collection on demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

Ensure that you have sudo permissions and that the following configurations are set:

Linux Operating Systems

OS	Commands	Agent version
CentOS,Red Hat	• `/usr/bin/systemctl start acc` • `/usr/bin/systemctl stop acc` • `<systemctl location> daemon-reload` (default location is `/usr/bin`) • `/usr/bin/rpm -Uv <cache dir location>/upgrade/agent-client-collector-upgrade.rpm` Default cache directory location: `/var/cache/servicenow/agent-client-collector` • `unzip -o`: Unzips the signature file to validate the installation. • `openssl dgst -sha256 -verify`: Verifies use of a signature from a servicenow installation file. **Note:** If you installed the Linux agent using the `--relocate` flag (for example, `rpm -i --relocate /var/cache=/opt/cache agent-client-collector-<version_number>-x86_64.rpm`), you must have permission to execute the following commands: • `sudo /usr/bin/rpm -q --`	2.7

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When connecting via a MID Server, ACC installs need to access one of the following URLs:

- `https://<MID-WEBSERVER-URI:PORT>/static/acc_installers`
- `https://install.service-now.com/`

When upgrading MID-less agents, upgrade is performed at the URL set in the *agent-upgrade-url-path* property of the acc.yml file. If no URL is set at this property, upgrade is performed by downloading the installer script from the following Content Delivery Network (CDN) URL: `https://cdn-install.sncapps.service-now.com/glide/distribution/builds/package`

Note: When using a CDN, send your download request through a proxy server, for added security. For details, see Configure a download proxy for Agent Client Collector upgrades.

Select the version to which you want to upgrade your agent.

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Select **New**.
3. Assign the following values:
   - Name = **sn_agent.agent_upgrade_version**
   - Type = **string**
   - Value = The version number to be upgraded to, in the format <major_version.minor_version.patch_version>. For example: **4.3.2**
4. Select **Submit**.

If you do not select a version, the agent automatically upgrades to the current Agent Client Collector Framework scoped app version.

Role required:

- Windows: Local SYSTEM account (Agent Client Collector service running as *Local System*)
- Linux: sudo rpm/dpkg/systemd-run
- macOS: sudo pkg

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select the agent that you want to upgrade.
   Verify that the agent has both a version number and **Status=Up**.
3. In the **Related Links** section, select **Upgrade agent**.
4. In the confirmation dialog box, select **Upgrade**.
   The **Agent Upgrade Histories** page appears, where you can monitor the upgrade progress in the **State** column, which displays either **Success** or **Failed**. The full upgrade process takes between 3-10 minutes.
5. View the log for the agent upgrade in the **Message** column.
   - For a failed upgrade on a Linux machine, navigate to the `<cache directory location>/upgrade/agent-client-collector-upgrade.rpm` file and ensure that the configurations are set for the relevant OS, according to the Linux Operating Systems table, above.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For a failed upgrade on a Windows machine, check the relevant log file, located at `<user folder>\AppData\Local\Temp\ACC_Logs`:
  - ACC logs: `ACC_Upgrade.log`
  - MSI logs: `MSI_ACC_Upgrade.log`
- For a failed upgrade on a macOS machine, check the log file, located at `/Library/Application Support/servicenow/agent-client-collector/log/upgrade.log`.

Related topics

Upgrade multiple agents in an instance

Upgrade multiple agents in an instance

When performing selective upgrade of an agent in an instance, you can select multiple instances to upgrade at once.

Before you begin

Supported Operating Systems: Windows, Linux and macOS.

Agent Client Collector installs need to access this URL: `https://install.service-now.com/`. MID connected agents can download the installer from the MID Server (`https://<MID-WEBSERVER-URI:PORT>/static/acc_installers`).

Select the version to which you want to upgrade your agent.

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Select **New**.
3. Assign the following values:
   - Name = **sn_agent.agent_upgrade_version**
   - Type = **string**
   - Value = The version number to be upgraded to, in the format <major_version.minor_version.patch_version>. For example: **4.3.2**
4. Select **Submit**.

If you do not select a version, the agent automatically upgrades to the current Agent Client Collector Framework scoped app version.

When working with MID-less agents, ensure that the agents can communicate with the ServiceNow Content Delivery Network (CDN). For details, see Configure a download proxy for Agent Client Collector upgrades.

Role required: agent_client_collector_admin

About this task

You can select up to 50 agents at a time for upgrade. To upgrade large numbers of agents, incorporate the Agent Client Collector into your software deployment tools.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select the check box next to the agents that you want to upgrade.
   You can select up to 20 agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Actions on selected rows...** box, select **Upgrade agent**.
4. In the confirmation dialog box, select **Upgrade**.

Related topics

Upgrade an agent in an instance

Run a mass upgrade via the scheduled Agent Client Collector upgrade job

Activate the built-in scheduled job to upgrade all eligible Agent Client Collector agents automatically in rate-limited batches.

Before you begin

Configure the required upgrade properties before enabling the scheduled job. For details, see Agent Client Collector upgrade properties.

Role required: agent_client_collector_admin

About this task

The **Upgrade agents incrementally** scheduled job upgrades all eligible agents on a recurring schedule. The job respects the rate limits set in the upgrade properties, upgrading agents in batches to avoid overloading MID Servers. Agents that have never failed an upgrade are prioritized over agents with prior failures.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Search for **Upgrade agents incrementally** and select record.
3. Set **Active** to **true**.
4. **Optional:** Adjust the **Run** schedule to match your maintenance window.
   The default schedule runs every hour.
5. Select **Update**.
   The job runs on the configured schedule, upgrading agents in batches that adhere to the configured rate limits.

Run a mass Agent Client Collector upgrade using a background script

Trigger an immediate upgrade of all eligible Agent Client Collector agents without waiting for the next scheduled job run.

Before you begin

Configure the required upgrade properties before running the script. For details, see Agent Client Collector upgrade properties.

Role required: agent_client_collector_admin

About this task

The background script upgrades agents connected via MID Server and agents connected via Cloud Services (ICS) in a single run. Both function calls in the script are required — omitting either skips the corresponding agent group.

The system queries all agents that are **Up**, not duplicated, have a valid MID Server or Pod connection, and have not exceeded the retry limit. Agents with no prior failures are upgraded before agents with prior failures.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **Scripts - Background**.
2. Change the application scope to `sn_agent` (Agent Client Collector).
3. Paste the following script into the editor.

```
var duration = 60; // Duration in minutes for rate limiting
 calculations

var a = new AgentUpgradeUtil();
a.upgradeAgentsLimitedByMid(duration);  // Upgrades agents
 connected via MID Servers
a.upgradeAgentsMidless(duration);       // Upgrades agents
 connected via Cloud Services
```

   Set `duration` to the number of minutes used for rate limiting calculations. The default value of `60` applies the per-hour limits configured in the upgrade properties.

4. Select **Run script**.
   The system begins upgrading eligible agents immediately, adhering to the rate limits set in the upgrade properties.

Repeat high-volume upgrade for failed agents

If high-volume upgrade fails for specific agents, you must clear the problematic agents' history to re-enable upgrade. If the target upgrade version changes, you don't need to clear the agents' history, as the agents upgrade with the next scheduled high-volume upgrade.

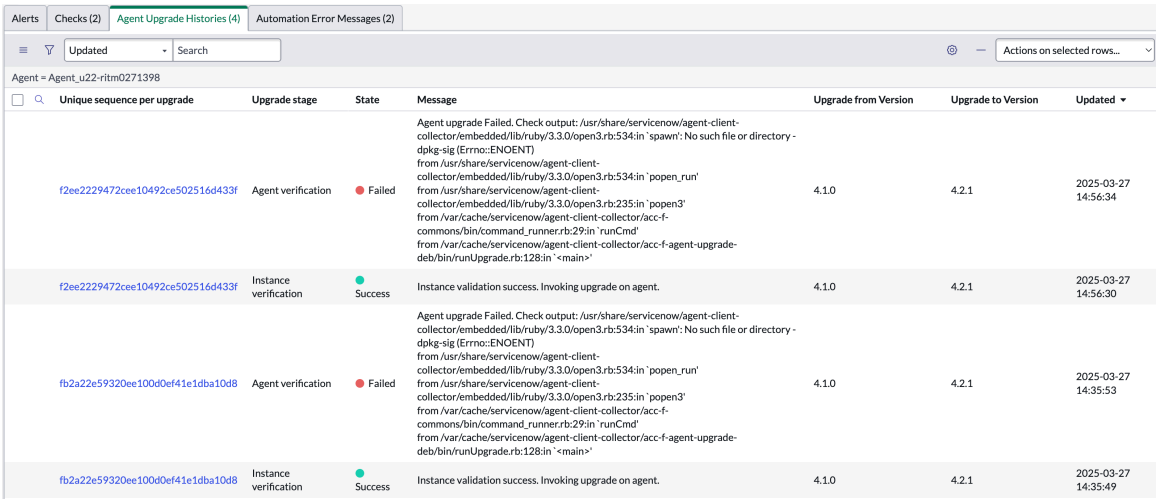
Before you begin

Roles required: agent_client_collector_admin

- In a Windows environment: Local SYSTEM account
- In a Linux environment: sudo rpm/dpkg/systemd-run
- In a macOS environment: sudo pkg

Procedure

1. Navigate to the Agent Client Collectors page **All** > **Agent Client Collector** > **Agents**.
2. Select an entry for which the *`Version`* number is not the highest available version.
3. Locate the *`Agent Upgrade Histories`* tab.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Underneath the check box , hover next to a failed upgrade entry and select the check box that appears.
5. Select the arrow next to the **Actions on selected rows...** drop-down and select **Delete**.

Result
The specified agents will be upgraded with the next scheduled high volume upgrade.

Configure a download proxy for Agent Client Collector upgrades

Add a proxy server entry so that agents behind a corporate proxy can download upgrade packages from the ServiceNow Content Delivery Network (CDN).

Before you begin
This configuration applies only to agents connected via Cloud Services (ICS) that can't reach the CDN directly. Agents connected via MID Server download packages from the MID Server or the Install Server and don't use this proxy configuration.

Role required: agent_client_collector_admin

About this task
Proxy configuration is managed through the Package Download Proxies table. When you add, update, or remove a proxy record, the system reads all active entries sorted by the **Order** field, generates a proxy list, and automatically pushes the updated configuration to all agents via MID Server configuration sync. No manual file editing or agent restart is required.

The agent tries each proxy in order, from the lowest **Order** value to the highest. If a proxy fails, the agent moves to the next entry. To configure a direct connection as a fallback, add an entry with the URL set to `direct`.

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Package Download Proxies**.
2. Select **New**.
3. Fill in the proxy record fields.

Package Download Proxies form

Field	Description
Name	Descriptive label for this proxy entry, for example US - `East Corporate Proxy`.
URL	Proxy address in `host` : `port` format, for example `proxy` . `example` . `com` : 8080. Enter `direct` to configure a direct connection with no proxy.
Order	Numeric priority. Lower numbers are tried first. Default is 100.
Active	Selected by default. Clear to disable this entry without deleting it.
Domain	The domain this proxy applies to. Use for domain-separated instances.

4. Select **Submit**.
   The system generates an updated proxy list and pushes it to all agents via MID Server configuration sync. Changes take effect without an agent restart.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** Add additional proxy entries to configure failover.
   Repeat the preceding steps for each proxy, assigning a higher **Order** value to each successive entry. The agent tries each proxy in order and falls back to the next if the current one fails.

Example: Proxy with direct connection fallback

The following configuration tries a corporate proxy first. If the proxy is unavailable, the agent connects directly to the CDN.

Proxy failover example

Name	URL	Order	Active
Corporate Proxy	`proxy.example.com:8080`	100	Yes
Direct Fallback	`direct`	200	Yes

What to do next

To temporarily block all CDN downloads, clear the **Active** check box on all proxy records. With no active entries, the system blocks CDN downloads. This is useful during maintenance windows.

Create and edit Agent Client Collector plugins

You can edit the default plugins, or you can add new plugins, as needed. Creating and editing plugins customizes the Agent Client Collector monitoring capabilities.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **ACC Plugins**.
2. Click **New**.
   The **Agent Client Collector Plugin - New record** page appears.
3. Enter values in the fields on the page, as described in the following table.

Agent Client Collector Plugin fields

Field	Description
Name	Name of the plugin. This field is populated automatically with the name of the tar.gz file attached to the plugin, and is visible only when selecting an existing record.
Description	Description of the plugin.
Operating System	Select the operating system to be monitored by the plugin.
Platform	Select the platform to be monitored by the plugin.
Active	Select to activate the plugin and download it to the MID server.
Advanced	Select to enable selecting the operating system version to be monitored by the plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
OS Version	Select the operating system version to be monitored by the plugin. This field is visible only when selecting the **Advanced** check box.

4. Attach the `tar.gz` file to the plugin record, according to the instructions that appear on the UI page.

Secure a custom plugin with a certificate

When you customize or create an Agent Client Collector plugin, you can secure the plugin with either a third-party certificate or an internal secure certificate in the plugin's script. Official plugins are signed by an external certificate authority.

Using a self-signed certificate is enabled by default. To disable this feature, set the *verify-plugin-signature* property to **False**. When you disable a self-signed certificate, your configured plugins use no certificate.

For details on how to configure a self-signed certificate by using OpenSSL, see Enable OpenSSL secure signing for plugins. For details on how to configure a third-party certificate, consult the third-party vendor's documentation.

When the agent's current certificates can't validate a plugin, Agent Client Collector requests the updated certificates from its synchronized MID Server. You can manually refresh the agent to receive these certificates before the scheduled synchronization. For details, see Manually refresh Agent Client Collector certificates.

You can manually save the certificates in a directory on the MID Server that is connected to the installed agents. Any agent that's installed in your environment can then access the certificates from that MID Server.

For details on how to configure the certificate synchronization properties, see Synchronization properties for validating Agent Client Collector plugins.

Optimize distribution of agents to MID Servers

Optimize the distribution of agents by allowing redistribution from one MID Server to another. Agents will always be connected to the MID Server with the fastest response time.

Before you begin

Ensure that the following settings are configured:

- The *sn_agent.enable_auto_mid_selection* system property is set to true. When using the `acc.yml` file, the property is *enable_auto_mid_selection*.
- On the MID Server page (**Agent Client Collector** > **MID Server**):
  - Status: Up
  - Validated: Yes

Role required: agent_client_collector_admin

About this task

Only validated MID Servers can accept connections from agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Agent Client Collector** > **Deployment** > **MID Servers**.
2. On the **MID Servers [Agent Client Collector view]** page, select the check box next to the MID Server from which you want to redistribute agents.
3. In the **Actions on selected rows** list, select **Try redistributing connected agents**.
   Note the number of agents assigned to your MID Servers.
4. Refresh the page to view the results of the redistribution attempt.
   The values in the **Number of agents** column for any affected MID Server will show a change if any agents were redistributed.

View the Agent Client Collector configuration file for an agent

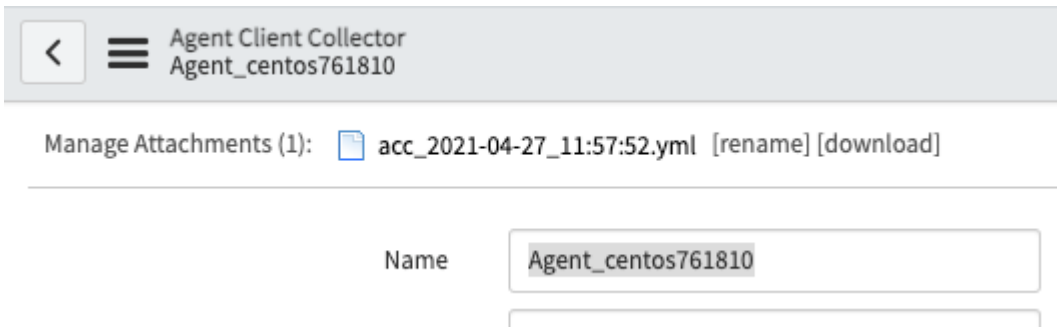
View the `acc.yml` Agent Client Collector configuration file without having to access the host server by retrieving the file from an agent.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. On the Agent Client Collectors page, select an agent.
3. In the **Related Links** section, select **Grab agent config (acc.yml)**.
   A message appears on the page that indicates that the file is attaching.
4. Wait several seconds and refresh the page.
   The `acc.yml` configuration file appears as an attachment on the agent.



Related topics

Configuration file options

Create an Agent Client Collector configuration data file

Create an Agent Client Collector configuration data file and associate it with check definitions so that you can view the information about your instance. You can also add or delete an attachment to the configuration data files, which are used by check definitions during check executions.

Before you begin

Role required: agent_client_collector_admin

About this task

A check definition is an individual check entry in the system. For details, see Agent Client Collector configuration data files.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration data file attachments contain instance data, such as configuration item (CI) information, which is used when executing a check.

Domain separation is supported in the Agent Client Collector configuration data files.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Configuration Files**.
2. Select **New**.
3. Add or remove an attachment.

Action	Description
Add a file	Synchronize the record and the relevant MID Servers. **a.** Select the paper clip icon . The Attachments dialog box opens. **b.** Select **Choose file** and select a file to at tach. **c.** Close the Attachments dialog box.
Delete a file	Optionally, delete an attachment you don't want to be associated with the record. **a.** Select **Manage Attachments**. The Attachments dialog box opens. **b.** Select the check box next to the attach ment that you want to remove. **c.** Select **Remove**.

The attachment name must be unique for each domain and can consist only of alphanumeric characters.

If the attachment contains invalid characters or is a duplicate of another attachment, the following situations occur:

- The configuration file is automatically set to **Active = False**.
- A message appears in the Error column indicating a problem with the attachment.

Each record can contain only one attachment.

4. **Optional:** In the **Description** field, enter a description for the configuration data file.
5. Select **Submit**.

Result

- The configuration data file is listed on the Agent Client Collector Configuration File page.
- The **Name** value is automatically set to the name of the attachment.

Checks use the configuration data file with instance data during check execution.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Validate plugins on the MID Server

Validate plugins on your MID Server to ensure that they match the plugins on your ServiceNow instance. Validating plugins ensures that the instance provides accurate data on all of your MID Server plugins.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **MID Servers**.
2. Select a MID Server entry on the MID Servers page.
3. Select the **Validate ACC Plugins** link.
   The **Queues** page appears, displaying the ECC queue.
4. Refresh the queue to view the new input record.
5. Select the record to view its results.

   Validation status is visible in the **Payload** section of the form.

   If plugins aren't validated, restart the MID Server. Plugins sync automatically when the MID Server restarts.

Validate plugins on agents

Validate plugins on your agents to ensure that they match the plugins on your ServiceNow instance. Validating plugins ensures that the instance provides accurate data on all of your agents' plugins.

Before you begin

Role required: agent_client_collector_admin

About this task

Only plugins that are able to be executed are validated. For example, if you're running an agent on a macOS, only macOS plugins on your instance are validated.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select an agent on the **Agent Client Collectors** page.
3. Select the **Validate ACC Plugins** link.
   The **Queues** page appears, displaying the ECC queue.
4. Refresh the queue to view the new input record.
5. Select the record to view its results.

   Validation status is visible in the **Payload** section of the form.

   If plugins aren't validated, navigate back to the **Agent Client Collectors** page and select the **Clear ACC Plugins** link.

   The plugins automatically re-sync the next time a command runs which requires the plugin.

Using proxy agents in Agent Client Collector

You can use a proxy agent to monitor the health and performance of your configuration items (CIs) even if the agent is in the cloud or any place that is external to your host server.

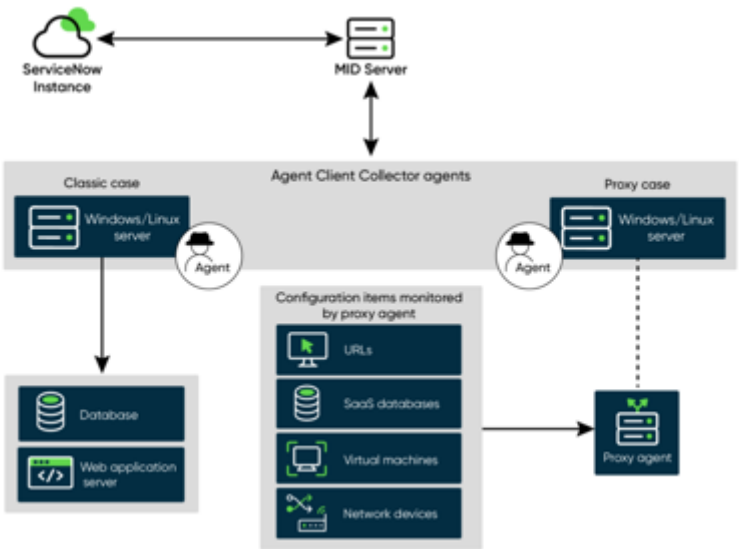
Proxy agents are used to monitor:

- URLs (to ensure that the URLs are available and accessible)
- Services that don't have a host server
- Closed services on which you can’t configure an agent
- External databases in the cloud

One agent can monitor multiple entities and their CIs.

The following diagram shows the connection between a ServiceNow instance, the MID Server, and Agent Client Collector agents, as well as proxy agents that monitor CIs that are external to the agent.

Proxy agent configuration



You can configure the proxy agent to do a custom check when it is monitoring external entities. To learn how to create custom checks, see Create and edit checks.

You can create a cluster of proxy agents on multiple proxy servers to monitor the services that are external to the host server. To learn how to create a proxy agent cluster, see Create a proxy agent cluster.

Use a Proxy Auto-Configuration (PAC) file to dynamically determine the appropriate proxy server to use. PAC files provide flexible and automated proxy configuration, enabling the agent to use different proxies for different destinations, connect directly to internal resources, implement complex proxy routing logic, and to automatically handle proxy failover. For details on the parameters used for PAC file configuration, see Configuration file options.

Following is a sample PAC file:

```
function FindProxyForURL (url, host) {

   // Connect directly to internal hosts
   if (isPlainHostName(host) ||
      shExpMatch(host, "*.internal.company.com")) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      return "DIRECT";
   }

   // use proxy for all other hosts
   return "PROXY proxy.company.com:8080:
}
```

Related topics

Checks and policies

Agent Client Collector Monitoring default checks and policies

Configure an agent on a proxy server

Configure an Agent Client Collector on a proxy server when monitoring services external to the host server, such as URLs or external databases in the cloud.

Before you begin

Role required: agent_client_collector_admin

About this task

Proxy agents should be dedicated agents, as running other apps on a proxy agent is likely to cause performance degradation.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents** > **Policies**.
2. Select the policy containing the checks that you want to run on a proxy server.
   You must configure a proxy server for checks and policies that monitor external services. For details on these checks and policies, see Agent Client Collector Monitoring default checks and policies.
3. Select the **Proxy Settings** tab.
4. Select from the following fields.

Field	Description
Single proxy agent	Select to display the **Proxy agent** field, where you select a single proxy agent.
Multi-proxy agents by cluster	Select to enable a group of proxy agents to monitor the policy CIs. When selecting this check box, the **Agent cluster name** field appears.
Agent cluster name	Select an agent cluster to monitor the policy CIs.
Multi-proxy agents by filter	Select to filter multiple proxy agents from the agent list. When selecting this option, all proxy agents monitor the same services. For example, you may want to use this option for multiple proxy servers in different geographic locations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: ○ This field appears only when the **Hide Multi Proxy Agent by filter, if its not selected** property (*sys_ui_policy*) is set to **active=false**. ○ This field appears only for existing policies where this option was previously selected. If you remove the filter in an existing policy, the option disappears.
Multi-proxy agents by script	Select to configure a JavaScript for selecting proxy agents. When selecting this option, you can assign services to different proxy agents, which can serve as a form of load balancing.
Run checks on all proxy agents (No load balancing)	Clear this option to load balance the selected multi proxy agents that monitor the matching CIs in the policy's **Monitored CIs** tab. Select this option for each agent to monitor all matching CIs in the policy's **Monitored CIs** tab. For example, if you have five agents in a cluster or five agents using the filter/script option and 10 matching CIs in the policy, when you clear this option, each agent monitors two CIs. When selecting this option, each agent monitors all 10 of the matching CIs in the policy. For existing or active policies, this option is enabled by default. For new and inactive policies, this option is turned off by default. Select this option only in a case where you have an external endpoint for which you want to measure how quickly it is accessed from different locations.

5. Select **Activate**.

Create a proxy agent cluster

Create a cluster of agents on multiple proxy servers to monitor services external to the host server. Creating a cluster of agents enables you to assign that cluster to multiple policies instead of having to assign the agents individually to every policy.

Before you begin

Role required: agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
A proxy agent cluster monitors the CIs that match the filter specified on the policy's **Monitored CIs** tab.

A proxy agent cluster must contain at least one agent. All of the cluster's agents monitor the CIs specified in its assigned policy. No special configuration is necessary on the policy level to enable proxy cluster monitoring.

The default CPU threshold value when working with proxy agent clusters is 80%. You can modify this value in the *proxy_cpu_percentage_limit* property.

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Proxy Agent Cluster**.
2. Select **New**.
3. In the **Name** field, enter a descriptive name for the cluster.
4. Add an agent to the cluster.
   a. In the **Agents in cluster** section, locate the **Agent** column and select **Insert a new row**.
   b. Select the search icon ( ) and select an agent to add to the cluster.
   c. Select the check icon ( ) to add the agent to the cluster.
   Repeat this step for each agent that you want to add to the cluster.
5. Select **Submit**.

Result
The **Proxy Agent Clusters** page appears and displays the agent added to the cluster.

What to do next
Select this proxy cluster to monitor CIs specified in an agent policy. For details, see Configure an agent on a proxy server.

Assign a proxy agent cluster to a policy

Assign a proxy agent cluster to a policy when monitoring services external to the host server, such as URLs or external databases in the cloud. The agents in the cluster monitor all of the policy's CIs.

Before you begin
Ensure that you have a policy containing the checks that monitor external services. For details on these checks and policies, see Agent Client Collector Monitoring default checks and policies.

Role required: agent_client_collector_admin

About this task
Only one app should be run on a given proxy agent because running multiple apps is likely to cause performance degradation.

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Agents** > **Policies**.
2. Select the policy containing the checks that you want to run on a proxy server.
3. Select the **Proxy Settings** tab.
4. Select **Edit in Sandbox** to enable modifying fields on the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Indicate whether you are assigning a single proxy agent or a proxy agent cluster to monitor the policy CIs.
   - Assign a single proxy agent by selecting **Single proxy agent** and selecting an agent.
   - Enable a proxy agent cluster by selecting **Multi-proxy agents by cluster**. Provide the name of the cluster in the field that appears.
6. Determine whether to select multiple proxy agents from the agents list through a filter or a script.
   - To select agents through a filter, configure a filter or retain or modify an existing filter when the **Multi-proxy agents by filter** option is selected.

     Note:
     - This field appears only when the **Hide Multi Proxy Agent by filter, if its not selected** property (*sys_ui_policy*) has been set to **active=false**.
     - If you remove the filter in an existing policy, the option disappears.

   - To select agents through a script:
     a. Select **Edit in Sandbox**.
     b. Clear any selected proxy options in the **Proxy Settings** tab.
     c. Select **Multi-proxy agents by script**.
     d. In the **Proxy script** field that appears, enter a script to assign services to different proxy agents as a form of load balancing.
7. Determine whether to load-balance the selected multi-proxy agents that monitor the matching CIs in the policy's **Monitored CIs** tab or have each agent monitor the matching CIs.
   - To load balance the selected multi-proxy agents that monitor the matching CIs, clear the **Run checks on all proxy agents (No load balancing)** option.

     For example, if you have five agents in a cluster or five agents using the filter/script option and 10 matching CIs in the policy, each agent would monitor two CIs.

     You can also enable load balancing at a later time, as described in Enable load balancing between proxy agents in a cluster.

   - To have each agent monitor all matching CIs, select the **Run checks on all proxy agents (No load balancing)** option.

     If there are 10 matching CIs in the policy, each agent would monitor all 10. For example, you might want to use this option for multiple proxy servers in different geographic locations.

     If an agent is not functioning properly, the monitored CIs are redistributed to another agent.

   Note: For existing or active policies, the **Run checks on all proxy agents (No load balancing)** option is enabled by default. For new and inactive policies, this option is turned off by default.

8. Select **Activate**.

Enable load balancing between proxy agents in a cluster

Enable load balancing between proxy agents in a cluster so that if an agent is not functioning properly, monitored CIs are redistributed to another agent. After enabling load balancing, you can view the CIs monitored by each proxy agent in a policy.

Before you begin
Ensure that you have upgraded to Tokyo patch 1 or San Diego patch 7.

Role required: agent_client_collector_user

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Policies**.
2. Select the policy containing the CIs you want the proxy agents to monitor.
3. Select the **Proxy Settings** tab.
4. Enable load balancing for the proxy agents by clearing the **Run checks on all proxy agents (No load balancing)** check box.
   Load balancing is enabled for the proxy agents monitoring the CIs. For example, if you have five agents and 10 matching CIs in the policy, each agent monitors two CIs.
5. In the **Related Links** section, select **Show distribution of proxy agent's CIs**.
   A pop-up window displays the distribution of monitored CIs among agents within the policy.

Configure a MID Server to work with Agent Client Collector Monitoring

Connect agents to a MID Server to enable Agent Client Collector Monitoring functionality.

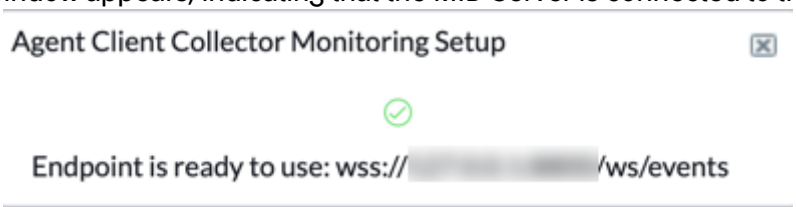
Before you begin
Role required: agent_client_collector_admin

About this task
For details on configuring Agent Client Collector for log monitoring, see Agent Client Collector Log Analytics.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **MID Servers**.
2. Select the MID Server that you want to connect to the agent.
3. In the **Related Links** section, select **Setup ACC Monitoring**.

Result
A confirmation window appears, indicating that the MID Server is connected to the agent.



Related topics

Configure multiple MID Servers to work with Agent Client Collector Monitoring

Configure multiple MID Servers to work with Agent Client Collector Monitoring

Connect agents to multiple MID Servers to enable Agent Client Collector Monitoring functionality. Multiple MID Servers can support each other with load balancing and domain separation.

Before you begin
Role required: agent_client_collector_admin

About this task
When configuring multiple MID Servers, use the same port for all MID Servers. Using different ports requires you to add each MID Server individually, as described in Configure a MID Server to work with Agent Client Collector Monitoring.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **MID Servers**.
2. Select the check boxes corresponding to the MID Servers you want to connect to your agent.
3. In the **Actions on selected rows...** window, select **Setup ACC Monitoring**.
   The option includes the number of MID Servers selected out of the number of available MID Servers. For example: **Setup ACC Monitoring (7 of 8)** indicates that 7 MID Servers were selected out of 8 available MID Servers.

Result
A confirmation window appears, indicating that the selected MID Servers are connected to the agent.

Enable log monitoring in a Linux environment

To enable monitoring logs in a Linux environment, select the relevant policy and assign specific check parameters to the policy. When log monitoring is enabled and a specified string is discovered in the log being monitored, the system creates an event.

Before you begin
Ensure that the servicenow user has access to the log file being monitored, or that the specified user can run the `sudo` command.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Select the **Linux log monitoring** policy.
3. On the **Check Instances** tab, select **util.check-logs** to enable monitoring log files not owned by the *`root`* user.
   Ensure that the Agent Client Collector *`servicenow`* user has read permissions for the log file being monitored.
4. Specify the log file to be searched by the check:
   a. In the **Check Parameter Definitions** tab at the bottom of the page, select the **file** entry in the **Name** column.
   b. In the **Default value** field, enter the path of the log file you want to search.
5. Specify the string you want to locate in the log:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Check Parameter Definitions** tab at the bottom of the page, select the **pattern** entry in the **Name** column.

b. In the **Default value** field, enter the search pattern strings that you want to search for in the log file, such as 404, `Error`, and so forth. The default values are SEVERE and `Exception`.

   Ensure that you separate multiple patterns with a pipe (|) and pass it as a parameter inside quotes. For example: `"SEVERE|404"`.

6. Click **Update** to save your check instance and return to the **Policy - Linux Log Monitoring** page.
7. Select the **util.check-logs-sudo** check to monitor logs owned by the root user.
8. Repeat steps 4 and 5 to monitor logs owned by the root user.
9. For the **util.check-logs-sudo** check, modify the `/etc/sudoers` file on the host or Linux virtual machine, as follows:
   When the agent is installed on the host's default location (`/usr/share/servicenow/agent-client-collector`) or on a Linux virtual machine, add the following string to the `/etc/sudoers` file:

```
servicenow ALL=
 SETENV: /
var/cache/servicenow/agent-client-collector/monitoring-plugin-l
inux/bin/check-log.rb *
Defaults:servicenow !requiretty
Defaults exempt_group += servicenow
```

10. On the **Policy** page, click **Save** and then click **Publish** to activate the policy to monitor the log file.

Enable log monitoring in a Windows environment

To enable monitoring logs in a Windows environment, select the relevant policy and assign specific check parameters to the policy. When log monitoring is enabled and a specified string is discovered in the log being monitored, the system creates an event.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Select the **Windows log monitoring** policy.
3. On the **Check Instances** tab, select **os.windows.check-log** to enable monitoring Windows log files.
4. On the **Check Parameters** tab, specify the log parameters to be monitored by the check, as described in the following table:

Check parameters

Name	Value
warning	Number of times the specified pattern strings are found in the log which generates a *`warning`* event. Default = 1.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Value
	For example, if the *pattern* value is **Exception** and one Exception event is located in the log, a *warning* event is generated.
critical	Number of times the specified pattern strings are found in the log which generates a *critical* event. Default = 2. For example, if the *pattern* value is **Exception** and two Exception events are located in the log, a *critical* event is generated.
file	Location of the log file.
pattern	Strings which are being searched for in the log. Default values are **Severe** and **Exception**. Other possible values include **404** and **Error**. Ensure that you separate multiple patterns with a pipe (|) and pass it as a parameter inside quotes. For example: `"SEVERE|404"`.

Select the Azure policies to activate for metric collection

Activate the Azure policies that come with the Agent Client Collector base system so that Azure virtual machines can collect metrics. These metrics help you monitor the configuration items (CIs) in the CMDB.

Before you begin

- Prepare an instance with an active MID Server and metric base.
- Install Agent Client Collector Framework and Agent Client Collector Monitoring.
- Run Discovery on the Azure cloud account to populate the CMDB with CIs to be monitored.

Role required: agent_client_collector_admin

Procedure

1. Prepare and configure the proxy agent to be used by the policy.
   For details on configuring a proxy agent, see Using proxy agents in Agent Client Collector.
2. Assign the credentials to the Azure policy.

   a. Navigate to **All** > **Agent Client Collector** > **Policies**.

   b. Select the relevant policy.
   For details on the policies that are available with the base system, see Azure cloud metrics.

   c. Select the **Credentials** tab.

   d. In the **Credential name** field, select the credentials to be invoked for the policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To see the available credentials, go to the Credentials page by navigating to **All** > **Discovery** > **Credentials**.

Ensure that you select the **Type=Azure** credentials. If you need to create credentials, select **New** and select **Azure Service Principal** credentials.

e. In the **Credential alias** field, assign an alias to the credentials.

3. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Policies** and select the relevant policy to activate.
4. Select the application scope icon and verify that you are in the Agent Client Collector Monitoring scope to edit the policy.
5. Enable the policy in Edit mode by selecting **Edit in Sandbox**.
6. Enable the proxy agent to be used to execute the check.
   a. Select the **Proxy Settings** tab.
   b. Select **Single proxy agent** and select the proxy agent to be used to execute the check from the **Proxy agent** field.
7. Select **Save**.
8. Republish the policy by selecting **Republish**.

Use the Agent Client Collector Health Dashboard

The Agent Client Collector Health Dashboard enables you to monitor the status of the agents in your system.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agent Health Dashboard**.
   The **Agent Health Dashboard** page appears and displays information about the configured agents in the dashboard widgets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the **Agents by Data Collection Status** widget, **Off (manual)** indicates agents manually turned off (for maintenance or troubleshooting), and **Off (auto)** indicates agents automatically turned off (after crossing the CPU usage threshold).

2. Click the refresh arrow icon on the top right corner of a widget to refresh its data, as needed.

   You can refresh all widgets on the dashboard by selecting the form header icon and then selecting **Refresh**.

Agent Client Collector Discovery

Discover CIs in your environment by using Agent Client Collector for Visibility - Content (ACC-VC) Discovery. ACC-VC works with both horizontal IP-based Discovery, and you can also use push-based Discovery.

Using push-based Discovery and horizontal IP-based Discovery together

Discovery performed by Agent Client Collector for Visibility - Content (ACC-VC) is compatible and can coexist with horizontal IP-based Discovery. You may have ACC installed on a given target host and still have that host as part of a horizontal IP-based Discovery schedule as well.

To avoid conflicts, ACC-VC does not perform Discovery when the target host's IP already has a CI that has been discovered by horizontal IP-based Discovery (discovery_source is ServiceNow). To override this behavior, set the system property [*sn_agent.disco_disable_ci_clobber_of_agentless_disco*] to false. This setting is ignored if horizontal IP-based Discovery was not performed over a specific time. Update the system property [*sn_agent.disco_ci_clobber_of_agentless_disco_threshold_days*] if necessary. The default is 14 days. See System properties for more details.

To enable Discovery using Agent Client Collector, enable the following Discovery properties on the Discovery properties page (**All** > **Discovery Definition** > **Properties**):

Agent Client Collector Discovery properties

Field	Description
glide.discovery.domain.name.nbt	Set OS domain name by NBT or WMI. If set to **true**, Windows domain name is set by NBT. Otherwise it's set by WMI. • **Type**: true | false • **Default value**: true
glide.discovery.enable.software_simplify	Enables cleanup for software's name and version. If set to **true**, it removes any appended version or commonly found phrases from the name and removes leading 0s in the version. If set to **false**, raw data is persisted in the table. Use with the **glide.discovery.enable.software_simplify_sccm** property to avoid software data discrepancy between Discovery and SCCM. • **Type**: true | false • **Default value**: true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector Discovery properties (continued)

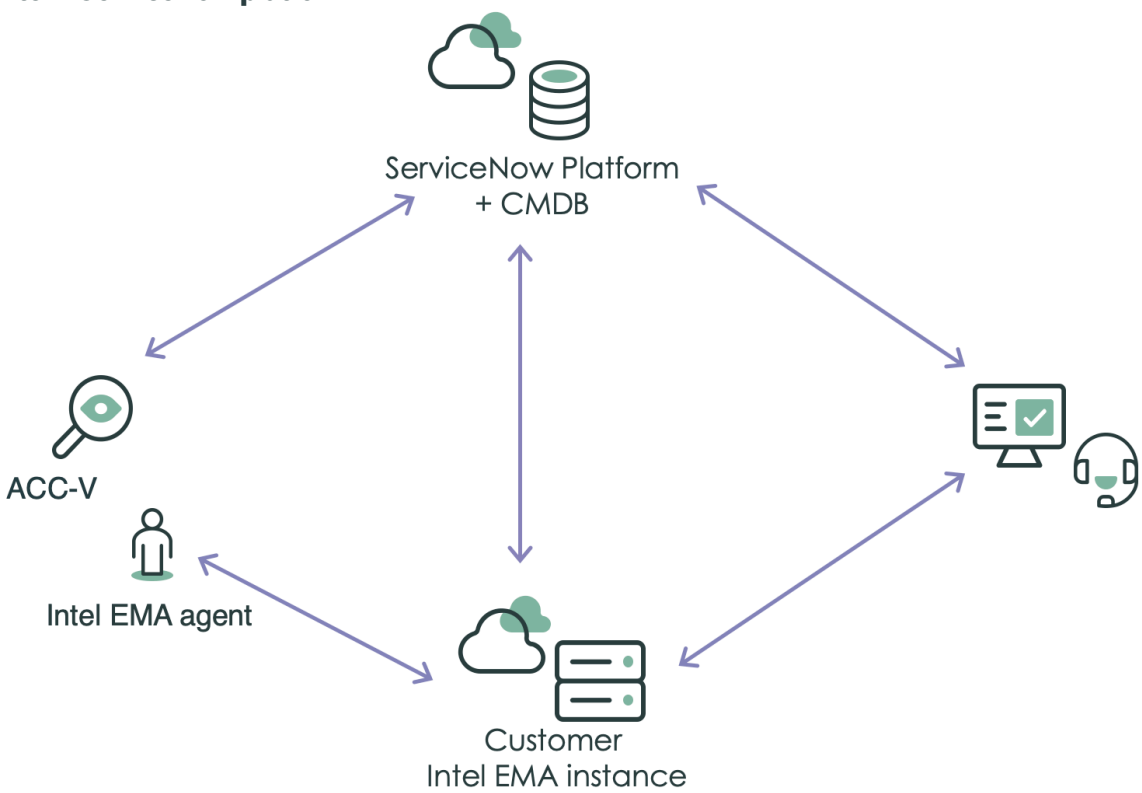
Field	Description
	Note: Once the property is set to **false**, to disable the cleanup, duplicate records are generated for a given software. Name and Version are the primary identifiers.

Using push-based Discovery and Intel Endpoint Management Assistant (EMA) together

Agent Client Collector for Visibility - Content (ACC-VC) can collect data for uses cases with the Intel vPro® platform when the Intel ® EMA application is installed on Windows endpoints. You can install the Intel EMA application from the ServiceNow store. Attributes are stored in the CMDB when enabled. Currently, data for Intel EMA can only be fetched for Windows endpoints.

The Intel EMA application enables customers to configure access to the Intel Instance from their ServiceNow instance. For example, IT Support groups can open a remote console and perform some actions like power cycle from a ServiceNow incident.

Intel + ServiceNow platform



Using push-based Discovery and SAM together

Agent Client Collector for Visibility - Content (ACC-VC) collects installed software data for use cases for Software Asset Management (SAM), when the SAM plugin is installed. Using push-based Discovery and SAM together can help optimize software data collection with SAM basic metering and SAM total usage metrics.

ACC-VC can capture the last accessed time for the software or applications that are installed on the target via push-based Discovery. This information along with the target CI reference, is added to the Software Update [samp_sw_usage] table.

SAM Basic metering and SAM total usage metrics are supported for both Windows and macOS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The software usage records are domain separated. The records are populated with the domain of the MID Server that is used for the agent-based Discovery for the target.

Note: For software installations (cmdb_sam_sw_install), to avoid insertion of duplicate records, the same discovery source "ServiceNow" is being used for both push-based Discovery and horizontal IP-based Discovery.

Requirements

SAM basic metering and SAM total usage metrics

For SAM basic metering and SAM total usage metrics, the non-privileged servicenow user (which the agent service logs on as) must be configured with READ only access in the registry. This access allows for successful execution of the OSQuery against the UserAssist table to be successful. Go to regedit and allow the servicenow user to read UserAssist for a user account on the device (for example: HKEY_USERS\SID...\Software\\Microsoft\\Windows\\CurrentVersion\\Explorer\\UserAssist for every user in HKEY_USERS).

Note: The *UserAssist* key does not inherit permissions from the *HKEY_USERS|SID...* parent key. Therefore, you must navigate to the *UserAssist* key and add permission directly on the key.

To apply SAM basic metering or SAM total usage metrics, you need the following:

- SAM plugin (com.snc.samp) enabled
- System property [*sn_acc_vis_content.persist_sam_usage_metrics*] set to true. See System properties for more details.

For details on SAM metering setup with the Agent Client Collector, see the Knowledge Base article KB1642676.

Software edition information

To retrieve software edition information, you need the SAM plugin (com.snc.samp) enabled.

SAM basic metering

Note: There is a configuration in the Windows operating system level that does not allow the correct detection of the data. Update the configuration so that the data can successfully be collected by the ACC-VC agent and brought to the ServiceNow platform correctly.
In the Registry Editor, create the following keys in the path: *HKEY_CURRENT_USER|SOFTWARE|Microsoft|Windows|CurrentVersion|Explorer|Advanced.*

- Name: Start_TrackProgs
  - Base: Hexadecimal
  - Value:1
- Name: Start_TrackProgsBase
  - Base: Hexadecimal
  - Value:1

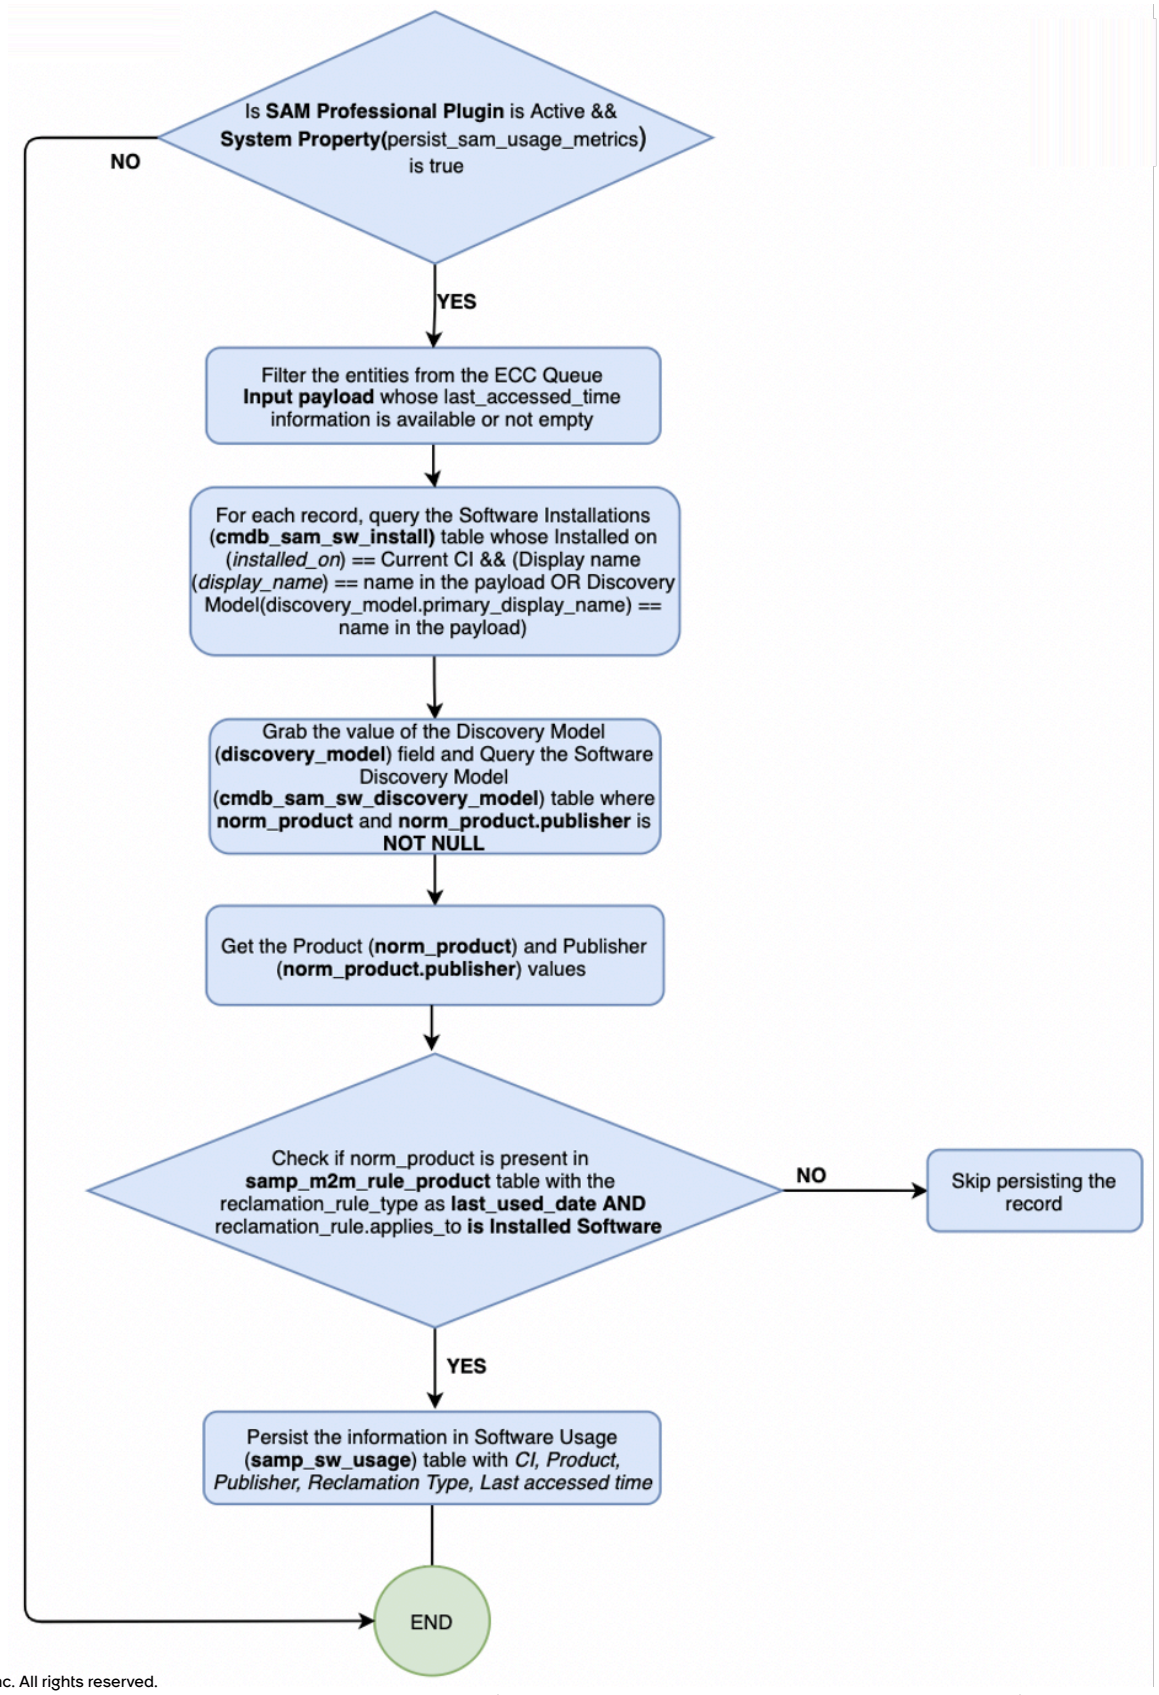
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SAM basic metering flowchart

For the list of software in the payload, query the Software Discovery Model [cmdb_sam_sw_discovery_model] table to fetch the corresponding product and publisher. Once the product is fetched, check if the reclamation rule is enabled for that product to persist the last usage information in the Software Usage [samp_sw_usage] table. See the flowchart for details.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: In the target, query the last accessed time from the UserAssist table via the OSQuery by taking the application or software name as the input to the Query.

Use the *sn_acc_vis_content.disable_sam_reclamation_rules_for_licensable_softwares* property to define reclamation rules for licensable software, as follows:

- **True**: SAM usage is stored for all licensable software (with or without defined reclamation rules), and for any non-licensable software that has a reclamation rule defined.
- **False**: Store SAM usage according to defined reclamation rules.

Common applications supported include:

- WinZip
- Google Chrome
- Sublime Text
- Notepad++
- Autodesk
- Microsoft Office 365
- Tableau

SAM total usage metrics

SAM total usage metrics allows you to measure total usage time and total usage count on any application that has a software reclamation rule enabled.

Osquery provides a daemon executable which can run as a service, called Osqueryd. Osqueryd needs to be manually deployed for SAM total usage metrics to work properly. Each Osqueryd deployment requires the osquery.conf file, optional external packs, and initialization flags (configured in osquery.flags file) provided when starting the service. In return, the daemon service runs scheduled queries on the host and logs it into a local file system.

Note: Osquery supports filesystem-based logging by default. This configuration is provided in the osquery.conf file on any fresh Osquery installation.

Domain information can be collected during the data collection. This can help large organizations with multiple employee directories map software to the correct user. Currently, this is supported for Windows only. To map the software usage/assigned_to with the correct user in a domain separated environment, use the system property [sn_acc_vis_content.column_name_for_user_mapping] with a valid field name. By default, the value of this system property is empty which means it only validates the username and not the domain. You can use either of the following formats to validate username and domain: username@domain or domain\username.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SAM total usage metrics flowchart

Using the list of processes, you can perform SAM normalization to map the processes for the relevant installed software records. This provides flexibility since installed software names and processes are not usually the same. For the list of processes in the payload, query the Software Discovery Model [cmdb_sam_sw_discovery_model] table and Software Product [samp_sw_product] table to fetch the corresponding product and publisher. Once the product is fetched, check if the reclamation rule is enabled for that product to persist the total usage time in the Software Usage [samp_sw_usage] table. See the flowchart for details.

```
cd 'C:\Program Files\osquery'
.\manage-osqueryd.ps1 -uninstall
.\manage-osqueryd.ps1 -install
Restart-Service osqueryd
```

For details on Windows and macOS see Configure Osqueryd schedule for SAM total usage metrics and Configure Osqueryd logs for SAM total usage metrics.

Collecting SAM metrics without osqueryd

Optionally, you can enhance efficiency by using non-osqueryd data collection when using push-based Discovery and Software Asset Management (SAM) together. When non-osqueryd data collection is invoked, data collection is automatically performed on all available agents, instead of invoking osqueryd on each agent individually.

To perform non-osqueryd data collection:

1. Ensure that the following permissions are configured for the relevant OS:
   - Windows: Either NT AUTHORITY\SYSTEM or admin
   - Linux and macOS: root
2. On the System Properties page (**All** > **System properties** > **All properties**), set the *sn_acc_vis_content.enable_sam_collection_without_osqueryd* property to **true**.

Note: Enable this property only when all agents are version 4.1.0 or later.

Software edition information

Starting in ACC-VC version 2.3.0, edition information is supported for Adobe Acrobat and MS SQL server. With this feature, SAM admins can get clear visibility into the editions of their installed software. Osquery commands are used to fetch the edition information which then shows in the Software Installation [cmdb_sam_sw_install] table in the Edition Override column. For more details, see the support KB: https://support.servicenow.com/kb?id=kb_article_view&sysparm_article=KB0721360

Related topics

Configure Osqueryd schedule for SAM total usage metrics

Configure Osqueryd logs for SAM total usage metrics

Configure Osqueryd schedule for SAM total usage metrics

SAM total usage metrics works by relying on the Osqueryd service running on the target host. Configure the Osqueryd service to run the required schedule Osquery on the host.

Before you begin

Role required: admin

Procedure

1. Navigate to **Osqueryd installation folder**.
2. Find and edit the osquery.conf file.
3. Add the below Osquery pack under the packs keyword.

   For Windows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
"packs": {
      "sam-metering":
 "C:\\ProgramData\\ServiceNow\\agent-client-collector\\cache\
\acc-visibility-modules\\bin\\sam-metering.conf"
  }
```

For macOS:

```
"packs": {
    "sam-metering": "/Library/Application\
 Support/servicenow/agent-client-collector/cache/acc-visibili
ty-modules/bin/sam-metering.conf"
  }
```

Result

You can now Configure Osquery logs for SAM total usage metrics.

Configure Osqueryd logs for SAM total usage metrics

By default, Osquery supports log rotation based on size. To enable it for SAM total usage metrics and to configure the log size and rotation, you need to add specific flags for Osqueryd service.

Before you begin

Role required: admin

Note: SAM with Osqueryd consumes memory and CPU cycles. For example, with the Agent installed on a Windows Machine having 2 CPU core, 8 GB RAM, 1000 software installations, and 500 running processes, the following was observed:

- Average CPU usage for the Agent and Osqueryd was less than 10 % CPU and maximum of 30% CPU. This will only occur when the SAM background policy is triggered. By default, the trigger happens every 480 seconds.
- Average Memory usage for Agent and Osqueryd was less than 10 MB and maximum of 26 MB was consumed.

To store the data for a single running process for two days, the log file size on an average should be 52429 bytes. The log file size must be increased if the number of running processes on the machine is higher. For example, with 500 running processes the log size would be on average 25 MB which is 26214400 bytes.

Procedure

1. Navigate to **Osqueryd installation folder**.
2. Find and edit the osquery.flags file.
3. Add the below flags with these sizing guidelines:

   Note: Modification of the log file size should be done as per the Osqueryd Log file sizing guidelines.

   For Windows:

   - --logger_rotate=true
   - --logger_rotate_size=26214400
   - --logger_rotate_max_files=1
   - --watchdog_level=1

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For macOS:

- --logger_rotate=true
- --logger_rotate_size=26214400
- --logger_rotate_max_files=1
- --watchdog_level=1
- --logger_mode=0644

4. Save the file.

Result
Once the Osqueryd schedule and Osqueryd logs are configured the Osqueryd service can start.

The schedule runs the Osquery: Select name, pid, elapsed_time, start_time, user_time, system_time, username from processes p JOIN users u ON u.uid = p.uid where p.elapsed_time ! = -1 AND u.type !='special';" runs every 5 minutes (300 seconds) on the target machine. This logs the results into the log file. The log file contains snapshot entries of all the queries configured to run by the Osqueryd . This query contains all the processes attributes.

Note:

A temporary file *marker.json* is created in a temporary local folder on your machine in the directory:

For Windows : `<userprofile>\\AppData\\Local\\AgentClientCollector\\SAM`.

For macOS: `/Library/Application\ Support/servicenow/agent-client-collector`.

This file has read/write permissions and contains the marker data: *Data and Last Read Unix Time stamp*.

The Osqueryd can also be configured to write its logs to a custom directory path instead of the default directory. If you choose a custom directory, modify the check definition [samadvanced-background-log-check].

Application patterns for the Agent Client Collector

Application patterns gather details on the applications that run on the Agent Client Collector (ACC) host. Application patterns are supported only for servers, and are triggered after the Agent Client Collector host Discovery is complete.

Prerequisites for using application patterns

To enable application patterns on the Agent Client Collector, install the following:

- Agent Client Collector Framework
- Agent Client Collector for Visibility - Content
- Discovery

Ensure that the agent is connected to a MID Server to enable pattern execution. The MID Server runs the pattern, and each command step is evaluated against the agent as an ad-hoc check who's name begins with *PatternOnTheFlyCheck*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set the *sn_agent.appl_classification_behavior* property to **full**, and restart any MID Servers connected to the agent.

When working in a Windows environment, ensure that you're working with Powershell 3.0 or higher.

Role required (on the host device):

- In a Linux or macOS environment: ServiceNow user with sudoers; nopasswd enabled with regular Discovery commands.
- In a Windows environment: Local System user, SYSTEM, or a local user account where the local user account uses one of the following:
  - Logon as a service
  - Backup (SeBackupPrivilege)
  - Debug Programs privileges

Viewing supported application patterns

To view the list of patterns supported for Agent Client Collector, navigate to **All** > **Pattern Designer** > **Supported Patterns for ACC**. Application patterns are the only pattern types supported for use with Agent Client Collector.

Viewing Application Patterns executed on Agent Client Collector

You can view the application patterns that were executed on a given agent.

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select an agent.
3. Select **View** > **Discovery** from the context menu (hamburger icon).
4. Open the agent.
5. Select the **Application Pattern logs** tab on the bottom of the page.

   The list of patterns executed on the agent appears. Executed patterns are indicated with the value **true** in the Executed On Agent column.

Unsupported application pattern operations

Application patterns aren't supported in the following pattern operations:

- WMI method invocation
- Change/unchange user
- All custom operations
- SNMP query
- Put file

Agent Client Collector pattern execution properties

Configure the following properties (**All** > **System Properties** > **All Properties**) to maximize the use of application patterns with Agent Client Collector:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application pattern properties

Property	Description
sn_agent.appl_classification_behavior	Set value to **full** to enable working with applications patterns and to access pattern commands in the allow-list. Default: simple **Note:** To enable application pattern execution with the allow-list, use the allow-list template for application patterns. For details, see the Pattern execution on ACC: Sample Allowlist for Pattern Content article in the Now Support Knowledge Base.

MID Server configuration parameter properties

mid.discovery.agent.command.mid.timeout	The maximum duration, in seconds, that the MID Server waits for a response from the agent before timing out. Default: 60 seconds
mid.discovery.agent.command.timeout	The maximum amount of time, in seconds, that the command is given to execute on the agent host. Default: 60 seconds

Using pattern designer debugging in ACC mode

You can debug application patterns that are configured in ACC mode.

1. Set the *sn_agent.appl_classification_behavior* property to **full**.
2. In the Pattern Designer, enable the debug option and select **Use ACC connection** in the Debug identification section.

The pattern log indicates whether the pattern was successfully executed on the agent.

You can also receive pattern details in the following logs:

- MID Server logs: Set *mid.log.level* to DEBUG for the mid agent log to display details on the pattern step, ACC check, and the pattern response.
- ACC logs: Search for the string *PatternOnTheFlyCheck* for details on pattern checks.

Oracle Global License Advisory Services (GLAS) data collection

Oracle Java process discovery works either with patterns (when using either a MID Server or Agent Client Collector), or with file-based discovery (using Agent Client Collector with file-based discovery). If both the pattern and file-based discovery run the same Java installation, the pattern-collected data takes precedence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When performing Discovery with Agent Client Collector, ensure that you have the following settings:

- All users must have the Oracle GLAS store app, starting with version 1.8.4.
- Agent Client Collector users:
  - Must have the Agent Client Collector Framework store plugin.
  - Can have the Agent Client Collector for Visibility - Content store plugin, for extra data.

  For information about privileged user access, see KB1705845.

> **Note:** Oracle Java discovery with ACC is applicable in all server environments. However, currently, it's partially supported for different Desktop environments. For a Windows Desktop update set, see the KB article KB1705845.

For information on java installation Discovery using Agent Client Collector for Visibility - Content, see Discover java installation data using Agent Client Collector for Visibility - Content file-based discovery.

For information on the collected data, see Data collected during Agent Client Collector for Visibility - Content file-based Discovery.

Application patterns support Oracle GLAS data collection in a Linux environment. For details on using patterns, see Oracle GLAS data collection using patterns.

Although Oracle GLAS supports Put file operations, the related files are deployed using Agent Client Collector plugins instead of SSH or WMI.

Related topics

Discovery patterns used by ITOM Visibility

Discover java installation data using Agent Client Collector for Visibility - Content file-based discovery

Discovering java installation data using Agent Client Collector for Visibility - Content file-based discovery enables you to discover file information in your system.

Before you begin

- Install the latest version of Agent Client Collector for Visibility - Content.
- Install file-based discovery.
- Enable the Oracle Global License Advisory Services (GLAS) hardware data collection policy.

Role required: discovery_admin

Procedure

1. Enable file-based discovery.
   a. Navigate to **All** > **Discovery Definition** > **Configuration Console**.
   b. Enable the **File Discovery** entry.
2. Enable the Java Discovery property.
   a. Locate the *sn_acc_vis_content.file_discovery.enable_java_discovery* property on the System Properties page (**All** > **System Properties** > **All Properties**).
   b. Set the property value to **true**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Grant elevated permissions to the `acc` user, enabling access to your java installation directories, for example:

   - `/usr/lib/jvm/*/bin/java`
   - `/usr/lib/jvm/*/*/bin/java`

   You can add additional java directories during java installation, as needed.

   - In a Linux environment, grant elevated permissions in the `/etc/sudoers` file to enable access to the java installation directories.
   - In a Windows environment, grant elevated permissions (read and execute) via the system administrator to enable access to the java installation directories.

Result
When running Discovery for java installation, data is discovered through file-based discovery and is stored in the `ora_java_audit` table. For details on the data stored in this table, see Data collected during Agent Client Collector for Visibility - Content file-based Discovery.

Discovering DNS names using push-based discovery

CMDB owners need CIs to contain all domain system names (DNS) associated with their system. Starting in Agent Client Collector for Visibility - Content (ACC-VC) version 2.3.0, ACC-VC can discover DNS name lists for Windows and Linux CIs.

When discovering DNS names associated with systems, the following occurs.

- network_adapters.rb is used to populate the DNS name for all the IP addresses using OSquery. (There is no limit.)
- Nslookupcommand is used to get the DNS name for all IP addresses.

Note: Nslookup must be configured on the target.

This creates a relationship of *`Owns::Owned by`* between the CI and the DNS names.

This information is then populated into the [cmdb_ci_dns_name] table.

Populating Assigned To attribute in Computer CI for Agent Client Collector for Visibility - Content

To update the Assigned To attribute of the Computer CI, you need to collect information from the logged in user.

Before you begin
Role required: admin

You can automatically populate Assigned to for Windows endpoint devices and macOS devices, like workstations or employee laptops, as part of agent-based Discovery using ACC-VC with the following system properties. See Available system properties for more information.

- **sn_acc_vis_content.set_assigned_to**
- **sn_acc_vis_content.assigned_to_user_order**
- **sn_acc_vis_content.column_name_for_user_mapping**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create higher user privileges to fetch the logged in user details.
   Use Log on As Local System User instead of the default ServiceNow user for running the Agent Client Collector. When working in a macOS environment, use the default ServiceNow user.

   Ensure that you have Powershell to run the internal commands on your machines that fetch the logged in user details.

2. User names match is performed on the user records in the sys_user table.
   The Assigned To attribute is populated and then it creates a reference to the user. Systems logs shows a warning if no user can be found in sys_user. The user names sourced for Assigned To attribute is based on the system property: **sn_acc_vis_content.assigned_to_user_order**.
3. Assigned_to attribute is set based on priorities.
   If assigned_to is already there, keep it as is by default. However, you can update the **sn_acc_vis_content.set_assigned_to** system property to override it. If there are any Reconciliation Rules defined, then the IRE populates the field accordingly.

Result

No new user account is created in the sys_user table. Instead, the existing user is queryied and the same is referenced as Assigned To user for a CI.

Populating users based on type for Agent Client Collector for Visibility - Content

You can persist the type of users that populate the CMDB depending on your particular interests. Currently, local and system are supported for Windows, Linux, and macOS.

You can filter the types of users by using the system property: **sn_acc_visibility.persist_os_user_type**. See Available system properties for more information.

For Windows

You need to identify if a server is domain controller or not. Since domain controller machines don't have local accounts, local user information does not persist for such machines and is not populated.

For non-domain controller Windows machines, use OSquery commands to get user information through ACC-VC: select *uid*, *username*, *directory*, *type* from users where **type=local** or **type=special**.

For Linux

The userID defines if a user is a local account or system account. This is defined by *UID_MIN* and *UID_MAX*.

Use this command to get user information through ACC-VC to get *UID_MIN* and *UID_MAX* value: `grep -E '^UID_MIN|^UID_MAX' /etc/login.defs`.

Use this command to get user names: `cat /etc/passwd | awk -F':' '{print $1,$3,$6`.

For macOS

Use OSquery commands to get user information through ACC-VC: select *uid*, *username*, *directory* from users. User names that are preceded by '_' are treated as system accounts. Others are local accounts.

License key discovery

License key discovery in Agent Client Collector for Visibility - Content automatically collects software license keys from the Windows registry on managed endpoints.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

License key discovery enables the Agent Client Collector for Visibility - Content (ACC-VC) Windows agent to read software license keys stored in the Windows registry on managed endpoints. When a device is discovered, the agent reads registry values defined by an admin-configured list of registry paths and value names, and reports the results in your instance.

The feature is off by default and must be explicitly enabled using a system property.

Why use license key discovery

License key discovery helps administrators track software license keys across managed Windows devices. By linking discovered keys to device CIs and SAM products, it supports software asset management and license tracking efforts. Administrators can detect duplicate licenses, track compliance, and manage license costs.

Who can use license key discovery

Specific roles are required to configure and view license key discovery data. For details, see the Access control table on the License key discovery and access control tables page.

No role can delete license key records. If a key that was previously detected is no longer found on a device, it is marked as **Absent** rather than deleted, preserving the audit trail.

Configure license key discovery

Enable license key discovery and define the registry paths and values you want the Agent Client Collector for Visibility - Content Windows agent to collect from managed endpoints.

Before you begin

The SAM Professional plugin (com.snc.samp) must be active.

The Agent Client Collector for Visibility - Content Windows agent must be deployed on the endpoints.

Role required: agent_client_collector_admin or discovery_admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the *sn_acc_vis_content.enable_license_key_discovery* property.
3. Set the **Value** field to `true`.
   The default value is `false`. Setting this property to `true` enables license key collection.
4. Select **Save**.
5. Navigate to the **License Registry Configuration** [sn_acc_vis_content_license_registry_config] table and create a record for each registry entry you want to collect.
   Enter the appropriate values in the fields for each record. For details about the fields, see the License Registry Configuration form table.
6. Select **Submit** to save the configuration record.
7. **Optional:** To apply configuration changes immediately, navigate to **All** > **System Definition** > **Scheduled Jobs**, search for the `Refresh License Key Config File` scheduled job, and select **Execute Now**.
   By default, this job runs daily at 8:30 a.m. UTC.

Result

The *Refresh License Key Config File* scheduled job reads all active configuration records and publishes them to the agent as `LicenseKeyConfig.json`. On the next agent run, the Windows agent queries the defined registry paths on each managed endpoint and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

sends the collected key values to your instance. Discovered keys are stored in the **License Keys** [sn_acc_vis_content_license_keys] table, linked to the device CI, the associated SAM product, and the user assigned to the CI. If a key that was previously detected is no longer found, it is marked as **Absent**.

Agent Client Collector Log Analytics setup

Configure Agent Client Collector Log Analytics on your ServiceNow instance either with or without using guided setup.

Agent Client Collector Log Analytics setup using guided setup

Agent Client Collector Log Analytics guided setup provides a sequence of tasks that help you configure Agent Client Collector Log Analytics on your instance. Using guided setup ensures that you have the minimum required setup to use the application. For more information, see Set up Agent Client Collector Log Analytics using guided setup.

For more information about using the guided setup interface, see Using guided setup.

Agent Client Collector Log Analytics setup without using guided setup

If you are not using guided setup, you must perform several configuration steps manually. For more information, see Set up Agent Client Collector Log Analytics without using guided setup.

Set up Agent Client Collector Log Analytics using guided setup

Configure Agent Client Collector Log Analytics on your ServiceNow instance using guided setup.

Before you begin

- Agent Client Collector Log Analytics has a dependency on the ServiceNow® Event Management application. Set up Event Management before you configure Agent Client Collector Log Analytics. For more information, see Event Management setup.
- ServiceNow Service Operations Workspace ITOM Apps must be installed. If it is not installed already, install it manually. For more information, see Install Service Operations Workspace for ITOM application.

Note: Currently, this setup only supports basic authentication with the MID Server. mTLS is not supported.

Role required: agent_client_collector_admin

About this task

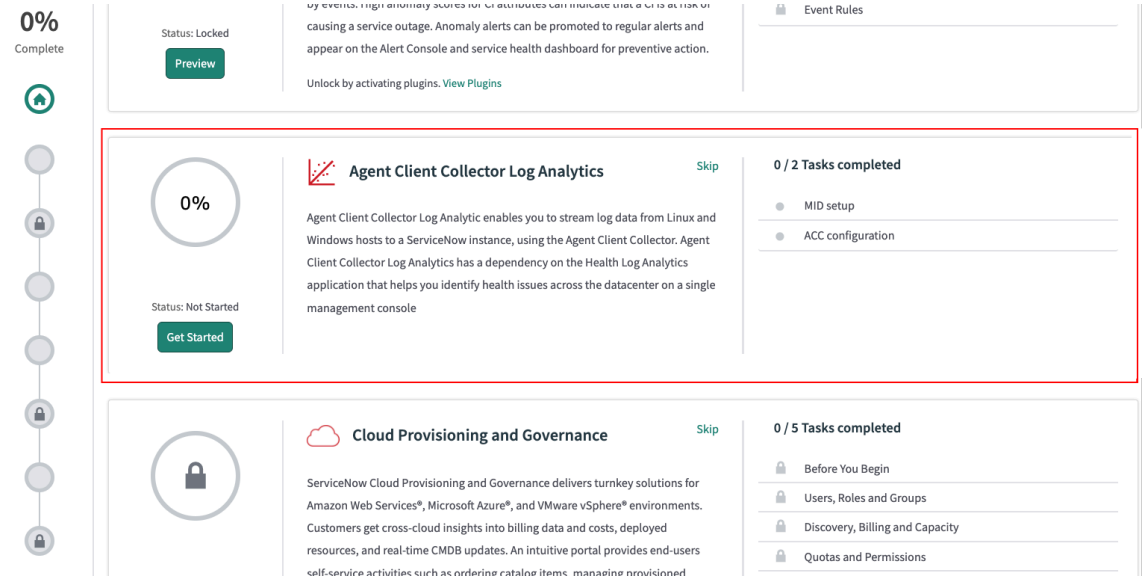
Agent Client Collector Log Analytics guided setup provides a sequence of tasks that help you configure Agent Client Collector Log Analytics. Using guided setup ensures that you have the minimum required setup to use the application.

Note: If you are not using guided setup, you must perform several configuration steps manually. For more information, see Set up Agent Client Collector Log Analytics without using guided setup.

Procedure

1. Navigate to **All** > **Guided Setup** > **ITOM Guided Setup**.
   The IT Operations Management Guided Setup welcome screen appears.
2. Select **Get Started**.
3. In the Agent Client Collector Log Analytics pane, click **Get Started**.

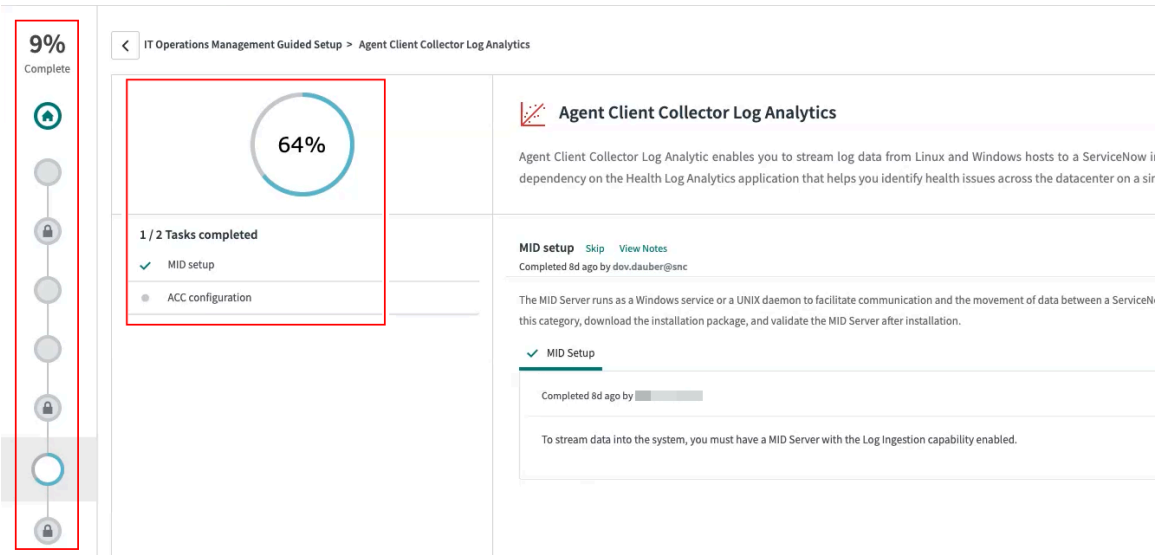
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. In the **MID setup** section, take the appropriate action:
   - If you have already configured a MID Server, select **Mark as Complete**.
   - If you have not configured a MID Server, select **Configure** and set up a MID Server, then select **Mark as Complete**. For more information, see Use MID Server guided setup.

   Note: To stream data into the system, you must have a MID Server with the Log Ingestion capability enabled.

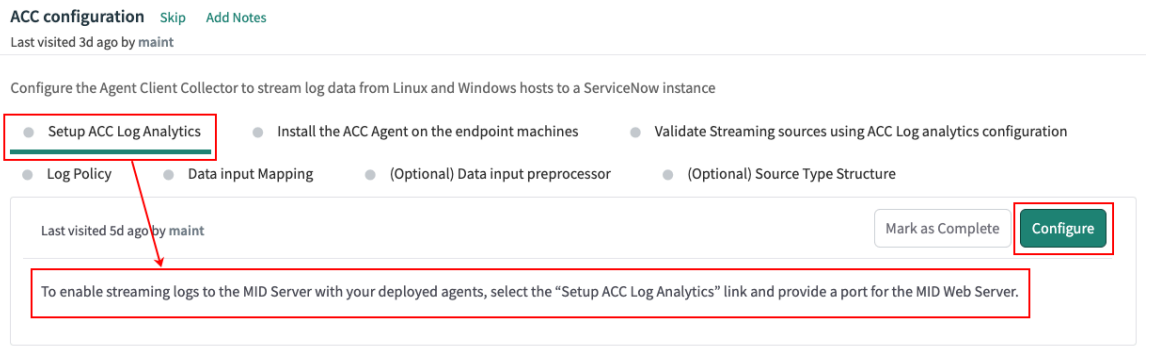
When the MID Server is configured, the status indicator for Agent Client Collector Log Analytics guided setup shows that 64% of the configuration is complete. The progress indicator shows the completion percentage for all the IT Operations Management tasks.



5. Configure Agent Client Collector Log Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **ACC Configuration** section, select a setup task and read the instructions in the help pane.



b. Select **Configure** and complete the task.
For detailed information about each setup task, consult the Agent Client Collector Log Analytics product documentation.

c. Complete all required setup tasks in the task list.

d. Select **Mark as Complete** to complete the Agent Client Collector Log Analytics configuration.

Set up Agent Client Collector Log Analytics without using guided setup

Configure the Agent Client Collector to stream log data from Linux and Windows hosts to a ServiceNow instance without using guided setup.

Before you begin

Note: You can configure Agent Client Collector Log Analytics using guided setup. The guided setup ensures that you have the minimum required setup for using the application. For more information, see Set up Agent Client Collector Log Analytics using guided setup.

- The Agent Client Collector Log Analytics (ACC-L) plugin must be installed. The plugin comes with the Agent Client Collector Framework (ACC-F) and Agent Client Collector Monitoring (ACC-M) plugins. For more information, see Agent Client Collector installation.
- ServiceNow Service Operations Workspace ITOM Apps must be installed. If it is not installed already, install it manually. For more information, see Install Service Operations Workspace for ITOM application.
- Agent Client Collector Log Analytics has a dependency on the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. Streaming log data from Windows hosts is supported in Agent Client Collector Log Analytics Version 3.1.0 and later.

  Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

- The Agent Client Collector comes with the default *`servicenow`* user. Ensure that this user has read access to enable Agent Client Collector to view all the configured log paths. For example, the Agent Client Collector *`servicenow`* user that comes installed with the base system does not have permissions to view the paths to `/var/log/` in Linux and C :

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`\Windows\System32` in Windows. For information about configuring permissions for the *`servicenow`* user, see the ACC-L Permission Denied issues [KB1117271] article in the Now Support Knowledge Base.

Note: Currently, this setup only supports basic authentication with the MID Server. mTLS is not supported.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **MID Servers**.
2. On the MID Server page, select a MID Server that is validated and has a Status value of **Up**.
3. On the MID Server page for the selected server, select **Setup ACC Log Analytics** in the related links section.
   Agent Client Collector Log Analytics setup starts.

   In addition, the system automatically creates an ACC data input. When it has been created, the data input record is added to the ACC data inputs table and the data input is ready to stream logs.

   Note: It is important to configure an ACC data input for every MID Server to which Agent Client Collectors can connect. For more information, see Set up additional ACC data inputs.

   The system also prompts you to set up the MID Web Server. For more information, see MID Web Server.
4. In the ACC Log Analytics Setup dialog box, configure the ports.

   a. In the **MID Web Server Port** and **ACC data input Port** fields, enter the appropriate port numbers.

   b. Select **OK**.
   The URL with the configured endpoint appears in the dialog box.

   c. Copy and save the endpoint URL for use when installing the ACC agent on the endpoint machine.
5. Navigate to **All** > **Agent Client Collector** > **MID Web Server API Key** and copy and save the MID Web Server API key for use when installing the ACC agent on the endpoint machine.
6. Install the ACC agent on the endpoint machine.

   Note: If you have already installed the ACC agent, proceed to Agent Client Collector log policies.

   a. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Downloads**.

   b. Download the ACC agent for the appropriate operating system.

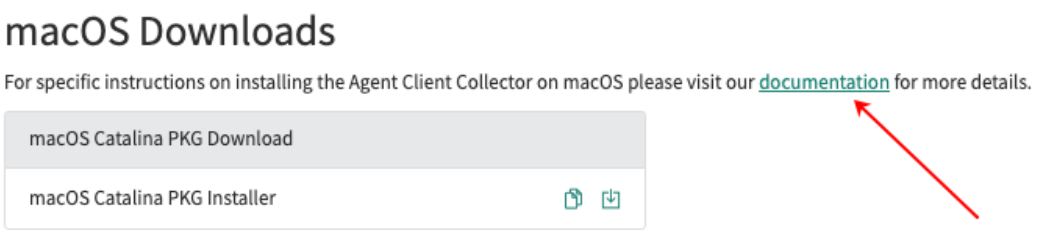
For detailed instructions, select the documentation link for the operating system. For example:



Result
Agent Client Collector Log Analytics and the ACC agent are installed. You can start using the application.

What to do next
Review the Agent Client Collector log policies.

Identify and resolve log streaming issues

Make sure that your ACC data inputs are streaming data properly by identifying and resolving log streaming issues.

Before you begin
Role required: agent_client_collector_admin

About this task
In the ACC data input record, the Streaming Sources related list shows the streaming data of that data input's sources. This data enables you to identify streaming issues and their possible cause.

For example, if the last event time for a data input's endpoint server is yesterday, the server might be down or configured incorrectly. A streaming issue might also be caused by the data input configuration file not being installed on the endpoint.

Note: You can view the streaming data of all data inputs and the MID Servers that receive logs from them in the Streaming Sources page. For more information, see Identify and resolve a log streaming issue in Health Log Analytics in the ServiceNow Health Log Analytics application documentation.

Procedure
1. Navigate to **All** > **ACC Data Inputs** and select a data input record.
2. On the data input form, select the Streaming Sources related list.
3. Review the streaming data of that data input's sources.
   For a description of the filters, see ACC data input streaming sources.
4. Resolve any data streaming issues.
   a. Navigate to **All** > **ACC Log Analytics** > **ACC Log Alerts**.
   b. Open alerts and address the specified issues.

What to do next
Proceed to the next step in the Health Log Analytics data input setup flow. For more information, see Set up additional ACC data inputs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACC data input streaming sources

In the ACC data input record, the Streaming Sources related list shows the streaming data of that data input's sources.

Streaming Sources related list

Filter	Description
Status	The status of the source. A red bullet indicates that this source has not streamed data in the last hour.
Last event time	The last recorded time an event arrived at the MID Server in the last one-minute interval. Health Log Analytics continuously updates the last event time. If the last event time is not up to date, data is not streaming.
Raw log lines/sec	The average number of raw log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value represents the number of raw log lines before preprocessing.
Preprocessed log lines/sec	The average number of preprocessed log lines that streamed to the MID Server per second in the last one-minute interval. **Note:** This value can differ from the number of raw log lines per second. For example, the difference can be a result of logs having been dropped during preprocessing.

View log shipper alerts

View all log shipper check alerts for Agent Client Collector Log Analytics (ACC-L) agents.

Before you begin

Role required: agent_client_collector_admin

About this task

In the ACC Alerts list, you can see at a glance if any issues are preventing the log shipper from collecting data. The list shows all log shipper-related alerts in one place and provides information to help you resolve the issues.

The ACC Alerts list only includes alerts about the success or failure of log shipper execution on a CI on a specific agent. These alerts are a subset of the alerts shown in the Event Management Alerts list, which includes alerts of all types. For more information about the Event Management Alerts list, see View alert information.

Log shipper alerts are generated from log shipper events with a severity of Major or Critical. These alerts are typically related to log path issues or a lack of permissions.

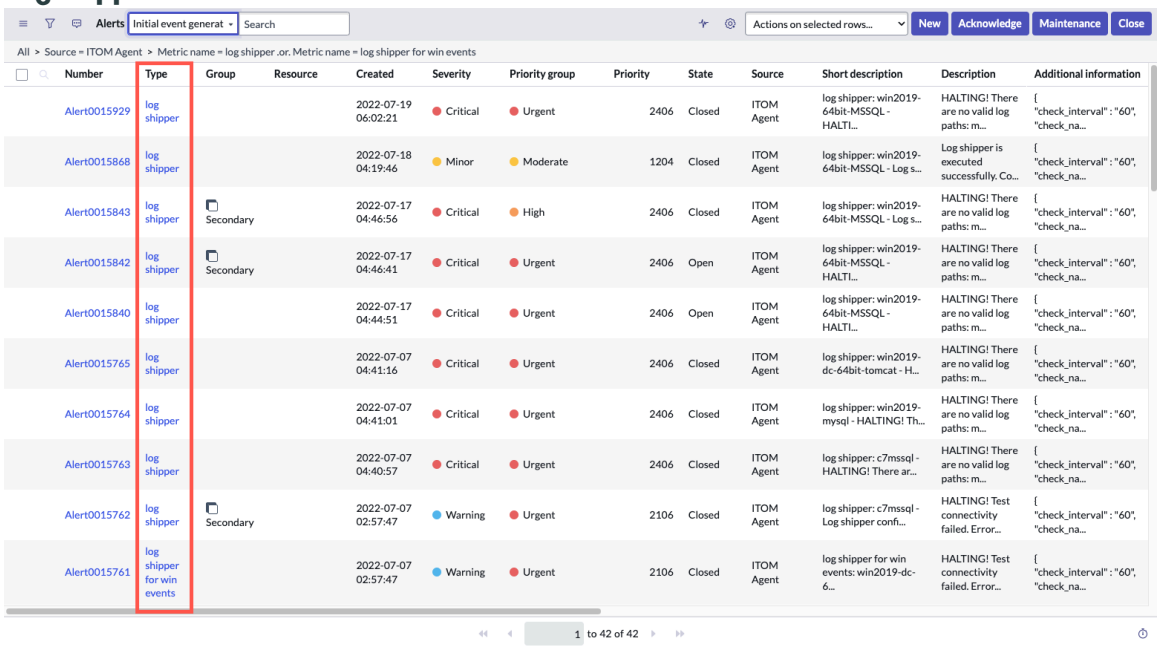
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If an **OK** event on the log shipper is received on a CI where an open log shipper alert exists, the open log shipper alert on that CI is closed.

Log shipper Alerts list



Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Log Alerts**.
2. Review the information provided in the Alerts list.
   For details and a description of the columns, see Monitor incoming alerts.

Related topics

View log shipper events

View log shipper events

View all log shipper events with all severity levels for Agent Client Collector Log Analytics (ACC-L) agents.

Before you begin

Role required: agent_client_collector_admin

About this task

The ACC Events list shows all log shipper-related events in one place. The list only includes events about the success or failure of log shipper execution on a CI on a specific agent. These events are a subset of the events shown in the Event Management Events list, which includes events of all types.

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Log Events**.
2. Review the information provided in the Events list.
   For details and a description of the columns, see View events.

Collect web usage data using Agent Client Collector for Visibility - Content

Track website visits across your organization and gain visibility into web applications your users access using Agent Client Collector for Visibility - Content (ACC-VC).

Before you begin

Verify that the following components are installed in your environment:

- Agent Client Collector Framework (ACC-F)
- Agent Client Collector for Visibility - Content
- URL Discovery and Monitoring (sn_itom_url_disc)
- The browser extension is enabled on the host

Role required: sn_acc_vis_content.application_admin and discovery_admin

About this task

Web data collection is enabled on Windows and macOS platforms.

ACC-VC can collect web usage data in the following modes:

- Configured monitoring (tracks only pre-configured websites)
- Full monitoring (tracks all websites accessed by users on Chrome-based browsers). Automatically captures domain-level usage data from managed Windows and macOS devices and stores it in the User Web Usage (sn_acc_vis_content_user_web_usage) table.

Procedure

1. Navigate to **System Definition** > **System Properties**.
2. Search for the property *sn_acc_vis_content.enable_full_monitoring*.
3. Set the **Value** field to `true`.
   Setting this property to true automatically activates the VISC Get URL Metrics monitoring policy and enables full monitoring of web usage data for all websites visited on Chromium-based browsers. Setting it to false deactivates the policy.
4. Select **Update**.
   The system activates the VISC Get URL Metrics monitoring policy and begins collecting web usage data from managed devices.
5. **Optional:** Configure the data retention period by searching for the property *sn_acc_vis_content.web_usage_retention_days* and setting the desired number of days.
   The default retention period is 7 days. Records older than this value are automatically deleted. Modifying this value updates the auto-flush retention period for the User Web Usage (sn_acc_vis_content_user_web_page) and Application Domain (sn_acc_vis_content_application_domain) tables.

Result

The ACC agent on each managed device monitors URL activity from Chrome-based browsers and stores the data locally. At scheduled intervals (default: once every 24 hours), the agent runs the VISC Get URL Metrics check and sends the data to your instance. The data is processed and stored in the User Web Usage table, with daily aggregation jobs updating domain-level totals. For details on the VISC Get URL Metrics policy and check, see Agent Client Collector for Visibility - Content default checks and policies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

After enabling web usage collection, you can view the collected data in the User Web Usage (sn_acc_vis_content_user_web_usage) table and monitor aggregated domain-level statistics in the Application Domain (sn_acc_vis_content_application_domain) table. Data aggregates from the User Web Usage table to the Application Domain table, including total page views, total unique users, last accessed time, and daily page view trends. By default, this job runs daily.

For details on these tables, see Web usage data collection tables and fields.

Agent Client Collector deployment - endpoints

When deploying the Agent Client Collector, perform deployment and management tasks on your endpoints.

Endpoint deployment connects agents directly to the ServiceNow® cloud through ITOM Cloud Services (ICS). Agents on laptops, remote offices, and distributed sites reach ICS over the internet using a secure connection, without a MID Server. ServiceNow® manages the infrastructure and issues certificates automatically.

Choose endpoint deployment when your agents operate beyond the data center, where maintaining MID Servers isn't practical. Digital End-User Experience (DEX) requires this architecture, and Agent Client Collector for Visibility - Content (ACC-VC) supports it in specific use cases.

Configuring MID-less Agent Client Collector

Configure MID-less Agent Client Collector to enable sending information through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Configure MID-less Agent Client Collector using a single-line command

Use a single-line command to set up a MID-less Agent Client Collector. You can also use the single-line command to migrate agents configured with a MID Server to have a MID-less configuration.

Before you begin

Role required:

- In a Linux or macOS environment: root
- In a Windows environment: agent_client_collector_admin

About this task

Running the single-line command includes flags, which indicate the options to be added to the `acc.yml` configuration file. These options dictate the configuration of the MID-less Agent Client Collector. If you don’t specify an option in the command, the existing option in the `acc.yml` file is used. If there’s no existing option, an error message indicates that the parameter is required to enable connecting to an endpoint.

Running a command validates that a connection can be made with the specified parameter (for example, the specified registration-key value). However, the command doesn’t verify if the value of the parameter is valid.

Procedure

1. Run the following command in a terminal window: `acc gateway ics <flags>`.
   The available flags appear in the following table:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID-less configuration flags

Flag	Type	Description
-y, <--acc-yml>	String	Location of the `acc.yml` being configured. Can also be used to modify and validate parameters if the file is in a different location from the default. Can also be used to modify a different file location to check if the parameters specified are valid. Optional. If no value is entered, the default location of the `acc.yml` file is used.
-b, <--backend-url>	String	The gRPC URL for the ITOM cloud services (ICS) gateway.
-i, <--instance-url>	String	The instance URL.
-r, <registration-key>	String	The registration key for the ITOM cloud services (ICS) gateway.
-h, help	N/A	Explains what the specified command does.

2. Restart the agent for the configuration settings to be entered into the `acc.yml` file.

Installing MID-less Agent Client Collector

Installing MID-less Agent Client Collector enables you to send data from the agent to the instance through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Before using MID-less Agent Client Collector, do the following:

1. Ensure that your ServiceNow instance has migrated from an F5 load balancer to Application Delivery Controller, version 2 (ADCv2) and has mTLS support.
   a. Enter the following command in your terminal: `curl -v https://<instance>.service-now.com/stats.do 2>&1 | grep "< Server"`.
      - If the system returns **snow_adc**, the instance is on ADCv2/ADCv3.
      - If the system doesn't return **snow_adc**, the instance isn't on ADCv2/ADCv3. To migrate the instance to ADCv2/ADCv3, contact Customer Support.
   b. Navigate to `<instance_url>/adcv2/supports_tls`

      If the URL returns a value of **true**, mTLS is supported.
2. Install the ITOM Cloud Services Core (sn_itom_cloud_svc) scoped app plugin.

   If you're using Agent Client Collector for Visibility - Content, install the Agent Client Collector for Visibility - Content (sn_acc_vis_content) plugin.
3. Configure an agent registration key on the instance. For details, see Configure an agent registration key.

   If registration fails between the agent and the instance, the registration key is cleared from the `acc.yml` configuration file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Install MID-less Agent Client Collector using a single-line command in a Windows environment

Install MID-less Agent Client Collector on a Windows machine to enable sending data from the agent to the instance through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Before you begin

- Install the ITOM Cloud Services Core (sn_itom_cloud_svc) plugin.
- Onboard your instance to use ITOM Cloud Services. For details, contact Customer Support.
- Configure an agent registration key. For details, see Configure an agent registration key.
- Role required: agent_client_collector_admin

About this task

For details on sending data through the cloud in a MID-less deployment, see DEX Architecture.

Procedure

1. Retrieve the publicly accessible gateway URL, based on your location.
   - AMER (Americas): `itomcnc-prod-gateway-amer.sncapps.service-now.com:443`
   - EMEA (Europe): `itomcnc-prod-gateway-emea.sncapps.service-now.com:443`
   - APAC (Asia Pacific): `itomcnc-prod-gateway-apac.sncapps.service-now.com:443`
2. On the Windows server where the agent is installed, enter the following command:

```
msiexec /i <msi_file_path> /quiet /qn /norestart
 CONNECT_WITHOUT_MID="true" ACC_CNC="<gateway_endpoint>"
 REGISTRATION_KEY="<registration_key>"
 INSTANCE_URL="https://<instance_url>"
```

The following table shows the parameter values in the command.

Installation command-line parameters

Parameter	Description
CONNECT_WITHOUT_MID	Specify **true** to enable MID-less Agent Client Collector installation. If you don't specify a value, the regular MID Server websocket installation is invoked.
ACC_CNC	Specify a public gateway endpoint for Agent Client Collector.
REGISTRATION_KEY	Active and valid registration key for the agent to communicate with.
INSTANCE_URL	ServiceNow instance that the agent is registered with.
ACC_ALLOW_LIST	Optional string. To disable the allow list, set *ACC_ALLOW_LIST=0*. By default, the allow list is enabled. **Note:** Disabling the allow list compromises your system's security and is intended as a temporary measure while you're updating the allow list. After completing the update, enable the allow list by setting **ACC_ALLOW_LIST=1**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
ACC_VALIDATE_SIG	Optional string. To disable verification of the installer certification validation, set *ACC_VALIDATE_SIG=0* that you can add to disable the verification of the installer certification validation. By default, validation is enabled. **Note:** Disable the certification validation only when using non-standard signature validation tools.

Agent Client Collector MID-less installation command parameters

Install MID-less Agent Client Collector manually in a Linux environment

Install MID-less Agent Client Collector manually on a Linux machine to enable sending data from the agent to the instance through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Before you begin

- Install the ITOM Cloud Services Core (sn_itom_cloud_svc) plugin.
- Onboard your instance to use ITOM Cloud Services. For details, contact Customer Support.
- Configure an agent registration key. For details, see Configure an agent registration key.
- Role required: agent_client_collector_admin

About this task

For details on sending data through the cloud in a MID-less deployment, see DEX Architecture.

Procedure

1. Download the relevant installation package.
   a. Navigate to > **Agent Client Collector** > **Deployment** > **Agent Downloads**.
   b. Download the relevant .rpm or .deb installation file.
   c. Download the relevant signature files to validate the installation files.
2. **Optional:** Verify the package signature.

   a. Extract the installation file (if it is compressed) by running the following command:
   `unzip agent_client-collector-<version_number>-x86_64-rpm-rpm.zip`

   b. Validate the installation file signature by running the indicated commands.
   - On an RPM-based system:

   ```
   openssl dgst -sha256 -verify {<ServiceNow
    DGST pem key>} -signature {<signature file>}
    agent-client-collector-<version number>-x86_64.rpm
   ```

   Where `<ServiceNow DGST pem key>` is the `.pem` file extracted from the `.zip` file, and `<signature file>` is the `.bin` file extracted from the `.zip` file.

   For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/p
ackage/app-signed/agent-client-collector-3.0.0-x86_64.rpm
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/p
ackage/app-signed/agent-client-collector-3.0.0-x86_64-rpm-rp
m.zip
$ unzip agent-client-collector-3.0.0-x86_64-rpm-rpm.zip
Archive: agent-client-collector-3.0.0-x86_64-rpm-rpm.zip
inflating: ServiceNow_Digicert_DGST.pem
extracting: agent-client-collector-3.0.0-x86_64.bin
$ openssl dgst -sha256 -verify ServiceNow_Digicert_DGST.pem
 -signature agent-client-collector-3.0.0-x86_64.bin
 agent-client-collector-3.0.0-x86_64.rpm
Verified OK
```

Note: Each command must appear on a single line.

- On a Debian-based system:

  (Optional) `gpg --import ServiceNow_Digicert_Public.gpg`

  `sudo gpg --verify agent-client-collector-<version number>-<distro>_amd64.deb`

  For example:

```
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/p
ackage/app-signed/agent-client-collector-3.0.0-debian-9_amd6
4.deb
$ curl -sLO
 https://install.service-now.com/glide/distribution/builds/p
ackage/app-signed/agent-client-collector-3.0.0-debian-9_amd
64-deb-deb.zip
$ unzip
 agent-client-collector-3.0.0-debian-9_amd64-deb-deb.zip
Archive:
 agent-client-collector-3.0.0-debian-9_amd64-deb-deb.zip
extracting: ServiceNow_Digicert_Public.gpg
$ gpg --import ServiceNow_Digicert_Public.gpg
gpg: /home/admin/.gnupg/trustdb.gpg: trustdb created
gpg: key 985DD52C6A0ABB45: public key "ServiceNow, Inc.
 (Signing) <seceng@servicenow.com>"
imported
gpg: Total number processed: 1
gpg: imported: 1
$ dpkg-sig --verify
 agent-client-collector-3.0.0-debian-9_amd64.deb
Processing
 agent-client-collector-3.0.0-debian-9_amd64.deb...
GOODSIG _gpgbuilder 9B928FB49771DF6C047430DD985DD52C6A0ABB45
 1665054068
```

Note: Each command must appear on a single line.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Install the Agent Client Collector package using the package manager associated with Linux distribution.

OS	Command
RHEL-based	`yum / dnf localinstall`
SLES	`zypper install`
Debian-based	`apt-get install`

Alternatively, if these commands are not configured correctly, you can use the core commands that are configured to run with the package manager commands.

- RPM-based system: `# rpm -vi agent-client-collector-<version number>-x86_64.rpm`
- Debian-based system: `# dpkg -i agent-client-collector-<version number>-<distro>_amd64.deb`

Verify that the package commands are configured correctly with your system administrator.

Note: Some file systems may have restrictions enabled; for example, `/var/` may be mounted with a *noexec* flag. Because the agent must execute Agent Client Collector plugins that are normally store in the `/var/cache` directory, you must deploy the application into specific folders by customizing the installation paths using the `--relocate` option as an `.rpm` parameter.

For example: `rpm -i --relocate /var/cache=/opt/cache agent-client-collector-<version_number>-x86_64.rpm`

The following paths can be relocated:

Path	Notes
`/etc`	When updating, you must also update the *allow-list* parameter in the `acc.yml` file with the new path.
`/usr/share`	N/A
`/var/cache`	Updating the `/var` directory retains all `/var` subdirectories, nested under the new directory.
`/var/log`	
`/var/run`	
`/var`	

Review the paths in `/usr/lib/systemd/system/acc.service` to ensure that they appear as expected.

4. Run the relevant package upgrade command, based on the cpu your machine runs with:
   - Intel cpu:

```
sudo installer -pkg agent-client-collector-<version
 number>-macos_x64.pkg -target /
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Apple silicon cpu:

```
sudo installer -pkg agent-client-collector-<version
 number>-macos_arm64.pkg -target /
```

This command also backs up and restores the agent-id and configuration files before upgrading.

5. In the `acc.yml` configuration file:

   a. Set the following parameters:

Parameter	Value
backend-url	"<gateway URL>"
connect-without-mid	true
instance-url	"<instance URL>"
registration-key	"<regsitration-key>"
insecure-skip-tls-verify	false

   b. Comment out the *api-key* parameter.

6. Save the configuration file.
7. Configure sudoers.

   Configuration is typically automated by your Linux sysadmin. To configure manually if you want to ensure correctness before full configuration, run the following.

```
# visudo -f /etc/sudoers.d/01_servicenow
User_Alias ACC_USERS = servicenow
Cmnd_Alias ACC_CMD = /usr/sbin/dmidecode -s
 baseboard-serial-number,/usr/sbin/dmidecode
 -s chassis-serial-number,/usr/sbin/dmidecode
 -s system-serial-number,/usr/sbin/dmidecode -s
 system-uuid,/usr/sbin/ss -tanp
ACC_USERS ALL = (root) NOPASSWD:ACC_CMD
Defaults:ACC_USERS !requiretty
```

8. Configure the agent to run as a service.

   a. Safeguard resource consumption by adding the indicated values to the `/usr/lib/systemd/system/acc.service` file.

   - CPUShares=128
   - CPUQuota=10%
   - MemoryLimit=192M
   - BlockIOWeight=10
   - LimitNICE=15

   For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
# vi /usr/lib/systemd/system/acc.service
[Unit]
Description=Agent-Now acc
After=network-online.target
[Service]
Environment=AGENT_ROOT=/usr/share
Environment=AGENT_CACHE_ROOT=/var/cache
Environment=AGENT_CONFIG_ROOT=/etc
Environment=AGENT_LOG_ROOT=/var/log
Environment=AGENT_RUN_ROOT=/var/run
Environment=RUBYOPT=-Eutf-8
User=servicenow
Group=servicenow
ExecStart=/usr/share/servicenow/agent-client-collector/bin/a
cc-service start acc
KillMode=process
Restart=on-failure
RestartSec=1min
CPUShares=128
CPUQuota=10%
MemoryLimit=192M
BlockIOWeight=10
LimitNICE=+15
[Install]
WantedBy=network-online.target
```

b. Run the reload daemon command If you modified the service file after enabling the acc service.

```
# systemctl daemon-reload
```

c. Enable and start the service by running the following commands.

```
# systemctl enable acc
```

```
# systemctl start acc
```

Install MID-less Agent Client Collector using a single-line command in a Linux environment

Install MID-less Agent Client Collector on a Linux machine to enable sending data from the agent to the instance through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Before you begin

- Install the ITOM Cloud Services Core (sn_itom_cloud_svc) plugin.
- Onboard your instance to use ITOM Cloud Services. For details, contact Customer Support.
- Configure an agent registration key. For details, see Configure an agent registration key.
- Role required: agent_client_collector_admin

About this task

For details on sending data through the cloud in a MID-less deployment, see DEX Architecture.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Retrieve the agent registration key:
   a. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Registration Key**.
   b. Select the relevant agent registration key.
   c. Copy the registration key value and store it in a place where you can easily retrieve it, when needed.
2. Retrieve the publicly accessible gateway URL, based on your location.
   - AMER (Americas): `itomcnc-prod-gateway.amer.sncapps.service-now.com:443`
   - EMEA (Europe): `itomcnc-prod-gateway.emea.sncapps.service-now.com:443`
   - APAC (Asia Pacific): `itomcnc-prod-gateway.apac.sncapps.service-now.com:443`
3. On the Linux server where the agent is installed, enter the following command:

```
CONNECT_WITHOUT_MID="true" ACC_CNC="<gateway_endpoint>"
 REGISTRATION_KEY="<registration_key>"
 INSTANCE_URL="https://<instance_url>" bash -c "$(curl -L
 https://<instance_url>/api/sn_agent/agents/install_agent)"
```

For details on the parameter values in the command, see Agent Client Collector MID-less installation command parameters.

Install MID-less Agent Client Collector manually in a macOS environment

Install MID-less Agent Client Collector manually on a macOS machine to enable sending data from the agent to the instance through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Before you begin

- Install the ITOM Cloud Services Core (sn_itom_cloud_svc) plugin.
- Onboard your instance to use ITOM Cloud Services. For details, contact Customer Support.
- Configure an agent registration key. For details, see Configure an agent registration key.
- Role required: agent_client_collector_admin

About this task

For details on sending data through the cloud in a MID-less deployment, see DEX Architecture.

Procedure

1. Download the installation files to your local machine.

```
curl -L <download link from the Agent Downloads page on the
 instance>
```

2. Validate the installation file signature.

```
pkgutil --check-signature agent-client-collector-<version
 number>-macos-catalina_x64.pkg
```

Note: Ensure that the `pkg` certificate chain has the ServiceNow developer ID installer certificate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Install the Agent Client Collector package.

```
sudo installer -pkg agent-client-collector-<version
 number>-macos-catalina_x64.pkg -target /
```

4. Copy the installation files.

   a. Sample configuration file:
   `sudo cp -p /Library/Application\ Support/servicenow/agent-client-collector/acc.yml.example /Library/Application\ Support/servicenow/agent-client-collector/acc.yml`

   b. Sample allow list file:
   `sudo cp -p /Library/Application\ Support/servicenow/agent-client-collector/check-allow-list.json.default /Library/Application\ Support/servicenow/agent-client-collector/check-allow-list.json`

5. **Optional:** To create new check definitions to be included in the allow list, first disable the allow list by commenting out the *`allow-list`* parameter in the `acc.yml` file.

   (Optional) `sudo -H -u _servicenow vi /Library/Application\ Support/servicenow/agent-client-collector/acc.yml`

   Note: This action compromises your system's security and is recommended only as a temporary measure until you finish updating the allow list. After completing the update, uncomment the allow list parameter in the configuration file to re-activate the allow list.

   For details on adding custom checks to an allow list, see Generate an Agent Client Collector allow list.

6. In the `acc.yml` configuration file:

   a. Set the following parameters:

Parameter	Value
backend-url	"<gateway URL>"
connect-without-mid	true
instance-url	"<instance URL>"
registration-key	"<regsitration-key>"
insecure-skip-tls-verify	false

   b. Comment out the *`api-key`* parameter.

7. Save the configuration file.
8. To ensure that the configuration file points to a valid endpoint, run the following commands to restart the Agent Client Collector:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
sudo launchctl unload
 -w /Library/LaunchDaemons/com.sn.acc.plist
sudo launchctl load -w /Library/LaunchDaemons/com.sn.acc.plist
```

Note: By default, exiting the installation program causes the program to restart immediately. To ensure that the program remains stopped after exiting, set the KeepAlive property in the `/Library/LaunchDaemons/com.sn.acc.plist` file to **false**.

Install MID-less Agent Client Collector using a single-line command in a macOS environment

Install MID-less Agent Client Collector on a macOS machine to enable sending data from the agent to the instance through the cloud. Sending information through the cloud allows the MID Server to be used for more persistent resources.

Before you begin

- Install the ITOM Cloud Services Core (sn_itom_cloud_svc) plugin.
- Onboard your instance to use ITOM Cloud Services. For details, contact Customer Support.
- Configure an agent registration key.
- Role required: root

About this task

Procedure

1. Retrieve the agent registration key:
   a. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Registration Key**.
   b. Select the relevant agent registration key.
   c. Copy the registration key value and store it in a place where you can easily retrieve it when needed.
2. Retrieve the publicly accessible gateway URL, based on your location:
   - AMER (Americas): `itomcnc-prod-gateway.amer.sncapps.service-now.com:443`
   - EMEA (Europe): `itomcnc-prod-gateway.emea.sncapps.service-now.com:443`
   - APAC (Asia Pacific): `itomcnc-prod-gateway.apac.sncapps.service-now.com:443`
3. On the server where you're installing the Agent Client Collector, enter the following command:

```
CONNECT_WITHOUT_MID="true" ACC_CNC="<gateway_endpoint>"
 REGISTRATION_KEY="<registration_key>"
 INSTANCE_URL="https://<instance_url>" bash -c "$(curl -L
 https://<instance_url>/api/sn_agent/agents/install_agent)"
```

The following table describes the parameter values in the command.

Command-line parameter values

Parameter	Value
CONNECT_WITHOUT_MID	Specify **true** to enable MID-less installation. If you don't specify a value, the regular MID Server websocket installation is invoked.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Value
ACC_CNC	Public gateway endpoint for Agent Client Collector that you can specify.
REGISTRATION_KEY	Active and valid agent registration key for the agent to communicate with.
INSTANCE_URL	ServiceNow instance that the agent is registering with.
ACC_ALLOW_LIST	Optional *ACC_ALLOW_LIST=0* string that you can add to disable the allow list. Default: The allow list is enabled. **Note:** When you disable the allow list, you compromise your system's security. This action is intended as a temporary measure while you're updating the allow list. After you complete the update, remove *ACC_ALLOW_LIST=0* from the command line.
ACC_VALIDATE_SIG	Optional *ACC_VALIDATE_SIG=0* string that you can add to disable the verification of the installer certification validation. Default: Validation is enabled. **Note:** Disable the certification validation only when you're using non-standard signature validation tools.

Configure an agent registration key

Configure an agent registration key so that you can deploy MID-less Agent Client Collector. Deploying MID-less Agent Client Collector enables you to use the MID Server for more persistent resources.

Before you begin

Install the plugins necessary for deploying MID-less Agent Client Collector.

Role required: agent_client_collector_admin

About this task

The Cleanup Agent Registration Keys scheduled job runs daily and deletes expired registration keys. The length of time for which a registration key is valid is controlled by the *sn_agent.registration_key_validity.days* property, based on when the key was created. The amount of time that the customer is notified prior to upcoming key expiration is controlled by the *sn_agent.registration_key_notification.days* property.

If a key's expiration date is approaching, create a new registration key and enter it into any existing automation jobs to prevent registration outage.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Registration Key**.
2. Select **New**.
3. In the **Name** field, enter a descriptive name for the registration key.
4. **Optional:** To receive notifications when a registration key is soon to expire, select a group with a valid email address in the **Ownership Group** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When keys are deleted via the Cleanup Agent Registration Keys scheduled job, the indicated group receives an email notification.

5. Select **Submit**.

Result

The new agent registration key is ready to use for installation.

Installing MID-less Agent Client Collector

Agent Client Collector Framework configuration properties

Agent Client Collector installation on a macOS system

Install Agent Client Collector on a system that uses macOS. You can either use a single-line command script or follow a manual installation procedure if the agent is not connected to the instance or you want enhanced customization options.

To enable privileged access to information on the macOS system, add the *_servcienow* user account to the admin group (or equivalent).

Incorporating the Agent Client Collector into a custom base image for mass deployment is not supported on macOS.

Perform a single-line Agent Client Collector installation on macOS

Use an efficient single-line command script to install Agent Client Collector on a machine that uses macOS operating system. Use the manual installation procedure if the agent is not connected to the instance or you want enhanced customization options.

Before you begin

- Ensure that you have configured the Agent Client Collector web server.
- Verify that your server's OS and version matches the list of supported OS versions as described in Agent Client Collector installation.
- Ensure that you have the *pkgutil* packages available, to be used by the install script.
- Enable golden image mode for cloning additional agents by setting the golden image marker located at `/Library/Preferences/acc.rc.plist`.
- Ensure that the target agents have connectivity to the following:
  - ServiceNow install server [install.service-now.com]
  - ServiceNow instance
  - The MID Server to which the agent will connect

Role required: agent_client_collector_admin

Procedure

1. Retrieve the MID Server websocket URL parameters.
   a. Navigate to **Agent Client Collector** > **Websocket Endpoint**.
   b. Select the relevant websocket endpoint.
   c. Copy the **Endpoint URL** field value to be used in the installation command.
2. Retrieve the API Key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Agent Client Collector** > **Deployment** > **MID Web Server API Key**.

b. Copy the **API Key** value, to be used in the installation command.

3. Run the following command on the server where the Agent Client Collector is being installed.

```
ACC_API_KEY=<api_key>
 ACC_MID=wss://<mid_ip>:<websocket_port>/ws/events
 bash -c "$(curl -L https://<instance
 URL>/api/sn_agent/agents/install_agent)"
```

Enter the following values in the command line:

Command line parameters

Parameter	Value
ACC_API_KEY	Replace the *<api_key>* string with the API key used to access the MID Server websocket. If no value is specified, you will be prompted to enter the API key value during the script's execution.
ACC_MID	Replace the *<mid_ip>* string with the URL of the MID Server websocket. When specifying multiple MID Servers, enter a string separated by commas for each MID Server.
ACC_ALLOW_LIST	(Optional) Add the string *ACC_ALLOW_LIST=0* to disable the allow list. By default, the allow list is enabled. **Note:** Disabling the allow list compromises your system's security and is recommended only as a temporary measure until you finish updating the allow list. After completing the update, re-activate the allow list by removing *ACC_ALLOW_LIST=0* from the single-line command string.
ACC_VALIDATE_SIG	(Optional) Add the string *ACC_VALIDATE_SIG=0* to disable verifying the installer certificate validation. By default, validation is enabled. Default: Validation is enabled. **Note:** Disable certification validation only when using non-standard signature validation tools.

Manually install Agent Client Collector on macOS

Install Agent Client Collector manually on a machine that uses macOS when the agent is not connected to the instance or you want enhanced customization options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that you have configured the Agent Client Collector web server.
- Verify that your server's OS and version matches the list of supported OS versions as described in Agent Client Collector installation.
- Enable golden image mode for cloning additional agents by setting the golden image marker located at `/Library/Preferences/acc.rc.plist`.
- Navigate to **Agent Client Collector** > **Deployment** > **Agent Downloads** and download the signed `.pkg` relevant for your OS.
- Store the `.pkg` installation package on one of your installed agents.

Role required: agent_client_collector_admin

Procedure

1. Download the installation files to your local machine.

```
curl -L <download link from the Agent Downloads page on the
 instance>
```

2. Validate the installation file signature.

```
pkgutil --check-signature agent-client-collector-<version
 number>-macos-catalina_x64.pkg
```

Note: Ensure that the `pkg` certificate chain has the ServiceNow developer ID installer certificate.

3. Install the Agent Client Collector package.

```
sudo installer -pkg agent-client-collector-<version
 number>-macos-catalina_x64.pkg -target /
```

4. Copy the installation files.

   a. Sample configuration file:
   `sudo cp -p /Library/Application\ Support/servicenow/agent-client-collector/acc.yml.example /Library/Application\ Support/servicenow/agent-client-collector/acc.yml`

   b. Sample allow list file:
   `sudo cp -p /Library/Application\ Support/servicenow/agent-client-collector/check-allow-list.json.default /Library/Application\ Support/servicenow/agent-client-collector/check-allow-list.json`

5. **Optional:** To create new check definitions to be included in the allow list, first disable the allow list by commenting out the *`allow-list`* parameter in the `acc.yml` file.

   (Optional) `sudo -H -u _servicenow vi /Library/Application\ Support/servicenow/agent-client-collector/acc.yml`

Note: This action compromises your system's security and is recommended only as a temporary measure until you finish updating the allow list. After completing the update, uncomment the allow list parameter in the configuration file to re-activate the allow list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on adding custom checks to an allow list, see Generate an Agent Client Collector allow list.

6. Save the configuration file.
7. In the configuration file, connect the agent with the MID Server.

   a. Set the MID Server connection.

   ```
   "wss://<MID Server IP>:<Web Socket Port>/ws/events"
   ```

   The web socket port was configured on the MID Server when it was set as an Agent Client Collector listener.

   b. Locate the *api-key* parameter and specify the API key value inside double quotation marks, as follows:
   api-key:"111111111"
   The specified API key is encrypted the first time the agent runs.

8. To ensure that the configuration file points to a valid endpoint, run the following commands to restart the Agent Client Collector:

```
sudo launchctl unload
 -w /Library/LaunchDaemons/com.sn.acc.plist
sudo launchctl load -w /Library/LaunchDaemons/com.sn.acc.plist
```

Note: By default, exiting the installation program causes the program to restart immediately. To ensure that the program remains stopped after exiting, set the KeepAlive property in the `/Library/LaunchDaemons/com.sn.acc.plist` file to **false**.

Upgrade Agent Client Collector manually on a macOS system

Perform a manual upgrade of your existing Agent Client Collector version on a system running a macOS. Manual upgrade is useful if the single-line command script isn't connected to the instance or you want to use enhanced customization options.

Before you begin

- The upgrade procedure is the same for both MID Server and MID-less deployments.
- Enable golden image mode for cloning additional agents by setting the golden image marker located at `/Library/Preferences/acc.rc.plist`.
- Role required: agent_client_collector_admin

Procedure

1. **Optional:** Manually back up the `agent-id` and `acc.yml` configuration files by running the following commands.

```
mkdir -p /tmp/acc-upgrade-backup

cp -rp /Library/Application\
 Support/servicenow/agent-client-collector/acc.yml /
tmp/acc-upgrade-backup

cp -rp /Library/Application\
 Support/servicenow/agent-client-collector/check-allow-list.js
on /tmp/acc-upgrade-backup
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
cp -rp /Library/Application\
 Support/servicenow/agent-client-collector/agent_now_id /
tmp/acc-upgrade-backup
```

Manually backing up the configuration files provides an added layer of security by ensuring that your files are backed up before beginning the upgrade process.

2. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Downloads**.
3. In the **macOS Downloads** section, download the relevant agent package and signature `.pkg` files.
4. Perform package upgrade, based on the cpu your macOS runs with.
   - Intel cpu:

     ```
     sudo installer -pkg agent-client-collector-<version
      number>-macos_x64.pkg
     ```

   - Apple silicon cpu:

     ```
     sudo installer -pkg agent-client-collector-<version
      number>-macos_arm64.pkg
     ```

   This command also backs up and restores the agent-id and configuration files before upgrading.
5. Verify that the upgrade was successful.
   a. Navigate to **All** > **Agent Client Collector** > **Agents**.
   b. Verify the following values for your agent:
      - **Host data collection** = Collected
      - **Version** = <Relevant version number>

Uninstall Agent Client Collector from macOS using a single-line command

Uninstall Agent Client Collector from macOS machine by running an efficient single-line command. If the agent is connected to the instance, uninstall Agent Client Collector manually.

Before you begin

- The uninstall procedure is the same for both MID Server and MID-less deployments.
- Role required: agent_client_collector_admin

Procedure

Run the following command.

```
bash -c "$(curl -L https://<Instance
 URL>/api/sn_agent/agents/install_agent)" -s "--remove"
```

Note: Uninstalling the Agent Client Collector removes the `acc.yml` file and its directory from your machine. The user and group **_servicenow**, created as part of the installation process, is also removed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Uninstall Agent Client Collector from a macOS machine manually

Uninstall Agent Client Collector from a macOS machine manually instead of using the single-line procedure when the specific agent is not connected to the instance.

Before you begin

- The upgrade procedure is the same for both MID Server and MID-less deployments.
- Role required: agent_client_collector_admin

Procedure

1. In a command window, disable and stop the service:
   sudo launchctl unload -w /Library/LaunchDaemons/com.sn.acc.plist
2. Delete the following files/directories:

```
sudo rm /Library/LaunchDaemons/com.sn.acc.plist
sudo rm -rf /opt/servicenow/agent-client-collector
sudo rm -rf /var/run/servicenow/agent-client-collector
sudo rm -rf /Library/Application\
 Support/servicenow/agent-client-collector
```

3. Remove the **_servicenow** user and group.

```
sudo /usr/bin/dscl . -delete /Users/_servicenow
sudo /usr/bin/dscl . -delete /Groups/_servicenow
```

4. Remove the **pkg** from the list of installed packages.

```
sudo pkgutil --forget com.servicenow.agent-client-collector
```

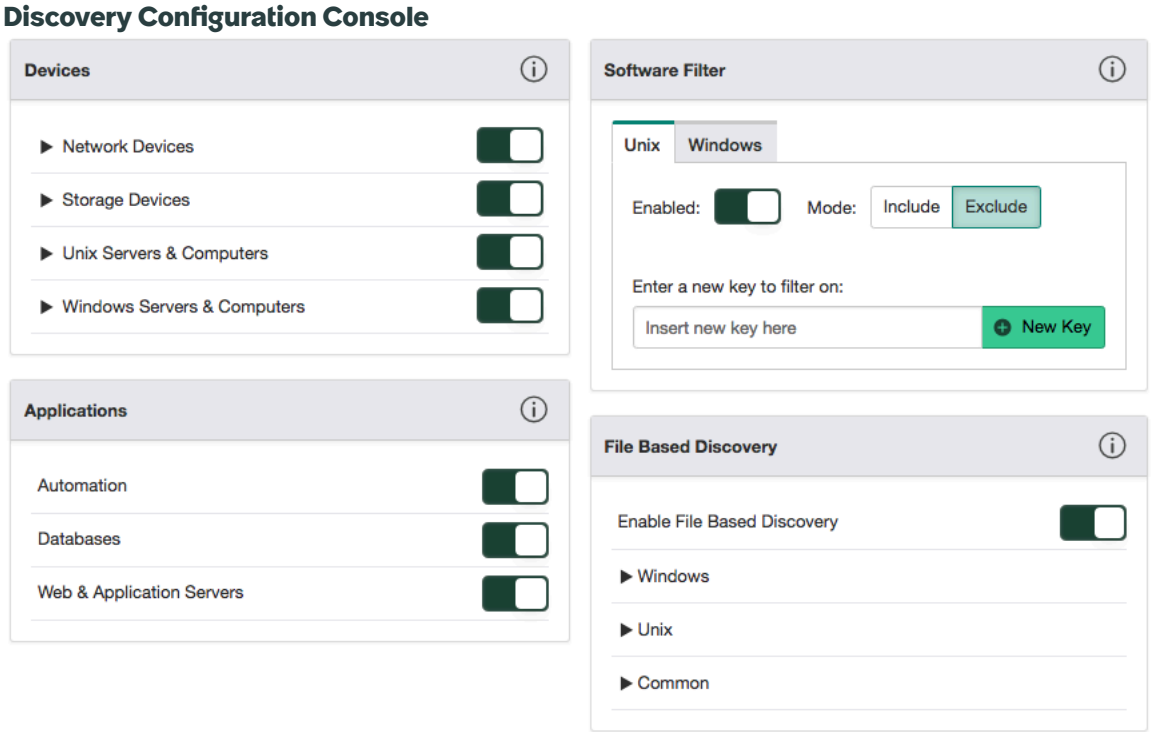
Agent Client Collector File-Based Discovery

Agent Client Collector File-Based Discovery (FBD) scans file systems on managed endpoints to discover installed software and track file inventories.

FBD runs as a lightweight background process within the existing Agent Client Collector agent. It is configured and controlled entirely from the ServiceNow instance. Administrators define which directories to scan, which files to look for, and how often to scan. The agent discovers matching files, collects metadata such as name, path, size, and version, and sends the results back to the instance where they are stored in the appropriate CMDB and application tables.

To activate FBD, navigate to the Discovery Configuration Console (**All** > **Discovery Definition** > **Configuration Console**) and in the **File Based Discovery** section, activate the **Enable File Based Discovery** toggle switch.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For details on the FBD configuration and system properties, see Agent Client Collector File-Based Discovery properties.

Supported platforms

FBD supports the following operating systems:

- Windows
- Linux
- macOS

Required plugins

The following plugins are required for File-Based Discovery on Agent Client Collector:

- *File-based Discovery* (com.snc.discovery.file_based_discovery)
- *Software Asset Management - File Signature Normalization* (com.snc.file_signature_normalization) — Activated automatically once the File-based Discovery plugin is active
- *Agent Client Collector - Visibility Content* (sn_acc_vis_content)
- *Software Asset Management Professional* (com.snc.samp)

Delta scanning

Delta scanning is a performance optimization that applies only to the File Management policy. It reduces the volume of data sent from the endpoint to the instance on repeat scans.

The delta scanning process works as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. **First scan** — A full scan runs. All matching files are sent to the instance. A fingerprint, which is a snapshot of all discovered file paths and sizes, is saved locally on the endpoint.
2. **Subsequent scans** — The scanner compares the current file list against the saved fingerprint and reports only the differences:
   - **Added** — files that exist now but were not in the previous fingerprint
   - **Modified** — files that exist in both but with a different size
   - **Deleted** — files that were in the previous fingerprint but no longer exist on disk
3. **Periodic full scan** — After a configured number of delta scans (default: 5), a full scan is automatically forced to verify accuracy and correct any drift.

Note: Delta scanning does not apply to the SAM or SWID policies. These policies always perform a full scan on each run.

Archive file scanning

Archive file scanning extends file-based discovery to inspect ZIP and JAR archive files and report the files contained within them. This enables discovery of software artifacts such as executables and libraries that are packaged in the ZIP or JAR files on the endpoint.

Archive file scanning is disabled by default. To enable it, set the *sn_acc_vis_content.file_discovery.archive_scan_enabled* property to **true**. This property requires the **discovery_admin** role to modify.

When archive file scanning is enabled, the agent inspects each ZIP or JAR file encountered during a directory scan. The agent reads the archive's internal index to enumerate the files inside. No file content is extracted or decompressed. Only metadata is collected.

For each file found inside an archive, the agent applies the same filtering rules used for regular files on disk, including SAM allowlist and File Management extension rules. Files that pass the filters are reported alongside other discovered files.

For filtering rules and performance safeguards, see Archive file scanning filtering rules and limits.

Running process-based discovery

Running process-based discovery extends File-Based Discovery (FBD) with process-based path detection, enabling the Agent Client Collector for Visibility - Content agent to detect software running outside of standard configured scan directories.

Why use running process-based discovery

Some software is never installed into the standard program directories that FBD scans. Common examples include:

- Portable applications run from a removable drive or a user folder
- User-installed tools placed in a personal directory, such as a Python interpreter under a user profile
- Command-line utilities installed into a user's local binary directory

A directory-only scan cannot detect applications installed outside standard scan directories, but they are visible as running processes. Running process-based discovery closes that gap, giving SAM teams a more complete and accurate view of the software in use across your organization. This reduces risk and improves audit readiness.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Platform coverage

Running process-based discovery supports Windows, Linux, and macOS. Coverage scope varies by operating system and depends on the privileges granted to the agent service account. For platform-specific coverage details and privilege requirements, see Running process-based discovery platform coverage and properties.

Enable running process-based discovery

Enable running process-based discovery so that the Agent Client Collector for Visibility - Content agent detects software running from directories outside your configured File-Based Discovery scan paths.

Before you begin

File-Based Discovery must be active on the configuration console.

The Agent Client Collector for Visibility - Content Windows agent must be deployed on the endpoints.

Role required: disco_admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the *sn_acc_vis_content.file_discovery.fbd_process_scan_enabled* property.
3. Set the **Value** field to `true`.
   The default value is `false`. Setting this property to `true` activates the agent policy that collects process directories.
4. Save the record.

Result

The associated agent policy activates during the next agent synchronization. From that point, the host runs the FBD SAM Process Scan Policy and begins collecting process directories every five minutes. The next daily FBD scan includes the process-discovered directories in its SAM output.

Note: A directory is removed from discovery when its software is no longer present on disk. If the software runs again, it is rediscovered within 24 hours.

What to do next

For Linux and macOS hosts, complete the privilege configuration to obtain full coverage across all users. For details, see Platform coverage.

To exclude specific directories from running process-based discovery, see Exclude directories from running process-based discovery.

Exclude directories from running process-based discovery

Exclude specific directories from running process-based discovery so that processes running from those locations aren't recorded or included in File-Based Discovery scans.

Before you begin

Running process-based discovery must be enabled. For details, see Enable running process-based discovery.

Role required: disco_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Some running processes have no Software Asset Management (SAM) value and only add noise to discovery output, such as security tooling or the agent's own processes. Use the FBD Process Path Exclusions [sn_acc_vis_content_fbd_proc_path_exclude] table to prevent those directories from being recorded. A set of common exclusions is included in the base system.

Procedure

1. Navigate to the FBD Process Path Exclusions [sn_acc_vis_content_fbd_proc_path_exclude] table.
2. Select **New**.
3. Complete the fields for the exclusion record.

FBD Process Path Exclusions form

Field	Description
Path	Absolute directory prefix to exclude. Any process running from this directory or a subdirectory of it is ignored.
Platform	Operating system the exclusion applies to: **Windows** or **Unix**. Unix covers Linux and macOS. There is no combined option; specify the platform explicitly.
Active	When selected (the default), the exclusion is enforced. Clear this check box to disable the exclusion temporarily without deleting the record.
Description	Optional notes describing the purpose of the exclusion.

4. Select **Submit**.

Result

The exclusion is pushed to the relevant agents automatically. New collection cycles skip the excluded directories. Any previously collected paths that match the exclusion are removed during the next daily maintenance cycle.

Perform Zscaler remediation

If the Zscaler application installed on your Windows or macOS agent is not running efficiently, you can stop and start the app. This process is called *remediation*. Running remediation automatically creates an incident on the agent. You can also view Zscaler statuses on the Zscaler dashboard as a graph.

By default, the **Zscaler Monitoring Policy** monitoring check runs every 30 minutes to check the status of the Zscaler app running on your agent. The Zscaler monitoring policy contains the following checks:

- *zscaler-monitoring-check*: Checks the status of the Zscaler app running on your agent.
- *zscaler-remediation-check*: Invoked only when the Zscaler app is not running efficiently. This check shuts down and restarts the app, and automatically creates an incident.

  Only one incident is created every 24 hours for a Zscaler app that does not remediate properly. For example, if the remediation check runs multiple times on an agent, new remediation records are created which are associated with the same incident until 24 hours have passed, at which time a second incident is created. When the Zscaler app restarts successfully, the incident closes.

  Zscaler remediation produces the following output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Amount of data produced per remediation: 2KB
- Maximum number of remediations that can run in a day: 48 (one every 30 minutes)
- Maximum amount of data produced by a single agent, per day: 96KB
- Maximum amount of data produced by a 20K agents, per day: 1.92GB

Check Zscaler monitoring

Check the monitoring status of your Zscaler app, to verify that it is running properly.

Before you begin

Role required: agent_client_collector_admin

About this task

If the monitoring app is down, the Zscaler tunnel status is either *51 (SERVICE - DOWN - ERROR)* or *56 (SYSTEM_SOCKETS_EXHAUSTED_ERROR)*. When that happens, a remediation check runs, which shuts down and then starts the Zscaler app.

By default, the Zscaler monitoring check (*zscaler - monitoring - check*) runs automatically every 30 minutes. If you are experiencing problems with your Zscaler app, you may want to run the check more often or immediately. For details, see Customize the Zscaler monitoring check.

Procedure

1. Navigate to **All** > **Remediate Zscaler VPN** > **Monitoring Status**.
   The **Application Monitoring Status** page appears.

Application Monitoring Status page

   - If the Zscaler app is running properly, the **Application Status** column displays the **Up** value.
   - If the Zscaler app is not running properly, the **Application Status** column displays the **Down** value.
2. If the **Application Status** column displays the **Down** value, the remediation check (*zscaler - remediation - check*) runs.
   - For details on customizing the amount of time after which the system verifes the Zscaler status, see Customize the Zscaler remediation wait time.
   - For details on monitoring Zscaler remediation checks, see Check Zscaler remediation.

Customize the Zscaler remediation wait time

Configure the amount of time (in seconds) by which the Zscaler remediation check verifies the Zscaler status. This amount of time indicates how often the system checks the Zscaler status after the remediation check runs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: agent_client_collector_admin

Procedure

1. Navigate to **Agent Client Collector** > **Agents** > **Configuration** > **Check Definition**.
2. Select *zscaler-remediation-check*.
3. In the **Command** field, modify the value to: `zscaler_app_remediator.rb --wait_time=<time_in_sec>`, where `<time_in_sec>` is the number of seconds the system waits before checking the Zscaler status.
   By default, the system waits 30 seconds.
4. Select **Save**.
   - If the Zscaler app is running within the configured `wait_time`, the remediation result is **Success**.
   - If the Zscaler app is not running within the configured `wait_time`, the remediation result is **Failed**.

Customize the Zscaler monitoring check

Customize the frequency by which the Zscaler monitoring check runs. By default, the Zscaler monitoring check runs every 30 minutes. If your Zscaler app is not working efficiently, you can set the check to run more frequently.

Before you begin
Role required: agent_client_collector_admin

About this task
For details on customizing the Zscaler monitoring check, see Perform Zscaler remediation.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Policies**.
2. Select the **Zscaler Monitoring Policy** entry.
3. Select the **Scheduling** tab.
4. In the **Interval (sec)** field, modify the value to the number of seconds for the monitoring check to wait in between executions.
   The default value is 1800.

   To run the monitoring check immediately, enter a value of **1**.

Result
Zscaler monitoring checks run according to the frequency specified in the **Interval (sec)** field.

Check Zscaler remediation

Verify that Zscaler remediation stops and starts the Zscaler app after the remediation monitoring check fails.

Before you begin
Verify that the Zscaler monitoring check returns an **Application Status** value of **Down**, indicating that the Zscaler app isn't working properly.

Role required: agent_client_collector_admin

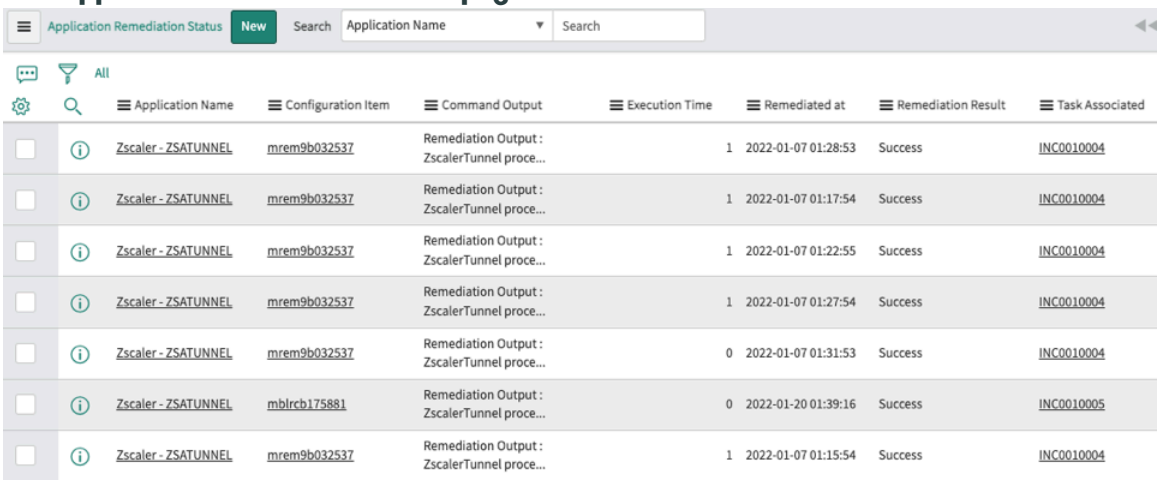
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

Navigate to **All** > **Remediate Zscaler VPN** > **Remediation Result**.

The **Application Remediation Status** page appears.

Application remediation status page



Application Name	Configuration Item	Command Output	Execution Time	Remediated at	Remediation Result	Task Associated

When remediation successfully shuts down and restarts Zscaler, the **Remediation Result** column has a value of **Success**. The **Task Associated** column displays a link to the incident created on remediation. When remediation is successful, the incident closes automatically.

Use the Zscaler dashboard

Use the Zscaler dashboard to view Zscaler monitoring and remediation statuses in graph format.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Remediate Zscaler VPN** > **Dashboard**.
   The Zscaler Remediation Dasbhoard appears.

Zscaler Dashboard

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The dashboard displays graphs divided according to the following sections:

Zscaler Remediation Dashboard sections

Section	Description
Application Monitoring Status	Displays a bar graph of the number of Zscaler apps by date, and their statuses (Up, Down, Unknown, Other).
Remediation Result	Displays a line graph of the number of Zscaler remediations, and their statuses (Success, Failed, Not Required).
Zscaler Incidents	Displays a line graph of the number of Zscaler incidents created, and their statuses (Opened, Closed).

2. **Optional:** In the **Host CI** window on the upper right side of the page, select the CI whose data you want to view.
   The default value is All, indicating that the dashboard displays data from all of the CIs on the host.

Choose and configure metrics to monitor

Metric Intelligence uses data sources that can be monitoring hundreds of metrics for all CIs. Choose for each data source type which details are important for which CIs, and then activate or deactivate the respective monitor type to control the amount of data that is being processed.

Before you begin

See Get started with Metric Intelligence for the high level steps of setting up Metric Intelligence.

Role required: evt_mgmt_admin

About this task

The SCOM data source, available by default, collects about 400 metric types from discovered devices such as '% Available Memory' and '% of Free Space'. Processing data from all metric types can overload the system and impact performance. It might be necessary to deactivate selected metric types for selected CIs to reduce that load.

The overall number of metrics that can be processed, depends on the number of MID Servers and their hardware configuration. For details about hardware requirements and metrics scalability, see MID Server and MID Server distributed cluster for Metric Intelligence.

Note: The *Active* setting (true or false) for a metric in the Monitoring System Metric Types [sa_source_metric_type] table takes precedence over the setting for the corresponding metric in the Metric To CI Mappings [sa_metric_map] table. If a metric type in the Monitoring System Metric Types [sa_source_metric_type] table is disabled, all records related to the corresponding metrics are removed from the Metric To CI Mappings [sa_metric_map] table.

Procedure

1. Navigate to **All** > **Event Management** > **Metrics** > **Metric Types**.
   The **Monitoring System Metric Types** displays the metric types that are being collected per data source, per CI type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Review the **Monitoring System Metric Types** list, and set the value in the **Active** column to **false** or **true**, as necessary.

Column	Description
Source	Data source monitoring the metric type.
Source Metric Type	Metric such as '% Free Space' that is being monitored for the CI type.
Anomaly Detection Action Level	The level of anomaly detection processing and analysis applied to CIs and metrics. The available options are: ○ **Metrics Only**: Only gather metrics from the data source without any further processing. ○ **Bounds**: Includes the Metrics Only processing level, and also creates a statistical model and shows bounds in Insights Explorer. ○ **Anomaly Scores**: Includes the Bounds processing level, and also calculates and displays anomaly scores. ○ **Anomaly Alerts**: Includes the Anomaly Scores processing level, and also creates anomaly alerts, as applicable. ○ **IT Alerts**: Includes the Anomaly Alerts processing level, and also creates IT alerts which are based on anomaly alerts, as applicable.
Monitored Object Type	CI type that is being monitored.
Active	Determines whether the metric data is processed by Event Management alert aggregation and RCA metrics.
Unit	Unit type that is associated with the source metric type, displayed in the Metric Intelligence reports.

Create a configuration settings rule

Configuration settings affect how metric data is processed. Configuration settings rules override the default metric processing behavior to determine the system actions when an anomaly is detected.

Before you begin

Role required: evt_mgmt_admin

About this task

A number of configuration settings determine the behavior of Metric Intelligence MID Servers. In the base system, these configuration settings are configured with default values, data types, and range of valid values. You cannot directly modify these configuration settings or add new ones. However, you can create a metric configuration rule with new configuration settings that override the default values on the MID Servers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Then, manually apply these rules to all Metric Intelligence MID Servers in a single synchronization operation, or rely on an hourly system job to perform the synchronization.

To take effect, Metric Intelligence MID Servers must be synchronized with the updates to the configuration settings rules.

It is valid to have multiple rules for a setting that affect the same CIs, in which case:

- Rules in which a filter is defined take precedence over a global rule in which no filter has been defined.
- If multiple rules that affect the same set of CIs have the same priority, then only the latest rule to be defined is applied.
- If multiple rules with different priorities affect the same set of CIs, then rules with the highest priority are applied.

Procedure

1. Navigate to **All** > **Event Management** > **Anomaly Detection** > **Metric Config Rules**.
2. On the Metric Configuration Rules pane, click **New**, and fill out the form.

Metric Configuration Rules form

Field	Description
Name	Rule name.
Order	Rule priority within all other rules. Higher numbers represent higher priorities.
Filter by	Check box for displaying the **Rule** field, where you can specify conditions that CIs must meet for the rule to apply. For example, in the **choose field** list, select **Add Related Fields** and then add the filter **[class][is][Linux Server]**. If clear, the rule applies globally to all CIs in the Metric To CI Mapping [sa_metric_map] table.

3. Right-click the form title, and click **Save**.
4. In the Metric overridden configurations form section click **New**, fill out the form, and then click **Submit**.

Metric overridden configurations form

Field	Description
Name	Configuration setting for which to override its value. Click the icon to display the list of all configuration settings. Click the icon to display the **Metric Settings** dialog with details such as range of possible values. See the following tables (Configuration Settings and Internal Configuration Settings) for details about configuration settings.

Field	Description
Rule	Rule to which the created configuration setting applies.
Value	New value that overrides the default value for the specified configuration setting.

You can modify the following configuration settings in the **Name** field.

Note: The filter specified in the metric configuration rule does not apply to settings with a global scope.

Configuration Settings

Name and Description	Values	Default	Data Type	Scope
anomaly_detection_enabled Enable/disable anomaly detection. **Note:** If anomaly_detection_action_level is set, then anomaly_detection_enabled is ignored.	N/A	true	boolean	CI/Metric
anomaly_detection_action_level Action level of anomaly analysis and processing. For more information, see Configure the action level for anomaly detection.	choices: ○ Metrics Only ○ Bounds ○ Anomaly Scores ○ Anomaly Alerts ○ IT Alerts	○ New records: Bounds ○ Upgraded records: Anomaly Alerts	choice	CI/Metric
buffer_anomaly_eviction_size Maximum number of anomalies at individual metric level that can be stored in internal buffer before sending them to instance for every CI/Metric pair.	60–1440	60	integer	Global
buffer_ci_score_eviction_size Maximum number of anomalies at CI level that can be stored in internal buffer before sending them to instance (Currently not being used)	60–1440	60	integer	Global
buffer_metric_eviction_size	60–1440	60	integer	Global

Name and Description	Values	Default	Data Type	Scope
Maximum number of metrics that can be stored in internal buffer before sending them to instance for every CI/Metric pair.				
connection_login_timeout_secs Maximum time in seconds to log in to the local database on MID Server.	30–60	30	integer	Global
corrupt_data_count_threshold Minimum number of training points (15-minute averages) required to do any statistical analysis.	10–100	30	integer	Global
deprioritize_early_batching_of_anomalous_ci Send anomalous CI information immediately or at regular interval.	N/A	false	boolean	Global
mad_model_min_days Number of days for which data must be available to consider a Median Absolute Deviation based model.	10-120	10	integer	CI/Metric
max_pool_connections_size Maximum number of connections for local database pool.	10–50	25	integer	Global
observation_time_min Expected minimum metric observation interval.	1–1440	1	integer	CI/Metric
robust_central_percentage Percentage of the residual data to compute the residual standard deviation, used for outlier detection. When set to 100 - uses the regular sample standard deviation.	50–100	90	double	Global
sparse_gap_fraction_threshold	0–100	50	double	Global

Name and Description	Values	Default	Data Type	Scope
If more than this percentage of data is missing and no other class has been identified, classify as SPARSE. Do not attempt to fit a WEEKLY model.				
weekly_model_min_days Number of days for which data must be available in order to consider only a WEEKLY seasonality decomposition.	14-90	15	integer	CI/Metric
daily_model_min_days Number of days for which data must be available in order to consider only a DAILY seasonality decomposition.	2-90	3	integer	CI/Metric
build_snpm_model Enable/disable building an SNPM data model.	N/A	true	boolean	CI/Metric
snpm_minimum_data_count Minimum number of data points required for building a stationary nonparametric model.	0 – 1e9	5000	integer	CI/Metric

The following configuration settings are for internal usage.

Internal Configuration Settings

Name and Description	Values	Default	Data Type	Scope
anomaly_memory_time_min Anomaly score calculator parameter: Memory time for abnormal situation.	1–600	45	double	CI/Metric
excess_z_score Anomaly score calculator parameter: Minimal anomalousness accumulated for outlier.	0–3	0.8	double	CI/Metric
linear_accumulator_threshold	0.5–5	1	double	Global

Name and Description	Values	Default	Data Type	Scope
Number of smoothed data points to set to the mean of double the smoothing length.				
dynamic_threshold_error_buffer_minutes Number of data points around each outlier to group together.	1 – 1000	30	integer	CI/Metric
dynamic_threshold_search_start Start value at which the optimal control factor is looked for.	0.5 – 20.0	3.0	double	CI/Metric
dynamic_threshold_search_interval Interval between search values of optimal control factor.	0.1 – 5.0	0.5	double	CI/Metric
dynamic_threshold_search_count Number of values required for searching for optimal control factor.	1 – 50	19	integer	CI/Metric
dynamic_threshold_error_sequence_limit Maximum number of error groups for a particular control factor value when searching.	1 – 20	5	integer	CI/Metric
dynamic_threshold_minimum_data_count Minimum number of raw data points needed before attempting dynamic thresholding.	1 – 10000	5000	integer	CI/Metric
linear_seasonal_log_likelihood_threshold Threshold used in deciding whether to prefer a fitted model with linear seasonality over a model with a periodic component.	10-5000	1000	integer	CI/Metric

Intelligence MID Servers must be synchronized with the updated set of configuration settings rules.

Before you begin
Role required: evt_mgmt_admin

About this task
You can manually initiate a synchronization to immediately apply the updates on all Metric Intelligence MID Servers. Or, you can rely on a system job, that runs on an hourly recurring schedule, checking for updates to the metric configuration rules. If it is determined that there are updates, the system job sends these updates to the Metric Intelligence MID Servers.

Procedure
1. Navigate to **All** > **Event Management Rules** > **Anomaly Detection** > **Metric Config Rules**.
2. On the Metric Configuration Rules pane, click **Sync to MID**.

What to do next
Verify that all Metric Intelligence MID Servers have been synchronized with the updated set of configuration settings rules:

1. Navigate to **Output and Artifacts** > **ECC Queue**.
2. In the **Queues** pane, search the **Topics** column for `MetricConfigProbe`.
3. Check the **Agent** column and verify that all MID Servers are updated.

Understanding the Monitoring Technology Dashboard

The Monitoring Technology Dashboard enables you to monitor server resources for the platform you select. The dashboard enables you to identify the CIs and servers in your system with the highest resource consumption, and the most recent active alerts.

You can customize the appearance of individual widgets on the Monitoring Technology Dashboard. For example, you could change the data parameters displayed for the CPU Utilization (Linux) metric, like the date range. You can include the customized widgets when creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

The Monitoring Technology Dashboard shows the five CIs and servers with the highest metric readouts during the past six hours, and the 50 most recent active alerts on your OS's servers.

To enable viewing the Monitoring Technology Dashboard, ensure that you have installed clotho version 23.1.0.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select the OS whose metrics you want to view.

Select the arrow next to the dashboard name to enabled choosing a different dashboard to view:

Monitoring Technology Dashboard for Linux

With the Linux Monitoring Technology Dashboard, you can monitor the health and performance of your Linux infrastructure. The dashboard enables you to identify the CIs and servers in your system with the highest resource consumption, and also the most recent active alerts.

Overview of the dashboard

The Monitoring Technology Dashboard shows the five CIs and servers with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts on your OS's servers.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **Linux Server**.

Using the Monitoring Technology Dashboard for Linux

Before using the Monitoring Technology Dashboard for Linux:

- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **Linux OS Events** and **Linux OS Metrics** policies are enabled.

  Enabling these policies activates metric to CI mapping.
- Ensure that the clotho plugin version 1.19.0.10 or above is enabled.
- After upgrading from a previous version, follow the procedure described in the ACC-M Dashboard Filters are not working when upgraded from Tokyo/Utah to Vancouver [KB1438042] article in the NOW Support Knowledge Base.

Point to the relevant widget to view a specific point of data and all of its details in a pop-up window. Select the Alerts tab to view the 50 most recent active alerts for CIs.

You can filter the dashboard data according to the following filters:

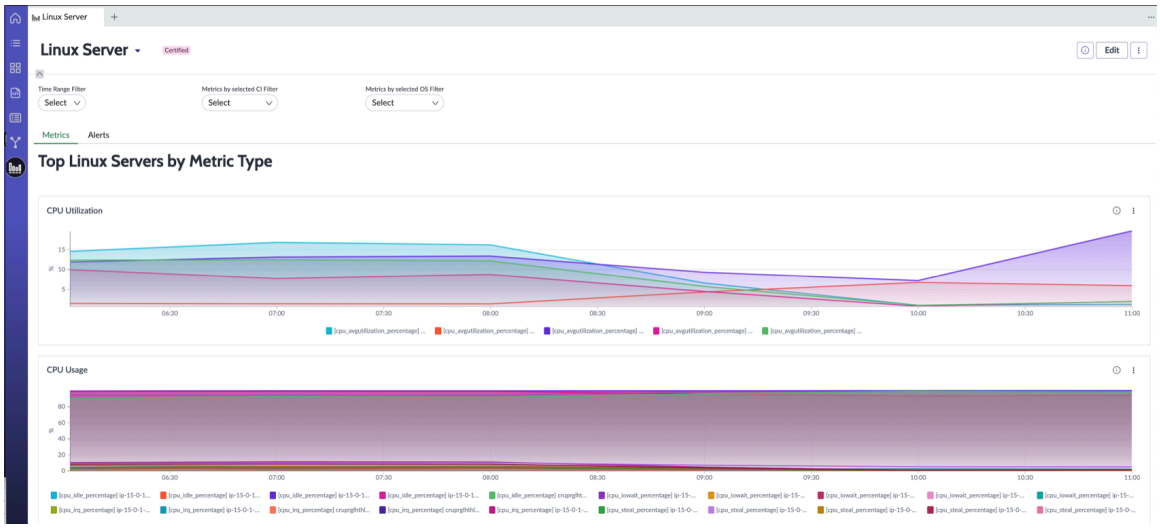
Dashboard filters

Filter name	Description
Time range filter	The time range for which you want metric data to display on the dashboard.
Metrics by selected CI filter	The CIs for which you want metric data to display on the dashboard.
Metrics by selected OS filter	The OS for which you want metric data to display on the dashboard.

On the right side of widgets displaying a single metric, you can select the More options icon (⋮) and select **Change group by**. Select the category you want to view the metric by: Host name, Class, Operating System, or OS Version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linux server dashboard



The Metrics subtab displays the top five performing CIs and servers over the past six hours, according to the following metrics.

- CPU Utilization
- System Uptime
- CPU Usage
- Load Average
- Memory
- Memory Distribution
- Processes
- Network Utilization
- Swap
- Disk Usage

You can customize the appearance of the individual widgets on the Linux Monitoring Technology Dashboard. For example, you could change the timeframe for which the alerts appear. You can also include customized widgets when you are creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Monitoring Technology Dashboard for Windows

With the Windows Monitoring Technology Dashboard, you can monitor the health and performance of your Windows infrastructure. The dashboard enables you to identify the CIs and servers in your system with the highest resource consumption, and also the most recent active alerts.

Overview of the dashboard

The Monitoring Technology Dashboard for Windows shows the five CIs and servers with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts on your OS's servers.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **Windows Server**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Using the Monitoring Technology Dashboard for Windows

Before using the Monitoring Technology Dashboard for Windows:

- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **Windows OS Events** and **Windows OS Metrics** policies are enabled:

  Enabling these policies activates metric to CI mapping.
- Ensure that the clotho plugin version 1.19.0.10 or above is enabled.
- After upgrading from a previous version, follow the procedure described in the ACC-M Dashboard Filters are not working when upgraded from Tokyo/Utah to Vancouver [KB1438042] article in the NOW Support Knowledge Base.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **Windows Server**.

Point to the relevant widget to view a specific point of data and all of its details in a pop-up window. Select the Alerts tab to view the 50 most recent active alerts for CIs.

You can filter the dashboard data according to the following filters:

Dashboard filters

Filter name	Description
Time range filter	The time range for which you want metric data to display on the dashboard.
Metrics by selected CI filter	The CIs for which you want metric data to display on the dashboard.
Metrics by selected OS filter	The OS for which you want metric data to display on the dashboard.

On the right side of widgets displaying a single metric, you can select the More options icon (⋮) and select **Change group by**. Select the category that you want to view the metric by: Host name, Class, Operating System, or OS Version.

© 2026 ServiceNow, Inc. All rights reserved.

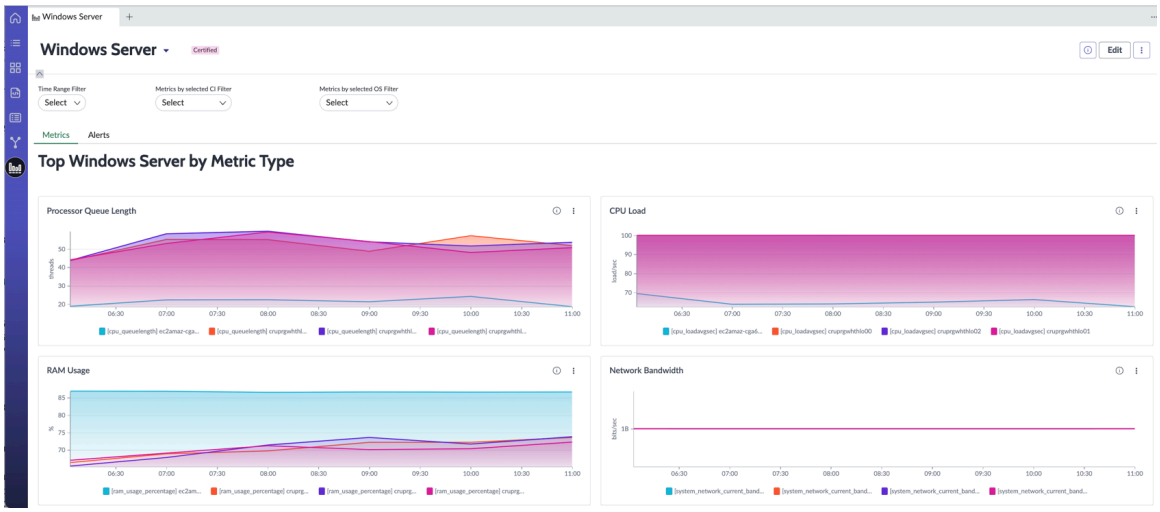
Windows server dashboard



The Metrics subtab displays the top five performing CIs and servers over the past six hours, according to the following metrics.

- Processor Queue Length
- CPU Load
- System Uptime
- CPU Core
- RAM Usage
- Network Bandwidth
- Memory Distribution
- Network Flow
- Disk Usage
- Disk Read/Write
- Disk Distribution

You can customize the appearance of the individual widgets on the Windows Monitoring Technology Dashboard. For example, you could change the timeframe for which the alerts appear. You can also include customized widgets when you are creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Monitoring Technology Dashboard for HTTP

With the HTTP Monitoring Technology Dashboard you can monitor the response time of your `http` and `https` URLs. By using the dashboard, you can identify the URLs with the highest metric readouts in your system's infrastructure, and view the most recent active alerts on those URLs.

Overview of the dashboard

The HTTP Monitoring Technology Dashboard shows the five URLs with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts on those URLs.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **HTTP**.

Using the Monitoring Technology Dashboard for HTTP

Before using the Monitoring Technology Dashboard for HTTP:

- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **HTTP Entry Points Events** and **HTTP Entry Points Metrics** policies are enabled.

  Enabling these policies activates metric to CI mapping.
- Ensure that the clotho plugin version 1.19.0.10 or above is enabled.
- After upgrading from a previous version, follow the procedure described in the ACC-M Dashboard Filters are not working when upgraded from Tokyo/Utah to Vancouver [KB1438042] article in the NOW Support Knowledge Base.

The Azure Monitoring Technology Dashboard contains the tabs that are listed in the following table.

HTTP Monitoring Technology Dashboard tabs

Tab	Description
Metrics	Displays the top 5 performing metrics that are associated with the URLs in your system.
Alerts	Displays the 50 most recent alerts that are associated with the URLs in your system. Alerts help you to remediate your system by providing information on problematic behavior.

On the right side of widgets displaying a single metric, you can select the More options icon (⋮) and select **Change group by**. Select the category you want to view the metric by: Host name, Class, Operating System, or OS Version.

Point to the relevant widget to view a specific datapoint and all of its details in a pop-up window.

Use the **Time range filter** to filter the time range for which you want metric data to display on the dashboard.

You can customize the appearance of the individual widgets on the HTTP Monitoring Technology Dashboard. For example, you could change the data parameters that display for the Response Time metric, like the time range that the response time is displayed. You can also include the customized widgets when you're creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Monitoring Technology Dashboard for Azure

With the Azure Monitoring Technology Dashboard, you can monitor the health and performance of your Azure infrastructure. By using the dashboard, you can identify the configuration items (CIs) and servers with the highest metric readouts, and view the most recent active alerts on those CIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview of the dashboard

The Azure Monitoring Technology Dashboard shows the five CIs and servers with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts in your Azure environment. Based on the dashboard metrics, you might want to resize your CIs and servers to improve your system performance and efficiency.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **Azure Monitoring**.

Using the Monitoring Technology Dashboard for Azure

Before using the Monitoring Technology Dashboard for Azure:

- Create an Azure credential. For details on creating Azure credentials, see Create Azure cloud credentials.
- Create a Discovery schedule, using the credential created in the previous step. For details on creating a Discovery schedule, see Discovery for Microsoft Azure Cloud.
- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **Azure VM Metrics**, **Azure Storage Account Metrics**, **Azure Load Balancer Metrics**, **Azure Gateway Metrics**, and **Azure Redis Cache Metrics** policies are enabled
- Ensure that the clotho plugin version 1.19.0.10 or above is enabled.

The Azure Monitoring Technology Dashboard contains the tabs that are listed in the following table.

Azure Monitoring Technology Dashboard tabs

Tab	Description
Virtual Machines	Displays the metric data from the virtual machines in the Azure environment.
Storage Accounts	Displays the metric data from the storage accounts in the Azure environment.
Load Balancer	Displays the metric data from the load balancers in the Azure environment.
Application Gateway	Displays the metric data from the application gateway in the Azure environment.
Redis	Displays the metric data from the Redis cache in the Azure environment.

Point to the relevant widget to view a specific datapoint and all of its details in a pop-up window.

You can filter the dashboard data according to the following filters:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dashboard filters

Filter name	Description
Time range filter	The time range for which you want metric data to display on the dashboard.
Metrics by selected CI filter	The CIs for which you want metric data to display on the dashboard.

You can customize the appearance of the individual widgets on the Azure Monitoring Technology Dashboard. For example, you could change the time that the CPU usage on virtual machines is displayed. You can also include the customized widgets when you're creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Monitoring Technology Dashboard for AWS

With the AWS Monitoring Technology Dashboard, you can monitor the health and performance of your AWS infrastructure. By using the dashboard, you can identify the configuration items (CIs) and servers with the highest metric readouts, and view the most recent active alerts on those CIs and servers.

Overview of the dashboard

The AWS Monitoring Technology Dashboard shows the five CIs and servers with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts in your AWS environment.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **AWS Monitoring**.

Using the Monitoring Technology Dashboard for AWS

Before using the Monitoring Technology Dashboard for AWS:

- Create an AWS credential. For details on creating AWS credentials, see Setting up AWS service accounts.
- Create a Discovery schedule, using the credential created in the previous step. For details on creating a Discovery schedule, see Access setup for AWS service accounts.
- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **AWS Metrics**, **AWS EC2 Metrics**, and **AWS DynamoDB Metrics** policies are enabled.

  Enabling these policies activates metric to CI mapping.
- Ensure that the clotho plugin version 1.19.0.10 or above is enabled.
- After upgrading from a previous version, follow the procedure described in the ACC-M Dashboard Filters are not working when upgraded from Tokyo/Utah to Vancouver [KB1438042] article in the NOW Support Knowledge Base.

The AWS Monitoring Technology Dashboard contains the tabs that are listed in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AWS Monitoring Technology Dashboard tabs

Tab	Description
EC2	Displays the metric data from the EC2 (virtual machines) in the AWS environment.
EC2 Alerts	Displays the active EC2 (virtual machine) alerts in the AWS environment.
EBS	Displays the metric data from the EBS (storage volume) in the AWS environment.
S3	Displays the metric data from the S3 (cloud object storage) in the AWS environment.
RDS	Displays the metric data from the RDS (cloud database) in the AWS environment.
ELB	Displays the metric data from the ELB (cloud load balancing) in the AWS environment.
Dynamo DB	Displays the metric data from the Dynamo DB (cloud database) in the AWS environment.
ECS Cluster	Displays the metric data from the ECS cluster in the AWS environment.
ECS Service	Displays the metric data from the ECS service in the AWS environment.

On the right side of widgets displaying a single metric, you can select the More options icon (⋮) and select **Change group by**. Select the category you want to view the metric by: Host name, Class, Operating System, or OS Version.

Point to the relevant widget to view a specific datapoint and all of its details in a pop-up window. Select the **Alerts** tab to view the 50 most recent active alerts in your environment. Alerts help you to remediate your system by providing the information on problematic behavior.

Use the **Time range filter** to filter the time range for which you want metric data to display on the dashboard.

Use the **Metrics by selected CI filter** to select the CIs for which you want to view metrics.

You can customize the appearance of the individual widgets on the AWS Monitoring Technology Dashboard. For example, you could change the time that the EC2 metrics appear. You can also include the customized widgets when you are creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Monitoring Technology Dashboard for GCP

With the GCP Monitoring Technology Dashboard, you can monitor the health and performance of your GCP infrastructure. By using the dashboard, you can identify the configuration items (CIs) and servers with the highest metric readouts, and view the most recent active alerts on those CIs and servers.

Overview of the dashboard

The GCP Monitoring Technology Dashboard shows the five CIs and servers with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts in your GCP environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **GCP Monitoring**.

Using the Monitoring Technology Dashboard for GCP

Before using the Monitoring Technology Dashboard for GCP:

- Create a GCP credential and use it to create a Discovery schedule. For details on creating GCP credentials, see Discovery for Google Cloud Platform.
- Create a Discovery schedule, using the credential created in the previous step. For details on creating a Discovery schedule, see Discovery for Google Cloud Platform.
- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **GCP GCE Metrics** policy is enabled.

  Enabling this policy activates metric to CI mapping.
- Ensure that the clotho plugin version 1.19.0.10 or above is enabled.
- After upgrading from a previous version, follow the procedure described in the ACC-M Dashboard Filters are not working when upgraded from Tokyo/Utah to Vancouver [KB1438042] article in the NOW Support Knowledge Base.

The GCP Monitoring Technology Dashboard contains the tabs listed in the following table.

GCP Monitoring Dashboard tabs

Tab	Description
GCP	Displays graphs of the top 14 performing OS resources, such as CPU, Memory, Disk Operations and Network.
Alerts	Displays the 50 most recent alerts that are associated with the URLs in your system. Alerts help you to remediate your system by providing information on problematic behavior.

On the right side of widgets displaying a single metric, you can select the More options icon (⋮) and select **Change group by**. Select the category you want to view the metric by: Host name, Class, Operating System, or OS Version.

Point to the relevant widget to view a specific datapoint and all of its details in a pop-up window.

Use the **Time range filter** to filter the time range for which you want metric data to display on the dashboard.

Use the **Metrics by selected CI filter** to select the CIs for which you want to view metrics.

You can customize the appearance of the individual widgets on the GCP Monitoring Technology Dashboard. For example, you could change the timeframe for which the alerts appear. You can also include customized widgets when you are creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Monitoring Technology Dashboard for VMware vSphere

With the VMware vSphere Monitoring Technology Dashboard, you can monitor the health and performance of your VMware vSphere infrastructure. By using the dashboard, you can identify the configuration items (CIs) and servers with the highest metric readouts, and view the most recent active alerts on those CIs and servers.

Overview of the dashboard

The VMware vSphere Monitoring Technology Dashboard shows the five CIs and servers with the highest metric readouts during the past six hours. The dashboard also shows the 50 most recent active alerts in your VMware vSphere environment.

To view the dashboard, navigate to **All** > **AIOps Dashboards** > **Monitoring Technology Dashboards** and select **VMWare vSphere Monitoring**.

Using the Monitoring Technology Dashboard for VMware vSphere

Before using the Monitoring Technology Dashboard for VMware vSphere:

- Create a VMware vSphere credential and use it to create a Discovery schedule. For details on creating VMware vSphere credentials, see Discovery for VMware Cloud.
- Create a Discovery schedule, using the credential created in the previous step. For details on creating a Discovery schedule, see Discovery for VMware virtualization.
- Ensure that you're working in the Agent Client Collector Monitoring scope in your ServiceNow instance.
- Ensure that the agent_client_collector_admin and dashboard_admin roles are enabled.
- Enable Metric Intelligence on the MID Server.
- Ensure that the **VSphere Datacenter Metrics**, **VSphere Datastore Metrics**, **VSphere ESX Server Metrics** and **VSphere VirtualMachine Metrics** policies are enabled.

  Enabling these policies activates metric to CI mapping.
- Ensure that the clotho plugin version 1.1.0 or above is enabled.
- After upgrading from a previous version, follow the procedure described in the ACC-M Dashboard Filters are not working when upgraded from Tokyo/Utah to Vancouver [KB1438042] article in the NOW Support Knowledge Base.

The VMware vSphere Monitoring Technology Dashboard contains the tabs listed in the following table.

VMware vSphere Monitoring Dashboard tabs

Tab	Description
VirtualMachine	Displays graphs of the top VMware vSphere VMs by metric type.
ESX Server	Displays graphs of the top VMware vSphere ESX servers by metric type.
Datacenter	Displays graphs of the top VMware vSphere datacenters by metric type.
Datastore	Displays graphs of the top VMware vSphere datastores by metric type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VMware vSphere Monitoring Dashboard tabs (continued)

Tab	Description
Alerts	Displays the 50 most recent alerts that are associated with the URLs in your system. Alerts help you to remediate your system by providing information on problematic behavior.

On the right side of widgets displaying a single metric, you can select the More options icon (⋮) and select **Change group by**. Select the category you want to view the metric by: Host name, Class, Operating System, or OS Version.

Point to the relevant widget to view a specific datapoint and all of its details in a pop-up window.

You can filter the dashboard data according to the following filters:

Dashboard filters

Time range filter	The time range for which you want metric data to display on the dashboard.
Metrics by selected CI filter	The CIs for which you want metric data to display on the dashboard.

You can customize the appearance of the individual widgets on the VMware vSphere Monitoring Technology Dashboard. For example, you could change the timeframe for which the alerts appear. You can also include customized widgets when you are creating a custom dashboard. For more information, see Customize the Monitoring Technology Dashboard.

Customize the Monitoring Technology Dashboard

Customize the Monitoring Technology Dashboard widgets in the Data Visualizations library so your dashboard displays information exactly as you want to see it.

Before you begin

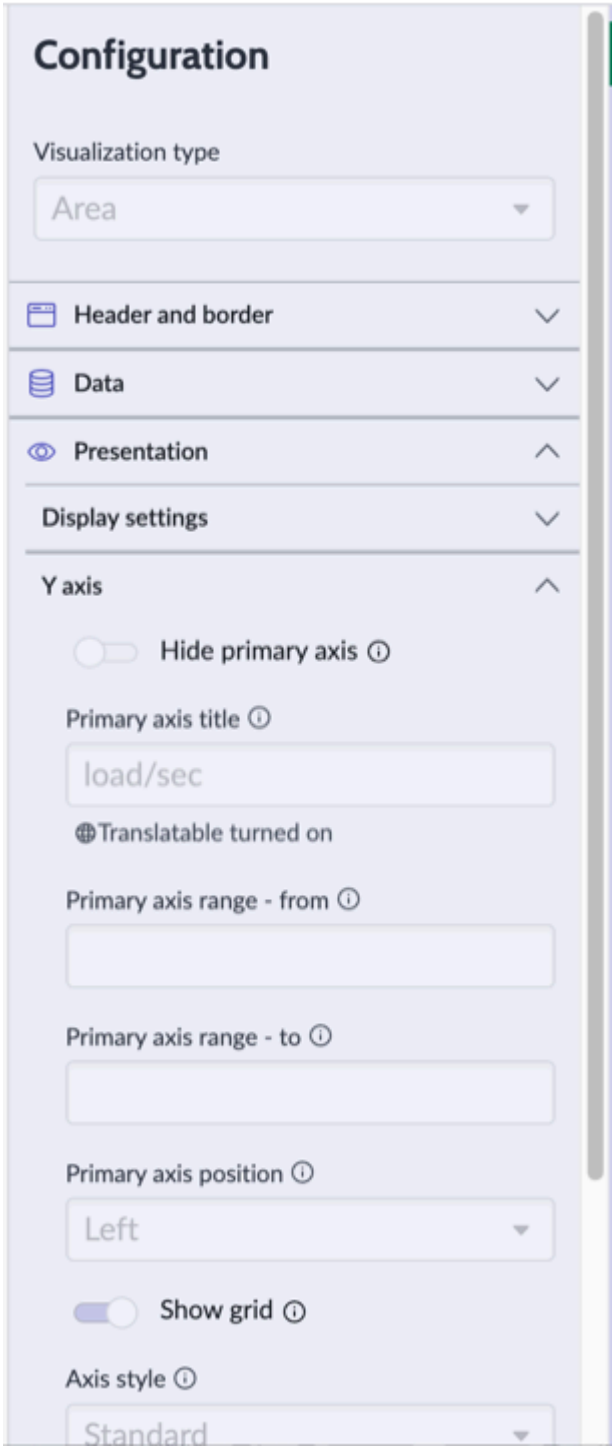
Role required: agent_client_collector_admin

Procedure

1. Navigate to the OS dashboard whose widgets you want to customize.
   - To access the Windows Server Dashboard, navigate to **All** > **AIOps** > **Monitoring Technology Dashboard** > **Windows Server**.
   - To access the Linux Server Dashboard, navigate to **All** > **AIOps** > **Monitoring Technology Dashboard** > **Linux Server**.
2. Select **Analytics Center** > **Data Visualizations**.
3. View all available widgets by selecting the **All** tab.
4. Select the widget that you want to change.
5. Select the (☰) icon, and select **Duplicate**.
6. In the **New name** field in the dialog box, enter a name for your duplicated widget, and select **Duplicate**.
7. In the widget's **Configuration** tab on the right, expand the relevant options and customize the information for the widget to display.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration tab



For details on working with data visualizations, see Data visualizations in the Analytics Center Data visualizations in the Analytics Center.

8. Select **Save and close**.

Result

Your customized widgets are saved in the Data Visualizations library, and can be used to configure a customized dashboard (see Create a dashboard with the In-line editor).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting exclusion lists for IPs and NICs

Agent Client Collector for Visibility - Content (ACC-VC) version 1.3.0 supports exclusion list for IPs and Network Interface Controllers (NICs) with a flexible mechanism for filtering out values for IPs and or NICs when creating or updating the host CI and related items.

The property [*sn_acc_visibility.network_adapter_exclusion_list*] contains the list of regular expressions for the names and IP addresses that are excluded in the Network Adapter and IP Address tables. The value of this property is comma-separated regular expressions. Make sure that there is no comma in the regex and nic and ip_addr should be in different lines.

Sample format of the value should be:

- nic = nameRegex1, nameRegex2, nameRegex3
- ip_addr = IPRegex1, IPRegex2

Identify software editions on Windows devices

Determine which edition of software is in use on Windows devices in your environment, to maintain an accurate software inventory. Software products commonly support multiple editions, making it difficult to identify which edition is in use.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. In the navigation pane, enter `sn_acc_vis_content_software_registry_edition_config.list`.
   The **Software Edition Configurations** page appears.
2. Select **New** to set edition configuration for a Windows device.
   The **Software Edition Configuration - New record** page appears. For details on the fields displayed on the page, see Software edition configuration fields.
3. Select **Submit**.
   The configured product appears on the **Software Edition Configurations** page, and is automatically added to the `EditionRegistryConfig.json` file after the daily scheduled job runs.
4. In the navigation pane, enter `cmdb_sam_sw_install.list`.
   The **Software Installations** page opens.
5. Find the relevant software entry, and confirm the edition in the **Edition override** column.
   The edition appears only after the **Software Installed** or **SAM Discovery** policy runs. By default, these policies runs once daily.

Generate a Pattern allowlist

Generate an allowlist for a selection of patterns, to configure the patterns permitted to run on an agent.

Before you begin

Ensure that the following plugins are installed on your instance:

- Discovery (com.snc.discovery)
- Pattern Designer Enhancements (com.sn_itom_pde)

Role required: discovery_admin or agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Pattern Designer** > **Patterns allowlist for ACC**.
   The **Pattern Allowlist Generator** page appears.
2. Select the type of pattern selection in the **Pattern Selection** section.
   - **All patterns**: The allowlist generates for all patterns on the agent.
   - **Specific patterns**: The allowlist generates on the agent only for the patterns you select.

     After selecting this option, choose the patterns from which you want the allowlist to be generated.
3. Select **Generate Allowlist**.
4. Select **Copy** to copy the generated allow list.
5. Append the copied allowlist into the existing `check-allow-list.json` allow list on the agent.
   The patterns specified in the allowlist are permitted to run on the agent.

Note: To generate allowlist for commands nested within EVAL() in a pattern step, ensure the Pattern Designer Enhancements plugin is v3.9.1 or above.

Define temporary variables for a pattern allowlist

Define temporary variables by assigning values such as executable paths, config file paths, and so forth. If a Linux command contains a string that isn't defined, the command fails when run.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Pattern Designer** > **Pattern Allowlist Temporary Variables**.
2. Select **New** to create a new variable.
3. Create a record and define the temporary variable.

   For example:

Pattern Allowlist Temporary Variables

Field	Value
Value	bin/sh/testexec
Pattern	.NET Application
Operating system	Linux
Temporary variable	exePath

4. Select **Submit**.

Agent Client Collector deployment - shared between servers and endpoints

When deploying the Agent Client Collector, there are components which are shared between servers and endpoints.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Checks and policies

A check is a combination of a command and its configuration. The check is executed on the Agent Client Collector's devices to gather data from those devices.

Checks

Checks are provided with the base system, and their commands execute scripts which provide monitoring data for your operating systems and applications. A check's default name indicates what is being monitored and measured, the entity, and the monitoring data. For example, a check named *os.linux.check-system-cpu* checks the CPU data on a Linux system. The identified command in the check runs on the monitored device, providing an output and status. Each individual check is referred to as a **check definition**. After being associated with policies, check definitions are then referred to as **check instances**.

You can customize check instances to meet your needs. For example, customize the running interval or the parameters specific to the policy, such as the login credentials to access a MySQL database. Customization of a check instance takes effect only on the check instance associated with the policy, which does not affect the original check definition or already created check instances in other policies.

The following check types are provided with the Event Management base system:

- **Event**: The check's result is transformed into an Event Management event.
- **Metric**: The values from the check result are transformed to metrics.

For details on the Agent Client Collector Framework default checks, see Agent Client Collector Framework default checks.

For details on the Agent Client Collector Monitoring default checks and policies, see Agent Client Collector Monitoring default checks and policies.

For details on the Agent Client Collector for Visibility - Content default checks and policies, see Agent Client Collector for Visibility - Content default checks and policies.

If checks are not running on the agent's devices, your agent may be in CPU protection mode. CPU protection mode is activated when a device's CPU consumption is too high. To view a list of all disabled checks related to the agent, navigate to the agent record on the Agent Client Collectors page (**All** > **Agent Client Collector** > **Agents**), select an agent and select the **Disabled Checks** tab at the bottom of the page.

In the `acc.yml` configuration file, you can modify the CPU protection mode thresholds which determine when a check is disabled. To re-enable a check, select the check and select **Re-enable disabled check** in the **Actions on selected rows...** drop-down. For details on the CPU protection mode thresholds, see Agent Client Collector CPU protection thresholds. For details on manually turning off data collection, see Pause Agent Client Collector data collection.

Configure the cpu_protection_behavior property to determine whether all checks enter CPU protection mode, or only the check that crosses the configured cpu_percentage_limit value with the highest CPU usage within the monitoring interval. For details, see Agent Client Collector CPU protection thresholds.

A check is marked as **Stale** if it is no longer associated with a policy. To remove a stale check, renable it by selecting the box next to the check and selecting **Re-enable disabled checks** from the **Actions on selected rows...** cell.

In the base system, the event's exit status indicates its severity, as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- 0 = OK
- 1 = WARNING
- 2 = CRITICAL

You can add additional severities (such as MAJOR and MINOR) by running a customized script. The following exit statues indicate these severities:

- 13 = MAJOR
- 14 = MINOR

Privileges for running check commands

If the servicenow base system user does not have privileges to run specific check commands, do the following for the relevant operating systems:

- In a Linux system: Enable the servicenow user to run the command with `sudo` permissions. Ensure that the following sudo configuration requirements are met:
  - Disable tty and password requirements
  - Preserve all environment variables
  - Support dynamic PATH for executing commands

  Example configuration in the `/etc/sudoers` file:

```
Cmnd_Alias ACC_F = /usr/sbin/dmidecode -s
 baseboard-serial-number, /usr/sbin/dmidecode -s
 chassis-serial-number, /usr/sbin/dmidecode -s
 system-serial-number, /usr/sbin/dmidecode -s
 system-uuid, /usr/sbin/ss -tanp
servicenow ALL=(root)
 SETENV: /
var/cache/servicenow/agent-client-collector/osquery/bin/osque
ryi *, ACC_F
Defaults:servicenow !requiretty
Defaults exempt_group += servicenow
```

  Note: Command paths may vary. Consult the sudoers manual for special considerations.
  - The `SETENV:` string enables the servicenow user to preserve environment variables.
  - The `!requiretty` string disables tty.
  - Adding the servicenow user to the `exempt_group` bypasses password requirements and enables dynamic PATH for executing sudo commands.

  Ensure that you configure the *must_sudo* check parameter with a value of **true** in the check command parameters section of the check definition.

- In a macOS system: Ensure that the user running the agent service belongs to a user group with privileges to query all tcp connections on the host.
- In a Windows system: Using Windows User Management, add the servicenow user to the groups with the relevant privileges, enabling the user to execute the required commands.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Policies

A **policy** is a combination of the CIs being monitored by the Agent Client Collector and the check definitions that run on those CIs.

To enable a single policy to support multiple credentials, assign a credential alias to the policy. For example, if you have MySQL servers for both Linux and Windows with different credentials, you must create separate policies for each credential type. However, if you use a credential alias, you can assign a single policy to the alias. The agent then matches the relevant credential to the application being monitored. For details on credential aliases, see Create a Connection and Credential alias.

Alerts generated by policies with an event-type check are automatically closed when the CI monitoring stops due to any of the following:

- De-activating the policy
- De-activating the check that caused the alert
- Deleting the check from the policy
- Deleting the policy
- Modifying the policy filter that determines the monitored CIs

Agent Client Collector configuration data files

Configuration data files store dynamic instance data, such as virtual machine details, that check definitions use during execution. This ensures that checks are executed with up-to-date and accurate information about the instance being monitored.

Configuration data files structure

- Attachment based: A configuration data file contains a single attachment with instance data, such as Azure VM details.
- Synchronization: When an attachment is added or deleted, the data file is synchronized across all MID Servers configured with the Agent Client Collector. If a file or its attachment is deleted, it is also removed from the MID Server.
- Access point: The configuration data files can be accessed on the MID Server at `\static \acc_config`.
- Size: Configuration data files cannot be larger than 10MB.

Check definitions used by configuration data files

- Check definition: Individual check entries are referred to as check definitions. For instance, *`os.linux.check-system-cpu`* checks the CPU on Linux systems.
- Accessing check definitions: Check definitions can be accessed from **All** > **Agent Client Collector** > **Configuration** > **Check Definitions**.

File association

- Download process: When a check executes, the agent downloads the configuration data file associated with that check.
- Domain-Specific Synchronization: Files are synchronized only with agents within the same domain, ensuring secure and localized data handling.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Working with configuration data files

Configuration data files serve as a repository for dynamic instance data that is used by check definitions when they are executed. These files ensure that checks are run with accurate, real-time information about the systems or instances being monitored. Configuration data files work as follows:

- Store instance-specific data: Configuration data files store dynamic instance data, such as virtual machine details, server configurations, and other system-specific information. This data is used by check definitions during execution to ensure the latest information is available.
- Create check definitions: A check definition is created with an associated configuration data file. For example, a check definition monitoring system CPU data may include configuration data detailing the system's environment, ensuring checks use accurate and relevant instance data.
- Synchronize with MID Servers: When a configuration data file is added or updated, it synchronizes across all MID Servers communicating with the Agent Client Collector. If the file or attachment is deleted, it is also removed from the MID Servers, ensuring consistency and up-to-date data availability.
- Execute with updated data: During execution, the Agent Client Collector agent downloads the relevant configuration data file from the MID Server. The agent uses this data to execute the check, ensuring access to the most current and accurate instance information.
- Store and access data: Configuration data files are stored on the MID Server in the `static/cache/config-files` directory. This storage location facilitates easy access and management, ensuring the necessary data for checks is always available when needed.

Agent Client Collector API

Use the Agent Client Collector (ACC) API to create a flow that executes an `osquery` command on agents and processes the results. By leveraging the ACC API, you can automate the querying of agent data and streamline the processing of results, making it easier to monitor and manage system performance.

The system supports osquery 5.7.0, providing compatibility with a range of queries for efficient data collection.

The ACC API enables seamless integration and automation for executing queries and managing agents. Here's how it works:

1. Execute osquery commands: You can use the ACC API to send osquery commands to agents. These commands collect a wide range of system and performance data from the target machines.
2. Process results: After the osquery command is executed on the agents, the ACC API processes the results and returns the necessary data. This data can be used for monitoring, troubleshooting, or reporting purposes.
3. Support for osquery 5.7.0: The ACC API is compatible with osquery 5.7.0, which ensures it supports the latest features and improvements, enabling you to leverage advanced query capabilities for enhanced data collection.
4. Enable API features: To use the ACC API, enable the agent and policy APIs. This allows you to configure and manage various aspects of your agents, including their communication, data collection, and query execution.

For details on agent APIs, see Enable agent APIs.

For details on enabling policy APIs, see Enable policy APIs.

Agent Client Collector health instance scan suite

The Agent Client Collector (ACC) health instance scan suite consists of checks that detect anomalies and other issues that might occur on your instance. These checks ensure the overall health and performance of the ACC, proactively identifying potential problems before they impact system operations.

For details on running the ACC health instance scan, see Run the Agent Client Collector (ACC) health instance scan as a scheduled job.

For details on the ACC health instance scan suite checks, see Agent Client Collector health instance scan checks.

For details on importing the `global.ACCInstanceScanUtil` script include, see the Script Include ACCInstanceScanUtil [KB1630132] article in the Now Support Knowledge Base.

Run the Agent Client Collector (ACC) health instance scan as a scheduled job

Run the **Run (ACC) health instance scan** scheduled job to monitor the overall health of the instance receiving data from the Agent Client Collector.

Before you begin

Role required: agent_client_collector_admin

About this task

This procedure describes how to schedule an ACC health instance scan. Alternatively, you can run the ACC health instance scan on demand, as follows:

1. Navigate to **All** > **Instance Scan** > **Suites**.
2. Select **ACC Health Instance Scan**.
3. Select **Execute Suite Scan**.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Select the **Run ACC Health Instance Scan** entry.
3. Select the **Active** check box.
4. Set the frequency by which the job is to repeat in the **Repeat Interval** field.
   The default is 7 days.
5. Select **Execute Now** to run the **Run ACC Health Instance Scan** job.

Result

The results of the job are compiled in the Scan Results (scan_result) table. Errors are compiled in the Agents issue (sn_agent_acc_error_msg) table.

For details on the ACC health instance scan suite checks, see Agent Client Collector health instance scan checks.

Agent Client Collector health instance scan checks

The Agent Client Collector (ACC) health instance scan suite includes checks that detect anomalies and issues on your instance. Use this reference to identify what each check does and when it applies.

ACC Health Instance Scan Suite checks

Check name	Description
ACC duplicate agent for host CI	Identifies configuration items (CIs) associated with multiple active agents, indicating potential issues with CI identification.
ACC Error Framework	Verifies whether the ACCErrorManager has been created, which enables associating errors to the relevant ACC scoped app. Detects whether an automation source application, automation error category, and automation error code exist for the Agent Client Collector Framework application.
ACC find modified script includes	Detects modified Agent Client Collector Framework script includes that might have been altered post-upgrade.
ACC skipped upgrades	Reports upgrades that were skipped since the last upgrade. **Note:** Skipped upgrades don't generate an error message.
ACC verify plugin folder hierarchy	Validates the correct creation of ACC Plugin folders and flags duplicate folders that may cause synchronization issues.
ACC active policies count	Counts the number of active published policies. If the number exceeds 300, consolidate the policy to improve performance.
ACC agent to MID Connection	Verifies the connection of 1000 agents per 1-GB Java Virtual Machine (JVM) to confirm the MID Server isn't overloaded. If overloaded, configure additional JVMs or redistribute agents to other MID Servers.
ACC verify sn_agent CI counts match	Confirms that the records in the sn_agent_ci_extended_info and sn_agent_cmdb_ci_agent tables match, verifying data consistency for agents.
ACC ICS Diagnostics Tool	Analyzes the ServiceNow instance and its setup with ITOM Cloud Services.
ACC automation_error_msg cleaner	Verifies that the Agent Issues table cleaner exists and is enabled, ensuring ACC-specific error records are regularly cleaned up and the table remains manageable.
ACC Verify global.ACCInstanceScanUtil exists	Detects that the `global.ACCInstanceScanUtil` file is installed for instances starting with the Xanadu release or later. Without this file,

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACC Health Instance Scan Suite checks (continued)

Check name	Description
	several ACC Health Instance Scan checks don't run.

Additional information

For details on importing the `global.ACCInstanceScanUtil` script include, see the Script Include ACCInstanceScanUtil [KB1630132] article in the HI Knowledge Base.

For details on running the ACC health instance scan, see Run the Agent Client Collector (ACC) health instance scan as a scheduled job.

Agent Client Collector certificates

Agent Client Collector certificates verify the authenticity of your agents, servers, and users. Using Agent Client Collector certificates ensures the safety of your environment.

Manually refresh Agent Client Collector certificates

Pull self-signed certificates from the ServiceNow install server, instead of waiting for the scheduled MID Server synchronization.

Before you begin

- Ensure that the self-signed certificate is placed in a `.zip` file on the MID Server in the following location: `agent\static\cert`
- Ensure that the certificate authority is part of the agent host's truststore, as the certificate chain is validated before the customer plugin signature.
- Role required: agent_client_collector_admin

About this task

The MID Server checks for updates once each day, or after being restarted.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **MID Servers**.
2. Select a MID Server.
3. In the Related Links section, select **Trigger ACC certificate sync**.
4. Restart the MID Server.

Result

When an agent fails to perform a certificate check, the agent synchronizes certificates available on the MID Server. Synchronization is carried out for certificates on the ServiceNow install server and the self-signed certificates placed in the `.zip` file on the MID Server's `agent\static\cert` folder. Certificates are downloaded by the Agent Client Collector if the agent fails to validate a check definition's associated plugin assets.

Enable OpenSSL secure signing for plugins

Create a self-signed certificate for an Agent Client Collector plugin. The following procedure gives an example of how to create an x509 certificate using OpenSSL. For other certificate types, consult OpenSSL documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that the *verify-plugin-signature* property is set to **True** in the agent's `acc.yml` file to verify plugin signing.
- Ensure **OpenSSL** is installed on your system.

Role required: agent_client_collector_admin

About this task

Enabling an OpenSSL secure signing mechanism for plugins works with an Agent Client Collector installed on a Linux system.

Procedure

1. Create a plugin file with a `tar.gz` extension.
   For more information, see Create and edit Agent Client Collector plugins.
2. Generate your own secure self-certificate for the plugin file.

   a. Create an x509 certificate.

   ```
   openssl req -nodes -x509 -sha256 -newkey rsa:2048 -keyout
    "sign.key" -out "sign.crt" -days 365 -subj

    "/C=<CountryName>/ST=<StateOrProvinceName>/L=<Locality>/O=<O
   rganization>/OU=<OrganizationalUnit>/CN=sign"
   ```

   b. Sign the plugin file.

   ```
   openssl dgst -sha256 -sign "sign.key" -out sign.txt.sha256
    <plugin-name>.tar.gz
   ```

   Alternatively, you can sign plugins using a certificate authority. When doing so, assign the certificate .pem format and place it in the agent's `cert` directory.

   c. Verify that the signature is configured correctly.

   ```
   openssl dgst -sha256 -verify  <(openssl x509 -in
    "sign.crt" -pubkey -noout) -signature sign.txt.sha256
    <plugin-name>.tar.gz
   ```

   If the file is valid, the output is `Verified OK`.

   d. Encode the signature's certificate with base64 coding.

   ```
   base64 sign.txt.sha256 > sign.txt.sha256_encode64.sig
   ```

   A `sign.txt.sha256_encode64.sig` file is created.

3. Run the following commands to create a new directory and insert the `tar.gz` and `sign.txt.sha256_encode64.sig` files.

   a. `mkdir signed-plugin`

   b. `mv <plugin-name>.tar.gz signed-plugin`

   c. `mv sign.txt.sha256_encode64.sig signed-plugin`

   d. `cd signed-plugin`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Create another `tar.gz` file by running the same commands as you ran for the first `tar.gz` file.

   a. `tar -C . -zcvf ../<plugin-name>.tar.gz *`

   b. `cd..`

   > **Note:** Save the new file as `../<plugin-name>.tar.gz` to avoid naming collisions with the original `<plugin-name>.tar.gz` file that exists in the current directory.

5. Upload the new `tar.gz` plugin file to the instance.
6. Set the plugin file as *`active=true`*.
7. Place the `sign.crt` file in the Agent Client Collector's `cert` directory, which is located in the `config` folder.
   Alternatively:

   a. Navigate to the MID Server's `agent/static/cert` directory.

   b. Create a directory called *`customer`*.

   c. Place the `sign.crt` file in the `customer` directory.

8. In the `acc.yml` file, set `verify-plugin-signature` to **true**.

Add a self-signed certificate to your operating system's truststore

Add a self-signed certificate to the truststore of your operating system (OS). By adding a certificate to the truststore, you can verify that the certificate is authentic and that your connections are secure.

About this task

The procedure for adding a certificate to a truststore depends on the host's OS.

Adding a self-signed certificate to the truststore instructs the operating system to trust the certificate when it's establishing secure connections. This way, the applications can communicate securely with services that use the self-signed certificate. If you add a certificate that isn't trustworthy, you might compromise your system's security.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. On a Windows OS:

   a. Press the Windows button + R on your keyboard.
   The **Run** field opens.

   b. Enter the string `certmgr.msc` and press **Enter**.
   The Certificate Manager opens.

   c. Expand the Trusted Root Certification Authorities directory.

   d. Select and hold (or right-click) **Certificates**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Select **All tasks** > **Import**.
The Certificate Import Wizard opens.

f. Follow the steps in the Certificate Import Wizard.
For details, see Import a self-signed certificate.

Alternatively, you can add a Windows certificate using PowerShell by running the following command as an administrator:

```
Import-Certificate -FilePath <path to your certificate file>
 -CertStoreLocation Cert:\LocalMachine\Root
```

2. On a macOS:

a. Import the certificate into a keychain by running the following command in a terminal window:

```
bash

code:
sudo security add-trusted-cert -d -r trustRoot -k
 "/Library/Keychains/System.keychain" <path to your
 certificate file>
```

b. Enter the administrator password when prompted.

c. Open the Keychain Access application to verify that the certificate has been added.
A successfully added certificate is labeled as, **This certificate is marked as trusted for...plugin verification.**

3. On a Linux OS:

a. Prepare the self-signed certificate file as a Privacy Enhanced Mail (PEM) file.

b. Copy the certificate to the Certificate Authority (CA) directory, which is the directory where the certificates are stored.

- On a Debian/Ubuntu-based system, run the following command:

```
sudo cp <path to certificate
 file> /usr/local/share/ca-certificates/
```

- On a Red Hat/Fedora-based system, run the following command:

```
sudo cp <path to certificate
 file> /etc/pki/ca-trust/source/anchors
```

c. Update the CA certificates:

- On a Debian/Ubuntu-based system, run the following command:

```
update-ca-certificates
```

The command reads the certificate bundle in the `/usr/local/share/ca-certificates` directory, updates the certificate bundle, and stores it in `/ext/ssl/certs/ca-certificates.crt`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- On a Red Hat/Fedora-based system, run the following command:

```
sudo update-ca-trust extract
```

Result
Your self-signed certificate is on the OS that you are working with.

Import a self-signed certificate

Import a self-signed certificate in a Windows system by using the Certificate Import Wizard. The Certificate Import Wizard is required to complete the self-signed certificate import process on a Windows Operating System (OS).

Before you begin
Ensure that you have followed the procedure for importing a self-signed certificate in a Windows system, as described in Add a self-signed certificate to your operating system's truststore.

Role required: agent_client_collector_admin

Procedure

1. On the first page of the wizard, select **Next**.
   The truststore is typically located in the Trusted Root Certification Authorities directory of the certificate manager.
2. Browse to the location where you have the self-signed certificate file.
   The file is typically located in the agent's `config/cert` directory.
3. Select and hold (or right-click) the certificate file and select **Install certificate**.
4. Select **Next**.
5. Select the option to place the certificate in the Trusted Root Certification Authorities truststore.
6. Select **Next** and **Finish** to complete the wizard.

Result
The certificate is imported into the truststore.

What to do next
If a security warning appears, select **Confirm** to confirm the import.

Revoke Agent Client Collector certificates

Stop communication between the agent and ITOM cloud services by removing an Agent Client Collector certificate. For example, there might be a security breach due to which you want to stop communication by revoking the agent's certificate.

Before you begin
Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select the agent for which you want to revoke the certificate.
3. Select the **Revoke Agent Certificate** button.
4. Select the reason for certificate revocation.
   For a list and explanation of the available revocation reasons, see Agent Client Collector certificate revocation reasons.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **OK**.
   The agent's certificate is revoked and the ITOM cloud services layer has its certificate revocation list (CRL) updated.

Result
Communication between the agent and ITOM cloud services is stopped.

Related topics
Add a self-signed certificate to your operating system's truststore

Agent certificate rotation

The Agent Client Collector certificate is valid for two years and must be rotated before it expires to avoid issues with agent connectivity. When expiration is approaching, the agent initiates a certificate rotation request.

When an Agent Client Collector's certificate expiration is approaching, system properties verify that a valid certificate is in place when the existing certificate expires.

- *certificate-rotation-days-out*: Indicates the number of days before certificate expiration that an agent attempts to rotate its certificate. Configured in the `acc.yml` configuration file. Default = 28.
- *sn_agent.certificate_rotation_days_out*: Indicates the number of days before certificate expiration that the system accepts a certificate rotation request for a specific agent. Configured on the System Properties page (**All** > **System Properties** > **All Properties**). Default = 28.

Related topics
View the Agent Client Collector configuration file for an agent

Configuration file options

Run Certificate Discovery via Agent Client Collector for Visibility - Content

Discover TLS/SSL certificates used by ports running on the agent's server. The Certificate Inventory and Management application uses this information to manage TLS/SSL certificates.

Before you begin
Verify that the latest version of Agent Client Collector for Visibility - Content (ACC-VC) is installed.

Verify that the latest version of Certificate Inventory and Management is installed.

Role required: agent_client_collector_admin

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Enable the *TLS SSL Certificate Capture* policy.
3. Navigate to **All** > **System properties** > **All properties**.
4. To discover certificates on specific ports:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Locate and select the *sn_acc_vis_content.tls_ssl_scanner_ports* property.

b. Enter a comma-separated list of port numbers on which to scan for certificates in the **Choices** field.
By default, the values are identical to those values configured for the *tls_ssl_certs* property.

5. To discover certificates on all available open ports:
   a. Locate and select the *sn_acc_vis_content.tls_ssl_scan_all_open_ports* property.
   b. Assign the value **true**.
6. **Optional:** To store the original certificate in the instance, set the *sn_acc_vis_content.tls_ssl_keep_original* property to **true**.

Result

The Agent Client Collector collects the data and discovers the TLS/SSL certificates. This data is the same as what is gathered by the IP-based *tls_ssl_probe* property.

The TLS/SSL certificates are populated in the following tables:

- Discovered Certificates [sn_disco_certmgmt_certificate_history]
- Unique Certificates [cmdb_ci_certificate]
- Installed Certificates [sn_disco_certmgmt_cmdb_installed_certificate]

A CI relationship is created between the discovered certificates and the corresponding Host CI (in this case, the agent's server).

Related topics

Certificate Inventory and Management

Run Certificate Discovery via port scans

Collecting data from your system devices

Run a check command on your server or database to gather data from those devices. Depending on the check that is invoked, collected data may be monitoring data, visibility data, log data, or user metrics.

Policies

A policy consists of the Configuration Items (CIs) monitored by the Agent Client Collector, and the checks that run on those CIs. Policies define which checks to run, as well as when and on which CIs to run them.

Checks

A policy runs a set of checks. Each check is defined with the following attributes:

- Command to run
- Check type
- Command timeout
- Plugins to be used (`tar.gz` files that are securely and automatically downloaded to the agent)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Determining when checks run

Policy checks run based on one of the following scheduling models:

- Interval-based scheduling: The minimum number of seconds between each check run. For example:
  - An interval value is at least once per hour (at least once every 3,600 seconds).
  - The agent was down during the scheduled interval when the check was to run.
  When the agent is back up, it runs the check within one hour.

  If a check interval is less than one hour, the check is executed based on the indicated amount of time since the check's most recent run. For example, for a check scheduled to run once every eight hours:

  - The check runs at 00:00 (midnight)
  - The check runs again at 08:00 (8 AM)

  However, if the agent is down at 8:00 and is back up at 09:03, the check runs within an hour; that is, between 09:03 and 10:03. If the check runs at 09:57, the next run is at 17:57 (5:57 PM). In these cases, the check picks the running time at random to ensure running of once every eight hours.

  A check completes its run when the results are sent to the MID Server (in a MID deployment) or ITOM Cloud Services (ICS) Pod (in a MID-less deployment).

- Cron-based scheduling: Runs at fixed times or intervals (for example, every day at 6:00 PM or every two hours).

Determining where checks run

Policies monitor the configuration items (CIs) that are mapped to the agent hosts. To determine the specific CI types to be monitored, you can create filters. For details on configuring policy filters, see Create a service filter for a policy.

Updating policy mappings

When activating a policy, Agent Client Collector Framework maps monitored CIs to a policy. This policy mapping repeats every seven days after the initial mapping. Every 15 minutes (by default), the Agent Client Collector monitors the CMDB for any changes matching the filter conditions, and updates the mapping accordingly. To modify the frequency by which mapping between the CMDB and CI is updated, modify the sn_agent_sync_filters_interval_min property on the System Properties page (**All** > **System Properties** > **All Properties**).

Verify data collection in Agent Client Collector

Collect data by gathering essential information from an agent's host system before executing any checks or policies. This process ensures that the Agent Client Collector has accurate and up-to-date data on the infrastructure, processes, and applications running on the host.

Before you begin
Role required: agent_client_collector_admin

About this task
Collected data is stored as Configuration Item (CI) data, which serves as a foundation for monitoring, alerts, and Metric Intelligence in the ServiceNow® instance.

Before checks and polices can be executed, Agent Client Collector collects data on:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Host system details (such as hardware and the system's OS version)
- Installed applications and services
- Running processes
- Resource usage metrics (such as CPU, memory, and disk utilization)

Collected data is stored in the ServiceNow instance in either the CMDB (Configuration Management Database) or events table.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. On the Agent Client Collectors page, locate the **Host Data Collection** column for an agent. A green Collected icon Collected indicates successful data collection for the specific agent.

Create a new Agent Client Collector policy

Policies consist of the CIs monitored by the Agent Client Collector and the checks that run on those CIs. When creating a policy, you configure a filter which determines the CIs on which the checks are to run. For example, a policy to run checks on all Apache web servers. You can create new policies or edit the default policies.

Before you begin

Role required: agent_client_collector_admin

About this task

When associating a check definition with a policy, a copy of the definition is created as a check instance. These values appear on the **Check Instances** tab on the bottom of the **Policy** form. Any changes you make to a check instance affect only the instance in the policy; the original check definition remains unchanged. When changing the original check definition, the changes do not apply to already created check instances. It is recommended you make a copy of a check definition if you are changing its default parameters after having initiated one or more check definitions in a policy.

Some policy checks require credentials, while others do not. For example:

- The Agent Client Collector does not require credentials for checks that run on its own server. However, when accessing software requiring root or administrator access (such as MySQL), credentials are required.
- When the Agent Client Collector is used as a proxy:
  - Credentials must be invoked to allow the agent to connect to the remote device over SNMP or other protocols.
  - Increase the agent's *`cpu_percentage_limit`* value in the `acc.yml` file, as indicated in the blue box on the **Proxy Settings** tab.
- When the Agent Client Collector uses the HTTP endpoint:
  - If the URL does not require logging in (such as with a public website), no credentials are required.
  - If the URL does require logging in (such as with an API endpoint), credentials are required.

You assign a credential alias in the policy's **Credentials** tab, as described in the following procedure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Click **New**.
   The **Policy** page appears.
3. Enter values in the fields on the page, as described in the following table:

Policy Definition Form

Field	Description
Name	A descriptive name for the policy.
Description	Description of the policy.
Publish status	Hard coded as **Draft**, which means that the policy has not yet been published. You cannot edit this field.
Hierarchy	Hard coded as **None**. When a child policy is added to the policy, the value changes to **Parent**. Child policies have a value of **Child**.

4. On the **Monitored CIs** tab, select one of the following options:
   - **Manual calculation**: Select to exclude the policy from scheduled policy calculation, ignoring any changes to the policy's impacted CIs.

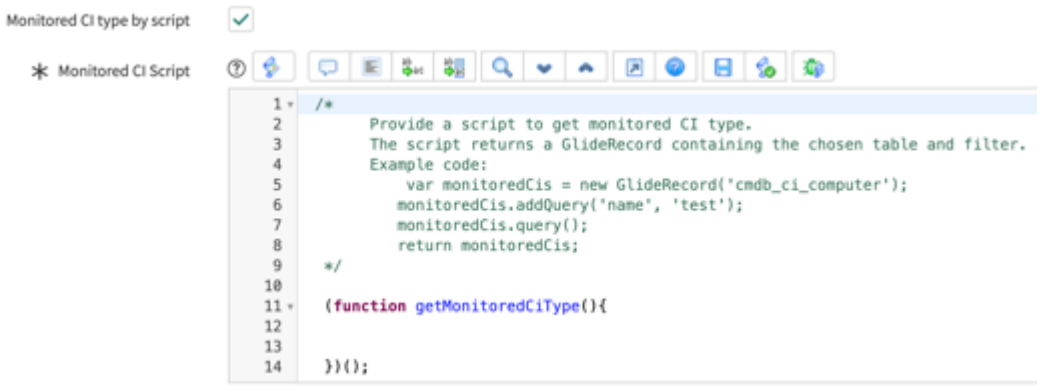
     Select this option when the policy monitors a single CI. Otherwise, the Refresh and Publish Monitoring Policies scheduled job takes an abnormally long time to complete.
   - **Monitored CI type by filter**: Configure the following sub-fields:
     - **Monitored CI type**: Select the CI type which you want the policy's checks to monitor.
     - **Filter**: Configure a filter so that the policy's checks monitor only CI types meeting the specified criteria. Included in the available criteria are a CI's **tags**.

Tags

   - **Monitored CI type by script**: Enables you to specify the monitored CIs using a script. Using a script allows you to create a CI filter for tables related to each other, and not just for a single table. For example, you can set a filter in both a Linux servers table and an Oracle table when searching for a CI. You return an object containing the table and filter at the end of the script.

     An example of a script appearing in the **Monitored CI Script** field is:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- **Monitored CI type by CMDB Group**: Enables you to specify the monitored CIs by using CMDB group queries. When selecting this option, the **Monitored CMDB group** field appears, where you select a CMDB group to associate with the policy.
  - For details on CMDB groups, see CMDB groups.
  - For details on building a CMDB query using the CMDB query builder, see Build a CMDB query using the CMDB query builder.

5. Select checks in the **Available** cell on the **Checks** tab, and move them to the **Selected** cell for them to be included in the policy.
   Checks can be selected multiple times, when you are monitoring more than one process. You can also select a group of checks in the **Filter checks by groups** field, which presents checks of the selected group in the **Available** cell.
6. **Optional:** Configure a proxy server on the **Proxy Settings** tab.

   (Optional) Configure a proxy server only when using the agent as a proxy to report data on remote machines. For details, see Configure an agent on a proxy server.
7. On the **Scheduling** tab, select one of the following:
   - **Interval-based scheduling**: Configure the time interval (in seconds) to indicate the frequency with which the policy's checks will run.
   - **Cron-based scheduling**: Enables configuring the policy to be active only during a specific time or time frames.

     a. Select the unlock icon (

) to enable selecting cron expressions.

     b. Select the search icon ( ) to select a cron expression. Select **New** to create a new cron expression, or select one of the cron expressions that come with the base system, which are:
     - Every hour nightly 5:00pm-7:00am
     - Every minute daily 8:00am-4:59pm
     - Every minute Mon-Fri 8:00am-4:59pm

     When creating a new cron expression, you must enter it in valid cron format.

     The specified cron expression operates in the time zone of the machine hosting the agent.

Note: If an **Interval** or **Cron** value was specified for the check definition, that value overrides the value configured in either of these fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. In the **How to send the check results** field, select the frequency with which check results are to be sent.
   - When event severity changes (default for event checks)
   - Always send check results (default for non-event checks)
   - Do not send check results
   - When the check results change
   - (Advanced) Based on exit codes of the check: Send results only if the exit code is 240 (OK), 241 (Warning), or 242 (Critical). However, if the command output is empty, then even if one of these codes are part of the exit code, check results are not sent.
9. On the **Credentials** tab, select one of the following:
   - **Credential name**: Select credentials to be assigned to the policy. The available credentials are those displayed on the associated check definition's **Check Secure Parameter Definitions** tab.
   - **Credential alias**: Select the search icon to select a credential alias to be used by the policy's checks to connect to the monitored CI. The available options are those created on the **Connection & Credential Aliases** page. For details on credential aliases, see Credential aliases for Discovery.
10. Click **Save**.
    The following buttons appear:
    - **Publish**: Publishes the Draft policy, moving its **Publish status** to **Queued**. A queued policy is processed by the policy publishing job. The job calculates which agents run the policy and then sends the policy to the relevant MID Servers. The job then moves the policy's **Publish status** to **Published**. A published policy is active on the agent.
    - **Delete**: Deletes the policy.

Related topics

Create a policy hierarchy

Create a policy hierarchy

Policies are attached to groups of related CIs. If you have a subgroup of related CIs, you can attach a new policy to the subgroup using a policy hierarchy, without creating the new policy from scratch.

Before you begin

Role required: agent_client_collector_admin

About this task

Policy hierarchy enables you to use a policy as a template to create a new policy, which is then attached to a subgroup of the original policy's CIs. The original policy is the **parent** policy, and the new policy is the **child** policy.

Note: You cannot create a child policy when a proxy agent is in place for the parent policy.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. On the **Policies** page, select a published policy with a Hierarchy value of either **None** or **Parent**.
3. Select the **Create Child** button at the top of the page or underneath the **Monitored CIs** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A new (child) policy opens with the same parameters as the original policy. The name of the policy is *<Policy name><date and time created>*.

Note: The child policy inherits the parent policy's parameters only when it is first created; there is no continuous inheritance from the parent to the child.

The following fields appear hard-coded with the indicated values:

Child policy fields

Field	Value
Publish status	Draft
Hierarchy	Child
Parent	<Name of the parent policy>

The **Order** field value indicates the priority by which the agent attaches itself to the policy. A lower number indicates higher priority, and each created child policy takes on a higher value than the policy preceding it. You can modify this value, as needed.

4. Modify the policy's parameters, as needed.
The following buttons appear on the child policy page:

Button	Description
Compare to Parent	Select to display the differences between the child policy and its parent policy.
Return to Parent	Select to leave the child policy page (without saving) and return to the parent policy.

The following buttons appear on the parent policy page:

Button	Description
Deactivate	Appears for an active policy. Enables you to select from the following: ○ Deactivate the parent policy and all of its child policies ○ Deactivate only the parent policy
Activate	Appears for an inactive policy. Enables you to select from the following: ○ Activate the parent policy and all of its child policies ○ Activate only the parent policy
Delete	Enables you to select from the following: ○ Delete the parent policy and all of its child policies ○ Delete only the parent policy

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Save**.
   Child policies appear on the **Child Policies** tab of the parent policy.

Edit a published policy

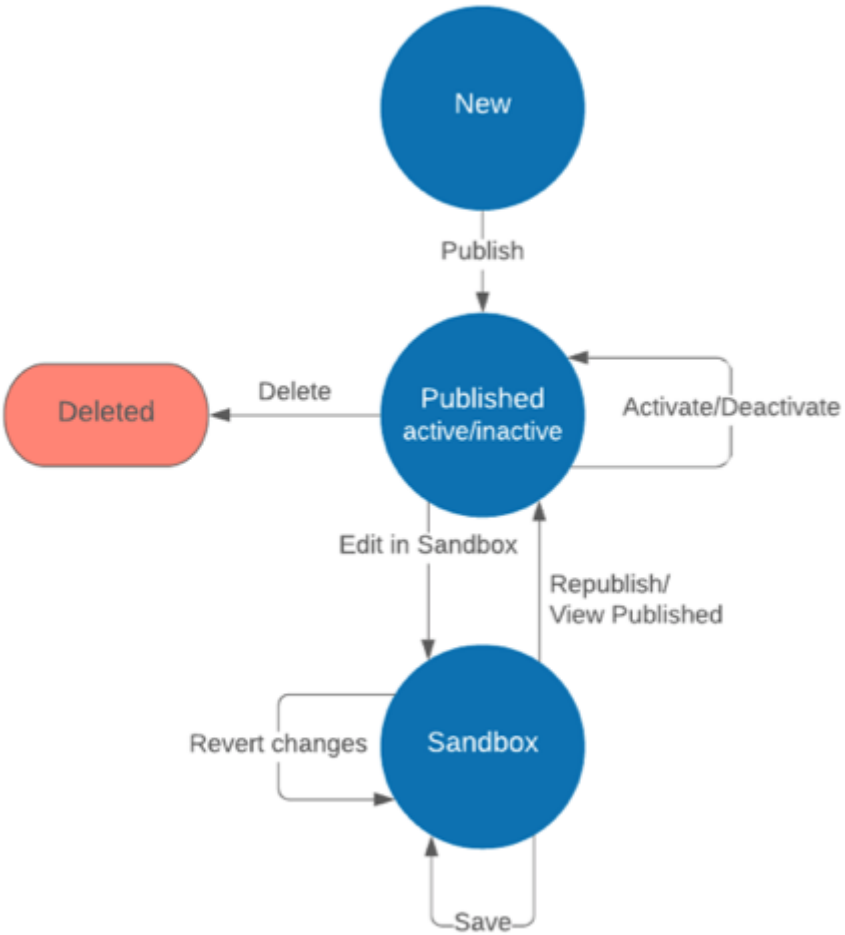
A policy with a status of **published** has been passed through the MID Server and sent to the agent. To edit a published policy, you must enable editing.

Before you begin

Role required: agent_client_collector_admin

About this task

You select a Published policy and then select the **Edit in Sandbox** option to enable editing of the policy. You edit the policy in the sandbox and then save, republish, or delete the policy, as needed. The following diagram illustrates the flow of editing a published policy:



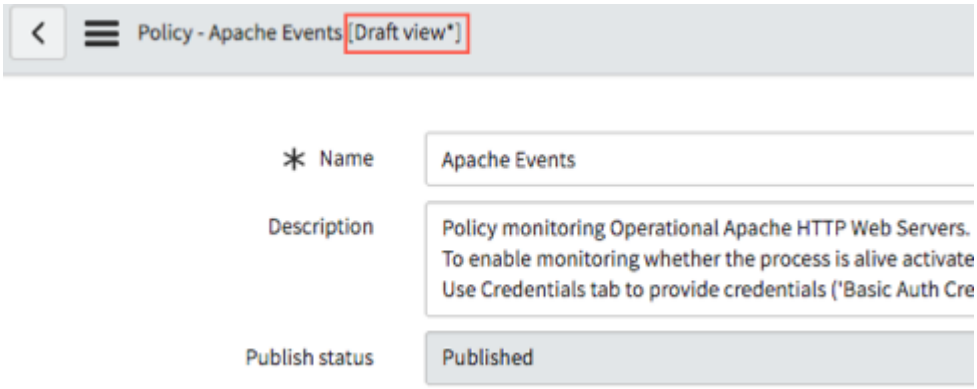
Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Click a policy for which the **Publish status** is **Published**.
3. Activate or deactivate the policy, as needed, by clicking the **Activate** or **Deactivate** button.
4. Select the **Edit in Sandbox** button.
   The policy is now in **Draft view**, and its fields are editable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- When you select this option, the policy's check instances are also editable.
- Although the policy is in **Draft view**, its **Publish status** remains **Published**.



While editing the policy's fields, you can select the following options, as needed:

Edit policy buttons

Button	Description
Revert All Changes	Reverts the changes you entered into the Sandbox policy fields to the most recently published values. The policy's **Publish status** returns to **Published**, and remains in **Draft view** for editing. This button appears only after entering updates into the Sandbox policy fields.
View Published	Returns to the most recently published policy. The policy returns to **Published** view.
Save	Saves the changes you entered into the Sandbox policy fields. The policy remains in **Draft view**, and the **Publish status** is **Published***. The asterisk indicates that the current published version is not the most up to date, since there are changes that have not yet been published.
Republish	Publishes the updates you entered into the Sandbox policy fields. The policy is saved with your updates and opens as the published policy. ○ The published policy's **Publish status** is set to **Queued** if the policy changes result in either: ▪ A change in which agents are running the policy (that is, a change to the monitored CI filter). ▪ A change in the policy's check instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Button	Description
	The policy's publishing job recalculates Queued policies and sends them to the relevant MID Servers. ○ The published policy's **Publish status** is set to **Ready to publish** if the changes to the policy do not require any agent recalculation (that is, a change to the policy interval). The policy's publishing job sends Ready to publish policies to the relevant MID Servers, without recalculating those policies. After the policy publishing job processes a policy, the policy **Publish status** moves to **Published**. This button appears only after entering updates into the policy fields, for a policy whose **Publish status** is **Published***.
Delete	Deletes the policy. This button appears only when viewing the published policy, and deletes both the Published and Sandbox policies.

5. Select checks in the **Available** cell of the Checks tab, and move them to the **Selected** cell for them to be included in the policy.
   Checks can be selected multiple times, when you are monitoring more than one process. You can also select a group of checks in the **Filter checks by groups** field, which presents checks of the selected group in the **Available** cell.
6. In the **Check Instances** table, view the check instances that are configured for the policy, or select a check instance to edit it.
7. On the **Agents** tab, view the agents that are executing the policy.

   The list of agents is calculated based on the monitored CIs.

   This tab appears only when viewing a published policy.

Create a service filter for a policy

Configure a service filter so that the policy monitors only those services that match the filter.

Before you begin

Role required: agent_client_collector_admin

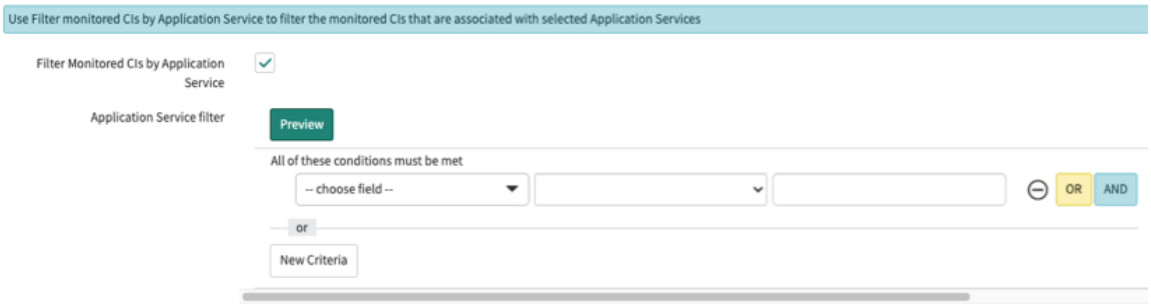
Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
   The **Policies** page appears.
2. Select a policy.
   The details page of the policy appears.
3. Select the **Edit in Sandbox** button to enable editing the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the Monitored CIs tab, select the **Filter Monitored CIs by service** check box.
   The **Application Service filter** section appears.

Application Service filter section



5. Configure conditions in the fields and select **Save** at the bottom of the page.
   The policy is configured with the indicated service filter. Only CIs matching the service filter are included in the policy's logs.

Export and import an Agent Client Collector policy

You can move a single or multiple Agent Client Collector policies from one ServiceNow instance to another by exporting the policy and then importing it into the target instance. Only published policies can be exported.

Before you begin

Ensure that you published the policies you want to export on the source instance.

Note: When working in a domain separated environment, imported policies are moved from the source instance domain to the identical domain on the target instance. Therefore, you must ensure that you have defined the same domains on the target instance as you have on the source instance, either by cloning the source instance or by exporting and importing domains from the source to the target instance.

Role required: agent_client_collector_admin

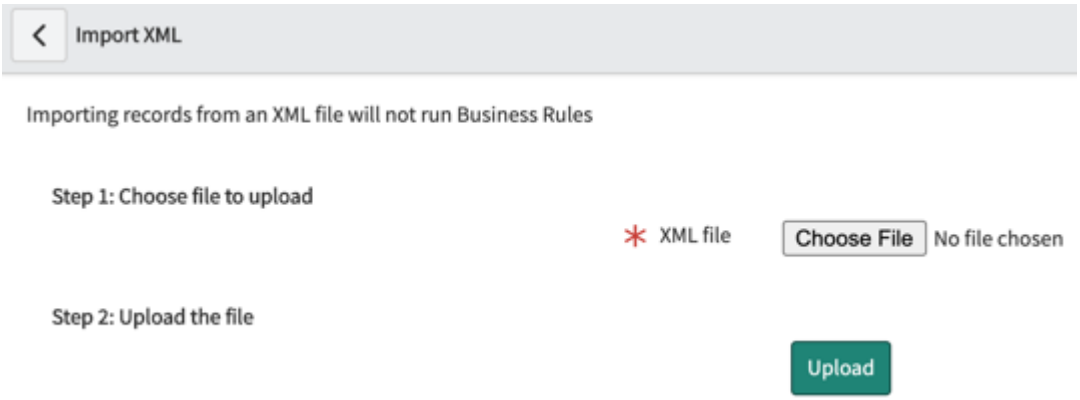
Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Select the check box of the published policies you want to export.
3. In the **Actions on selected rows...** list underneath the list of policies, select **Export policies**.
   A confirmation dialog box appears.
4. Click **Yes**.
   The selected policies are exported as an update set file in XML format, which is downloaded to your browser. The generated update set has the following name convention: `AccPolicyExport <Current Date and Time>`. For example, `AccPolicyExport 2020-08-11 15:35:05`.
5. Import the policy to the target instance.

   a. Navigate to **System Update Sets** > **Retrieved Update Sets**.
      The **Retrieved Update Sets** page appears.

   b. Right-click on one of the table headers and select **Import XML**.
      The **Import XML** page appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Click the **Choose File** button and select the previously downloaded update set to import.

d. Click **Upload**.

> **Note:** When the exported content is in a scope, the imported update set appears on the **Retrieved Update Sets** page as multiple records. The **Global** scope record is the parent, and the other records appear with the Global record as their parent update set. Only the Global update set record can initiate the import process.

e. Select the **Global** update set.

f. On the **Retrieved Update Sets** page, click **Preview Update Set Batch** to verify whether there are any conflicts with existing policies on the target instance.
Resolve any conflicts, as needed.

g. If no conflicts exist, click **Commit Update Set Batch** to validate and commit the update set.

h. Navigate to **Agent Client Collector** > **Policies** and verify that the imported policies appear on the Policies list.
The imported policies are synchronized with the relevant MID Servers on the target instance and are ready for immediate use.

> **Note:** The import process overrides any existing policies on the target instance and sets the imported policies to **Published**. However, draft copies of policies created on the target instance are not modified. Therefore, delete draft records of the imported policies after completing the import process, as these records are not synchronized with the published policies on the target instance.

Create and edit checks

You can select a check based on the type of entity (such as a server or an application) you want to monitor. You can view and edit the default checks or create new checks, as needed.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Check Definitions**.
2. Click **New**.
   The **Check Definition** page appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Using Ruby scripts in a Windows environment causes high CPU consumption.

3. Enter values in the fields on the page, as described in Agent Client Collector check definition page.
4. On the **Parameters** tab, enter parameter definitions, as needed.
   Parameters are used for the **Command** field when the Simple template is used, as described in Agent Client Collector check definition page.

   The information you can add for parameters is described in Check definition form parameters tab.

Test a check definition or check instance

When working with a check definition or check instance, you can test the check against its assigned agent to ensure that the check is configured properly.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Check Definitions**.
2. Select a check definition from the list.

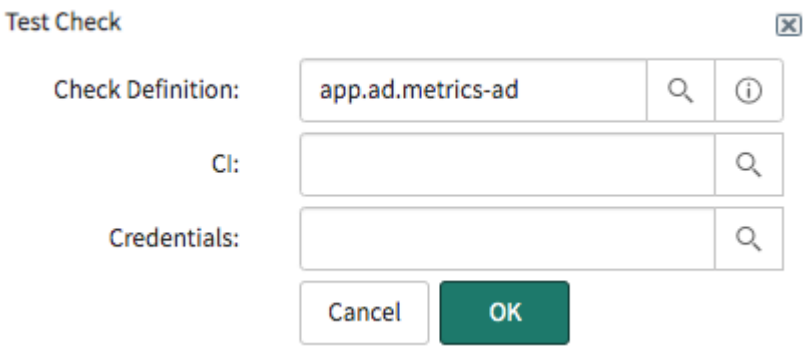
   Note: When running a Test Check in a check instance:

   a. Navigate to **Agent Client Collector** > **Policies**.

   b. Select a policy.

   c. Select a check instance in the policy.
   Continue with the following steps in this procedure.

3. In the **Related Links** section, click **Test Check**.
   The **Test Check** dialog box appears.



4. Configure the fields in the dialog box.

Test Check dialog box fields

Field	Description
Check Definition	Displays the name of the selected check definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
CI	Select the CI on which to run the check. The available options are those CIs which meet both of the following criteria: ○ Belong to the group specified in the **Check group** field. ○ Belong to an agent with **Up** status. If the **Check group** field is empty, the value defaults to **cmdb_ci_computer**.
Credentials	Select the credentials of the user whom you want the agent to connect with. This field appears only if you have configured secure check parameters on the **Check Secure Parameter Definitions** tab in the Check Definition.
Proxy agent	Select a proxy agent to be associated with the check. This field appears only when working with a check instance and when one of the options has been selected on the **Proxy Settings** tab in the instance's policy.

Create secure parameters for a check

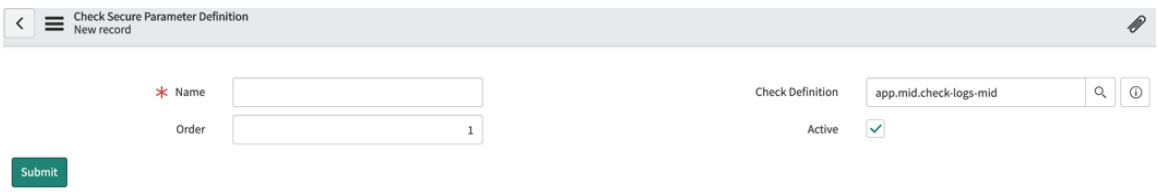
When creating a check definition or check instance, you can configure the parameters you want to be secured when the agent executes the check. During check execution, the secured parameters are obfuscated, securing their information. Only credential information is obfuscated.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Check Definitions**.
2. Select a check definition from the displayed list.
   The **Check Definition** page for the selected check appears.
3. Scroll to the bottom of the page and select the **Check Secure Parameter Definitions** tab.
4. Click **New**.
   The **Check Secure Parameter Definition New Record** page appears.



5. Configure the fields on the page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field Name	Description
Name	The name of the parameter, formatted as a reference prefix. For example, `cred_` is a reference prefix for the credentials table.
Check Definition	The name of the check definition connected to the parameter.
Order	A number indicating the order in which the parameter is sent to the check command/script. For example, if you configure the following parameters: ○ Name=**cred_user_name**, Order=**1** ○ Name=**cred_password**, Order=**2** The *username* parameter is sent first to the standard input, and the *password* parameter is sent second to the standard input. The *READ* command is performed first on the *username* parameter and then on the *password* parameter. You can then use *$username* and *$password* in your *Bash* script.
Active	Select the check box to activate the secure parameter.

6. Click **Submit**.
   The configured parameter appears in the table on the **Check Secure Parameter Definitions** tab.

   Repeat this procedure to enter multiple secure parameters.
7. Enter the secure parameters into the **Command prefix** field of the check definition.

Create a check type

Create a check type to execute the `osquery` command on the Agent.

Before you begin

Role required: agent_client_collector_integration or agent_client_collector_admin

Procedure

1. In an Event Management instance, enter `sn_agent_check_type.list` into the navigation bar.
   The **Check Types** page appears.
2. Click **New**.
   The `Check Type - New Record` page appears.
3. In the **Name** field, enter `osquery`.
4. In the **Instance Script** field, enter the following script:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
for (var index = 0; index < checkResults.length; index++) {
var check = checkResults[index].check;
gs.info('result ' +
index + ': requestId: ' +
check.requestId + ' agent_name: ' +
checkResults[index].agent_id +
' ci_id: ' + check.ci_id +
' status: ' + check.status +
' output: ' + check.output);

}
```

You can modify this script, as needed, but this initial script helps you to verify that your setup was successful.

5. Click **Submit**.

Create a check definition

Create a check definition to execute the `osquery` command on the Agent.

Before you begin

Role required: agent_client_collector_integration or agent_client_collector_admin

Procedure

1. In an Event Management instance, navigate to **Agent Client Collector** > **Check Definitions**.
2. Click **New**.
3. In the **Name** field, enter `util.osquery`.
4. In the **Check type** field, enter `osquery`.
5. In the **Command** field, enter the following script:

```
osqueryi  --logger_min_status 1 --json
 "{{.labels.params_query}} "
```

6. In the **Plugins** field, enter the `osquery` plugin.
7. In the **Parameters** section, enter the following values for a check parameter definition.

Column	Value
Name	query
Default value	select * from logged_in_users
Mandatory	true

8. Click **Test check** and select one of the available agents.
   The test result appears, indicating its success or failure.

Enable checks from the community for Agent Client Collector

You can take checks from the github community and customize them for use in the Agent Client Collector (ACC), or you can compose your own scripts. Create a plugin with the customized Sensu check and install it on a ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Copy a check from the github community to your local machine.
2. Create a `tar.gz` file to be appended to your plugin:
   a. Create a folder on your local machine.
   b. Create a sub-folder called `bin`.
   c. Place the checks you want to run (scripts and executables) in the `bin` folder.
   d. In a Linux environment, give executable permissions to the checks by running *`chmod +x filename`* on each of the checks.
   e. Navigate to the parent folder (above the bin folder).
   f. In a Linux environment, run the *`tar -C <parent_folder_name> --zcvf <my_plugin_name>.tar.gz *`* command.
   In a Windows environment, use an archiving utility that supports the `tar.gz` format.
   g. In a Windows environment, ensure that you include the following scripts in the `bin` folder:
      - A batch script configured to run on the check command and initiate the run. For example, *`powershell <%~dp0>\test.ps1`*

        The *<%~dp0>* variable directs to the drive (*d*) and path (*p*) of the batch file.
      - The relevant script (for example, `test.ps1`) to be executed in the batch script.
3. Create a new ACC plugin, as described in Create and edit Agent Client Collector plugins.
4. Test the new plugin.
   a. Create a new check definition for the customized Sensu check.
   For details, see Create and edit checks.
   b. On the **Check Definition** page, navigate to the **Related Links** section and select **Generate allow list content**.
   c. Copy the entries you want to include in the allow list and add them to the agent's `check-allow-list.json` file, either manually or using an automation tool.
   The location of this file is indicated in the `allow-list` parameter of the agent's `acc.yml` file.
   d. Create a new policy and add the newly created check definition.
   For details on creating a policy, see Create a new Agent Client Collector policy.
   e. Select the check definition and in the **Related Links** section, select **Test check**.
5. Enable credentials when testing a check:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Connections & Credentials** > **Credentials**.

b. Click **New**.

c. Select the type of credentials you want to create.
For details on creating credentials, see Create a Connection and Credential alias.

d. Enter values in the fields on the page to assign credentials to your selected credential type.

e. Click **Submit**.

6. Create secure parameters for your check, as described in Create secure parameters for a check.

Verify agent functionality

Verify that an agent is running properly by performing a self-test on the agent. If one or more of the tests fail, you can diagnose the agent problem and view a potential resolution.

Before you begin
Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select an agent that is running (**Status = Up**).
3. In the **Related Links** section, select **Run self-test**.
4. The **Agent Self Test Runs** page appears, displaying the previous self-tests run on the agent. If the current test doesn't appear, refresh the page.
5. Hover next to the entry for the current test and select the info icon .
The **Agent Self Test Run** pop-up window appears.
