6. Select **Open Record**.
The Agent Self Test Run page appears, displaying information on the self test.
7. In the **Agent Self Test Results** table at the bottom of the page, locate a test with **Status = Fail**.
8. Hover next to the entry for the failed test and select the info icon .
The **Agent Self Test Results** pop-up window appears.
9. Select **Open Record**.
The Agent Self Test Results page appears, displaying information on the failed test.

Result
In the **Agent Self Test Logs** table on the bottom of the page, you can view the level of the failed test (ERROR or WARNING), and a resolution for the failed test.

View the agent feature matrix

The agent feature matrix displays the availability of Agent Client Collector features. The matrix displays data in a graph and a table.

Before you begin
Role required: agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

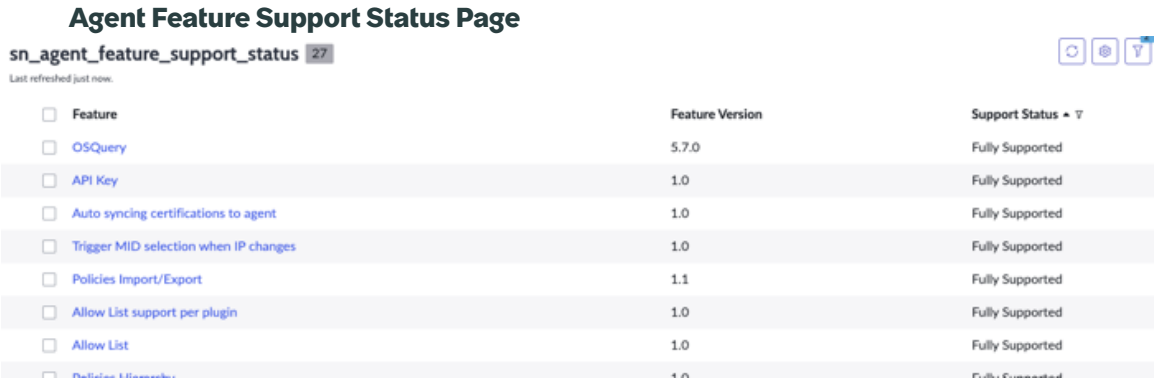
The agent feature matrix displays the granularity of Agent Client Collector features that are fully supported, partially supported, and not supported. A partially supported feature may have instance and framework requirements met, but runs on at least one agent version which does not meet the feature requirements.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agent Feature Matrix**.
   The **Agent feature matrix** appears.

   The matrix shows the support status of Agent Client Collector features that are fully supported, partially supported, and not supported (Unsupported).

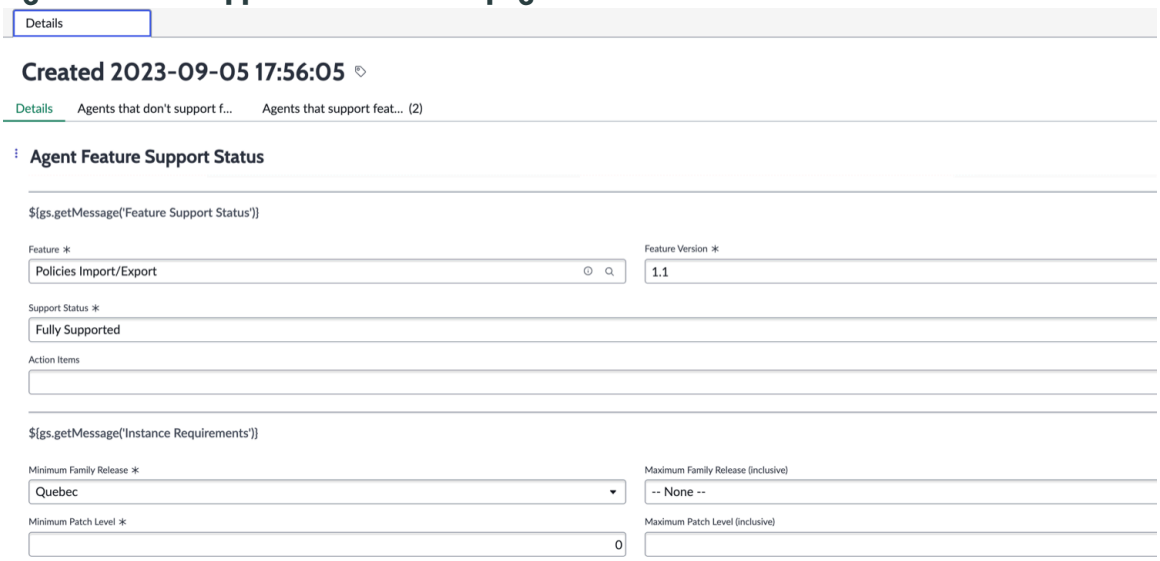
2. Select one of the categories on the graph.
   A list of all features in the category appears on the **Agent Feature Support Status** page.



3. Select one of the features.
   The **Agent Feature Support Status** page for the specific feature appears:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Feature Support Status Details page



The page displays the following:

- Sections indicating the support status of the feature, and the various instance requirements of the feature. The **Action Items** field displays the actions you need to take to fully support a feature that is either partially supported or unsupported.
- Instance requirements and agent framework version requirements that have been met by the agent feature.

View agent errors

Agent Client Collector (ACC) errors are visible in logs related to the agent and the ServiceNow instance. This feature provides improved visibility of agent errors, enabling faster error resolution.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agent Issues**.
   The **ACC Error Messages** page appears and lists the agents containing errors.

   The following columns display the indicated information about the errors.

ACC Error Messages page

Column	Description
CI ID	The name of the agent containing the error, or a configuration item (CI) with an issue.
Code	Error code assigned to the issue.
Message	A message describing the error.
Source application	The application triggering the error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

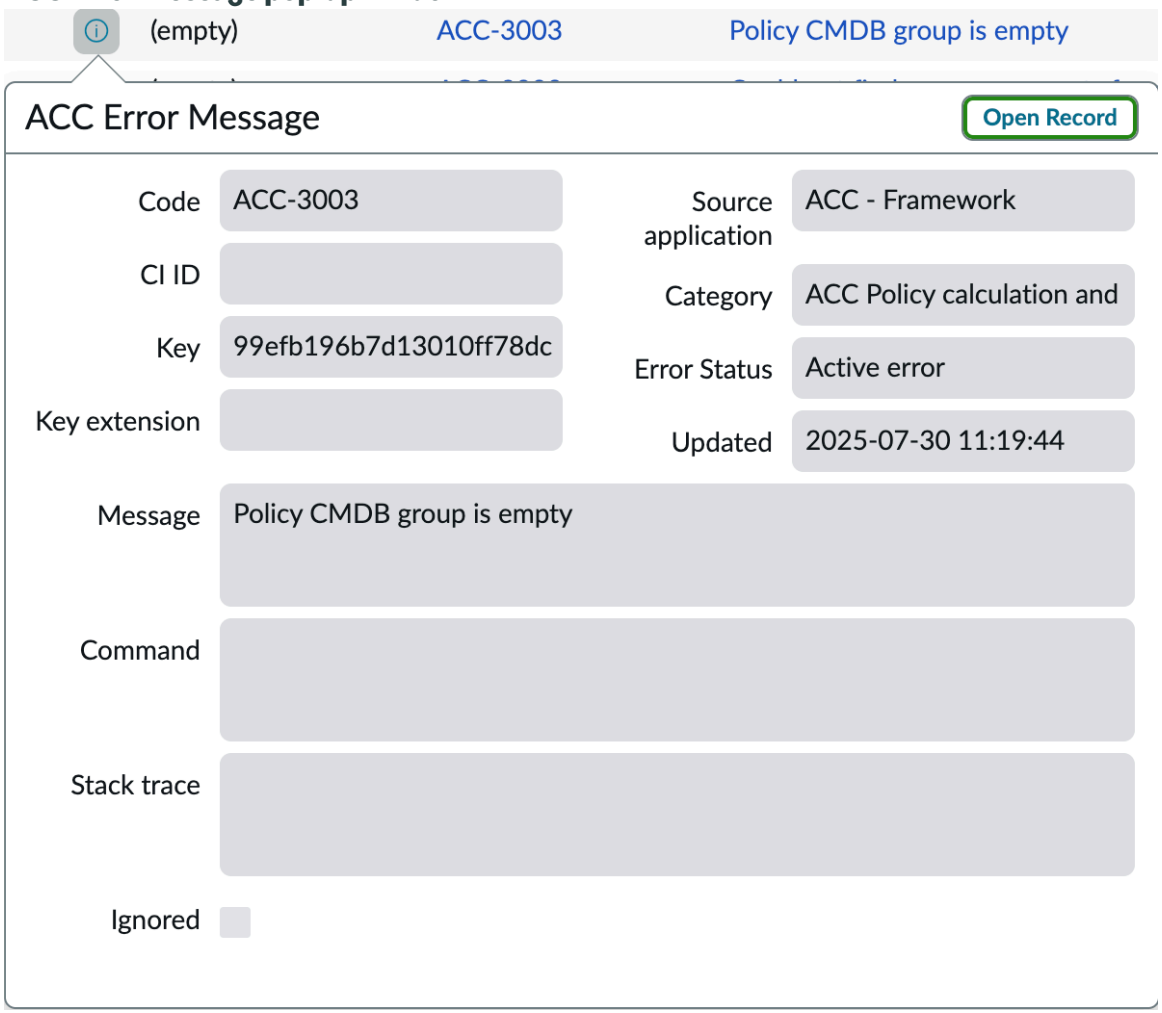
Column	Description
Error status	Indicates the state of the error: **Active** or **Resolved**.
Category	The error category which the error is classified under.
Key	Internal value used to identify the error. For data collection errors, specifies the **agent_id** value.
Key extension	Internal value used to identify the error. For check execution errors, specifies the check name.
Command	The command executed when the error occurred (if applicable).
Stack trace	A reference to the **ecc_queue** record that was processed and triggered the error (if applicable).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Not all columns are visible by default on the page.
- Select the info icon (ⓘ) next to an error to view a pop-up window with full information about the error.

ACC Error Message pop-up window



The info icon is visible when hovering under the search icon (🔍) next to the error entry.

2. **Optional:** To view errors for a specific agent:

   a. Select **All** > **Agent Client Collector** > **Agents**.
   The **Agent Client Collectors** table appears.

   b. Select an agent.

   c. Select the **Automation Error Messages** tab at the bottom of the page to view errors relating to the agent.

Result
If an error causes an agent's registration to fail, the agent's **Status** column displays **Registration Failure** on the Agent Client Collectors page (**All** > **Agent Client Collector** > **Agents**).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using Agent Client Collector logs

Use Agent Client Collector logs to track events in your system. Log levels indicate the severity of each event.

Configure Agent Client Collector log levels

You configure the log levels that you want the Agent Client Collector logs to contain. All events that match or exceed the specified log level display in the Agent Client Collector logs.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Specify the desired log level in the `acc.yml` configuration file.
   Alternatively, you can specify the log level as an argument in the `--loglevel` command-line flag, as follows:

   ```
   acc start --log level debug
   ```

2. Restart the agent using the service manager:
   - **Linux**:

     ```
     sudo service acc restart
     ```

   - **Windows**:

     ```
     sc.exe stop AgentClientCollector
     sc.exe start AgentClientCollector
     ```

   - **macOS**:

     ```
     sudo launchctl load
      -w /Library/LaunchDaemons/com.sn.acc.plist
     ```

   Note: You must restart the service after changing the log level.

View the Agent Client Collector logs

You can view the activity logs for an Agent Client Collector.

About this task

Agent Client Collector logs are accessible from:

- **Linux**: `/var/log/servicenow/agent-client-collector/acc.log`
- **Windows**: The location specified by the `log-file` configuration flag. The default location is: `C:/ProgramData/ServiceNow/agent-client-collector/log/acc.log`

  If the `C:/ProgramData` directory is hidden (such as on older Windows versions), change the Explorer filter to show hidden elements.

- **macOS**: The default location is: `/Library/Application\ Support/servicenow/agent-client-collector`

Before you begin

Role required: agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
   The **Agent Client Collectors** page opens.

Agent Client Collectors page

   The displayed columns are those selected when clicking the Settings icon .

   The **Host** column indicates the host name of the agent.

   The **Class** column indicates the agent's CI type.

2. Select an agent.
   The **Agent Client Collector** page opens.
3. In the **Related Links** section, click **Grab Agent Log**.
   The **Queues** page opens for the selected Agent.
4. Refresh the page and click the relevant entry with the value **Queue = input**.
   The **Payload** section on the **Queue** form displays the log for the Agent Client Collector.

Enable log monitoring in a Linux environment

Enable log monitoring in a Windows environment

Set the agent log level

Configure the agent log level directly from your ServiceNow® instance, without needing to access the `acc.yml` configuration file.

About this task

Configuring the agent log level from the instance changes the log level temporarily, and doesn't update the log level in the `acc.yml` configuration file. When restarting the agent, the log level reverts to its status as set in the `acc.yml` configuration file.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select an agent.
3. In the related links, select **Set Log Level**.
4. In the Set Log Level dialog box, select the log level to invoke for the agent, and select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Reset the log level to its originally configured level by doing one of the following actions:
   - In the related links, select **Reset Log Level**.
   - Restart the agent.

Enable metrics collection and evaluation

To enable a ServiceNow instance to collect and evaluate metrics, you must create a distributed MID Server cluster, associate MID Servers with the cluster, and enable Metric Intelligence for your MID Server.

Before you begin

Ensure that the following plugins are installed on your instance:

- Event Management (com.glideapp.itom.snac)
- Metric Intelligence - com.snc.sa.metric plugin
- MetricBase

To verify that the MetricBase plugin has been installed correctly:

1. Enter `stats.do` in the instance navigation pane.
2. Search for the **MetricBase Statistics** section and verify that the following appears:
   - Status: ONLINE
   - Name: clotho

Role required: agent_client_collector_admin

Procedure

1. Create a distributed MID Server cluster in your instance:

   a. Navigate to **MID Server** > **Clusters**.
   The MID Server Clusters page opens, displaying the list of configured MID Server clusters.

   b. Click **New**.
   The **MID Server Cluster - New record** page opens.

   c. In the **Name** field, assign a descriptive name for the cluster.

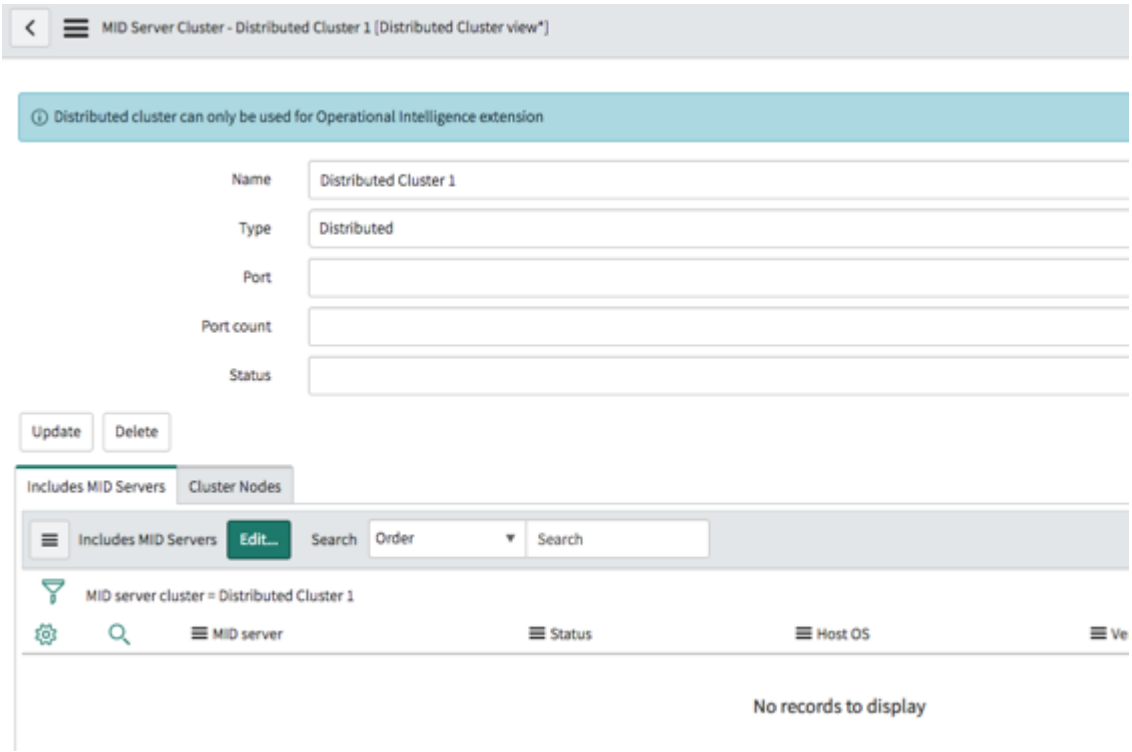
   d. In the **Type** field, select **Distributed**.

   e. Click **Submit**.
   The distributed MID Server appears on the MID Server Clusters page.

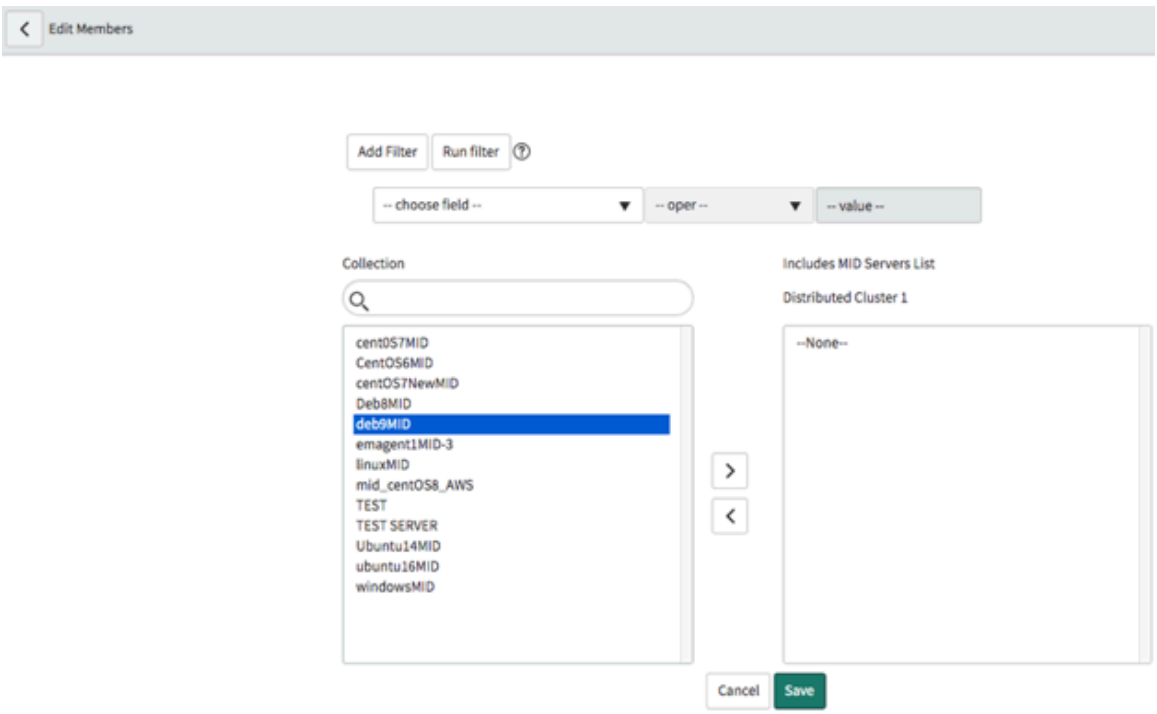
2. Assign MID Servers to the distributed MID Server cluster:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the MID Server Clusters page, select the distributed MID Server cluster.
The following page appears:



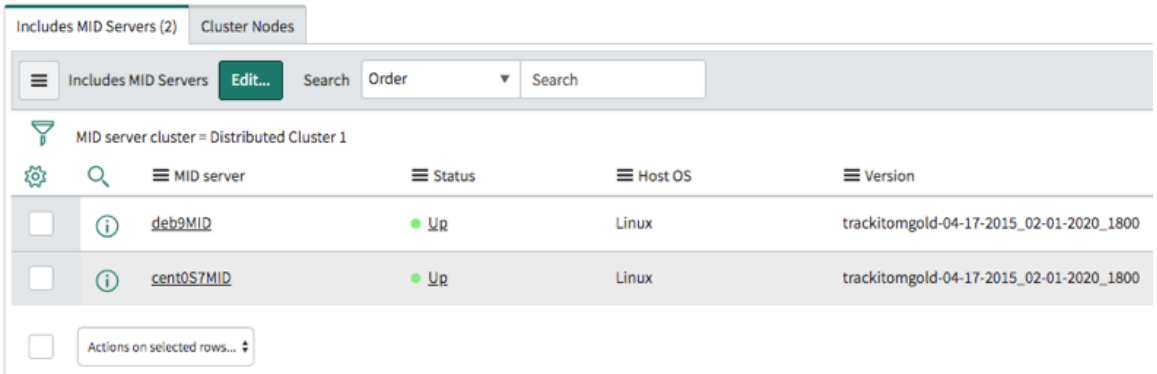
b. On the **Includes MID Servers** tab, click **Edit**.
The **Edit Members** page appears.



c. Select the relevant MID Servers from the left cell and click the right arrow button to move them to the right cell.
In a staging environment, it is acceptable to have only one MID Server in the cluster.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

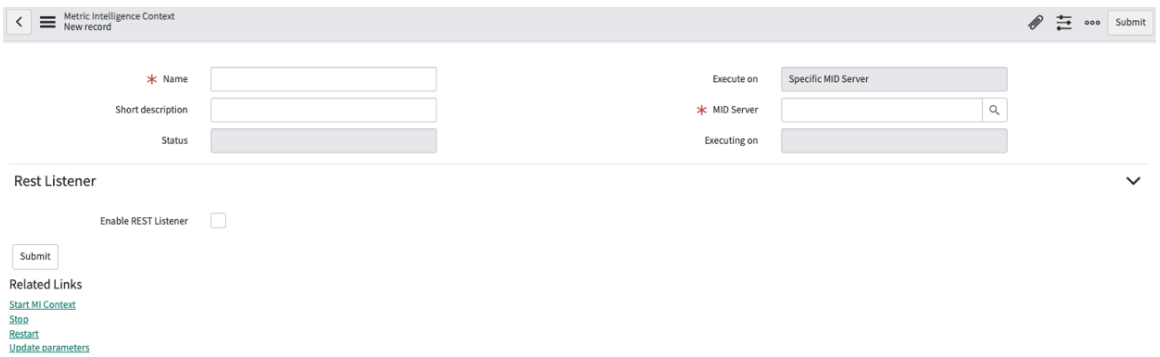
d. Click **Save**.
The **Includes MID Servers** tab displays the MID Servers that are part of the cluster.



3. Enable Metric Intelligence for your MID Server:

a. Navigate to **MID Server** > **Extensions** > **Metric Intelligence**.
The **Metric Intelligence Metrics Contexts** page appears.

b. Click **New**.
The **Metric Intelligence Contexts - New record** page appears.



c. In the **Name** field, enter a descriptive name for the Metric Intelligence metrics extension.

d. In the **MID Server** field, select the MID Server to which you want to associate the Metric Intelligence metrics extension.

e. Select the **ACC Dedicated MID** check box to assign the specified MID Server as the only MID Server in the distributed cluster.
Selecting this option helps conserve system resources and memory.

f. In the **Related Links** section at the bottom of the page, click **Start**.
A message appears, indicating the status of the extension.

g. Click **Submit**.

h. Click **Start**.

Limit metrics collection and evaluation

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Limit metrics collection and evaluation

You can limit the metrics you send from the MID Server to the instance, either by de-activating a specific CI or an entire CI type.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. To limit metrics collection and evaluation for specific CIs:

   a. Navigate to **Event Management** > **Anomaly Detection** > **Metric to CI**.
   The **Metric to CI Mappings** page appears.

   Note: The Metric to CI Mapping is identified by both its metric identifier and its configuration item.

   b. To prevent sending metrics for a specific metric and CI, set the value of the **Active** column to **false**.

2. To limit metrics collection and evaluation for an entire CI type:

   a. Navigate to **Event Management** > **Anomaly Detection** > **Metric Types**.
   The **Monitoring System Metric Types** page appears.

   b. To prevent sending metrics for a metric type, set the value of the **Active** column to **false**.

Configure the Google Cloud Platform (GCP) configuration data file

Configure the Google Cloud Platform (GCP) configuration data file to monitor metrics in your GCP environment.

Before you begin

Role required: agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The GCP configuration data file is a .json file which contains all of the metrics collected from your GCP environment. Metrics that you add to the *acc_gcp_metrics_list.json* file are monitored by the check to which the file is attached.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Configuration Files**.
2. Locate the *acc_gcp_metrics_list.json* configuration file.
3. Download and add the GCP metrics to the configuration file that you want to be monitored. For details on the available GCP metrics, see Google Cloud Platform (GCP) metrics.
4. Select the Manage Attachments icon ( ) to attach the updated configuration file.

Configure the action level for anomaly detection

Create a configuration setting rule that refines the level of anomaly detection processing and analysis that is applied to specific CIs and metrics. Set a processing level that reflects the importance of metrics at different stages of implementation, to reduce data load if needed.

Anomaly detection consists of multiple levels of processing. At the lowest level, metric data is gathered from data sources. At the highest level, statistical models are created, anomaly scores are calculated, and anomaly alerts and IT alerts are created. You can apply the full anomaly detection process or a reduced level of processing, for specific data series.

Use the *anomaly_detection_action_level* configuration setting in a configuration setting rule to set the level of processing for specific CIs and metrics. For example, you can initially set only a small percentage of CIs and metrics to generate anomaly alerts, and later increase that percentage.

Action levels

The *anomaly_detection_action_level* configuration setting provides action levels starting at 'Metrics only' for basic anomaly processing, and ending at 'IT Alerts' for full processing and analysis.

Action levels from lowest to highest:

Metrics Only

Only gather metrics from the data source without any further processing.

Bounds

'Metrics Only' processing level and in addition creates statistical model and show bounds in Insights Explorer.

Anomaly Scores

'Bounds' processing level and in addition calculates and display anomaly scores.

Anomaly Alerts

'Anomaly Scores' processing level and in addition creates anomaly alerts as applicable.

IT Alerts

'Anomaly Alerts' processing level and in addition creates IT alerts which are based on anomaly alerts, as applicable.

Create Azure policies for metric collection

Create your own policies to enable Azure to collect the metrics for the resources that have policies that don't come with the base system. The Azure Metrics Collector check brings the metrics to the agent through the Azure Metrics Batch API.

Before you begin

- Ensure that the configuration Items (CIs) that you want to collect the metrics for are included in the CMDB. CIs are typically populated during Discovery.
- Ensure that the *sn_agent.multi_ci_dev_mode* property is set to **true** on the **System Properties** page (**All** > **System Properties** > **All Properties**).

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Policies**.
2. Select **New**.
3. Select the application scope icon and verify that you are in the Agent Client Collector Monitoring scope.
4. In the **Name** field, enter a name for the policy.
5. Configure a filter that determines which CIs are to be monitored by the policy by selecting the **Monitored CIs** tab and the **Monitored CI type by filter** check box, as described in the following table.

Monitored CIs filter

Option	Action
Monitored CI type	Select the CI type to be monitored. The CI type must match the resource that you entered in the .json script file that contains the metrics to be monitored.
<Filter fields>	Configure the conditions that must be met for the resources in the specified Monitored CI type to be monitored. Ensure that you set the following conditions: ○ **Object ID** = <name of the resource entered in the .json script file that contains the metrics to be monitored> ○ **State** = Available The Available state indicates that resources must be available to be monitored.
Preview	Select to view the number of resources that match the specified condition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Action
	The number of matching results appears next to the **Preview** button. Select the result to view all CI records that match the condition.

6. Add the Azure Metrics Collector check to the policy.
   a. On the **Checks** tab, locate the **Azure Metrics Collector** check in the **Available** cell.
   b. Select the right arrow button to move the check to the **Selected** cell.
7. Configure a proxy server to access the Azure metrics.
   a. On the **Proxy Settings** tab, select **Single proxy agent**.
   b. In the **Proxy agent** field, select the proxy agent to execute the policy and retrieve the Azure metrics.
8. Configure the credentials for the policy.
   a. Select the **Credentials** tab.
   b. In the **Credential name** field, select the **azure_metrics_collector**.
9. Select **Save**.
10. Add secure parameters to the check instance.
    a. In the policy's **Check Instances** section, select the **Azure Metrics Collector** check instance.
    b. On the **Check Secure Parameters** tab, select **New**.
    c. Add the secure check parameters that are described in the following table.

Secure check parameters

Name	Order value
cred_tenant_id	1
cred_client_id	2
cred_secret_key	3

Ensure that the **Active** check box is selected for each parameter.

    d. Select **Update**.

11. Add the `.json` configuration file to the check instance.
    The file sends the list of Azure resources to the agent.
    a. Select the Azure Metrics Collector check instance.
    b. Select the **Check Parameters** subtab.
    c. Select **New**.
    d. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check Parameter form

Field	Description
Name	Descriptive name for the `.json` file to be added to the instance's configuration files (**Agent Client Collector** > **Configuration Files**).
Value	String that indicates the name of the `.json` file. For example: `acc_azure_vm_metrics_config.json`
Flag	Value that you enter (**-c**) to indicate that the check retrieves the name of the configuration file. The configuration file contains a namespace and a list of metrics. The value must indicate the name of the file that was uploaded to the list of configuration files (**Agent Client Collector** > **Configuration Files**), in `.json` format. For example: `acc_azure_vm_metrics_config.json`.

Ensure that the **Active**, **Mandatory**, and **Value required** check boxes are selected.

e. Select **Submit**.

12. Create a `.json` file that indicates the metrics that you want your policy to monitor.

The following example displays a `.json` file for retrieving load-balancer metrics.

acc_azure_static_ms_lb_config.json

```
{
  "namespace": "Microsoft.Network/loadBalancers",
  "metrics": [
        "AllocatedSnatPorts",
        "ByteCount",
        "DipAvailability",
        "PacketCount",
        "SnatConnectionCount",
        "SYNCount",
        "UsedSnatPorts",
        "VipAvailability"
  ],
  "time_grain": "PT1M"
}
```

Add the `.json` file to the list of configuration files at **Agent Client Collector** > **Configuration Files**.

13. Create a .json file to indicate the resources that you want your policy to monitor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the **Proxy Settings** tab, select **Multi-CI Mode**.

b. Copy a script from one of the Azure cloud policies that comes with the base system.
   - Cloud policies that come with the base system are described in Create Azure policies for metric collection.
   - The script is located in the **Config file creation script** field of the policy's **Proxy Settings** tab.

c. Paste the script into the **Config file creation script** field of your policy.

d. At the end of the script, configure the *resource_id*, *region*, and *sys_id* parameters with the values of the CI that you want the policy to monitor.

14. Select **Save** and then publish the policy by selecting **Publish**.

Result
The configured policy retrieves the resources and their metrics from the specified Azure CI and sends them to the agent.

Block event creation for non-existent entities

Invoke the *skip_events_for_nonexistent* parameter to block event creation when specific process, service, or log does not exist. Invoke this parameter if you do not want to be notified about these non-existent entities.

Before you begin
Role required: agent_client_collector_admin

About this task
A process, service, or log does not exist when the following checks do not contain valid values for the indicated parameters:

Check parameters

Check	Parameter
os.linux.check-process	*file_pid*, *daemon_name*
util.check-windows-service	*service*
os.windows-check-log	*file*
util.checks-logs	*file*
util.checks-logs-sudo	*file*

Procedure
1. Navigate to **All** > **Agent Client Collector** > **Configuration** > **Check Definitions**.
2. Locate the check definition for which you want to block events.
3. On the **Check Parameter Definitions** tab, select *skip_events_for_nonexistent*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the **Active** check box to enable the parameter and prevent alert creation when the process, service, or log isn't located for the specified check.
   If you want to receive notification about the missing process or service, leave the *skip_events_for_nonexistent* parameter with its default value of **false**.

Enable viewing HAProxy metrics

Configure the HAProxy metrics stats page to enable monitoring your system devices by viewing HAProxy metrics.

Before you begin

Role required: agent_client_collector_admin

About this task

HAProxy provides load balancing and reverse proxy capabilities for both HTTP and TCP requests. The HAProxy checks remove backend servers that fail several health checks in a row, and transfer incoming traffic to backend servers as part of load balancing.

Procedure

1. Access the HAProxy configuration file, located at: `/etc/haproxy/haproxy.cfg`.
2. Add the following to the bottom of the file:

```
listen frontend *:8080       #Haproxy
Monitoring run on port 8080
mode http
option forwardfor
option httpclose
stats enable
stats show-legends
stats refresh 5s
stats uri /stats        #URL for HAProxy monitoring
stats realm Haproxy\Statistics.   #Title for pop up window
stats auth admin:admin     #User and Password for login to the
 monitoring dashboard
stats admin if TRUE
default_backend backend       #This is optional for monitoring
 backend
```

3. Run the following command to restart the HAProxy:
   `sudo service haproxy restart`
4. View the HAProxy metrics on your system by viewing the HAProxy metrics stats page, accessible from the following URL:
   `http://<HAProxyServer>:8080/stats`

Enable Apache Kafka health monitoring

Set configurations in the Apache HTTP server application to enable the Agent Client Collector to perform Apache Kafka HTTP server monitoring.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Enable Java Management Extensions (JMX) for Kafka metric collection by running the following command:

```
Environment="JMX_PORT=9999"
```

- Role required: agent_client_collector_admin

Procedure

1. Enable collecting Apache Kafka performance metrics using Java Management Extensions (JMX) by running the following command:

```
JMX_PORT=9999 bin/kafka-server-start.sh config/server.properties
```

2. Configure the admin server port by modifying the port number of the admin.serverPort property in the zookeeper.properties file.
   The default port is 8080.

Enable running of Varnish checks

Use application fingerprints to discover the Varnish CI, to enable running Varnish checks.

Before you begin

Role required: discovery_admin

Procedure

1. Navigate to **All** > **Discovery** > **Home**.
2. Select the **Application Fingerprints** tile.
   The **Application Fingerprints** dashboard appears.
3. Select the **All Suggested Applications** tile.
4. On the Application Suggestions page, select the **varnishstat** entry in the **Suggested Group Name** column.
   The varnishstat details appear on the Application Suggestion page.
5. Select Discover Application.
   Discovery locates an application CI for the varnishstat entry. The CI appears on the Application Fingerprints dashboard in the **Created Applications** section.

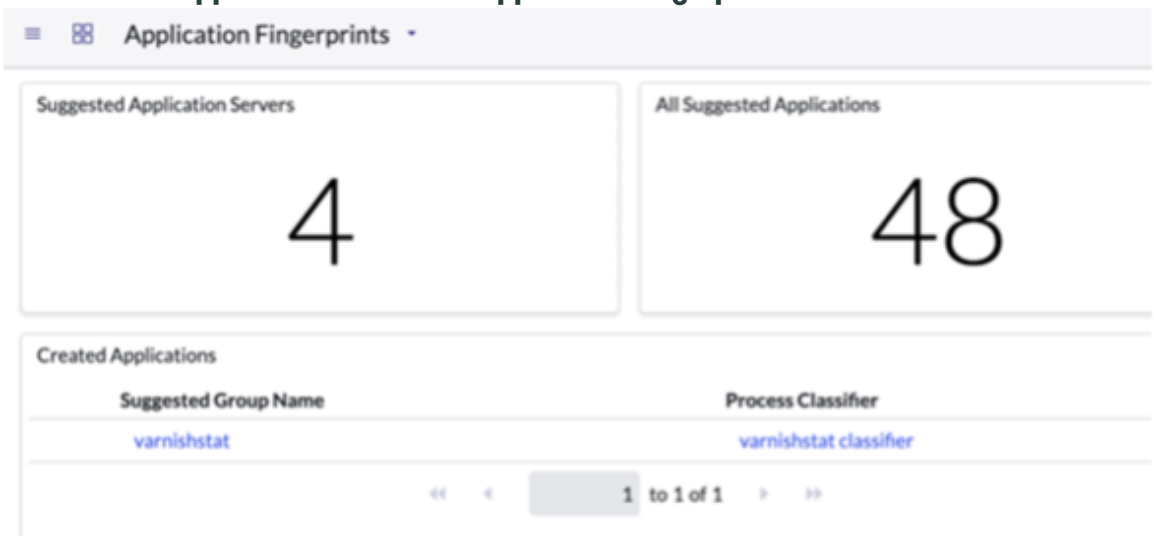
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Created applications section of Application Fingerprints dashboard



6. Run basic Discovery on the host machine.

Result
The varnishstat CI is discovered and a record is created in the u_cmdb_ci_varnishtat table.

The Varnish policies and checks are available to run.

Detecting portable applications using push-based discovery

Portable applications are those applications that don't need to be installed on the target system. Starting in ACC-VC version 2.3.0, push-based Discovery can detect portable applications, such as Firefox, VLC, Notepad++ etc, for Windows only.

Note: Only portable applications listed in https://portableapps.com/ are supported.

When the portable application is executed, it creates a running process. The application creates a path similar to the following for the configuration file 'appinfo.ini':

```
-\ <--- Directory with FirefoxPortable.exe
 +\App
 +\firefox
 +\Data
 +\profile
 +\settings
 +\plugins\ (optional)
```

Note: ServiceNow users must have Local account access to get the data in order to read appinfo.ini file.

Name, Version, and Vendor attributes are fetched from the Portable software and are found in the appinfo.ini files. appinfo.ini is the mandatory file to execute any portable application. If SAM is installed, the information is displayed in Software installation [cmdb_sam_sw_install] table. If SAM is not installed, the information shows in the Software instance [cmdb_software_instance] table.

Cloud Native Operations for Visibility

Cloud Native Operations for Visibility (CNO for Visibility) has been renamed Agent Client Collector for Kubernetes – Visibility. The term Cloud Native Operations for Visibility has been deprecated.

For the Kubernetes Visibility Agent documentation, see Kubernetes Visibility Agent.

Enabling Agent Client Collector data collection

You can perform actions which enhance data collection from the hosts on which Agent Client Collector is running.

Create a call API to send an osquery request

Create a background script to send an `osquery` request. The `osquery` request enables data collection from your host's operating system.

Before you begin
Role required: administrator

Procedure

1. Create the following background script:
   - `"MTLV9DE22016"` is the name of the server running an agent
   - `"c8bf9072539333003e76ddeeff7b12c5"` is the sys_id of the previously created check definition

```
cis = new GlideRecord("cmdb_ci_server");
    cis.addQuery("name", "MTLV9DE22016");
    cis.query();
    check = {
        "checkDefId": "c8bf9072539333003e76ddeeff7b12c5",
        "params": {
            "query": "select pid,cmdLine from processes limit
 4"
        }
    };
    var agentNow = new sn_agent.AgentNowHandler();
    gs.info('request_id: ' +
 agentNow.runCheckForCis(cis,check,'1',60000));
```

2. Run the script to print the request ID:
   request_id: `eefbff7ab75733003e766068de11a981`
3. Check the system logs for messages coming from the instance script.

```
result 0 requestId: 06c6c887b79733003e766068de11a912
 agent_name: MTLV9DE22016 ci_id:
00726c36539333003e76ddeeff7b12db status: 0 output: [
{"cmdline":"","pid":"0"},
{"cmdline":"","pid":"1"},
{"cmdline":"","pid":"45"},
{"cmdline":"","pid":"46"}
]
```

View host data collection for an agent

Run data collection on an agent's host to discover the components that are running on the host.

Before you begin
Role required: agent_client_collector_admin

About this task
The Refresh Host Data for Agents scheduled job collects host data and runs every hour on the following:

- Hosts which have not been discovered in the past 12 hours.
- Host for which Discovery failed.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
   In the **Host data collection** column, view the status of data collection on the agent's host. The possible statuses are:

Host data collection statuses

Status	Description
<empty>	Indicates that the agent has been added within the past minute and the Refresh and Publish Monitoring Policies scheduled job has not yet run to initiate data collection. The job runs every minute.
Collected (green)	Host data collection is complete.
Collecting (yellow)	Host data collection is in progress.
Collection failed (red)	Host data collection failed.

2. **Optional:** Locate the **Host data last collected** column to view when data collection was last performed on the host.

Generate an Agent Client Collector allow list

Specify the checks to be included in the list of checks that are enabled to run on the agent.

Before you begin
Role required: agent_client_collector_admin

About this task
The default allow list includes all validated checks, and is included in the base system policies. If the allow list cannot be read correctly, no checks run on the agent.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Check Definitions**.
   The **Check Definitions** page appears.
2. In the **Related Links** section at the bottom of the page, click **Generate allow list**.

Note: Alternatively, you can click a check definition or check instance record and click **Generate allow list** to generate a complete allow list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Agent Client Collector Command Allow-list Generator** page appears, with the list of checks scanned from the **Command** field of the check instance records.

The values appear with the following attributes:

Command attributes

Attribute	Description
exec	The executing command.
args	Possible argument strings.
skip_arguments	Boolean. Determines whether to verify that the argument was added to the allow list. ○ **true**: Skips argument validation and checks only for illegal characters, specifically |; \<>&'$() ○ **false**: Executes argument validation to ensure that the argument is included in the allow list. If it is not, the command cannot execute.
use_regex	Boolean. Determines whether to evaluate the *arg* strings as a regular expression. ○ **true**: Evaluates each entry in the args array as a regular expression ○ **false**: Evaluates each entry in the args array as it is. **Note:** Ensure that the regex is useable in valid JSON format and is golang compatible.
allow_shell	Boolean. Allow for the given entry to be executed in shell mode and for check definitions to default to *execv*. ○ **true**: This allow list entry permits execution in shell mode. ○ **false**: This allow list entry doesn't permit execution in shell mode.

3. Copy the entries you want to include in the allow list and add them to the agent's `check-allow-list.json` file, either manually or using an automation tool.
The location of this file is indicated in the *allow-list* parameter of the agent's `acc.yml` file.

Run host data collection for an agent

Collect data on the host being monitored by an agent. Manually collecting host data ensures that the host's files are up to date.

Before you begin

Role required: agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Underneath the check box icon , hover next to an agent and select the check box that appears.
   Repeat this step for all agents for which you want to collect data.
3. Select the arrow next to the **Actions on selected rows...** drop-down and select **Collect host data**.

Result

Data is collected for the specified agents. The collection status is indicated in the page's **Host data collection** column.

Run host data collection on demand

You can perform host data collection on demand, if you need to perform data collection before the job is scheduled to run.

Before you begin

Ensure that you have sufficient permissions to create CIs.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
   The **Agent Client Collectors** page appears.
2. Select an agent with **Status = Alive**.
3. On the agent form, click the **Collect Host Data** button.

Pause Agent Client Collector data collection

If CPU consumption on your server is getting too high, you can manually turn off the Agent Client Collector data collection to pause all checks performed by the agent, except for the agent's keep alive messages.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
   The **Agent Client Collectors** page appears, displaying the list of configured agents.
2. Select the checkbox next to the relevant agents.
3. In the **Actions on selected rows...** dropdown, select **Pause data collection** to pause data collection on the agents (**Data Collection = Off (manual)**).

   Select **Resume data collection** to resume data collection on the agents.

   Alternatively, you can set the status of an agent by selecting the agent and in the **Related Links** section, select the **Pause data collection** link to pause data collection on the agent. To resume data collection on the agent, select the **Resume data collection** link.

Clear Agent Client Collector plugins

Clear the plugin and configuration file cache folder and control plugin downloads. Clearing the cache folder removes unwanted plugins that have synced to the agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Ensure that the following are installed on your system:

- Agent Client Collector Framework (ACC-F), starting with version 3.5.5
- MID Server
- CMDB
- Agent Client Collector agent, starting with version 3.5.5
- ACC Global Utilities

Ensure that the **disable_assets** system property in the `acc.yml` configuration file is set to **false**.

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Agents**.
2. Select an agent.
3. In the **Related Links** section, select **Clear ACC Plugins**.
4. In the confirmation dialog box, select **Clear ACC Plugins**.
5. **Optional:** Select **Collect host data** to re-download your plugins from the instance. Plugins download automatically when used by their respective checks/policies.

Agent Client Collector Framework reference

Reference topics provide additional information about mapping and fine-tuning application services using Agent Client Collector Framework lists and forms.

Agent Client Collector user roles

Administrators can assign user roles to grant access to the Agent Client Collector. The following standard roles for the Agent Client Collector Framework (ACC-F) are included in the ServiceNow system with the Agent Client Collector installed on it.

Agent Client Collector user roles

Role	Description
agent_client_collector_admin	All permissions on Agent Client Collector, including: • Access to REST API • Add, edit, and delete policies, checks, agents, web sockets • MID Server management
agent_client_collector_integration	Access to REST API
agent_client_collector_user	• View checks and policies • Access to some REST APIs
evt_mgmt_admin	Starts the ACC listener.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector Framework default checks

Agent Client Collector Framework provides default checks with the base system.

Checks

The following table lists the default checks that come with the Agent Client Collector Framework base system.

Type	Name	Description	Command
Restart	restart	Restarts the agent. Check is active by default	Restart agent
Discovery	check-discovery-basic	Performs basic discovery of the agent's host to discover: • Host CI, including IP address, serial number, and hostname. • Running processes (cmdb_running_process) of the host • TCP ports (cmdb_tcp) The check is performed by default every 12 hours (43200 seconds), and times out after 600 seconds of inactivity. Plugins: osquery, acc-f-commons, acc-f-modules	endpoint_discovery.rb

Note: The *check-read-log* and *config-file-reader* checks are for internal use only.

Agent Client Collector performance and footprint for URL monitoring

The following tables display the agent performance KPIs and its footprint on the host during URL monitoring data collection execution on different operation systems.

URL monitoring checks on a Linux system

Linux Cent OS 8, 2 CPUs, 4GB RAM					
Checks per minute	100	250	500	1000	1500

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL monitoring checks on a Linux system (continued)

Linux Cent OS 8, 2 CPUs, 4GB RAM					
Metrics (expected/ actual)	700/700	1750/1750	3500/3500	7000/7000	10500/10500
Network utilization - Tx (MID > Agent)	35 KB/s	78 KB/s	146 KB/s	286 KB/s	430 KB/s
Network utilization - Rx (MID < Agent)	15 KB/s	27 KB/s	51 KB/s	107 KB/s	116 KB/s
Network utilization - Tx (Agent > MID)	8 KB/s	23 KB/s	37 KB/s	89 KB/s	113 KB/s
Network utilization - Rx (Agent < MID)	28 KB/s	72 KB/s	142 KB/s	285 KB/s	426 KB/s
Memory consumption	22 MB	25 MB	26 MB	34 MB	39 MB
CPU of all checks	~3%	~7%	~11%	~21%	~24%
Process CPU utilization	1% - 1.5%	1.5% - 2.5%	5% - 6%	6% - 7%	12% - 13%
Host CPU utilization	~10%	~19%	~23%	~45%	~53%

Agent Client Collector certificate revocation reasons

The following table lists and describes the possible reasons for revoking an Agent Client Collector certificate to stop communication between the agent and ITOM cloud services.

Certificate revocation reasons

Reason	Description
Unspecified	Revoke a certificate without providing a specific revocation code. **Note:** This reason code doesn't provide an audit trail identifying why a certificate was revoked.
Key Compromise	You suspect that the private key associated with a certificate is compromised. For example, if a laptop belonging to a user in your organization is stolen, any private keys stored on the laptop may be compromised.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Certificate revocation reasons (continued)

Reason	Description
CA Compromise	You suspect that a Certificate Authority's (CA) private key has been compromised and is in the hands of an unauthorized individual. If a CA's private key is revoked, the CA hierarchy considers all certificates below that CA revoked as well.
Affiliation Changed	An individual is no longer working in the organization, or the computer account to which the certificate was issued is no longer in use. Can also be used if a person changes roles within an organization and no longer requires using the certificate associated with their previous role. For example, an employee could move from the purchasing department and no longer require a certificate to authorize purchase requests.
Superseded	Indicates that a new certificate must be issued in place of a previously issued certificate. For example, if you update a certificate template and reissue certificates, you could revoke the previous certificate with this reason code.
Cessation of Operation	A server or workstation is decommissioned, and all certificates issued to the server are no longer required. You can use this revocation reason when decommissioning a CA.
Certificate Hold	A temporary revocation indicating that a CA won't validate a certificate at that specific time. **Note:** Using this reason code makes it difficult to determine whether a certificate was valid at a specific time.
Remove from CRL	Enables future unrevoking of the certificate, removing the certificate from the certificate revocation list (CRL).
Privilege Withdrawn	The certificate holder no longer has the privileges required to continue using the certificate.
AA Compromise	Indicates suspected or actual compromise of the authentication authority (AA) validated in the certificate.

Agent Client Collector check definition page

The fields to be configured on the Check Definition page, when creating a check definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check Definition Form

Field	Description
Name	A descriptive name for the check.
Check Type	Select the type of check. The available monitoring options are: • Events • Metrics
Active	Select to activate the check.
Is Proxy Valid	Select to indicate that the check's policy is set to work as a proxy. When viewing this option in the check instance, it is read-only.
Command Auto Generation	Select to automatically generate the command with the **Command Prefix** value and the **Parameters** tab values.
Command Prefix	The command that is used for automatic generation when the **Command Auto Generation** check box is selected. The prefix consists of any portion of the command which is static (does not change), such as the script name.
Command	• Enter the command that the Agent Client Collector executes. **Note:** When the **Command Auto Generation** check box is selected, this field is automatically populated with the prefix and flags of the active parameters specified in the **Parameters** tab. • The field contains parameters taken from one or more of the following: ○ Simple template: `{{.labels.params_field_name}}`: Takes values from entries in the **Parameters** tab. For example, a string of `{{.labels.params_warning}}` means that the value of the *warning* parameter is used (provided it has been configured on the **Parameters** tab). ○ Monitored CI: `{{.labels.params_ci_field_name}}`: Takes values automatically from the monitored CI, where `field_name` is replaced with the exact name of the required field in the CI table.
Configuration Data Files	Select the configuration data files to be downloaded when the check runs.
Description	Description of the check.
Exec Mode	The execution mode of the check. Available options are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check Definition Form (continued)

Field	Description
	• *shell*: To be used for checks which do not support *execv*. • *execv*: Provides enhanced security during check execution. The default execution modes are: • Existing check definitions: *shell* • New check definitions: *execv* • If no value is entered in the field: *shell* When upgrading to version 2.9.0, if this field is read-only, ensure that you disable the read-only status, as described in the (KB1122498) article in the Now Support Knowledge Base.
Interval	The amount of time, in seconds, to wait between check executions. For example, a value of 60 means that the check runs every 60 seconds. Specified value must be an integer.
Timeout	The amount of time, in seconds, after which the check execution stops when no output is returned. For example, a value of 60 means that when the check execution doesn't return a value for 60 seconds, the execution stops.
Event status change threshold	The number of consecutive times that a check's response status must happen before a new event is sent. For example, if this value is set to 5, a check whose response status changes from **OK** to **Error** generates a new event with an **Error** status only after the fifth consecutive occurrence of the status change. After an agent restart, an initial event is always sent. Default value: 5 (except for AWS event policies)
Event status repair threshold	The number of consecutive times that a check's response status must improve to close the previous event. For example, if this value is set to 3, a check whose response status changes from **Error** to **OK** closes the previous event and generates a new event with an **OK** status only after the third consecutive occurrence of the status change. Default value: 1 (except for AWS event policies)
Credential failure regex	The string from the check's output indicating that the check failed due to a credentials error. The agent then continues

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check Definition Form (continued)

Field	Description
	searching credentials that are part of the credential alias until it finds the correct one. This field is relevant (and mandatory) when the check's policy uses a credential alias. When creating a new check, enter the string manually.
Plugins	Select the plugins to be associated with the check. Once this is done, the plugins download before the check executes.

Check definition form parameters tab

The Parameters tab definitions for the **Command** field on the check definition form.

Parameters Tab

Field	Description
Name	A descriptive name for the parameter.
Default value / value	Default value / value of the parameter.
Active	Boolean. When set to **true**, the parameter is taken to the **Command** field when the **Command Auto Generation** check box is selected.
Mandatory	Boolean. When set to **true**, a parameter value must be specified for the command to run.
Flag	String. Prefix that is added before the parameter value in the **Command** field when the **Command Auto Generation** check box is selected.
Value required	Boolean. When set to **true** and when the **Command Auto Generation** check box is selected, the value of this parameter is added to the **Command** field after the **Flag** value.

Test check dialog box fields

The dialog box fields when testing a check definition.

Test Check dialog box fields

Field	Description
Check Definition	Displays the name of the selected check definition.
CI	Select the CI on which to run the check. The available options are those CIs which meet both of the following criteria:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Test Check dialog box fields (continued)

Field	Description
	• Belong to the group specified in the **Check group** field. • Belong to an agent with **Up** status. If the **Check group** field is empty, the value defaults to **cmdb_ci_computer**.
Credentials	Select the credentials of the user whom you want the agent to connect with. This field appears only if you have configured secure check parameters on the **Check Secure Parameter Definitions** tab in the Check Definition.
Proxy Agent	Select a proxy agent to be associated with the check. This field appears only when working with a check instance and when one of the options has been selected on the **Proxy Settings** tab in the instance's policy.

Agent Client Collector data collection properties

Description of the properties that determine the behavior of Agent Client Collector data collection.

Data collection properties

Property	Description
sn_agent.host-data_collection_refresh_duration_seconds	The amount of time (in seconds) between agent data collections on the host. Applicable only when no host CI is assigned to the agent. Default: 43200 (12 hours)
sn_agent.disco_minimum_threshold_minutes	The minimum number of minutes since the last endpoint Discovery on a given IP before Discovery can be triggered again. This property prevents running endpoint Discovery too often, such as in cases where a network intermittently has a break or a laptop is repeatedly rebooted. Default: 60
sn_agent.disco_disable_ci_clobber	When set to true, indicates that data collected by the ServiceWatch or ServiceNow Discovery sources takes precedence over Agent Client

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collection properties (continued)

Property	Description
	Collector when the threshold in the *sn_agent.disco_ci_clobber_of_agentless_disc* property hasn't been exceeded. Default: true
sn_agent.disco_ci_clobber_of_agentless_threshold_days	Maximum number of days since an existing CI has been discovered using agentless Discovery where the existing CI is linked instead of being rediscovered by the agent. Takes effect when *endpoint_disco_disable_ci_clobber_of_agentl* = **true** and over 14 days (by default) have passed since a non-ACC Discovery source (such as ServiceWatch or ServiceNow) has discovered the CI. After this threshold has been exceeded, agent Discovery can execute and overwrite an existing CI regardless of whether the CI has been previously discovered by a non-ACC Discovery source. This process presents the most recently discovered data in the CMDB. Default: 14
sn_agent.ci_prefers_ip_version	Indicates whether IPv4 or IPv6 is the preferred version when saving an IP Address value in the IP Address field of the CI record. Default: 4
sn_agent.ci_serial_number.pref_order	Specify the order of the fields to locate a serial number value to be saved to the host CI's *serial_number* field during agent data collection. Values must be comma-separated, without spaces, and in lowercase. Default: bios,system,uuid,baseboard,chassis
sn_agent.mac_ci_name_pref_order	Specify the order of the values by which the CI record's *Name* field is populated during macOS data collection. Values must be comma-separated, without spaces, and in lowercase. Default: name,hostname,computer_name,local_hostname
sn_agent.host_data_collection.disable_when_containerized	When set to *true*, indicates that data collection is disabled for containerized agents. Default: true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector policy collection properties

Description of the properties that determine the behavior of Agent Client Collector policy collection.

Policy collection properties

Property	Description
sn_agent.full_policy_calculation_cycle_days	The number of days for a policy to reach a full calculation cycle. If the policy's last full calculation cycle was more than 7 days ago, the policy is queried to fully calculate its calculation cycle. Default: 7
sn_agent.max_number_of_monitored_cis_per_policy	The maximum number of monitored CIs that can be processed per policy. Default: 400000
sn_agent.max_num_of_monitored_cis_unassociation	The maximum number of monitored CIs unassociated with agents that can be processed per policy. Default: 1000
sn_agent.policy_force_recalc_interval	The interval limit, in minutes, used to determine whether forced recalculation is required for any policies. Forced recalculation redistributes both a policy's monitored CIs and the corresponding agent. Default: 10
sn_agent.policy_force_recalc_required	When set to *true*, checks whether forced recalculation is required for policies. Forced recalculation redistributes a policy's monitored CIs and the corresponding agent. Default: true
sn_agent.populate_proxy_agent_monitored_cis	When set to *true*, populates the monitored CIs for given policies to show the distribution of CIs among proxy agents. Default: false

Agent Client Collector Framework configuration properties

Description of the properties that determine the behavior of Agent Client Collector Framework configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Framework configuration properties

Property	Description
sn_agent.agent_static_import_char_limit	The character limit for a given payload item. Relates only to the configuration item being processed and not the total attachment size. Default: 1000000
sn_agent.agent_upgrade_wait_time	Maximum number of minutes for an agent to successfully upgrade before entering *Warning* status. Default: 30
sn_agent.agent_version	The current ACC-F release version installed on the instance. Type: String
sn_agent.appl_classification_behavior	The characteristics and behaviors for applications during Agent Discovery. When set to *simple*, creates a shell CI. Default: simple
sn_agent.auto_upgrade.enabled	When set to true, the instance automatically upgrades existing Agent Client Collector installations to the version set in the sn_agent.agent_version property, if the agent version is lower than the property's version. Type: Boolean Default: false
sn_agent.auto_upgrade.max_upgrades_per_hour	The maximum number of Agent Client Collector upgrades possible per MID Server every hour. Type: Integer Default: 50 **Note:** Modifying this value may negatively affect system performance.
sn_agent.auto_upgrade.max_upgrades_total	The maximum number of Agent Client Collector upgrades possible for all agents on all MID Servers. Type: Integer Default: 1000

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Framework configuration properties (continued)

Property	Description
	Note: Modifying this value may negatively affect system performance.
sn_agent.config_publish.max_payload_size	The size, in bytes, that the config_publish_payload can reach on the MonitoringProbe ECC queue topic before an error is logged and the payload is skipped. Default: 15000000
sn_agent.ecc_queue.max_payload_size	The maximum allowable payload size for an ECC queue record to be processed by the agent. Default: 5000000
sn_agent.enable_auto_mid_selection	When set to **true**, the instance sends a list of MID Servers to the agents. To enable automatic selection of a MID Server from the list, set the *auto-mid-selection* property to true in the agents' acc.yml file. Automatic selection of MID Servers ensures that each agent uses the most efficient available MID Server. Default: false **Note:** This property determines only whether a list of MID Servers is sent to the agent. • If this property was previously set to **true** and is then set to **false**, automatic MID selection is performed on the previously sent MID Server list if the *auto-mid-selection* property is set to **true** in the acc.yml file. • If this property is set to **true** and the *auto-mid-selection* property in the acc.yml file is set to **false**, no automatic MID Server selection is performed.
sn_agent.installer_max_endpoints	Maximum number of MID Web Server endpoint URLs to be selected during agent single line installation. Default: 3
sn_agent.keep_alive.alive_duration	The amount of time, in seconds, within which the agent's last_refreshed timestamp must be updated. After this time period, the agent status moves from *Up* to *Warning*. If the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Framework configuration properties (continued)

Property	Description
	indicated time period passes again, the status moves from *Warning* to *Down*. Default: 120
sn_agent.keep_alive.disconnected_threshold	The maximum of time, in seconds, within which the last_keepalive timestamp must be updated. After this time period, the agent status changes from *Up* to *Disconnected*. Default: 600
sn_agent.logging.verbosity	The minimum level of messages that are logged for Agent Client Collector Framework. Messages with the indicated status and anything more severe are logged. Options: • error • warn • info • debug Default: info
sn_agent.max_sys_ids_in_query	The maximum number of sys IDs to return during GlideRecord queries. Default: 400000
sn_agent.maximum_mids_to_select	The maximum number of MID Servers that can be selected for agent setup. Default: 20
sn_agent.min_upgrade_history_per_agent	The minimum number of upgrades saved per agent. Default: 2
sn_agent.registration_key_validity_days	The number of days after creation of a registration key that the key is valid before it is deleted. Default: 90
sn_agent.registration_key_notification_days	The number of days before registration key deletion that an email notification is sent to the key's ownership group, informing of pending deletion. Default: 14

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Framework configuration properties (continued)

Property	Description
sn_agent.sync_filters_interval_mi	The number of minutes after which CMDB changes are detected and then synched to the MID Server. Default: 10
sn_agent.time_ago_in_seconds_to_query	When processing sn_acc_queues, only query those created within the indicated time (in seconds). Default: 43200 (12 hours)

Agent Client Collector data collection tables

Agent Client Collector performs data collection based on the scoped apps that you've installed. Agent Client Collector Framework performs basic data collection, and Agent Client Collector for Visibility - Content performs enhanced data collection.

The Refresh Host Data for Agents scheduled job collects host data every hour on hosts that haven't had data collection run in the past 12 hours. The job collects the data described in the following tables.

Agent Client Collector Framework data collection

Data	CMDB field
hostname	ci.name
physical memory	ci.ram
hardware vendor	ci.manufacturer
hardware model	ci.model_id
CPU name	ci.cpu_type
OS domain	ci.os_domain
OS name	ci.os
OS version	ci.os_version
IPv4 address	ci.ip_address
Default gateway	ci.default_gateway
Serial number	ci.serial_number
DNS Name	ci.name
FQDN	ci.fqdn
TCP Connections	cmdb_tcp
Running Processes	cmdb_running_process
Serial numbers	cmdb_serial_number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector Framework data collection (continued)

Data	CMDB field
Note: When collecting data from Linux hosts, `dmidecode` must be configured with `sudo` permissions to collect all serial numbers.	

Agent Client Collector for Visibility - Content data collection

Data	CMDB field
CPU manufacturer	ci.cpu_manufacturer
CPU speed	ci.cpu_speed
OS arch	ci.os_address_width
CPU count	ci.cpu_count
CPU core count	ci.cpu_core_count
CPU core thread	ci.cpu_core_thread
Is virtual	ci.virtual
Start date (uptime)	ci.start_date
Object ID	ci.object_id
TCP Connections	cmdb_tcp
Running Processes	cmdb_running_process

Account commands for LocalService, LocalSystem, and gMSA during Windows installation

When installing an agent on a Windows host using a LocalService, LocalSystem, or gMSA account, you must run msi commands to enable the accounts.

Account type commands

Account type	Command
LocalSystem	`msiexec /i C:\acc-installer.msi /qn /norestart ACC_API_KEY=<API key code> ACC_MID=<MID Server URL>/ws/events ACC_ALLOW_LIST=False LOCALUSERNAME="SYSTEM"`
LocalService	`msiexec /i C:\acc-installer.msi /qn /norestart ACC_API_KEY=<API key code> ACC_MID=<MID Server URL>/ws/events`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Account type commands (continued)

Account type	Command
	`ACC_ALLOW_LIST=False LOCALUSERNAME="LOCALSERVICE"`
gMSA	`msiexec /i C:\acc-installer.msi /qn /norestart ACC_API_KEY=<API key code> ACC_MID=<MID Server URL>/ws/events ACC_ALLOW_LIST=False LOCALUSERNAME="DOMAIN\gMSA$"`

Verify API is associated with a live agent

Call the *AgentNowHandler.hasAgent* API to determine if the CI is associated with a live agent. The API gets a sys_id of the CI and returns a true/false result.

The *hasAgent()* method takes a sys_id of the CI as a string parameter and returns **true** when the CI fulfills one of the following conditions:

- The CI is `sn_agent_cmdb_ci_agent` and this agent is alive.
- The CI is a host (extends `cmdb_ci_hardware`) and is associated with a live agent.
- The CI is an application (extends `cmdb_ci_appl`) and has a runs-on relation to a host associated with a live agent.

For example:

```
var agentNow = new sn_agent.AgentNowHandler();
gs.info('Agent assocation with CI? ' +
agentNow.hasAgent('158279505372b30034b8ddeeff7b1270'); // sys_id
 of agent
```

Configuration file options

Options available in the `acc.yml` configuration file.

Basic configuration options for acc.yml configuration file

Option	Type	Default	Description	Example
name	String	Agent_<value of the *hostname* command>	Agent name registered on the SN instance can be specified by the user. The result of the 'hostname' command is used as the default.	`name: <name of agent>`
backend-url	List	`wss://127.0.0.1:8800/ws/events`	List of MID Webserver endpoint URLs	`backend-url: <mid server`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic configuration options for acc.yml configuration file (continued)

Option	Type	Default	Description	Example
			to communicate with. If communication cannot be configured with the first URL, the system moves to the ensuing URLs until it establishes a connection. Works when `enable-auto-mid-selection=true`	`ip>:<websocket port>`
api-key	String	<None>	API key used by the MID Server to authenticate incoming agent connections. Value is encrypted on initial agent startup.	`api-key: <mid web server api key>`
user	String	admin	Username used for basic authentication. If this parameter is empty, the agent does not start.	`user: "agent-01"`
password	String	admin	Password used for basic authentication. Value is encrypted on initial agent startup. If this parameter is empty, the agent does not start.	`password: <secure-password>`
log-level	String	Info	Amount of logging to appear in the acc.log file. Values:	`log-level: debug`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic configuration options for acc.yml configuration file (continued)

Option	Type	Default	Description	Example
			• Panic • Fatal • Error • Warn • Info • Debug	
allow-list	String	/etc/servicenow/agent-client-collector/check-allow-list.json	Path to the JSON file that contains the list of check commands the agent can execute. Comment out this parameter to disable the allow-list. If this parameter is empty, the allow-list is disabled.	`allow-list: /etc/agent/check-allow-list.json`
appl_classification_behavior	String	simple	Indicates whether to enable shell CI creation on the agent. Possible values are: • simple: Indicates that shell CI creation is enabled. • off: Indicates that no shell CIs are created for the application. • full: Indicates that complete Discovery of the application CIs is performed using patterns.	`appl_classification_beha off`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration options for acc.yml configuration file

Option	Type	Default	Description	Example
verify-plugin-signature	Boolean	True	Verifies the plugin signature prior to execution. Disable when using self-signed or developmental plugins.	`verify-plugin-signature: true`
insecure-skip-tls-verify	Boolean	True	Determines whether the verify the certificate when connecting to the MID Server.	`insecure-skip-tls-verify: true`
enable-auto-mid-selection	Boolean	True	Controls the Auto MID Selection feature to connect to the optimal MID Web Server provided by the instance.	`enable-auto-mid-selection: true`
check-command-prefer-installed	Boolean	False	Indicates the preference of executables provided within ACC plugins or executables available in the host system's PATH variable. • false = ACC plugins • true = Executables in the host system's PATH variable	`check-command-prefer-installed: false`
powershell_installed	Boolean	False	Disables powershell command execution on agents.	`powershell-installed: true`
allow-list-global-only	Boolean	False	Set to **true** to enhance security by relying only on the allow list defined in the *allow-list*	`allow-list-global-only: false`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration options for acc.yml configuration file (continued)

Option	Type	Default	Description	Example
			parameter you specify during configuration, ignoring allow lists bundled with ACC plugins.	
disable-assets	Boolean	false	Indicates whether a check running with an asset (plugin) dependency fetches ACC plugins from the ServiceNow® instance, or uses a copy of the plugins in its cache folder. When set to **false**, additional assets can be downloaded during check execution. Set to **true** to enhance security and ensure that no new plugins are downloaded during check execution.	`disable-assets: false`
agent-upgrade-url-path	String	`https://install.servicenow.com/glide/distribution/builds/package/app-signed/`	Indicates an alternate web server URL endpoint for downloading ACC installer packages when performing selective upgrade.	`agent-upgrade-url-path: https://<ip address>:<port>/acc_installers`
certificate-rotation-days-out	Integer	28	Indicates the number of days before certificate expiration that an agent attempts to rotate its certificate.	`certificate-rotation-days-out=28`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration options for acc.yml configuration file (continued)

Option	Type	Default	Description	Example
enable-patterns-on-agent	Boolean	false	Enables gathering details on the applications which run on the Agent Client Collector. This parameter is required only when using the Agent Client Collector for pattern execution.	`enable-patterns-on-agent: true`
keepalive-filter-nics	Boolean	true	Indicates whether Network Interface Controllers (NICs) are filtered on the agent (**true**) or the MID Server (**false**) during keepalive action.	`keepalive-filter-nics: true`
keepalive-number_nics_per_ip_type	Integer	1	Indicates the maximum number of Network Interface Controllers (NICs) per IP type (IP4, IP6) sent with a keepalive action. The indicated number is sent for each IP type. For example, if the value is 1, a maximum of 2 NICs are sent (0-1 each for IP4 and IP6). If the value is 4, a maximum of 8 NICs are sent (0-4 each for IP4 and IP6).	`keepalive-number_nics_per_ip_type 4`

Proxy Auto-Configuration (PAC) file parameters

Option	Type	Default	Description	Example
pac-file	String (Required)	"" (empty)	Specifies the location of the PAC file to use for proxy configuration. Can be either: • A local file path (such as: `file:///etc/proxy/proxy.pac`) • A remote URL (such as: `https://proxy.company.com/proxy.pac`)	`pac-file: "https://proxy.company.com/proxy.pac"`
pac-cache-ttl	Duration (Optional)	30m (30 minutes)	Determines how long proxy rules from the PAC file are cached in memory. Setting this to 0 disables caching.	`pac-cache-ttl: "1h" # Cache for 1 hour`
pac-refresh-interval	Duration (Optional)	30m (30 minutes)	Specifies how often the agent is to check for updates to the PAC file. Useful when the PAC file is hosted remotely and may be updated periodically.	`pac-refresh-interval: "15m" # Check for updates every 15 minutes`
pac-dial-timeout	Duration (Optional)	30s (30 seconds)	Indicates the amount of time to wait when establishing a connection through a proxy server before timing out.	`pac-dial-timeout: "10s" # 10 second timeout`
pac-reset-on-connect-failure	Boolean (Optional)	true	When set to true, the agent clears the PAC cache and attempts to refresh the	`pac-reset-on-connect-failure: true`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Proxy Auto-Configuration (PAC) file parameters (continued)

Option	Type	Default	Description	Example
			PAC file if a proxy connection proxy fails. This helps recover from proxy configuration changes or temporary proxy issues.	

Synchronization properties for validating Agent Client Collector plugins

Use the following properties when synchronizing public certificates from the MID Server to the Agent Client Collector.

Certificate synchronization - MID properties

Property	Description
mid.acc.cert_monitor_disable	Ability to disable the monitor from synchronizing the public certificates. Default value: False
mid.acc.cert_monitor_interval	Interval (in seconds) at which the monitor synchronizes public certificates from a configured endpoint URL. Default value: 86400
mid.acc.cert_monitor_target_url	Endpoint URL prefix (minus the filename) from which the monitor synchronizes public certificates. Default value: ServiceNow Install server
mid.acc.cert_monitor_target_filename	Endpoint URL target filename from which the monitor synchronizes public certificates. Default value: SNCertificates.zip

Certificate synchronization - Agent properties

Property	Description
fetch-certificates-from-mid	Status of whether the public certificates are retrieved from the MID Server for plugin asset validation. Default value: True

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector statuses

The following table lists and describes the Agent Client Collector statuses.

Agent Client Collector statuses

Status	Description
Up	Agent is connected and working properly.
Warning	Agent has not been refreshed in over 2 minutes (based on the value of the sn_agent.keep_alive.alive_duration property).
Down	Agent is shut down.
Restarting	Agent restart is in progress.
Upgrading	Agent upgrade is in progress.
Disconnected	Agent's MID Server is down.
Unknown	Agent's MID Server has not sent a keepalive communication for over 10 minutes (based on the value of the sn_agent.keep_alive.disconnected_duration system property).

Agent Client Collector log levels

The following table displays the available log levels which indicate the severity of Agent Client Collector events.

Log level	Description
Panic	Severe errors that cause the service to shut down unexpectedly.
Fatal	Fatal errors that cause the service to shut down (status 0).
Error	Non-fatal service error messages.
Warn	Warning messages indicating potential issues.
Info	Information messages representing service actions.
Debug	Detailed service operation messages which help troubleshoot issues.

Agent Client Collector log rotation parameters

If Agent Client Collector logs get too large, they can drain system resources. To ensure system efficiency, configure parameters in the `acc.yml` file by which to rotate logs out of the system's storage (Windows default location = `C:\ProgramData\ServiceNow\agent-client-collector\config\acc.yml`. Linux default location = `/etc/servicenow/agent-client-collector/acc.yml`).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log rotation parameters

Parameter	Definition
log-file-and-stdout	Write logs to the `stdout` file. Default: **false**
log-retention-duration	Maximum age, in days, of the log file before it is rotated out of the system's storage. Default: **72h** (3 days)
log-retention-files	Maximum number of log files that can be stored before being rotated out of the system. Default: **3**
log-max-size	Maximum size, in MB, of the log file before it is rotated out of the system's storage. Default: **10**
log-level	The log level to be measured by the logs. Available options are: **Panic, Fatal, Error, Warn, Info, Debug**. Default: **Info** The specified log level represents the lowest level of events displayed in the log. For example, a user who specifies **Error** sees all Error events, as well as Fatal and Panic events.

Agent Client Collector CPU protection thresholds

When an agent meets the configured thresholds specified in the agent's `acc.yml` file, it enters CPU protection mode, either for an individual check or for all checks. Agents in CPU protection mode appear in the agent logs with the syntax `Agent Protection`.

Parameter	Description
agent_cpu_threshold_disabled	To prevent the agent from shutting itself off when CPU memory reaches a certain threshold, set value to **True**. Default=False
cpu_percentage_limit	The percentage of the agent's CPU usage that sends the agent into CPU protection mode. Default=5%
cpu_protection_behavior	Assign **individual** for the system to disable only the individual check that passed the *cpu_percentage_limit* value. If multiple

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	checks crossed the threshold, the check with the highest CPU is disabled. Assign **all** to disable all checks and pause data collection. Possible values: all, individual Default: all
repeated_high_cpu_num	The number of consecutive times CPU consumption exceeds the *cpu_percentage_limit* for the agent to enter CPU protection mode. Default=3
monitor_interval_sec	Indicates the frequency, in seconds, that the agent monitor runs to check if the *cpu_percentage_limit* is exceeded. Default=60
proxy_cpu_percentage_limit	The percentage of the agent's CPU usage when the agent is running proxy checks too frequently, that sends the agent into CPU protection mode. Default=80

Agent onboarding configuration settings

The settings you can customize when generating an Agent Onboarding installation plan. Toggle settings to activate and enable customization.

Agent onboarding configuration fields

Field	Description	Options
Connection type	Method the agent uses to connect to the instance.	• **Use ICS (MID-less)** • **Use MID Server**
MID Server	MID Servers the agent sends data to. Up to three MID Servers can be selected. Appears only when the Connection type is set as **Use MID Server**.	Drop-down list of available MID Server instances.
Registration key	Authorization key for registering with the ServiceNow instance for ICS (MID-less) connection.	Drop-down list of available registration keys.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent onboarding configuration fields (continued)

Field	Description	Options
	Appears only when the Connection type is set as **Use ICS (MID-less)**.	
API key	Authentication key for connecting to the MID Server. Enabled by default and can't be turned off.	Drop-down list of available API keys. Select **Add new** to create a new key.
Log level/debug mode	Controls the level of details that the agent logs. Keep at **Info** unless you're troubleshooting.	• **Error** • **Warn** • **Info** (default) • **Debug** • **Trace**
CPU thresholds	Caps agent CPU usage to protect endpoint performance. Default: 20% for Digital End-User Experience (DEX), 5% for all others.	Enter an integer
Enable PAC file configuration	URL to be used when connecting the agent through a proxy server.	Enter the Proxy Auto-Configuration (PAC) file URL.
API port	REST API port on the agent.	Enter the port number Default port number: 3031

Agent installation plan steps

After you complete agent onboarding, the system generates an installation plan. The following table describes each step in the plan and the commands or actions required.

Installation plan steps

Step	Description
Instance configured	Confirms the instance is configured and ready. Marked as Completed when the criteria monitored by the check are complete.
MID Server configured	Confirms the MID Server is configured and ready. Marked as Completed when the criteria monitored by the check are complete.
ICS configured	Confirms the ITOM Cloud Service (ICS) is configured and ready.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Installation plan steps (continued)

Step	Description
	Marked as Completed when the criteria monitored by the check are complete.
Network connectivity verified from endpoint to MID	Runs the indicated command in a terminal on the endpoint to verify network connectivity before installation.
Service Account Configuration	Runs the indicated commands in an elevated Command Prompt on the endpoint. For the "Deny log on locally" setting, use Local Security Policy (`secpol.msc`). Required for Linux and macOS, optional for Windows
Installation packages downloaded for Windows	Runs the indicated command in an elevated Command Prompt or PowerShell, from the directory where you downloaded the .msi file.

Review and update configuration file	After installation, find the agent `acc.yml` configuration file and update it with your registration (for ICS) or API key (for MID Server) and verify that the default field values match your configuration. The default field values are:
	`verify-plugin-signature: true`
	`max-running-checks: 10`
	`disable-secrets: true`
	`disable-api: true`
	`stated-disable: true`
	
	Note: Only the configuration options handled by the onboarding process are used.

Agent Client Collector upgrade properties

System properties that control Agent Client Collector upgrade behavior, including the target version, rate limits, retry logic, and timeouts.

Selective upgrade properties

Set these properties before running any selective upgrade. Navigate to **All** > **System Properties** > **All Properties** and search for each property name.

Selective upgrade properties

Property	Value	Description
sn_agent.auto_upgrade.enab	`true`	Enables the upgrade feature. Set to **true** before running any upgrade, manual or scheduled.
sn_agent.agent_upgrade_version	Target version, for example `5.0.1`	The version agents upgrade to. If empty, the system uses the current Agent Client Collector Framework application version. Must be a valid version number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Optional properties

These properties have default values suitable for most environments. Adjust them only when your environment requires different rate limits or timeout thresholds.

Optional upgrade properties

Property	Default	Description
sn_agent.auto_upgrade.max_upgrades_per_run	1000	Maximum agents upgraded per job run across all MID Servers. Lower this value for a more gradual rollout pace.
sn_agent.auto_upgrade.max_upgrades_per_mid	50	Maximum agents upgraded through a single MID Server per job run. Prevents overloading individual MID Servers.
sn_agent.auto_upgrade.retry_limit	3	Number of times the system retries a failed upgrade before permanently skipping the agent. After an agent reaches this limit, reset the `failed_upgrade_attempts` field on the Agent Extended Info record to allow retries.
sn_agent.agent_upgrade_wait_time	30	Minutes the system waits for an agent to complete its upgrade before marking it as failed and transitioning the agent to **Warning** status.
sn_agent.upgrade.timeout_minutes	10	Minutes allowed for the initial upgrade validation check on the agent (AgentVerification stage).
sn_agent.min_upgrade_history_per_agent	2	Number of upgrade history records retained per agent. Older records are automatically removed.

Property usage note

The *sn_agent.agent_upgrade_version* property is specifically for overriding the upgrade target version. The *sn_agent.agent_version* property controls package download URLs, version display, and other system behaviors. Use *sn_agent.agent_upgrade_version* when you want to target a specific version for upgrades without affecting other system behavior.

Agent Client Collector upgrade error codes

Error codes generated during Agent Client Collector upgrades, with descriptions and resolution steps.

Upgrade errors appear in **All** > **Agent Client Collector** > **ACC Errors**. Filter by error codes starting with ACC - 50 to see upgrade-specific issues. Additional detail is available in the **Message** column of the Agent Upgrade Histories table. For supported platforms, see Supported platforms for Agent Client Collector auto-upgrade.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Upgrade error codes

Error code	Description	Resolution
ACC-5005	Agent operating system is not supported for auto-upgrade.	The agent can't be auto-upgraded. Manually install the new version on the agent host. For supported platforms, see Supported platforms for Agent Client Collector auto-upgrade.
ACC-5006	Agent version is earlier than the minimum required for auto-upgrade (2.7.0).	Manually upgrade the agent to version 2.7.0 or higher, then retry.
ACC-5007	Agent is not in **Up** status.	Wait for the agent to reconnect. If the agent remains down, investigate connectivity issues on the agent host.
ACC-5013	Agent-side validation failed (AgentVerification stage).	Check the `acc.log` file on the agent host. Common causes include insufficient permissions, low disk space, and missing dependencies.
ACC-5015	MID Server is not in **Up** status.	Restore the MID Server that this agent connects through, then retry the upgrade.
ACC-5016	Upgrade timed out. The agent did not complete the upgrade within the allowed time.	Connect to the agent host and check whether the agent service is running. Review the upgrade log: • Linux and macOS: `{AGENT_LOG_DIR}/servicenow/agent-client-collector/upgrade.log` • Windows: `%TEMP%\ACC_Logs\ACC_Upgrade.log` If the service is running but the status did not update, restart the agent service.
ACC-5017	Agent has exceeded the maximum retry limit for failed upgrades.	1. Investigate the root cause in the agent logs. 2. After resolving the issue, open the agent record and navigate to the related Agent Extended Info record. 3. Set `failed_upgrade_attempts` to `0` and save. 4. Navigate to ACC Errors and resolve the ACC-5017 error for this agent. 5. The agent is picked up in the next scheduled upgrade run.
ACC-5018	Target upgrade version is invalid.	Check the *`sn_agent.agent_upgrade_version`* property. The value must be a valid version number, for example `5.0.1`.

© 2026 ServiceNow, Inc. All rights reserved.

Supported platforms for Agent Client Collector auto-upgrade

Operating systems and package types supported for Agent Client Collector auto-upgrade, and the minimum agent version required.

The minimum agent version for upgrade eligibility is 2.7.0 on all platforms. Agents on unsupported platforms are skipped with error code ACC-5005.

Supported platforms for auto-upgrade

Operating system	Package type	Requirements
Windows	MSI	Agent must run as the SYSTEM account.
Linux — Red Hat, CentOS, Oracle, Rocky, Alma, CentOS Stream	RPM	Agent must run as root or have full sudo access. For information on configuring sudo access, see Install Agent Client Collector on a Linux system.
Linux — Ubuntu, Debian, GNU/Linux	DEB	Agent must run as root or have full sudo access. For information on configuring sudo access, see Install Agent Client Collector on a Linux system.
macOS — Intel (x64)	PKG	Agent must run as root or have full sudo access. For information on configuring sudo access, see Manually install Agent Client Collector on macOS.
macOS — Apple Silicon (ARM64)	PKG	Architecture is detected automatically. Agent must run as root or have full sudo access. For information on configuring sudo access, see Manually install Agent Client Collector on macOS.

Non-supported platforms

Auto-upgrade is not supported on Linux SuSE, Solaris, or AIX. Agents on these platforms are skipped during upgrade runs and generate error code ACC-5005. To upgrade agents on unsupported platforms, manually install the new version on the agent host.

Required agent permissions

Agents must run with elevated privileges on the host to perform a self-upgrade:

- Windows: SYSTEM account
- Linux: root user or sudoers file configuration with full sudo access
- macOS: root user or sudoers file configuration with full sudo access

Agent Client Collector Monitoring reference

Reference topics provide additional information about Agent Client Collector Monitoring checks and policies.

Agent Client Collector Monitoring Footprint

The following table describes Agent Client Collector resource consumption. We supply performance testing values to specific customers upon request.

Parameters	Linux	Windows
Machine spec	Cent OS 8, 4 CPU Core, 8GB Memory	Windows Server 2019, 2 CPU, 4GB Memory
Network - (Agent > MID)	10.64 KB/s	350-400 byte/s
Network - (MID > Agent)	48 byte/s	5-15 byte/s
Average CPU Utilization	~1%	~3.89%
Max CPU per check	10 to 15%	15 to 20%
Memory overhead (avg)	~13.88 MB	~31.15 MB

Agent Client Collector Monitoring default checks and policies

Agent Client Collector Monitoring provides various default checks and policies.

Provided checks

The following tables list the default checks. You can edit these checks as needed. For more information about a specific check, see its Check Definitions page, as described in Checks and policies.

Linux

Type	Name	Description
Event	os.linux.check-process	Counts the number of running processes. You can block event creation for this check when no process is detected. For details, see Block event creation for non-existent entities.
Event	os.linux.check-system-cpu	Checks the CPU usage percentage.
Event	os.linux.check-system-cpu-load	Checks the CPU data load percentage against the configured thresholds.
Event	os.linux.check-system-disk-usage	Checks the file system's mount points and metrics.
Event	os.linux.check-system-memory-percentage	Checks the memory usage percentage.
Event	os.linux.check-system-memory-swap	Checks the memory swap usage.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linux (continued)

Type	Name	Description
Event	os.linux.check-threads-count	Counts the number of threads running on the system. Sends an alert if that number is greater than the Warning or Critical threshold values.
Metric	os.linux.metrics-memory-vmstat	Collects vmstat memory metrics.
Metric	os.linux.metrics-process-status	Collects process status metrics provided to the metrics parameter.
Metric	os.linux.metrics-system-cpu	Collects CPU metrics, including cores.
Metric	os.linux.metrics-system-cpu-load	Uses uptime to collect CPU load metrics.
Metric	os.linux.metrics-system-cpu-percentage	Collects CPU usage percentage metrics, including average CPU utilization percentage.
Metric	os.linux.metrics-system-disk	Collects disk metrics.
Metric	os.linux.metrics-system-disk-capacity	Collects disk capacity metrics.
Metric	os.linux.metrics-system-disk-usage	Collects disk usage metrics, providing total, used, and available disk memory, as well as the disk's percentage of memory used.
Metric	os.linux.metrics-system-memory	Collects memory metrics, providing data in KB.
Metric	os.linux.metrics-system-memory-percent	Collects memory percentage metrics.
Metric	os.linux.metrics-system-uptime	Collects system uptime in seconds.
Metric	os.linux.metrics-reboot-count-today	Collects the number of reboots performed today.

Linux Log Monitoring

Type	Name	Description
Event	util.check-logs	Enables monitoring log files owned by a regular user. You can block event creation for this check when no process is detected. For details, see Block event creation for non-existent entities.
Event	util.check-logs-sudo	Enables monitoring log files owned by a root user. You can block event creation for this check when no process is detected. For details, see Block event creation for non-existent entities.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linux Network Monitoring

Type	Name	Description
Metric	os.linux.metrics-network-interface	Retrieves all network interface related metrics for Linux servers.
Metric	os.linux.metrics-netstat.tcp	Retrieves metrics on TCP socket states from netstat. Useful on high-traffic web or proxy servers with large numbers of short-lived TCP connections coming and going.

Windows Log Monitoring

Type	Name	Description
Event	os.windows.check-log	Enables monitoring log files on a Windows server.

Windows

Type	Name	Description
Event	os.windows.check-disk-name	Takes the storage drive name as input and verifies if the drive is present. Returns a CRITICAL\WARNING\OK value based on the parameter provided.
Event	os.windows.check-event-log	Measures the Windows event log against parameter thresholds and returns a CRITICAL\WARNING\OK event.
Event	os.windows.check-event-log-count	Measures the Windows event log against parameter thresholds and returns a CRITICAL\WARNING\OK event. Provides information on the number of events that have occurred within a specified duration for a single log file and a single ID. Also indicates the filters to be applied to retrieve events for a specific single-valued windows event level and provider name. Retrieving events from multiple log files is not supported. The number of events is provided, without details of each and every event.
Event	os.windows.check-event-log-details	Collects and filters Windows event logs based on the `duration_hour`, `event_log_level` and `log_file` values. Retrieves and filters Windows event logs according to the provided parameters. It returns details about the events with CRITICAL, WARNING, or OK status, based on the specified severity level. Supported on Windows version 7 and higher.
Event	os.windows.check-env-variables	Checks the environmental variables using a regular expression and returns either a *WARNING* or *OK* value. If a new system variable is created after agent installation, you must restart the agent. This check can access only

Windows (continued)

Type	Name	Description
		those user variables that are associated with the current user (used during agent installation).
Event	os.windows.check-file-hashcode-update	Takes the file's path and MD5 hashcode as an input and verifies whether file content has been modified. Returns a *CRITICAL*, *WARNING*, or *OK* value. Read permissions are required on the monitored file.
Event	os.windows.check-file-update	Takes the file's path and interval as an input and verifies whether file content has been modified. Returns a *CRITICAL*, *WARNING*, or *OK* value. Read permissions are required on the monitored file.
Event	os.windows.check-modules	Verifies whether the list of modules is present.
Event	os.windows.check-processor-queue-length	Checks Processor Queue Length.
Event	os.windows.check-system-cpu-load	Checks the CPU load by using the *typeperf* command.
Event	os.windows.check-system-disk	Checks disk usage under specific parameters.
Event	os.windows.check-system-memory	Collects RAM usage.
Event	os.windows.check-system-patch	Verifies system patch installation. Returns either a *WARNING* or *OK* value.
Event	os.windows.check-system-process	Checks the user's task list to find running processes.
Event	os.windows.check-user-account	Takes the list of user names as an input and verifies whether the user account is active. Returns a *CRITICAL*, *WARNING*, or *OK* value.
Event	os.windows.check-windows-directory	Checks if a directory exists.
Event	os.windows.check-windows-pagefile	Collects page file usage and compares it to the Warning and Critical thresholds.
Event	os.windows.check-windows-process	Checks if a user input process is running.
Event	util.check-windows-service	Checks if a user-supplied service is running on Windows. Only the RUNNING status is treated as OK. Any other status generates either a WARNING or CRITICAL event, depending on your configuration. You can block event creation for this check when no process is detected. For details, see Block event creation for non-existent entities.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows (continued)

Type	Name	Description
Metric	os.windows.metrics-process-status	Retrieves the number of running instances, the percentage of CPU utilization, and the memory usage (in kilobytes) of the specified Windows process.
Metric	os.windows.metrics-processor-queue	Collects Processor Queue Length.
Metric	os.windows.metrics-system-cpu-load	Collects the average CPU load per second.
Metric	os.windows.metrics-system-disk-usage	Collects disk usage metrics.
Metric	os.windows.metrics-system-memory-percent	Collects RAM usage per second, providing free physical, free virtual, total physical and total virtual memory percentage.
Metric	os.windows.metrics-system-network	Collects network metrics.
Metric	os.windows.metrics-system-uptime	Collects system uptime.
Metric	util.metrics-windows-perf-counters	(No description)

MID Server

Type	Name	Description
Event	app.mid.check-active	Checks if the MID Server is active, based on the occurrence of LogStatusMonitor in the MID log.
Events	app.mid.check-logs-mid	Checks the MID logs for errors.
Metric	app.mid.metrics-stats	Collects MID Server information from the log and returns metrics.

HAProxy monitoring

Type	Name	Description
Event	check-haproxy	Retrieves the HAProxy load balancer details to determine whether it is running.
Metric	metrics-check-haproxy	Retrieves the HAProxy load balancer metrics to determine whether it is running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTTP (to be run in proxy mode)

Type	Name	Description
Event	util.check-http-response	Takes a URL or a combination of host/path/port/ssl, and checks for a 200 response that matches a pattern, if provided. Can use client certificates.
Event	util.check-http-follow-redirect	Checks that the URL doesn't exceed the maximum number of redirects.
Metric	util.metrics-http-curl	Retrieves HTTP endpoint metrics using curl.

Additional HTTP checks (no policy)

Type	Name	Description
Event	util.check-http-response-code	Raises a critical event if the URL response code does not match the regex.

Active Directory Metrics

Type	Check	Description	Command
Metric	metrics.windows.active-directory	Collects Active Directory metrics on the Windows host. Usage: winchecks metric-windows-active-dir -s hostname	`winchecks metric-windows-active-dir {{if .labels.params_scheme}} -S {{.labels.params_scheme}} {{end}}`

Apache

Type	Event/Metric	Description	Minimum version
Metric	app.apache.metrics-apache	Retrieves Apache HTTP server metrics.	2.4.x

Apache Kafka

Type	Event/Metric	Description	Minimum version
Event	kafka.check-zookeeper-status	Raises a critical event if the hosted Kafka Zookeeper is down.	ZooKeeper 3.1.2
Event	kafka.check-topic-replicas	Raises a critical event if any topic has partitions with unknown replicas.	ZooKeeper 3.1.2
Event	kafka.check-topic-replication-factor	Raises a critical event if replication factor of at least one topic is above or below provided replication factor parameter.	ZooKeeper 3.1.2

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Apache Kafka (continued)

Type	Event/Metric	Description	Minimum version
Event	kafka.check-topic-leader	Raises a critical event if any topic has partitions with unknown leaders or unpreferred replica as leader.	ZooKeeper 3.1.2
Event	kafka.check-topic-partitions	Raises a critical event if the number of partitions for a topic is less the min_partitions param.	ZooKeeper 3.1.2
Event	kafka.check-broker-status	Raises a critical event if Kafka Broker on the host is down.	Kafka 0.10.1.0
Metric	kafka.metrics.broker	Collects Kafka Broker Metrics from the host.	Kafka 0.10.1.0
Metric	kafka.metrics.zookeeper	Collects Zookeeper Metrics from the host.	ZooKeeper 3.5.0-alpha

Azure k8s Metrics

Type	Event/Metric	Description	Command
Metric	azure.metrics-k8s-service	Provides pod, nodes, and cluster level metrics from all Azure Kubernetes services in metric form. Usage: metrics-azure-k8s-service.rb Command example: `metrics-azure-k8s-service.rb -S {{.labels.params_subscription_id}} -r westus2`	`metrics-azure-k8s-service.rb -r {{.labels.params_ci_region}} {{-s {{if.labels.params_subscrip -S {{.labels.params_subscripti {{end}}`

Azure VM Metrics

Type	Event/Metric	Description	Command
Metric	azure.metrics-vm-cpu	Provides CPU-related metrics of each VM instance in the Azure region. Command example: `./metrics-azure-vm.rb -S {{.labels.params_subscription_id}} -T cpu`	`metrics-azure-vm.rb -r {{.labels.params_ci_region}} {{if .labels.params_subscri -S {{.labels.params_subscripti {{end}} -T {{.labels.params_type}}`
Metric	azure.metrics-vm-disk	Provides disk-related metrics of each VM	`metrics-azure-vm.rb -r`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure VM Metrics (continued)

Type	Event/Metric	Description	Command
		instance in the Azure region. Command example: `./metrics-azure-vm.rb -S {{.labels.params_subscription_id}} -T disk`	`{{.labels.params_ci_region} {{if .labels.params_subscri -S {{.labels.params_subscripti {{end}} -T {{.labels.params_type}}`
Metric	azure.metrics-vm-memory	Provides memory-related metrics of each VM instance in the Azure region. Command example: `./metrics-azure-vm.rb -S {{.labels.params_subscription_id}} -T memory`	`metrics-azure-vm.rb -r {{.labels.params_ci_region} {{if .labels.params_subscri -S {{.labels.params_subscripti {{end}} -T {{.labels.params_type}}`
Metric	azure.metrics-vm-network	Provides network-related metrics of each VM instance in the Azure region. Command example: `./metrics-azure-vm.rb -S {{.labels.params_subscription_id}} -T network`	`metrics-azure-vm.rb -r {{.labels.params_ci_region} {{if .labels.params_subscri -S {{.labels.params_subscripti {{end}} -T {{.labels.params_type}}`
Metric	azure.metrics-vm-flows	Provides flows-related metrics of each VM instance in the Azure region. Command example: `./metrics-azure-vm.rb -S {{.labels.params_subscription_id}} -T flows`	`metrics-azure-vm.rb -r {{.labels.params_ci_region} {{if .labels.params_subscri -S {{.labels.params_subscripti {{end}} -T {{.labels.params_type}}`

GCP GCE metrics

Type	Event/Metric	Description
Metric	gcp.metrics.GCE	Retrieves metrics from GCP for Google Compute Engine.
Metric	glassfish.metric-server-requests	Provides http-request metrics for all applications deployed on the Glassfish server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GCP GCE metrics (continued)

Type	Event/Metric	Description
Metric	glassfish.metric-server-resources	Provides metrics of the resources deployed on the Glassfish server.
Metric	glassfish.metric-transaction-service	Provides metrics for all transactions on applications deployed on the Glassfish server.
Metric	glassfish.metric-deployed-apps	Provides metric output of the applications deployed on the Glassfish server.
Metric	glassfish.metric-deployment-lifecycle	Provides lifecycle metrics applications deployed on the Glassfish server.

Glassfish

Type	Name	Description
Metric	glassfish.metric-jvm-level	Retrieves JVM metrics on the Glassfish server.
Metric	glassfish.metric-server-requests	Provides http-request metrics for all applications deployed on the Glassfish server.
Metric	glassfish.metric-server-resources	Provides metrics of the resources deployed on the Glassfish server.
Metric	glassfish.metric-transaction-service	Provides metrics for all transactions on applications deployed on the Glassfish server.
Metric	glassfish.metric-deployed-apps	Provides metric output of the applications deployed on the Glassfish server.
Metric	glassfish.metric-deployment-lifecycle	Provides lifecycle metrics applications deployed on the Glassfish server.

IBM WebSphere AS

Type	Event/Metric	Description	Minimum version
Metric	app.websphere.metrics-websphere	Returns IBM WebSphere application server metrics. Ensure that the user running the agent has sufficient permissions to access the required	9

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IBM WebSphere AS (continued)

Type	Event/Metric	Description	Minimum version
		files in the `IBM Websphere AS` installation directories.	

IIS

Type	Event/Metric	Description	Minimum version
Event	app.iis.check-iis-alive	Checks if IIS is running.	-
Event	app.iis.check-iis-current-connections	Checks the number of current connections to the IIS server and their status, depending on the input. By default, all sites are connected to the IIS server.	-
Metric	app.iis.metrics-iis	Returns IIS metrics.	-

JBoss/WildFly

Type	Event/Metric	Description	Minimum version
Metric	app.jboss.metrics-jboss	Retrieves JBoss/WildFly server metrics. Ensure that the user running the agent has sufficient permissions to access the required files in the`JBoss/WildFly` installation directories.	16, 17

Kubernetes

Type	Event/Metric	Description	Command
Event	k8s.check-kube-apiserver-available	Checks if Kubernetes API server is up.	`check-kube-apiserver-available.rb {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}}`
Event	k8s.check-kube-nodes-ready	Checks whether Kubernetes nodes are in ready-to-use state.	`check-kube-nodes-ready.rb {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}}`
Event	k8s.check-kube-pods-pending	Measures the threshold by which pods are in the Pending state. Determine the threshold by setting the *`pending_timeout`* check parameter	`check-kube-pods-pending.rb {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Kubernetes (continued)

Type	Event/Metric	Description	Command
		value (default = 300 seconds).	
Event	k8s.check-kube-pods-restarting	Checks the pods that are restarting. Determine the threshold by setting the check parameter value (default = 10).	`check-kube-pods-restarting.rb {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}} {{if .labels.params_restart}} -r {{.labels.params_restart}} {{end}}`
Event	k8s.check-kube-pods-running	Checks the pods that are in the running state. Configure the threshold in the *not_ready_time* check parameter, in seconds (default = 0).	`check-kube-pods-running.rb {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}} {{if .labels.params_not_ready_time}} -time {{.labels.params_not_ready_time}} {{end}}`
Event	k8s.check-kube-pods-runtime	Checks whether pods are running longer than expected. Configure threshold in the check parameter (in seconds). You can configure both WARNING and CRITICAL thresholds.	check-kube-pods-runtime.rb {{if .labels.params_critical}} -c {{.labels.params_critical}} {{end}} {{if .labels.params_warning}} -w {{.labels.params_warning}} {{end}} {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}}
Event	k8s.check-kube-service-available	Checks whether Kubernetes services are up and running. Add the list of services to be monitored in the services' *check_param* field as comma-separated values (without spaces). If you enter services that are not valid, the check fails.	`check-kube-pods-runtime.rb {{if .labels.params_critical}} -c {{.labels.params_critical}} {{end}} {{if .labels.params_warning}} -w {{.labels.params_warning}} {{end}} {{if .labels.params_api_server}} -s {{.labels.params_api_server}} {{end}}`
Metric	k8s.metrics-pods	Provides a pod count from all of the exposed services.	`metrics-pods.rb {{if .labels.params_api_server}} -s {{.labels.params__api_server }} {{end}}`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MsSQL

Type	Event/Metric	Description	Minimum version
Metric	app.msssql.metrics-mssql	Retrieves MSSQL database metrics.	2016
Metric	app.metrics-mssql-query	Generic MSSQL query class which accepts a query and dumps metrics.	2016

MySQL

Type	Event/Metric	Description	Minimum version
Event	app.mysql.check-mysql-alive	Checks if the MySQL database is running.	5.7, 8
Event	app.mysql.check-mysql-threads	Checks the number of running threads on the MySQL database. Depending on the input, it determines the status: OK, Warning, or Critical.	5.7, 8
Event	util.check-mysql-query	Checks the length of a MySQL query result set. Ensure that you use the native_password authentication method on the MySQL server when utilizing this check.	5.7, 8
Metric	app.mysql.metrics-mysql	Returns MySQL database metrics.	5.7, 8
Metric	app.mysql.metrics-mysql-processes	Returns MySQL database process metrics.	5.7, 8
Metric	util.metrics-mysql-query	Creates a formatted metric for the length of a MySQL query result set.	5.7, 8

MongoDB

Type	Event/Metric	Description	Minimum version
Event	app.mongodb.check-mongodb-alive	Monitors whether the MongoDB server is alive and creating alerts for the MongoDB server health status.	
Event	app.mongodb.check-mongodb-metrics	Creates alerts for any of the MongoDB metrics, based on the threshold limit.	
Metric	app.mongodb.metrics-mongodb	Returns metrics of the MongoDB server and all databases.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Oracle

Type	Event/Metric	Description	Minimum version
Event	app.oracle.check-oracle-alive	Checks if the Oracle database is running.	12c, 18c
Metric	app.oracle.metrics-oracle	Returns Oracle database metrics.	12c, 18c
Metric	util.metrics-oracle-query	Generic Oracle query class that accepts a query and dumps metrics.	12c, 18c

Oracle WebLogic AS

Type	Event/Metric	Description	Minimum version
Metric	app.weblogic.metrics-weblogic	Returns Oracle WebLogic application server metrics. Ensure that the user running the agent has sufficient permissions to access the required files in the `WebLogic` installation directories.	12cR2

Tomcat

Type	Event/Metric	Description	Minimum version
Metric	app.tomcat.metrics-tomcat	Returns Apache Tomcat server metrics.	8.5.27, 9.x

App

Type	Name	Description
Event	util.check-snmp	SNMP check that compares the metric value to the default. Requires input such as server, port, SNMP community, and limits.
Metric	util.metrics-snmp	Collects metrics from an SNMP OID value.
Metric	util.metrics-snmp-bulk-sn	Collects metrics from an SNMP Table OID and returns the result as a table.

Service enhancements (can be associated with any policy)

Type	Event/Metric	Description	Command
Metric (Windows)	os.windows.metrics-service-status	Collects Windows service status, providing metric of number of services running.	`winchecks metric-windows-service-status -S Wcmsvc --scheme hostname.proc`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service enhancements (can be associated with any policy) (continued)

Type	Event/Metric	Description	Command
		Only the RUNNING status is treated as OK. Any other status generates either a WARNING or CRITICAL event, depending on your configuration.	

Varnish

Type	Name	Description
Metric	app.varnish.metrics-varnish	Collects Varnish metrics from the host.

vSphere

Type	Name	Description
Metric	vsphere.metric-VirtualMachine	Retrieves metrics for the vSphere Virtual Machine.
Metric	vsphere.metric-Datastore	Retrieves metrics for the vSphere Datastore.
Metric	vsphere.metric-Datacenter	Retrieves metrics for the vSphere Datacenter.
Metric	vsphere.metric-ESX_Server	Retrieves metrics for the vSphere ESX Server or HostSystem

Zscaler

Type	Name	Description
Metric	zscaler-monitoring-check	Verifies whether the Zscaler app is running properly.
Metric	zscaler-remediation-check	Shuts down and restarts the Zscaler app, and creates an incident. Runs only when the zscaler-monitoring-check fails.

CPU enhancements

Type	Event/Metric	Description	Command
Metric	os.windows.metrics-system-cpu	Collects CPU core metrics.	`winchecks metric-windows-cpu --scheme hostname.proc`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Disk enhancements - Linux events (can be associated with any policy)

Event/Metric	Description	Command
os.linux.check-disk-ioTimeWeighted	Measures the `disk ioTimeWeighted` value, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-ioTimeWeighted.rb`
os.linux.check-disk-sectorsWritten	Measures the total number of sectors written successfully, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-sectorsWritten.rb`
os.linux.check-disk-sectorsRead	Measures the disk's total number of sectors read successfully, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-sectorsRead.rb`
os.linux.check-disk-readTime	Measures the total number of milliseconds spent by all read- against thresholds, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-readTime.rb`
os.linux.check-disk-writes	Measures the total number of writes completed successfully, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-writes.rb`
os.linux.check-disk-reads	Measures the total number of reads completed successfully, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-reads.rb`
os.linux.check-disk-writesMerged	Measures the `disk writesMerged` value, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-writesMerged.rb`
os.linux.check-disk-readsMerged	Measures the `disk readsMerged` value, returning a **CRITICAL\WARNING\OK** message,	`check-disk-readsMerged.rb`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Disk enhancements - Linux events (can be associated with any policy) (continued)

Event/Metric	Description	Command
	according to the thresholds specified in the parameters.	
os.linux.check-disk-writeTime	Measures the total number of milliseconds spent by all write operations, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-writeTime.rb`
os.linux.check-disk-ioInProgress	Measures the `disk ioInProgress` value, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-ioInProgress.rb`
os.linux.check-disk-iotime	Measures the `disk ioTime` value, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-disk-ioTime.rb`

Disk enhancements - Windows events (can be associated with any policy)

Event/Metric	Description	Command
os.windows.check-disk-AvgSecWrite	Measures average disk writes per second, returning a **CRITICAL\WARNING\OK** message, according to the specified in the parameters.	`winchecks check-windows-AvgDisksec-write -w 1 -c 0`
os.windows.check-disk-ReadBytes-sec	Measures the `disk ReadBytes` value per second, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`winchecks check-windows-DiskReadBytes-sec -w 1 -c 0`
os.windows.check-disk-WriteBytes-sec	Measures the `disk WriteBytes` value per second, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`winchecks check-windows-DiskWriteBytes-sec -w 1 -c 0`
os.windows.check-disk-AvgSecRead	Measures the average disk reads per second, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`winchecks check-windows-AvgDisksec-read -w 1 -c 0`

Disk enhancements - Windows metrics (can be associated with any policy)

Event/Metric	Description	Command
os.windows.metrics-system-disk	Collects the following disk metrics: • AvgDiskSecPerRead • AvgDiskSecPerWrite • DiskReadBytesPerSec • DiskWriteBytesPerSec	`winchecks metric-windows-disk`

Memory enhancements (can be associated with any policy)

Type	Event/Metric	Description	Command
Event (Linux)	os.linux.check-free-physical-memory	Measures the free physical memory percentage of the Linux system, returning a **CRITICAL\WARNING\OK** event message, according to the thresholds specified in the parameters.	`check-free-physical-memory -w 10 -c 5`
Event (Linux)	os.linux.check-free-virtual-memory	Measures the free virtual memory percentage of the Linux system, returning a **CRITICAL\WARNING\OK** event message, according to the thresholds specified in the parameters.	`check-free-virtual-memory -w 10 -c 5`
Event (Windows)	os.windows.check-free-physical-memory	Measures the free physical memory percentage of the Windows system, returning a **CRITICAL\WARNING\OK** event message, according to the thresholds specified in the parameters.	`winchecks check-windows-free-physfical-memory -w 10 -c 5`
Event (Windows)	os.windows.check-free-virtual-memory	Measures the free virtual memory percentage of the Windows system, returning a **CRITICAL\WARNING\OK** event message, according	`winchecks check-windows-free-physical-memory -w 10 -c 5`

Memory enhancements (can be associated with any policy) (continued)

Type	Event/Metric	Description	Command
		to the thresholds specified in the parameters.	
Metric (Windows)	os.windows.metrics-system-memory	Collects the following memory metrics: • FreePhysicalMemory • TotalPhysicalMemory • FreeVirtualMemory • TotalVirtualMemorySize • AvailableMemory • TotalVisibleMemorySize	`winchecks metric-windows-memory --scheme hostname.proc`

Process enhancements (can be associated with any policy)

Type	Event/Metric	Description	Command
Event (Linux)	os.linux.check-process-cpu	Measures the Linux process CPU usage, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-process-cpu.rb -p acc -c 95 -w 85`
Event (Linux)	os.linux.check-process-memory	Measures the Linux process memory usage, returning a **CRITICAL\WARNING\OK** message, according to the thresholds specified in the parameters.	`check-process-memory.rb -p acc -c 95 -w 85`
Metric (Linux)	os.linux.metrics-process-usage	Collects the Linux process status, including the CPU and memory data used by the process.	`metrics-process-usage.rb -p acc -s hostname.proc`
Event (Windows)	os.windows.check-process-cpu	Measures the Windows process CPU usage, returning a **CRITICAL\WARNING\OK** message according to the thresholds specified in the parameters.	`winchecks check-windows-process-cpu-p acc -c 95 -w 85`

Process enhancements (can be associated with any policy) (continued)

Type	Event/Metric	Description	Command
Event (Windows)	os.windows.check-process-memory	Measures the Windows process memory usage, returning a **CRITICAL\WARNING\OK** message according to the thresholds specified in the parameters.	`winchecks check-windows-process-memory-p acc -c 95 -w 85`
Metric (Windows)	os.windows.metrics-process-usage	Collects the Windows process status, including the CPU and memory data used by the process.	`winchecks metric-windows-process-status -n Svchost -s hostname.proc`

Supported Agent policies

This table lists the supported Agent Client Collector for Monitoring policies that the check definitions are associated with. The policies consist of the monitored CIs and the checks that run on them.

Name	Description	Checks
Apache Events	Monitors operational Apache HTTP web servers. To enable monitoring if the process is alive, activate the relevant check: • For Linux: os.linux.check-process • For Windows: os.windows.check-windows-process On the **Credentials** tab, specify Basic Auth Credentials.	• os.linux.check-process • os.windows.check-windows-process
Apache Metrics	Monitors operational Apache HTTP web servers. On the **Credentials** tab, specify Basic Auth Credentials.	app.apache.metrics-apache
Apache Kafka Events	Monitors the status of Kafka Broker, Kafka topics, partictions, replicas and Zookeeper.	
Apache Kafka Metrics	Monitors and collects metrics from Kafka Broker and Kafka Zookeeper.	
Azure DB Metrics	Monitors Azure databases on an Azure datacenter. To enable the policy's checks:	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks

	• Configure a proxy agent.
	• Add the following Azure service principal credentials:
	  ○ Tenant ID
	  ○ Client ID
	  ○ Secret Key
	• Configure the Authentication Method as **Client secret**.
	• Add Azure credentials in the policy.
	• Provide the *subscription_id* value in each check instance.
	
	The default monitored CI Type is cmdb_ci_azure_datacenter, but the binding occurs on the Cloud Database (cmdb_ci_cloud_database).
	
	For details on configuring a policy, see Create a new Agent Client Collector policy.	

Azure k8s Service Metrics	Monitors the Azure CI, *cmdb_ci_azure_datacenter*. Binds with the Kubernetes data cluster, *cmdb_ci_kubernetes_cluster*.	azure.metrics-k8s-service For details, see Azure Health Monitoring default checks and policies.
Azure VM Metrics	Monitors the Azure CI, *cmdb_ci_azure_datacenter*. Binds with the virtual machine instance, *cmdb_ci_vm_instance*.	• azure.metrics-vm-cpu • azure.metrics-vm-disk • azure.metrics-vm-memory • azure.metrics-vm-network • azure.metrics-vm-flows For details, see Azure Health Monitoring default checks and policies.
Basic Discovery	Runs basic ServiceNow Discovery on all agents, every 12 hours. This check extracts basic information about the host and its running processes. The host information is used to create the corresponding host in the CMDB, while the running processes create the classified application CIs. You need advanced OS privileges to use the Net stat command to discover ports. The command that you run depends on your OS, as follows:	check-discovery-basic

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
	• Linux: `sudo -n netstat -antp` • Windows: `netstat -anop TCP`	
Docker Container Metrics	Collects performance metrics for Docker containers. Provide the credentials of users who are Docker user group members or have sudo rights. Provide these credentials on the **Credentials** tab of the policy form.	container.docker.metrics-docker
Docker Engine Metrics	Collects general metrics for the Docker engine. Provides the credentials of a user which is either a member of the Docker user group or has been assigned sudo rights on the **Credentials** tab. To enable running checks through this policy, add the servicenow user to the Docker user group on the machine where the agent is running.	container.docker.metrics-docker-info
F5 SNMP Events	Example for using SNMP checks. Because the Agent doesn't run on SNMP devices, provide the following to complete this policy: • A Proxy Agent and credentials. • The host of the Proxy Agent. On the **Credentials** tab, specify the SNMP Community Credentials for connecting to the server.	util.check-snmp
F5 SNMP Metrics	Example for using SNMP metrics. Because the Agent doesn't run on SNMP devices, provide the following to complete this policy: • Proxy Agent and credentials. • The host of the Proxy Agent. On the**Credentials** tab, specify the SNMP Community Credentials for connecting to the server.	• util.metrics-snmp • util.metrics-snmp-bulk-sn
Glassfish Metrics	Runs metric checks on the Glassfish server. Glassfish metrics are supported in ITOM Agent Client Collector version 2.3.0 - August 2022, available from the ServiceNow Store.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
HAProxy Events	Retrieves the HAProxy load balancer details to determine whether it is running. HAProxy events are supported in ITOM Agent Client Collector version 2.3.0 - August 2022, available from the ServiceNow Store.	
HAProxy Metrics	Retrieves the HAProxy load balancer metrics to determine whether it is running. HAProxy metrics are supported in ITOM Agent Client Collector version 2.3.0 - August 2022, available from the ServiceNow Store.	
HTTP Entry Points Events	Runs the util.check-http-follow-redirect check on all HTTP entry points that belong to application business services. The policy filter chooses the services. The services define the entry points. • To enable this check, there is a new database view which combines the application services table with the entry points table. • You can filter the services and receive the entry points. • When you receive an alert, it is automatically bound to the entry points. This alert affects the impact calculation, because entry points are considered. • This policy requires a Proxy Agent.	util.check-http-follow-redirect
HTTP Entry Points Metrics	For example, when the alert is bound to the entry point, the service map identifies an entry point problem. • The metric binds to the entry point CI. In previous releases, the metric was bound to the service and the entry point was the resource. • This policy requires a Proxy Agent.	util.metrics-http-curl
IIS Events	Monitors operational IIS servers.	• app.iis.check-iis-alive • app.iis.check-iis-current-connections
IIS Metrics	Monitors operational IIS servers.	app.iis.metrics-iis
JBoss/WildFly Application Server Events	Monitoring operational JBoss/WildFly application servers.	os.linux.check-process

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
	To enable monitoring if the JBoss process is alive, activate os.linux.check-process. The *jboss_home* parameter in the check instance is specified as the location where JBoss is installed.	
JBoss/WildFly Application Server Metrics	Monitors operational JBoss/WildFly application servers.	app.jboss.metrics-jboss
Kubernetes	Monitors health of Kubernetes infrastructure, such as clusters, nodes, pod status, API, and service availability. When running Kubernetes checks: • Proxy agent must be enabled. • Enter Kubernetes credentials, either a username/password combination or a bearer token (but not both). • To activate and publish the policy, configure the *api_server* value in the check parameter definitions of each check, as one of the following: ◦ `https://127.0.0.1:<portnumber>/api` (If the API server and agent are running on the same server) ◦ `https://<api_server_url>/api` (Whether the API server and agent are running on the same or different servers). To use the localhost as your api_server, run the following command: `"kubectl proxy -port=8081 &"` • Run Discovery to discover all Kubernetes CIs. For details, see Kubernetes discovery.	• k8s.check-kube-apiserver-available • k8s.check-kube-nodes-ready • k8s.check-kube-pods-pending • k8s.check-kube-pods-restarting • k8s.check-kube-pods-running • k8s.check-kube-pods-runtime • k8s.check-kube-service-available • k8s.metrics-pods
Linux log monitoring	Monitors logs on operational Linux servers.	• util.check-logs • util.check-logs-sudo
Linux OS Events	Runs Linux checks on operational Linux servers.	• os.linux.check-process • os.linux.check-system-cpu • os.linux.check-system-cpu-load • os.linux.check-system-disk-usage • os.linux.check-system-memory-percentage

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
		• os.linux.check-system-memory-swap • os.linux.check-threads-count
Linux OS Metrics	Collects Linux metrics on operational Linux servers.	• os.linux.metrics-memory-vmstat • os.linux.metrics-process-status • os.linux.metrics-system-cpu • os.linux.metrics-system-cpu-load • os.linux.metrics-system-disk • os.linux.metrics-system-disk-capacity • os.linux.metrics-system-disk-usage • os.linux.metrics-system-memory • os.linux.metrics-system-memory-percentage • os.linux.metrics.reboot_count_today
MSSQL Events	Monitors the operational MSSQL server process. Runs os.windows.check-windows-process to monitor when the server process is alive.	os.windows.check-windows-process
MSSQL Metrics	Monitors operational MSSQL server process. Runs app.mssql.metrics-mssql to gather metrics.	app.mssql.metrics-mssql
MySQL DB Events	Monitors operational MySQL instances. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the database server. **Note:** Utility checks, prefixed with util, have required parameters for which you must specify a value. These parameters have no default values.	• app.mysql.check-mysql-alive • app.mysql.check-mysql-threads • util.check-mysql-query

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
MySQL DB Metrics	Monitors operational MySQL instances. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the database server. **Note:** Utility checks, prefixed with util, have required parameters for which you must specify a value. These parameters have no default values.	• app.mysql.metrics-mysql • app.mysql.metrics-mysql-processes • util.metrics-mysql-query
Network ping metrics	Monitors the ip address discovered in the ServiceNow instance. The cmdb_ci_hardware monitored CI type is bound to the relevant server: This policy requires a proxy agent.	util.metrics-ping
Oracle DB Events	Monitors operational Oracle Database instances. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the database server. **Note:** Utility checks, prefixed with util, have required parameters for which you must specify a value. These parameters have no default values.	app.oracle.check-oracle-alive
Oracle DB Metrics	Monitors operational Oracle Database instances. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the database server. **Note:** Utility checks, prefixed with util, have required parameters for which you must specify a value. These parameters have no default values.	• app.oracle.metrics-oracle • util.metrics-oracle-query
Self-Healing Events	Runs a ping command to another host. Ensure that you run this check in proxy mode.	util.check-ping
Tomcat Events	Monitors operational Apache Tomcat servers. To enable monitoring if the Tomcat process is alive, activate the relevant check: • For Linux: os.linux.check-process • For Windows: util.check-windows-service If the Tomcat service is running under a different name, update the value of the check instance's *`service`* parameter to the correct value.	• os.linux.check-process • util.check-windows-service

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
Tomcat Metrics	Monitors operational Apache Tomcat servers. If Tomcat Metrics are running on a port other than the default port (9000), update the value of the check instance's *port* parameter to the correct port value.	app.tomcat.metrics-tomcat
Varnish Metrics	Monitors and collects metrics from Varnish. Varnish metrics are supported in ITOM Agent Client Collector version 2.3.0 - August 2022, available from the ServiceNow Store. You must perform discovery using application fingerprints before running Varnish checks. For details, see Enable running of Varnish checks.	
vSphere Metrics	Monitors and collects metrics from vSphere. vSphere metrics are supported in ITOM Agent Client Collector version 2.3.0 - August 2022, available from the ServiceNow Store. This policy requires a proxy agent.	
WebLogic Application Server Events	Monitors operational Oracle WebLogic application servers. This policy monitors if the WebLogic process running on Linux is alive. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the application server.	os.linux.check-process
WebLogic Application Server Metrics	Monitors operational Oracle WebLogic application servers. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the application server. Ensure that the user running the agent has sufficient permissions to access the required files in the `WebLogic` installation directories.	app.weblogic.metrics-weblogic
WebSphere Application Server Events	Monitors operational IBM WebSphere servers. This policy monitors if the WebSphere process running on Linux is alive. On the **Credentials** tab, specify Basic Auth Credentials for connecting to the application server.	os.linux.check-process
WebSphere Application Server Metrics	Monitors operational IBM WebSphere servers.	app.websphere.metrics-websphere

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
	On the **Credentials** tab, specify Basic Auth Credentials for connecting to the application server.	
Windows Log Monitoring	Monitors logs on operational Windows servers.	os.windows.check-log You can block event creation for this check when no process is detected. For details, see Block event creation for non-existent entities.
Windows OS Events	Runs Windows checks on operational Windows servers.	• os.windows.check-processor-queue-length • os.windows.check-system-cpu-load • os.windows.check-system-disk • os.windows.check-system-memory • os.windows.check-system-process • os.windows.check-windows-directory • os.windows.check-windows-directory • os.windows.check-windows-directory • os.windows.check-windows-pagefile • os.windows.check-windows-process
Windows OS Events - Extended	Runs Windows checks to monitor directories and files on Windows servers.	• check-directory-file-count • check-directory-integrity • check-file-age • check-file-response-time • check-file-size • check-file-space • os.windows.check-directory-space

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Checks
Windows OS Metrics	Collects Windows metrics on operational Windows servers.	• os.windows.metrics-processor-queue-len • os.windows.metrics-system-cpu-load • os.windows.metrics-system-disk-usage • os.windows.metrics-system-memory-percent • os.windows.metrics-system-network • os.windows.metrics-system-uptime
Zscaler Monitoring Policy	Executes Zscaler monitoring on all of a machine's CIs.	• zscaler-monitoring-check • zscaler-remediation-check

Active Directory metrics

The following table lists the metrics that are gathered as output from Active Directory checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

Active Directory metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
active_dir.DRA_Inbound_Bytes_after_compressed/sec			Shows the compressed size of inbound compressed replication data (size after compression, from DSAs in other sites).
active_dir.DRA_Inbound_Bytes_before_compressed/sec			Shows the original size of inbound compressed replication data (size before compression, from DSAs in other sites).
active_dir.DRA_Inbound_Bytes_not_compressed/sec			Shows the number of incoming bytes replicated that were not compressed at the source (that is, from

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active Directory metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			DSAs in the same site).
active_dir.DRA_Inbound_Bytes_Total/sec (featured metric)			Shows the total number of bytes replicated in. This counter is the sum of the number of uncompressed bytes (never compressed) and the number of compressed bytes (after compression).
active_dir.DRA_Inbound_Full_Sync_Objects_Remaining (featured metric)			Shows the number of objects remaining until the full synchronization is completed (when set).
active_dir.DRA_Inbound_Object_Updates_Remaining_in_Packet			Shows the number of object updates received in the current directory replication update packet that have not yet been applied to the local server.
active_dir.DRA_Inbound_Objects/sec			Shows the rate at which replication updates received from replication partners are applied by the local directory service. This counter excludes changes that are received but not applied (because, for example, the change has already been made). This indicates how much replication update activity is occurring on the server as a result of changes generated on other servers.
active_dir.DRA_Inbound_Objects_Applied/sec			Shows the number of objects received from inbound replication partners

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active Directory metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			that contained no updates that needed to be applied.
active_dir.DRA_Inbound_Objects_Filtered/sec			Shows the number of objects received from neighbors through inbound replication. A neighbor is a domain controller from which the local domain controller replicates locally.
active_dir.DRA_Inbound_Properties_Applied/sec			Shows the number of properties that are updated due to the incoming property's winning the reconciliation logic that determines the final value to be replicated.
active_dir.DRA_Inbound_Properties_Filtered/sec			Shows the number of property changes that are received during the replication that we have already seen.
active_dir.DRA_Inbound_Properties_Total/sec			Shows the total number of object properties received from inbound replication partners.
active_dir.DRA_Inbound_Values_DNs/sec			Shows the number of object property values received from inbound replication partners that are distinguished names (DNs) that reference other objects. DN values, such as group or distribution list memberships, are generally more expensive to apply than other kinds of values.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active Directory metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
active_dir.DRA_Inbound_Values_Total/sec			Shows the total number of object property values received from inbound replication partners. Each inbound object has one or more properties, and each property has zero or more values. Zero values indicate property removal.
active_dir.DRA_Outbound_Bytes_after_compressed/sec			Shows the compressed size of outbound compressed replication data (size after compression, from DSAs in other sites).
active_dir.DRA_Outbound_Bytes_before_compressed/sec			Shows the original size of outbound compressed replication data (size before compression, from DSAs in other sites).
active_dir.DRA_Outbound_Bytes_not_compressed/sec			Shows the number of bytes replicated out that were not compressed (that is, from DSAs in the same site).
active_dir.DRA_Outbound_Bytes_Total/sec (featured metric)			Shows the total number of bytes replicated out. This counter is the sum of the number of uncompressed bytes (never compressed) and the number of compressed bytes (after compression).
active_dir.DRA_Outbound_Objects/sec			Shows the number of objects that were determined by outbound replication

Active Directory metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			to have no updates that the outbound partner did not already have.
active_dir.DRA_Outbound_Objects_Filtered/sec			Shows the number of objects replicated out.
active_dir.DRA_Outbound_Properties/sec			Shows the number of properties replicated out.
active_dir.DRA_Outbound_Values_DNs/sec			Shows the number of object property values containing DNs sent to outbound replication partners. DN values, such as group or distribution list memberships, are generally more expensive to read than other kinds of values.
active_dir.DRA_Outbound_Values_Total/sec			Shows the number of object property values sent to outbound replication partners.
active_dir.DRA_Pending_Replication_Synchronizations			Shows the number of directory synchronizations that are queued for this server but not yet processed.
active_dir.DRA_Sync_Requests_Made			Shows the number of synchronization requests made to neighbors.
active_dir.DS_Threads_in_Use (featured metric)			Shows the current number of threads in use by the directory service (which is different from the number of threads in the directory service process). This is the number of threads currently servicing client API calls; it can be used to indicate

Active Directory metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			whether additional processors should be used.
active_dir.LDAP_Bind_Time (featured metric)			Shows the time, in milliseconds, taken for the last successful LDAP bind.
active_dir.LDAP_Client_Sessions (featured metric)			Shows the number of currently connected LDAP client sessions.
active_dir.LDAP_Searches/sec (featured metric)			Shows the rate at which LDAP clients perform search operations.
active_dir.LDAP_Successful_Binds/sec (featured metric)			Shows the number of LDAP binds per second.

Apache Kafka default checks and policies

Agent Client Collector provides the following policies for Apache Kafka health monitoring. Policies come with the checks specified in the indicated table. Policies and checks are available for both Windows and Linux.

Apache Kafka Topic Events

Check	Description	Usage	Output
kafka.check-zookeeper-status	Raises a critical event if the hosted Kafka Zookeeper is down.	`commonchecks check-kafka-zk-status` [flags] Where the flags are: `-p, --port =` Zookeeper Port (default "2181"). Usage example: `commonchecks check-kafka-zk-status -p 2181`	Kafka Zookeeper Status OK: Kafka Zookeeper is Up!
kafka.check-topic-replicas	Raises critical event if any topic has partitions with unknown replicas.	`commonchecks check-kafka-replicas` [flags] Where the flags are:	<topic> has partitions with unknown replicas. Unknown replicas are: {"0":["0"],"1":["0"],"2":["0"]}.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Apache Kafka Topic Events (continued)

Check	Description	Usage	Output
		• `-p, --port =` Zookeeper Port (default "2181"). • `-d, --detailed` = Lists unknown replicas in each partition of a topic. • `-i, --include_list` = Comma seperated list to include topics (allows * wild character) • `-e, --exclude_list` = Comma seperated list to exclude topics (allows * wild character) Usage example: commonchecks check-kafka-replicas -H localhost -p 2181 -i "test*" -e "accTopic,*offsets" -d	<topic> has partitions with unknown replicas. Unknown replicas are: {"0": ["0"]}.
kafka.check-topic-replication-factor	Raises critical event if replication factor of at least one topic is above or below provided replication factor param.	`commonchecks check-kafka-rf` [flags] Where the flags are: • `-p, --port =` Zookeeper Port (default "2181"). • `-d, --detailed` = Lists unknown replicas in each partition of a topic. • `-i, --include_list` = Comma separated list to include topics (allows * wild character) • `-e, --exclude_list` =	TestTopic has replication factor 1, which is less than expected: 2. accMetrics has replication factor 1, which is less than expected: 2.

Apache Kafka Topic Events (continued)

Check	Description	Usage	Output
		Comma separated list to exclude topics (allows * wild character) • `-r, --replication factor` = Expected replication factor for a topic (default 1) Examples: `commonchecks check-kafka-partitions -H localhost -p 2181 -r 2 -i "accMetrics,*Topic" -e "testTopic"`	
kafka.check-topic-leader	Raises critical event if any topic has partitions with unknown leaders or unpreferred replica as leader.	`commonchecks check-kafka-leader` [flags] Where the flags are • `-p, --port` = Zookeeper Port (default "2181"). • `-d, --detailed` = A list of partitions in each topic with unknown leaders or unpreferred replicas. • `-i, --include_list` = Comma separated list to include topics (allows * wild character) • `-e, --exclude_list` =Comma separated list to exclude topics (allows * wild character) Examples:	<topic> contains, partitions with unpreferred replica as leader.(partitions with unpreferred replicas are [0]). <topic> contains, partitions with unpreferred replica as leader.(partitions with unpreferred replicas are [0]).

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Apache Kafka Topic Events (continued)

Check	Description	Usage	Output
		`commonchecks check-kafka-leader -H localhost -p 2181 -d -e "*offsets"`	
kafka.check-topic-partitions	Raises critical events if number of partitions for a topic is less the min_partitions param.	`commonchecks check-kafka-partitions [flags]` Where the flags are: • `-p, --port` = Zookeeper Port (default "2181"). • `-P, --min_partitions` = Minimum partitions for a topic (default 1). • `-i, --include_list` = Comma separated list to include topics (allows * wild character) • `-e, --exclude_list` =Comma separated list to exclude topics (allows * wild character)	
		Usage example 1: `commonchecks check-kafka-partitions -H localhost -p 2181 -P 3`	<topic> has 1 partitions, expected at least 3. <topic> has 1 partitions, expected at least 3. <topic> has 1 partitions, expected at least 3.
		Usage example 2: commonchecks check-kafka-partitions -H localhost	<topic> has 1 partitions, expected at least 3.

Apache Kafka Topic Events (continued)

Check	Description	Usage	Output
		-p 2181 -P 3 -i "accMetrics,*Topic" -e "testTopic"	<topic> has 1 partitions, expected at least 3.

Note: Values for include_list and exclude_list parameters have to be wrapped between double quotes. For example: "test1,*topic".

Apache Kafka Broker Events

Check	Description	Usage	Output
kafka.check-broker-status	Raises critical event if Kafka Broker on the host is down.	`commonchecks check-kafka-broker-status` [flags] Where the flags are: `-p, --port` = Kafka Broker port (default "9092"). Usage example: `commonchecks check-kafka-broker-status -p 9092`	Kafka Broker Status OK: Kafka Broker ubuntu20:9092 is Up!

Apache Kafka Broker Metrics

Check	Description	Usage	Output
kafka.metrics.broker	Collects Kafka Broker Metrics from the host.	`commonchecks metric-kafka-broker` [flags] Where the flags are: • `-J, --javapath` = Java executable path (default "java"). • `-j, --jmxport` = JMX Port (default "9999") Usage example: `commonchecks metric-kafka-broker -J "/usr/bin/java" -j 9999`	hostname.Kafka.Broker.ReplicaManage 0.000 hostname.Kafka.Broker.DelayedOperati 627.000 hostname.Kafka.Broker.ControllerStats. 0.000 hostname.Kafka.Broker.RequestMetrics 0.000

Apache Kafka Zookeeper Metrics

Check	Description	Usage	Output
kafka.metrics.zookeeper	Collects Zookeeper Metrics from the host.	`commonchecks metric-kafka-zookeeper` [flags] Where the flag is: `-p, --adminserverport` = Admin Server Port (default "8085") Usage example: `commonchecks metric-kafka-zookeeper -p 8085`	hostname.Kafka.Zookeeper.outstanding 2.000 1648183249 hostname.Kafka.Zookeeper.avg_latency 1.05 1648183249 hostname.Kafka.Zookeeper.num_alive_ 1.000 1648183249 hostname.Kafka.Zookeeper.open_file_d 124.000 1648183249

Apache Kafka metrics

The following table lists the metrics that are gathered as output from Kafka checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

Broker metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
Kafka.Broker.RequestMetrics.TotalTimeMs.FetchConsumer.Mean (featured metric)			Total time (in ms) to serve the Consumer request.
Kafka.Broker.RequestMetrics.TotalTimeMs.FetchFollower.Mean (featured metric)			Total time (in ms) to serve the Follower request.
Kafka.Broker.RequestMetrics.TotalTimeMs.Produce.Mean (featured metric)			Total time (in ms) to serve the Producer request.
Kafka.Broker.BrokerTopicMetrics.BytesOutPerSec.OneMinuteRate (featured metric)			Aggregate outgoing byte rate.
Kafka.Broker.BrokerTopicMetrics.BytesInPerSec.OneMinuteRate (featured metric)			Aggregate incoming byte rate.
Kafka.Broker.ReplicaManager.UnderReplicatedPartitions.Value			Number of unreplicated partitions.
Kafka.Broker.ReplicaManager.IsrExpandsPerSec.OneMinuteRate			Rate at which the pool of in-sync replicas (ISRs) shrinks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Broker metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
Kafka.Broker.ReplicaManager.IsrShrinksPerSec.OneMinuteRate			Rate at which the pool of in-sync replicas (ISRs) shrinks.
Kafka.Broker.KafkaController.ActiveControllerCount.Value (featured metric)			Number of active controllers in cluster.
Kafka.Broker.KafkaController.OfflinePartitionsCount.Value			Number of offline partitions.
Kafka.Broker.ControllerStats.LeaderElectionRateAndTimeMs.OneMinuteRate (featured metric)			Leader election rate and latency.
Kafka.Broker.ControllerStats.UncleanLeaderElectionsPerSec.OneMinuteRate			Number of unclean elections per second.
Kafka.Broker.DelayedOperationPurgatory.PurgatorySize.Fetch.Value			Number of requests waiting in fetch purgatory.
Kafka.Broker.DelayedOperationPurgatory.PurgatorySize.Produce.Value			Number of requests waiting in producer purgatory.
Kafka.Broker.RequestMetrics.RequestsPerSec.Produce.OneMinuteRate (featured metric)			Number of producer requests per second.
Kafka.Broker.RequestMetrics.RequestsPerSec.FetchConsumer.OneMinuteRate (featured metric)			Number of consumer requests per second.
Kafka.Broker.RequestMetrics.RequestsPerSec.FetchFollower.OneMinuteRate (featured metric)			Number of follower requests per second.

Zookeeper metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
Kafka.Zookeeper.outstanding_requests (featured metric)			Number of requests queued.
Kafka.Zookeeper.avg_latency (featured metric)			Average amount of time it takes to respond to a client request (in ms).
Kafka.Zookeeper.num_alive_connections (featured metric)			Number of clients connected to ZooKeeper.
Kafka.Zookeeper.open_file_descriptor_count			Number of file descriptors in use.
Kafka.Zookeeper.pending_syncs			Number of pending syncs from followers.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Zookeeper metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
Kafka.Zookeeper.followers			Number of active followers.

AWS Health Monitoring default checks and policies

Agent Client Collector provides the following default checks and policies for AWS monitoring.

AWS Metrics policy

Type	Check	Description	Usage	Usage example
Metric	aws.metrics-ec2	Returns metrics of all EC2 instances in a AWS Datacenter.	metrics-ec2.rb (options) -F, --filter FILTER String representation of the filter to filter EC2 instances by tags. -b, --batch_size BATCH_SIZE Batch size. Number of instances to fetch metrics in parallel. (Default value: 10)	`./metrics-ec2.rb -F "{name:tag:environment,[ENV1,ENV2]} {name:tag:Name,values:[Instance1,Instance2]}"` Provide the filter string along with double quotes ("") around the filter parameter. Set the *batch_size* parameter according to the agent environment.
Metric	aws.metrics-ebs	Returns metrics of all EBS volumes in an AWS datacenter.	metrics-ebs.rb (options) -F, --filter FILTER String representation of the filter to filter EBS Volumes by Tags. -b, --batch_size BATCH_SIZE Batch size. Number of volumes to fetch metrics parallelly. (Default value: 10)	`./metrics-ebs.rb -F "{name:tag:environment,[ENV1,ENV2]} {name:tag:Name,values:[Volume1,Volume2]}"` Provide filter string along with double quotes ("") for the filter parameter. Set the *batch_size* parameter according to the agent environment.

AWS Metrics policy (continued)

Type	Check	Description	Usage	Usage example
Metric	aws.metrics-s3	Returns metrics of all S3 buckets in an AWS datacenter.	metrics-s3.rb (options) -b, --batch_size BATCH_SIZE Batch size. Number of S3 buckets to fetch metrics in parallel. (Default value: 10)	`./metrics-s3.rb -b 5` Set the *batch_size* parameter according to the agent environment.
Metric	aws.metrics-rds	Returns metrics of all RDS buckets in an AWS datacenter.	metrics-rds.rb (options) -F, --filter FILTER String representation of the filter to filter RDS Instances by tags. -b, --batch_size BATCH_SIZE Batch size. Number of databases to fetch metrics in parallel. (Default value: 10)	`./metrics-rds.rb -F "{name:tag:environment,v [ENV1,ENV2]} {name:tag:engine,values [MariaDB]}"` Provide the filter string with double quotes ("") around the filter parameter. Set the *batch_size* parameter according to the agent environment.
Metric	aws.metrics-classic-elb	Returns metrics of all classic elastic load balancers in an AWS datacenter.	metrics-elb.rb (options) -e, --exclude_lb EXCLUDE_LB Exclude metrics from load balancers whose name contains one of the comma separated strings. -b, --batch_size BATCH_SIZE Batch size. Number of databases to fetch metrics in	`./metrics-elb.rb -t classic -e "classic,itom,ip" -b 10` Provide comma separated strings in double quotes ("") for the *exclude_lb* parameter. Set the *batch_size* parameter according to the agent environment.

AWS Metrics policy (continued)

Type	Check	Description	Usage	Usage example
			parallel. (Default value: 10)	
Metric	aws.metrics-network-elb	Returns metrics of all network elastic load balancers in an AWS datacenter.	metrics-elb.rb (options) -e, --exclude_lb EXCLUDE_LB Exclude metrics from load balancers whose name contains any of the comma separated strings. -b, --batch_size BATCH_SIZE Batch size. Number of databases to fetch metrics in parallel. (Default value: 10)	`./metrics-elb.rb -t network -e "vpc,itom,ip" -b 10` Provide comma separated strings in double quotes ("") for the *`exclude_lb`* parameter. Set the *`batch_size`* parameter according to the agent environment. Do not change the command prefix.
Metric	aws.metrics-application-elb	Returns metrics of all application elastic load balancers in an AWS datacenter.	metrics-elb.rb (options) -e, --exclude_lb EXCLUDE_LB Exclude metrics from load balancers whose name contains any one of the string from comma separated strings. -b, --batch_size BATCH_SIZE Batch size. Number of databases to fetch metrics in parallel. (Default value: 10)	`./metrics-elb.rb -t application -e "classic,app,ip" -b 10` Provide comma separated strings in double quotes ("") for the *`exclude_lb`* parameter. Set the *`batch_size`* parameter according to the agent environment. Do not change the command prefix.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AWS Metrics policy (continued)

Type	Check	Description	Usage	Usage example

Metric	aws.metrics-ec2-count	Returns count of EC2 instances by instance_type or status in an AWS datacenter.	metrics-ec2-count.rb (options)
			
			-s, --scheme SCHEME Metric naming scheme, text to prepend to metric. Default: aws.ec2
			
			-t, --type METRIC type Count by type: status, instance. Default: instance
				`./metrics-ec2-count.rb -t status`
				
				`./metrics-ec2-count.rb -t status -s metric.aws.ec2`

AWS DynamoDB metrics

Type	Check	Description	Usage	Command
Metric	aws.metrics-dynamodb	Monitors the health of DynamoDB tables in an AWS datacenter. Binds to the DynamoDB table (cmdb_ci_dynamodb_table)	e, --exclude_tb EXCLUDE_TB Exclude metrics from tables whose name contains a string from comma separated strings. b, --batch_size BATCH_SIZE Batch size. Number of tables to fetch metrics in parallel. (Default value: 10)	`metrics-dynamodb.rb -r {{.labels.params_ci_reg {{.labels.params_exclud -f {{.labels.params_exclud {{end}} {{.labels.params_batch_ -b {{.labels.params_filter {{end}}`

AWS EC2 metrics

Type	Check	Description	Usage	Command
Metric	aws.metrics-ecs-cluster	Monitors ECS clusters in an AWS datacenter. Binds to the AWS ECS	-F, --filter FILTER String representation of the filter to filter ECS clusters by tags.	`metrics-ecs-cluster.rb -r {{.labels.params_ci_reg {{.labels.params_filter -f {{.labels.params_filter`

AWS EC2 metrics (continued)

Type	Check	Description	Usage	Command
		Cluster CI type (cmdb_ci_cloud_ecs_cluster)	b, --batch_size BATCH_SIZE Batch size. Number of clusters to fetch metrics in parallel. (Default value: 10)	{{end}} {{.labels.params_batch_s -b {{.labels.params_filter {{end}}
Metric	aws.metrics-ecs-service	Monitors ECS services in an AWS datacenter. Binds to the AWS ECS Service CI type (cmdb_ci_cloud_ecs_service)	-F, --filter FILTER String representation of the filter to filter ECS clusters by tags. b, --batch_size BATCH_SIZE Batch size. Number of clusters to fetch metrics in parallel. (Default value: 10)	metrics-ecs-service.rb -r {{.labels.params_ci_regi {{.labels.params_filter -f {{.labels.params_filter {{end}} {{.labels.params_batch_s -b {{.labels.params_filter {{end}}

AWS metrics

AWS metrics

The following tables list and describe the metrics that are gathered as output from the specified AWS checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

aws.metrics-ec2 metrics

Metric Name	Description
aws.ec2.CPUCreditBalance.Average	Number of earned CPU credits that an instance has accrued since it was launched or started.
aws.ec2.CPUUtilization.Average	Average percentage of allocated EC2 compute units that are currently in use on the instance.
aws.ec2.DiskReadOps.Average (Featured metric)	Average of completed read operations from all instance store volumes available to the instance in a specified time period.
aws.ec2.DiskWriteOps.Average	Completed write operations to all instance store volumes available to the instance in a specified time period.

© 2026 ServiceNow, Inc. All rights reserved.

aws.metrics-ec2 metrics (continued)

Metric Name	Description
(Featured metric)	
aws.ec2.DiskReadBytes.Average (Featured metric)	Average number of bytes read from all instance store volumes available to the instance.
aws.ec2.DiskWriteBytes.Average (Featured metric)	Average number of bytes written to all instance store volumes available to the instance.
aws.ec2.NetworkIn.Average (Featured metric)	Average number of bytes received by the instance on all network interfaces. This metric identifies the volume of incoming network traffic to a single instance.
aws.ec2.NetworkOut.Average (Featured metric)	Average number of bytes sent out by the instance on all network interfaces. This metric identifies the volume of outgoing network traffic from a single instance.
aws.ec2.NetworkPacketsIn.Average	Average number of packets received by the instance on all network interfaces. This metric identifies the volume of incoming traffic in terms of the number of packets on a single instance.
aws.ec2.NetworkPacketsOut.Average	Average number of packets sent out by the instance on all network interfaces. This metric identifies the volume of outgoing traffic in terms of the number of packets on a single instance.
aws.ec2.MetadataNoToken.Average	Average number of times the instance metadata service was successfully accessed using a method that does not use a token.
aws.ec2.CPUCreditUsage.Average	Average number of CPU credits spent by the instance for CPU utilization.
aws.ec2.CPUSurplusCreditBalance.Average	Average number of surplus credits that have been spent by an unlimited instance when its *`CPUCreditBalance`* value is zero.
aws.ec2.CPUSurplusCreditsCharged.Average	Average number of spent surplus credits that are not paid down by earned CPU credits, and which thus incur an additional charge.
aws.ec2.StatusCheckFailed_Instance.Average	Reports whether the instance has passed the instance status check in the last minute.
aws.ec2.StatusCheckFailed_System.Average	Reports whether the instance has passed the system status check in the last minute.
aws.ec2.StatusCheckFailed.Average	Reports whether the instance has passed both the instance status check and the system status check in the last minute.

aws.metrics-ebs metrics

Metric Name	Description
aws.ebs.VolumeReadBytes.Average (Featured metric)	Average total number of bytes transferred during the period while reading.
aws.ebs.VolumeWriteBytes.Average (Featured metric)	Average total number of bytes transferred during the period while writing.
aws.ebs.VolumeReadOps.Average (Featured metric)	Average total number of read operations in a specified time period.
aws.ebs.VolumeWriteOps.Average (Featured metric)	Average total number of write operations in a specified time period.
aws.ebs.VolumeTotalReadTime.Average (Featured metric)	Average total number of seconds spent by all read operations completed in a specified time period.
aws.ebs.VolumeTotalWriteTime.Average (Featured metric)	Average of total number of seconds spent by all write operations completed in a specified time period.
aws.ebs.VolumeIdleTime.Average	Average of total number of seconds in a specified time period when no read or write operations were submitted.
aws.ebs.VolumeQueueLength.Average	Average number of read and write operation requests waiting to be completed in a specified time period.
aws.ebs.VolumeThroughputPercentage.Average	Average percentage of I/O operations per second (IOPS) delivered of the total IOPS provisioned for an Amazon EBS volume.
aws.ebs.VolumeConsumedReadWriteOps.Average	Average total amount of read and write operations (normalized to 256K capacity units) consumed in a specified time period.
aws.ebs.BurstBalance.Average	Average percentage of I/O credits (for gp2) or throughput credits (for st1 and sc1) remaining in the burst bucket.

aws.metrics-s3 metrics

Metric Name	Description
aws.s3.NumberOfObjects.Average (Featured metric)	Average total number of objects stored in a bucket for all storage classes. Collected every 12 hours.
aws.s3.BucketSizeBytes.Average (Featured metric)	Average amount of data in bytes stored in a bucket in the STANDARD storage class.

aws.metrics-s3 metrics (continued)

Metric Name	Description
	Collected every 12 hours.

aws.metrics-rds metrics

Metric Name	Description
aws.rds.BinLogDiskUsage.Average	Average amount of disk space occupied by binary logs on the primary. Applies to MySQL read replicas.
aws.rds.BurstBalance.Average	Average percent of General Purpose SSD (gp2) burst-bucket I/O credits available.
aws.rds.CPUUtilization.Average (Featured metric)	Average percentage of CPU utilization.
aws.rds.CPUCreditUsage.Average	Average number of CPU credits spent by the instance for CPU utilization.
aws.rds.CPUCreditBalance.Average	Average number of surplus credits that have been spent by an unlimited instance when its *CPUCreditBalance* value is zero.
aws.rds.DatabaseConnections.Average (Featured metric)	Average number of database connections in use.
aws.rds.DiskQueueDepth.Average (Featured metric)	Average number of outstanding I/Os (read/write requests) waiting to access the disk.
aws.rds.EBSByteBalance%.Average	Average percentage of throughput credits remaining in the burst bucket of your RDS database.
aws.rds.EBSIOBalance%.Average	Average percentage of I/O credits remaining in the burst bucket of your RDS database.
aws.rds.FailedSQLServerAgentJobsCount.Average (Featured metric)	Average number of failed Microsoft SQL Server Agent jobs during the last minute.
aws.rds.FreeableMemory.Average (Featured metric)	Average amount of available random access memory.
aws.rds.FreeStorageSpace.Average	Average amount of available storage space.
aws.rds.MaximumUsedTransactionIDs.Average	Average amount of maximum transaction IDs that have been used. Applies to PostgreSQL.
aws.rds.NetworkReceiveThroughput.Average (Featured metric)	Average incoming (receive) network traffic on the DB instance, including both customer database traffic and Amazon RDS traffic used for monitoring and replication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

aws.metrics-rds metrics (continued)

Metric Name	Description
aws.rds.NetworkTransmitThroughput.Average (Featured metric)	Average outgoing (transmit) network traffic on the DB instance, including both customer database traffic and Amazon RDS traffic used for monitoring and replication.
aws.rds.OldestReplicationSlotLag.Average	Average lagging size of the replica lagging the most in terms of write-ahead log (WAL) data received. Applies to PostgreSQL.
aws.rds.ReadIOPS.Average	Average number of disk read I/O operations per second.
aws.rds.ReadLatency.Average (Featured metric)	Average amount of time taken per disk I/O operation.
aws.rds.ReadThroughput.Average	Average number of bytes read from disk per second.
aws.rds.ReplicaLag.Average	Average amount of time a read replica DB instance lags behind the source DB instance. Applies to MySQL, MariaDB, Oracle, PostgreSQL, and SQL Server read replicas.
aws.rds.ReplicationSlotDiskUsage.Average	Average amount of disk space used by replication slot files. Applies to PostgreSQL.
aws.rds.SwapUsage.Average	Average amount of swap space used on the DB instance. This metric is not available for SQL Server.
aws.rds.TransactionLogsDiskUsage.Average	Average disk space used by transaction logs. Applies to PostgreSQL.
aws.rds.TransactionLogsGeneration.Average	Average size of transaction logs generated per second. Applies to PostgreSQL.
aws.rds.WriteIOPS.Average	Average number of disk write I/O operations per second.
aws.rds.WriteLatency.Average (Featured metric)	Average amount of time taken per disk I/O operation.
aws.rds.WriteThroughput.Average	Average number of bytes written to disk per second.
aws.rds.CPUSurplusCreditBalance.Average	Average number of surplus credits that have been spent by an unlimited instance when its *`CPUCreditBalance`* value is zero.
aws.rds.CPUSurplusCreditsCharged.Average	Average number of spent surplus credits that are not paid down by earned CPU credits, and which therefore incur an additional charge.

aws.metrics-classic-elb metrics

Metric Name	Description
aws.classicElb.EstimatedALBActiveConnectionCount.Average (Featured metric)	Average estimated number of concurrent TCP connections active from clients to the load balancer and from the load balancer to targets.
aws.classicElb.EstimatedALBConsumedLCUs.Average	Average estimated number of load balancer capacity units (LCU) used by an Application Load Balancer. You pay for the number of LCUs that you use per hour.
aws.classicElb.EstimatedALBNewConnectionCount.Average (Featured metric)	Average estimated number of new TCP connections established from clients to the load balancer and from the load balancer to targets.
aws.classicElb.EstimatedProcessedBytes.Average	Estimated number of bytes processed by an Application Load Balancer.
aws.classicElb.DesyncMitigationMode_NonCompliant_Request_Count.Sum	Number of requests that do not comply with RFC 7230.
aws.classicElb.HTTPCode_ELB_5XX.Sum (Featured metric)	Number of HTTP 4XX client error codes generated by the load balancer.
aws.classicElb.HTTPCode_ELB_4XX.Sum (Featured metric)	Number of HTTP 5XX server error codes generated by the load balancer.
aws.classicElb.SurgeQueueLength.Maximum	Maximum total number of requests (HTTP listener) or connections (TCP listener) that are pending routing to a healthy instance. The maximum size of the queue is 1,024. Additional requests or connections are rejected when the queue is full.
aws.classicElb.SpilloverCount.Sum (Featured metric)	Total number of requests rejected because the surge queue is full.
aws.classicElb.RequestCount.Sum	Total number of requests completed or connections made during the specified interval.
aws.classicElb.Latency.Average (Featured metric)	Average total time elapsed, in seconds, from the time the load balancer sent the request to a registered instance until the instance started to send the response headers.
aws.classicElb.BackendConnectionErrors.Sum (Featured metric)	Total number of connections that were not successfully established between the load balancer and the registered instances.
aws.classicElb.HealthyHostCount.Average	Average number of healthy instances registered with your load balancer. A newly registered instance is considered healthy after it passes the first health check.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

aws.metrics-classic-elb metrics (continued)

Metric Name	Description
aws.classicElb.UnHealthyHostCount.Average	Average of number of unhealthy instances registered with your load balancer. An instance is considered unhealthy after it exceeds the unhealthy threshold configured for health checks.

aws.metrics-network-elb

Metric Name	Description
aws.networkElb.ActiveFlowCount.Average (Featured metric)	Average total number of concurrent flows (or connections) from clients to targets. This metric includes connections in the SYN_SENT and ESTABLISHED states.
aws.networkElb.ActiveFlowCount_TCP.Average (Featured metric)	Average total number of concurrent TCP flows (or connections) from clients to targets. This metric includes only connections in the ESTABLISHED state.
aws.networkElb.ActiveFlowCount_TLS.Average (Featured metric)	Average total number of concurrent TLS flows (or connections) from clients to targets. This metric includes only connections in the ESTABLISHED state.
aws.networkElb.ActiveFlowCount_UDP.Average (Featured metric)	Average total number of concurrent UDP flows (or connections) from clients to targets.
aws.networkElb.ClientTLSNegotiationErrorCount.Average (Featured metric)	Average total number of TLS handshakes that failed during negotiation between a client and a TLS listener.
aws.networkElb.ConsumedLCUs.Average	Average number of load balancer capacity units (LCU) used by your load balancer.
aws.networkElb.ConsumedLCUs_TCP.Average	Average number of load balancer capacity units (LCU) used by your load balancer for TCP.
aws.networkElb.ConsumedLCUs_TLS.Average	Average number of load balancer capacity units (LCU) used by your load balancer for TLS.
aws.networkElb.ConsumedLCUs_UDP.Average	Average number of load balancer capacity units (LCU) used by your load balancer for UDP.
aws.networkElb.HealthyHostCount.Maximum (Featured metric)	The maximum number of targets that are considered healthy.
aws.networkElb.NewFlowCount.Sum (Featured metric)	Total number of new flows (or connections) established from clients to targets in the time period.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

aws.metrics-network-elb (continued)

Metric Name	Description
aws.networkElb.NewFlowCount_TCP.Sum (Featured metric)	Total number of new TCP flows (or connections) established from clients to targets in the time period.
aws.networkElb.NewFlowCount_TLS.Sum (Featured metric)	Total number of new TLS flows (or connections) established from clients to targets in the time period.
aws.networkElb.NewFlowCount_UDP.Sum (Featured metric)	Total number of new UDP flows (or connections) established from clients to targets in the time period.
aws.networkElb.PeakBytesPerSecond.Maximum (Featured metric)	Maximum average throughput (bytes per second), calculated every 10 seconds during the sampling window. This metric includes health check traffic.
aws.networkElb.PeakPacketsPerSecond.Maximum (Featured metric)	Maximum average packet rate (packets processed per second), calculated every 10 seconds during the sampling window. This metric includes health check traffic.
aws.networkElb.ProcessedBytes.Sum	Total number of bytes processed by the load balancer, including TCP/IP headers. This count includes traffic to and from targets, minus health check traffic.
aws.networkElb.ProcessedBytes_TCP.Sum	Total number of bytes processed by TCP listeners.
aws.networkElb.ProcessedBytes_TLS.Sum	Total number of bytes processed by TLS listeners.
aws.networkElb.ProcessedBytes_UDP.Sum	Total number of bytes processed by UDP listeners.
aws.networkElb.ProcessedPackets.Sum	Total number of packets processed by the load balancer. This count includes traffic to and from targets, including health check traffic.
aws.networkElb.TargetTLSNegotiationErrorCount.Sum (Featured metric)	Total number of TLS handshakes that failed during negotiation between a TLS listener and a target.
aws.networkElb.TCP_Client_Reset_Count.Sum	Total number of reset (RST) packets sent from a client to a target. These resets are generated by the client and forwarded by the load balancer.
aws.networkElb.TCP_ELB_Reset_Count.Sum	Total number of reset (RST) packets generated by the load balancer.
aws.networkElb.TCP_Target_Reset_Count.Sum	Total number of reset (RST) packets sent from a target to a client. These resets are generated by the target and forwarded by the load balancer.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

aws.metrics-network-elb (continued)

Metric Name	Description
aws.networkElb.UnHealthyHostCount.Maximum (Featured metric)	Maximum number of targets that can be considered unhealthy.

aws.metrics-application-elb metrics

Metric Name	Description
aws.applicationElb.ActiveConnectionCount.Sum (Featured metric)	Total number of concurrent TCP connections active from clients to the load balancer and from the load balancer to targets.
aws.applicationElb.ClientTLSNegotiationErrorCount.Sum (Featured metric)	Total number of TLS connections initiated by the client that did not establish a session with the load balancer due to a TLS error.
aws.applicationElb.ConsumedLCUs.Average	The average number of load balancer capacity units (LCU) used by your load balancer. You pay for the number of LCUs that you use per hour. For more information, see Elastic Load Balancing pricing.
aws.applicationElb.DesyncMitigationMode_NonCompliant_Request_Count.Sum (Featured metric)	Total number of requests that do not comply with RFC 7230.
aws.applicationElb.DroppedInvalidHeaderRequestCount.Average (Featured metric)	Average of requests where the load balancer removed HTTP headers with header fields that are not valid before routing the request. The load balancer removes these headers only if the routing.http.drop_invalid_header_fields.enabled attribute is set to true.
aws.applicationElb.ForwardedInvalidHeaderRequestCount.Average (Featured metric)	Average of requests routed by the load balancer that had HTTP headers with header fields that are not valid. The load balancer forwards requests with these headers only if the routing.http.drop_invalid_header_fields.enabled attribute is set to false.
aws.applicationElb.GrpcRequestCount.Sum	Total number of gRPC requests processed over IPv4 and IPv6.
aws.applicationElb.HTTP_Fixed_Response_Count.Sum	Total number of fixed-response actions that were successful.
aws.applicationElb.HTTP_Redirect_Count.Sum	Total number of redirect actions that were successful.
aws.applicationElb.HTTP_Redirect_Url_Limit_Exceeded_Count.Sum (Featured metric)	Total number of redirect actions that couldn't be completed because the URL in the response location header is larger than 8K.

aws.metrics-application-elb metrics (continued)

Metric Name	Description
aws.applicationElb.HTTPCode_ELB_3XX_Count.Sum (Featured metric)	Total number of HTTP 3XX redirection codes that originate from the load balancer. This count does not include response codes generated by targets.
aws.applicationElb.HTTPCode_ELB_4XX_Count.Sum (Featured metric)	Total number of HTTP 4XX client error codes that originate from the load balancer. This count does not include response codes generated by targets.
aws.applicationElb.HTTPCode_ELB_5XX_Count.Sum (Featured metric)	Total number of HTTP 5XX server error codes that originate from the load balancer. This count does not include any response codes generated by the targets.
aws.applicationElb.HTTPCode_ELB_500_Count.Sum (Featured metric)	Total number of HTTP 500 error codes that originate from the load balancer.
aws.applicationElb.HTTPCode_ELB_502_Count.Sum (Featured metric)	Total number of HTTP 502 error codes that originate from the load balancer.
aws.applicationElb.HTTPCode_ELB_503_Count.Sum (Featured metric)	Total number of HTTP 503 error codes that originate from the load balancer.
aws.applicationElb.HTTPCode_ELB_504_Count.Sum (Featured metric)	Total number of HTTP 504 error codes that originate from the load balancer.
aws.applicationElb.IPv6ProcessedBytes.Sum	Total number of bytes processed by the load balancer over IPv6.
aws.applicationElb.IPv6RequestCount.Sum	Total number of IPv6 requests received by the load balancer.
aws.applicationElb.NewConnectionCount.Sum	Total number of new TCP connections established from clients to the load balancer and from the load balancer to targets.
aws.applicationElb.NonStickyRequestCount.Sum	Total number of requests where the load balancer chose a new target because it couldn't use an existing sticky session.
aws.applicationElb.ProcessedBytes.Sum (Featured metric)	Total number of bytes processed by the load balancer over IPv4 and IPv6.
aws.applicationElb.RejectedConnectionCount.Sum (Featured metric)	Total number of connections that were rejected because the load balancer had reached its maximum number of connections.
aws.applicationElb.RequestCount.Sum	Total number of requests processed over IPv4 and IPv6.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

aws.metrics-application-elb metrics (continued)

Metric Name	Description
aws.applicationElb.RuleEvaluations.Sum	Total number of rules processed by the load balancer given a request rate averaged over an hour.

aws.metrics-ec2-count metrics

Metric Name	Description
aws.ec2.types.<type_name>	Count of EC2 instances for the specified type in AWS Datacenter.
aws.ec2.status.running	Count of EC2 instances in Active state in an AWS Datacenter.
aws.ec2.status.stopped	Count of EC2 instances in Stopped state in an AWS Datacenter.
aws.ec2.status.total	Count of all EC2 instances in an AWS Datacenter.

aws.metrics-dynamodb metrics

Metric Name	Description
aws.dynamodb.ConsumedWriteCapacityUnits.Average (Featured metric)	Number of write capacity units consumed over the specified time period, for tracking how much provisioned throughput is used.
aws.dynamodb.ConsumedReadCapacityUnits.Average (Featured metric)	Number of read capacity units consumed over the specified time period, for tracking how much provisioned throughput is used.
aws.dynamodb.ProvisionedWriteCapacityUnits.Average (Featured metric)	Number of provisioned write capacity units for a table.
aws.dynamodb.ProvisionedReadCapacityUnits.Average (Featured metric)	Number of provisioned read capacity units for a table.
aws.dynamodb.SuccessfulRequestLatency.GetItem.Average (Featured metric)	Successful requests to DynamoDB or Amazon DynamoDB streams during the specified time period. Run by a GetItem operation.
aws.dynamodb.SuccessfulRequestLatency.BatchGetItem.Average	Successful requests to DynamoDB or Amazon DynamoDB streams during the specified time period. Run by a BatchGetItem operation.
aws.dynamodb.SuccessfulRequestLatency.PutItem.Average (Featured metric)	Successful requests to DynamoDB or Amazon DynamoDB streams during the specified time period. Run by a PutItem operation.
aws.dynamodb.SuccessfulRequestLatency.BatchPutItem.Average	Successful requests to DynamoDB or Amazon DynamoDB streams during the specified time period. Run by a BatchPutItem operation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

aws.metrics-dynamodb metrics (continued)

Metric Name	Description
aws.dynamodb.SuccessfulRequestLatency.Query.Average	Successful requests to DynamoDB or Amazon DynamoDB streams during the specified time period. Run by a Query operation.
aws.dynamodb.SuccessfulRequestLatency.Scan.Average	Successful requests to DynamoDB or Amazon DynamoDB Streams during the specified time period. Run by a Scan operation.
aws.dynamodb.ReturnedItemCount.Scan.Average	Number of items returned by Scan operations during the specified time period.
aws.dynamodb.ReturnedItemCount.Query.Average	Number of items returned by Query operations during the specified time period.
aws.dynamodb.UserErrors.Average (Featured metric)	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 400 status code during the specified time period. An HTTP 400 usually indicates a client-side error, such as an invalid combination of parameters, an attempt to update a nonexistent table, or an incorrect request signature.
aws.dynamodb.SystemErrors.GetItem.Average (Featured metric)	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a GetItem operation.
aws.dynamodb.SystemErrors.Scan.Average	The requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a Scan operation.
aws.dynamodb.SystemErrors.Query.Average	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a Query operation.
aws.dynamodb.SystemErrors.BatchGetItem.Average	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a BatchGet operation.
aws.dynamodb.SystemErrors.PutItem.Average (Featured metric)	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a PutItem operation.

aws.metrics-dynamodb metrics (continued)

Metric Name	Description
aws.dynamodb.SystemErrors.UpdateItem.Average	The requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by an UpdateItem operation.
aws.dynamodb.SystemErrors.DeleteItem.Average	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a DeleteItem operation.
aws.dynamodb.SystemErrors.BatchWriteItem.Average	Requests to DynamoDB or Amazon DynamoDB streams that generate an HTTP 500 status code during the specified time period. An HTTP 500 usually indicates an internal service error. Run by a BatchWrite operation.
aws.dynamodb.ConditionalCheckFailedRequests.Average (Featured metric)	Number of failed attempts to perform conditional writes.
aws.dynamodb.TimeToLiveDeletedItemCount.Average	Number of items deleted by Time to Live (TTL) during the specified time period. This metric helps you monitor the rate of TTL deletions on your table.
aws.dynamodb.TransactionConflict.Average	Rejected item-level requests due to transactional conflicts between concurrent requests on the same items.
aws.dynamodb.ReadThrottleEvents.Average (Featured metric)	Requests to DynamoDB that exceed the provisioned read capacity units for a table.
aws.dynamodb.WriteThrottleEvents.Average (Featured metric)	Requests to DynamoDB that exceed the provisioned write capacity units for a table.
aws.dynamodb.ThrottledRequests.GetItem.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a GetItem operation.
aws.dynamodb.ThrottledRequests.PutItem.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a PutItem operation.
aws.dynamodb.ThrottledRequests.DeleteItem.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a DeleteItem operation.

aws.metrics-dynamodb metrics (continued)

Metric Name	Description
aws.dynamodb.ThrottledRequests.UpdateItem.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for an UpdateItem operation.
aws.dynamodb.ThrottledRequests.BatchGetItem.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a BatchGetItem operation.
aws.dynamodb.ThrottledRequests.Scan.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a Scan operation.
aws.dynamodb.ThrottledRequests.Query.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a Query operation.
aws.dynamodb.ThrottledRequests.BatchWriteItem.Average	Requests to DynamoDB that exceed the provisioned throughput limits on a resource for a BatchWriteItem operation.
aws.dynamodb.SuccessfulRequestLatency.GetRecords.Average	The number of successful requests to DynamoDB or Amazon DynamoDB Streams during the specified time period. Run by a GetRecords operation.
aws.dynamodb.ReturnedBytes.GetRecords.Average	The number of bytes returned by GetRecords operations (Amazon DynamoDB streams) during the specified time period.
aws.dynamodb.ReturnedRecordsCount.GetRecords.Average	The average of stream records returned by GetRecords operations (Amazon DynamoDB streams) during the specified time period.

aws.metrics-ecs-cluster metrics

Metric	Description
aws.ecs.cluster.CPUReservation.Average (Featured metric)	Percentage of CPU units reserved by running tasks in the cluster.
aws.ecs.cluster.CPUUtilization.Average (Featured metric)	Percentage of CPU units used in the cluster.
aws.ecs.cluster.MemoryReservation.Average (Featured metric)	Percentage of memory reserved by running tasks in the cluster.
aws.ecs.cluster.MemoryUtilization.Average (Featured metric)	Percentage of memory used in the cluster.
aws.ecs.cluster.CpuReserved.Average	CPU units reserved by tasks in the cluster.
aws.ecs.cluster.CpuUtilized.Average	CPU units used by tasks in the cluster.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

aws.metrics-ecs-cluster metrics (continued)

Metric	Description
aws.ecs.cluster.NetworkRxBytes.Average (Featured metric)	Number of bytes received by the cluster.
aws.ecs.cluster.NetworkTxBytes.Average (Featured metric)	Number of bytes transmitted by the cluster.
aws.ecs.cluster.EphemeralStorageReserved.Average	Ephemeral storage is the volatile temporary storage attached to your instances, present only during the running lifetime of the instance.
aws.ecs.cluster.MemoryUtilized.Average (Featured metric)	Memory being used by tasks in the cluster.
aws.ecs.cluster.MemoryReserved.Average (Featured metric)	Memory reserved by tasks in the cluster.
aws.ecs.cluster.StorageReadBytes.Average (Featured metric)	Number of bytes read from storage in the cluster.
aws.ecs.cluster.StorageWriteBytes.Average (Featured metric)	Number of bytes written to storage in the cluster.
aws.ecs.cluster.ContainerInstanceCount.Average (Featured metric)	Number of EC2 instances running the Amazon ECS agent that are registered with a cluster.
aws.ecs.cluster.ServiceCount.Average (Featured metric)	Number of services in the cluster.
aws.ecs.cluster.TaskCount.Average	Number of tasks running in the cluster.

aws.metrics-ecs-service metrics

Metric	Description
aws.ecs.service.CPUUtilization.Average (Featured metric)	Percentage of CPU units used in the service.
aws.ecs.service.MemoryUtilization.Average (Featured metric)	Percentage of memory used in the service.
aws.ecs.service.CpuReserved.Average	CPU units reserved by tasks in the service.
aws.ecs.service.CpuUtilized.Average	CPU units used by tasks in the service.
aws.ecs.service.NetworkRxBytes.Average	Number of bytes received by the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

aws.metrics-ecs-service metrics (continued)

Metric	Description
(Featured metric)	
aws.ecs.service.NetworkTxBytes.Average (Featured metric)	Number of bytes transmitted by the service.
aws.ecs.service.EphemeralStorageReserved.Average	Ephemeral storage is the volatile temporary storage attached to your instances which is present only during the running lifetime of the instance.
aws.ecs.service.MemoryUtilized.Average	Memory being used by tasks in the service.
aws.ecs.service.MemoryReserved.Average	Memory reserved by tasks in the service.
aws.ecs.service.StorageReadBytes.Average (Featured metric)	Number of bytes read from storage in the service.
aws.ecs.service.StorageWriteBytes.Average (Featured metric)	Number of bytes written to storage in the service.
aws.ecs.service.RunningTaskCount.Average (Featured metric)	Number of tasks currently in the RUNNING state.
aws.ecs.service.DeploymentCount.Average	Number of deployments in an Amazon ECS service.
aws.ecs.service.DesiredTaskCount.Average (Featured metric)	Desired number of tasks for an Amazon ECS service.
aws.ecs.service.TaskSetCount.Average (Featured metric)	Number of task sets in the service.
aws.ecs.service.PendingTaskCount.Average (Featured metric)	Number of tasks currently in the PENDING state.

Azure Health Monitoring default checks and policies

Agent Client Collector provides the following default checks and policies for Azure health monitoring.

Azure k8s Metrics

Type	Check	Description	Command
Metric	azure.metrics-k8s-service	Provides pod, nodes, and cluster level metrics from all Azure Kubernetes services in metric form.	`metrics-azure-k8s-service.rb -r {{.labels.params_ci_region}} {{-s`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure k8s Metrics (continued)

Type	Check	Description	Command

		Usage: metrics-azure-k8s-service.rb
		`-S, --subscription ID ARM Subscription ID`
		`-r, Region`
		Example: `metrics-azure-k8s-service.rb -S {{.labels.params_subscription_id}} -r westus2`
			`{{if.labels.params_subscrip -S {{.labels.params_subscripti {{end}}`

Azure metrics

The following tables list and describe the metrics that are gathered as output from Azure checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

Azure Kubernetes Service check metrics

Metric Name	Description
apiserver_current_inflight_requests (Featured metric)	Maximum number of currently used inflight requests on the API server per request kind in the past second.
cluster_autoscaler_cluster_safe_to_autoscale	Determines whether cluster autoscaler takes action on the cluster.
cluster_autoscaler_scale_down_in_cooldown	Determines if the scale down is in cooldown; no nodes are removed during this timeframe.
cluster_autoscaler_unneeded_nodes_count	Number of nodes that are currently not needed and can be removed by the autoscaler.
cluster_autoscaler_unschedulable_pods_count	Number of pods that are currently not able to be scheduled in the cluster.
kube_node_status_allocatable_cpu_cores (Featured metric)	Total number of available CPU cores in a managed cluster.
kube_node_status_allocatable_memory_bytes (Featured metric)	Total amount of available memory in a managed cluster.
kube_node_status_condition	Statuses for various node conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Kubernetes Service check metrics (continued)

Metric Name	Description
(Featured metric)	
kube_pod_status_phase (Featured metric)	Number of pods by phase.
kube_pod_status_ready (Featured metric)	Number of pods in Ready state.
node_cpu_usage_millicores (Featured metric)	Aggregated measurement of CPU utilization in millicores across the cluster.
node_cpu_usage_percentage (Featured metric)	Aggregated average CPU utilization measured in percentage across the cluster.
node_disk_usage_bytes	Number of disk space bytes in use by device.
node_disk_usage_percentage (Featured metric)	Percentage of disk space used by device.
node_memory_rss_bytes	Number of container RSS memory bytes in use.
node_memory_rss_percentage (Featured metric)	Percentage of container RSS memory in use.
node_memory_working_set_bytes	Number of container working set memory bytes in use.
node_memory_working_set_percentage (Featured metric)	Percentage of container working set memory in use.
node_network_in_bytes (Featured metric)	Network received bytes.
node_network_out_bytes (Featured metric)	Network transmitted bytes.

Azure VM CPU metrics

Metric Name	Description
Percentage CPU (Featured metric)	The percentage of allocated compute units that are currently in use by the Virtual Machine(s).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure VM CPU metrics (continued)

Metric Name	Description
CPU Credits Remaining	Total number of credits available to burst. Only available on B-series burstable VMs.
CPU Credits Consumed	Total number of credits consumed by the Virtual Machine. Only available on B-series burstable VM.

Azure VM Network metrics

Metric Name	Description
Network In (Featured metric)	The number of billable bytes received on all network interfaces by the Virtual Machines (Incoming Traffic) (Deprecated).
Network Out (Featured metric)	The number of billable bytes out on all network interfaces by the Virtual Machines (Outgoing Traffic) (Deprecated).
Network In Total (Featured metric)	The number of bytes received on all network interfaces by the Virtual Machines (Incoming Traffic).
Network Out Total (Featured metric)	The number of bytes out on all network interfaces by the Virtual Machines (Outgoing Traffic).

Azure VM Disk metrics

Metric Name	Description
Disk Read Bytes (Featured metric)	Bytes read from disk during monitoring period.
Disk Write Bytes (Featured metric)	Bytes written to disk during monitoring period.
Disk Read Operations/Sec (Featured metric)	Disk Read IOPS.
Disk Write Operations/Sec (Featured metric)	Disk Write IOPS.
Data Disk Read Bytes/sec (Featured metric)	Bytes per second read from a single disk during monitoring period.
Data Disk Write Bytes/sec (Featured metric)	Bytes per second written to a single disk during monitoring period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure VM Disk metrics (continued)

Metric Name	Description
Data Disk Read Operations/Sec (Featured metric)	Read IOPS from a single disk during monitoring period.
Data Disk Write Operations/Sec (Featured metric)	Write IOPS from a single disk during monitoring period.
Data Disk Bandwidth Consumed Percentage (Featured metric)	Percentage of data disk bandwidth consumed per minute.
Data Disk IOPS Consumed Percentage (Featured metric)	Percentage of data disk I/Os consumed per minute.
Data Disk Target Bandwidth (Featured metric)	Baseline bytes per second throughput Data Disk can achieve without bursting.
Data Disk Target IOPS (Featured metric)	Baseline IOPS Data Disk can achieve without bursting.
Data Disk Max Burst Bandwidth (Featured metric)	Maximum bytes per second throughput Data Disk can achieve with bursting.
Data Disk Max Burst IOPS (Featured metric)	Maximum IOPS Data Disk can achieve with bursting.
Data Disk Used Burst BPS Credits Percentage	Percentage of Data Disk burst bandwidth credits used so far.
Data Disk Used Burst IO Credits Percentage	Percentage of Data Disk burst I/O credits used so far.
Premium Data Disk Cache Read Hit (Featured metric)	Premium Data Disk Cache Read Hit.
Premium Data Disk Cache Read Miss (Featured metric)	Premium Data Disk Cache Read Miss.
Premium OS Disk Cache Read Hit (Featured metric)	Premium OS Disk Cache Read Hit.
Premium OS Disk Cache Read Miss (Featured metric)	Premium OS Disk Cache Read Miss.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure VM Flow metrics

Metric Name	Description
Inbound Flows (Featured metric)	Inbound Flows are number of current flows in the inbound direction (traffic going into the VM).
Outbound Flows (Featured metric)	Maximum creation rate of outbound flows (traffic going out of the VM).
Inbound Flows Maximum Creation Rate (Featured metric)	Maximum creation rate of inbound flows (traffic going into the VM).
Outbound Flows Maximum Creation Rate (Featured metric)	Maximum creation rate of outbound flows (traffic going out of the VM).

Azure VM Memory metrics

Metric Name	Description
VM Cached Bandwidth Consumed Percentage (Featured metric)	Percentage of cached disk bandwidth consumed by the VM.
VM Cached IOPS Consumed Percentage	Percentage of cached disk IOPS consumed by the VM.
VM Uncached Bandwidth Consumed Percentage (Featured metric)	Percentage of uncached disk bandwidth consumed by the VM.
VM Uncached Bandwidth Consumed Percentage	Percentage of uncached disk IOPS consumed by the VM.
Available Memory Byte (Featured metric)	Amount of physical memory, in bytes, immediately available for allocation to a process or for system use in the Virtual Machine.

Azure VM Metrics policy - Azure Metrics Collector check metrics

Metric name	Units	Description
Percentage CPU (featured metric)	%	The percentage of allocated compute units that are currently in use by the Virtual Machine.
CPU Credits Remaining		Number of earned CPU credits that have not been consumed by the Virtual Machine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure VM Metrics policy - Azure Metrics Collector check metrics (continued)

Metric name	Units	Description
CPU Credits Consumed		Total number of CPU credits that have been consumed by the Virtual Machine.
Network In		Number of bytes received on all network interfaces by the instance.
Network Out		Number of bytes sent out on all network interfaces by the instance.
Network In Total (featured metric)	Bytes	The number of bytes received on all network interfaces by the Virtual Machine(s) (Incoming Traffic).
Network Out Total (featured metric)	Bytes	The number of bytes out on all network interfaces by the Virtual Machine(s) (Outgoing Traffic).
Available Memory Bytes (featured metric)	Bytes	Amount of physical memory in bytes immediately available for allocation to a process or for system use in the Virtual Machine.
VM Cached Bandwidth Consumed Percentage		Percentage of cached disk bandwidth consumed by the VM.
VM Cached IOPS Consumed Percentage		Percentage of cached disk IOPS consumed by the VM.
VM Uncached Bandwidth Consumed Percentage		Percentage of uncached disk bandwidth consumed by the VM.
VM Uncached IOPS Consumed Percentage		Percentage of uncached disk IOPS consumed by the VM.
Disk Read Bytes (featured metric)	Bytes	Bytes read from disk during monitoring period.
Disk Write Bytes (featured metric)	Bytes	Bytes written to disk during monitoring period.
Disk Read Operations/Sec (featured metric)	CountPerSecond	Disk Read IOPS.
Disk Write Operations/Sec (featured metric)	CountPerSecond	Disk Write IOPS.
OS Disk Read Bytes/sec		Bytes/Sec read from disk during monitoring period.
OS Disk Write Bytes/sec		Bytes/Sec written to disk during monitoring period.

Azure VM Metrics policy - Azure Metrics Collector check metrics (continued)

Metric name	Units	Description
OS Disk Read Operations/Sec		Read IOPS from disk during monitoring period.
OS Disk Write Operations/Sec		Write IOPS from disk during monitoring period.
OS Disk Queue Depth		Average number of read and write requests that were queued for the selected disk during the sample period.
OS Disk Bandwidth Consumed Percentage		Percentage of data disk bandwidth consumed per minute.
OS Disk IOPS Consumed Percentage		Percentage of data disk I/Os consumed per minute.
OS Disk Target Bandwidth		Baseline bytes per second throughput data disk can achieve without bursting.
OS Disk Target IOPS		Baseline IOPS data disk can achieve without bursting.
OS Disk Max Burst Bandwidth		Maximum bytes per second throughput data disk can achieve with bursting.
OS Disk Max Burst IOPS		Maximum IOPS data disk can achieve with bursting.
OS Disk Used Burst BPS Credits Percentage		Percentage of data disk burst bandwidth credits used so far.
OS Disk Used Burst IO Credits Percentage		Percentage of data disk burst I/O credits used so far.
Premium OS Disk Cache Read Hit		Premium OS disk cache read hit.
Premium OS Disk Cache Read Miss		Premium OS disk cache read miss.
Inbound Flows		Number of current flows in the inbound direction (traffic going into the VM).
Outbound Flows		Number of current flows in the inbound direction (traffic going out of the VM).
Inbound Flows Maximum Creation Rate		Maximum creation rate of inbound flows (traffic going into the VM).
Outbound Flows Maximum Creation Rate		Maximum creation rate of outbound flows (traffic going out of the VM).

Azure Load Balancer metrics policy - Azure Metrics collector check metrics

Metric name	Units	Description
AllocatedSnatPorts (featured metric)		Total number of SNAT ports allocated within the time period specified by the metric definition's *PT* (Period of Time) value.
ByteCount (featured metric)	bytes	Total number of bytes transmitted within the time period specified by the metric definition's *PT* (Period of Time) value.
DipAvailability (featured metric)	count	Average load balancer health probe status per time duration.
BlockedCount (featured metric)		Total number of packets transmitted within the time period specified by the metric definition's *PT* (Period of Time) value.
SnatConnectionCount (featured metric)	count	Total number of new SNAT connections created within the time period specified by the metric definition's *PT* (Period of Time) value.
SYNCount (featured metric)		Total number of SYN packets transmitted within the time period specified by the metric definition's *PT* (Period of Time) value.
UsedSnatPorts (featured metric)		Total number of SNAT ports used within the time period specified by the metric definition's *PT* (Period of Time) value.
VipAvailability (featured metric)	count	Average load balancer data path availability per time duration.

Azure Redis Cache policy - Azure Metrics Collector check metrics

Metric name	Units	Description
connectedclients		Number of client connections to the cache.
totalcommandsprocessed		Total number of commands processed by the cache server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Redis Cache policy - Azure Metrics Collector check metrics (continued)

Metric name	Units	Description
cachehits (featured metric)	count	Number of successful key lookups.
cachemisses (featured metric)	count	Number of failed key lookups.
cachemissrate		Rate of failed key lookups.
getcommands		Number of get operations from the cache.
setcommands (featured metric)	count	Number of set operations to the cache.
operationsPerSecond		Number of instantaneous operations per second executed on the cache.
evictedkeys		Number of items evicted from the cache.
totalkeys		Number of keys in the cache.
expiredkeys		Number of items expired from the cache.
usedmemory	bytes	Amount of cache memory used for key/value pairs in the cache.
usedmemoryRss	bytes	Amount of cache memory used during the specified reporting interval, including fragmentation and metadata
serverLoad (featured metric)	Percent	Percentage of cycles in which the Redis server is busy processing and not waiting idle for messages
cacheWrite (featured metric)	BytesPersSecond	Amount of data written to the cache.
cacheRead (featured metric)	BytesPerSecond	Amount of data read from the cache.
allConnectionsCreatedPerSecond		Number of instantaneous connections created per second on the cache via port 6379 or 6380 (SSL).
allConnectionsClosedPerSecond		Number of instantaneous connections closed per second on the cache via port 6379 or 6380 (SSL).
allconnectedclients (featured metric)	count	Number of currently connected clients to the system.

Azure Redis Cache policy - Azure Metrics Collector check metrics (continued)

Metric name	Units	Description
alltotalcommandsprocessed		The cumulative count of all commands processed by the system.
alloperationsPerSecond		Total number of operations (such as read or write commands) performed per second across all instances.
allusedmemory (featured metric)	bytes	Total amount of memory being used across the system.
allusedmemoryRss (featured metric)	bytes	The total Resident Set Size (RSS), which reflects the amount of memory physically present in RAM across all instances, including swap.

Azure Gateway Metrics policy - Azure Metrics collector check metrics

Metric name	Units	Description
ApplicationGatewayTotalTime (featured metric)	MilliSeconds	Time that it takes for a request to be processed and its response to be sent.
AvgRequestCountPerHealthyHost		Average request count per minute per healthy backend host in a pool.
AzwafBotProtectionMatches		Matched Bot Rules.
AzwafCustomRuleMatches		Matched Custom Rules.
AzwafSecRuleMatches		Matched Managed Rules.
AzwafTotalRequests		Total number of requests evaluated by WAF.
BackendConnectTime		Time spent establishing a connection with a backend server.
BackendFirstByteResponseTime		Time interval between start of establishing a connection to backend server and receiving the first byte of the response header, approximating processing time of backend server.
BackendLastByteResponseTime		Time interval between start of establishing a connection to backend server and receiving the last byte of the response body.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Gateway Metrics policy - Azure Metrics collector check metrics (continued)

Metric name	Units	Description
BackendResponseStatus		Number of HTTP response codes generated by the backend members. This does not include any response codes generated by the Application Gateway.
BlockedCount		Total number of blocked operations or requests
BytesReceived (featured metric)	bytes	Total number of bytes received by the Application Gateway from the clients.
BytesSent (featured metric)	bytes	Total number of bytes sent by the Application Gateway to the clients.
CapacityUnits		Capacity units consumed.
ClientRtt		Round trip time between clients and Application Gateway. Indicates how long it takes to establish connections and return acknowledgments.
ComputeUnits		Compute units consumed.
CpuUtilization		Current CPU utilization of the Application Gateway.
CurrentConnections (featured metric)	count	Count of current connections established with Application Gateway.
EstimatedBilledCapacityUnits		Estimated capacity units that will be charged.
FailedRequests (featured metric)	count	Count of failed requests that Application Gateway has served.
FixedBillableCapacityUnits		Fixed Billable Capacity Units.
HealthyHostCount (featured metric)	count	Number of healthy backend hosts.
NewConnectionsPerSecond		New connections per second established with Application Gateway.
ResponseStatus		HTTP response status returned by Application Gateway.
Throughput (featured metric)	bytesPerSecond	Number of bytes per second the Application Gateway has served.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Gateway Metrics policy - Azure Metrics collector check metrics (continued)

Metric name	Units	Description
TotalRequests (featured metric)	count	Count of successful requests that Application Gateway has served.
UnhealthyHostCount (featured metric)	count	Number of unhealthy backend hosts.

Azure Storage Account policy - Azure Metrics Collector check metrics

Metric name	Units	Description
Transactions (featured metric)	count	Total number of requests made to the storage account.
Ingress (featured metric)	bytes	Amount of ingress data. This number includes ingress from an external client into Azure Storage as well as ingress within Azure.
Egress (featured metric)	bytes	Amount of egress data. This number includes egress from an external client into Azure Storage as well as egress within Azure. As a result, this number does not reflect billable egress.
SuccessServerLatency (featured metric)	milliseconds	Average latency used by Azure Storage to process a successful request.
SuccessE2ELatency (featured metric)	milliseconds	The average end-to-end latency of successful requests made to a storage service or the specified API operation.
Availability (featured metric)	percent	The percentage of availability for the storage service or the specified API operation.

Azure Blob Services metrics

Metric Name	Description
Availability	Percentage of availability for the storage service or the specified API operation. Availability is calculated by taking the TotalBillableRequests value and dividing it by the number of applicable requests, including those that produced unexpected errors. All unexpected errors result in reduced availability for the storage service or the specified API operation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Blob Services metrics (continued)

Metric Name	Description
BlobCapacity (Featured metric)	Amount of storage used by the storage account's Blob service, in bytes.
BlobCount	Number of Blobs in the storage account's Blob service
Container Count	Number of containers in the storage account's Blob service.
Egress (Featured metric)	Amount of Egress data, in bytes. Includes egress from an external client into Azure Storage as well as Egress within Azure. As a result, this number does not reflect billable Egress.
Index Capacity (Featured metric)	Amount of storage used by ADLS Gen2 (Hierarchical) Index, in bytes.
Ingress (Featured metric)	The amount of Ingress data, in bytes. Includes Ingress from an external client into Azure storage, as well as ingress within Azure.
SuccessE2ELatency (Featured metric)	End-to-end latency of successful requests made to a storage service or the specified API operation, in milliseconds. Includes the required processing time within Azure storage to read the request, send the response, and receive acknowledgment of the response.
SuccessServerLatency (Featured metric)	Latency used by Azure storage to process a successful request, in milliseconds. This value does not include the network latency specified in **SuccessE2ELatency**.
Transactions	Number of requests made to a storage service or the specified API operation. Includes successful and failed requests, as well as requests which produced errors. Use the *ResponseType* dimension for the number of different types of responses.

Azure cloud metrics

Azure cloud metrics are gathered from Azure virtual machines (VMs) and Azure storage account policies. Collecting the cloud metrics enables you to monitor the performance of your Azure resources.

Azure cloud metrics collection - Overview

To begin collecting Azure cloud metrics, you must select the metrics that you want to add to the CMDB and set the relevant system configurations. For example, you can monitor the number of bytes sent and received from Azure resources. For details, see Agent Client Collector for Visibility - Content reference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using Azure policies

You can use preconfigured Azure policies for metric collection, or you can create your own Azure policies.

When using a preconfigured policy, you do the following tasks:

- Prepare an instance with an active MID Server and metric base.
- Install Agent Client Collector Framework and Agent Client Collector Monitoring.
- Run Discovery on the Azure cloud account to populate the CMDB with the configuration items (CIs) to be monitored.
- Configure a proxy agent and assign credentials to the policy. Proxy agents monitor CIs for agents that are in the cloud. Credentials enable the agent to access the Azure policy.

The policies available with the base system for you to activate and configure are described in the following table.

Azure policies available with base system

Policy name	Description	Link to supported metrics
Azure Load Balancer metrics	Collects the metrics for the Azure load balancers.	Supported metrics for Microsoft Load Balancers
Azure Gateway metrics	Collects the metrics for the Azure network gateway.	Supported metrics for Microsoft Network Gateways
Azure Redis Cache metrics	Collects the metrics for the Azure Redis cache.	Supported metrics for Microsoft Redis cache
Azure Storage Account metrics	Collects the metrics for the Azure storage accounts.	Supported metrics for Microsoft storage accounts
Azure Virtual Machine (VM) metrics	Collects the metrics for the VMs, which help you monitor Azure VMs.	Supported metrics for Microsoft virtual machines

Specifying the CIs for metric collection

When creating policies, you must include the CIs that you want to collect the metrics for in the CMDB. The CIs are typically populated during Discovery, which finds applications and devices on your network and updates the CMDB accordingly.

When creating a policy, you must decide which CIs you want the policy to monitor. To enable monitoring CIs, you do the following tasks:

1. Configure the Azure Metrics Collector check in the policy.
2. Set the credentials for the Azure Metrics Collector check to enable retrieving metrics from Azure to the Agent Client Collector agent.
3. Generate a .json file that specifies the list of resources to be monitored.
4. Generate a .json file that specifies the list of metrics to be retrieved from monitored resources.

For details on the Azure policies, see Create Azure policies for metric collection.

For details on the Azure Metrics Batch API, see the Metrics Batch API page.

Cassandra default checks and policies

Agent Client Collector provides the following policies for Cassandra health monitoring. Policies come with the checks specified in the indicated table. Policies and checks are available for Linux only.

Cassandra Metrics

Check	Description	Usage	Command	Output
app.cassandra.metrics-cassandra	Returns metrics of a Cassandra database.	`metrics-cassandra-graphite.rb` Options: **-h host** Hostname where the Cassandra database is running **-P port** Cassandra JMX port	`metrics-cassandra-graphite.rb --cfstats -P {{.labels.params_port}} -h {{.labels.params_host}}`	`<host>.cassandra.load 132270.08 1645107221`

Cassandra metrics

The following table lists the metrics that are gathered as output from Cassandra checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

metrics-cassandra metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.load (featured metric)		byte	The disk space used by live data on a node.
cassandra.uptime (featured metric)		seconds	
cassandra.heap.used (featured metric)		byte	
cassandra.heap.total (featured metric)		byte	
cassandra.exceptions		count	Number of internal exceptions caught. Under normal

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			exceptions this should be zero.
cassandra.key_cache.size		byte	Total size of occupied cache, in bytes.
cassandra.key_cache.capacity		byte	Cache capacity in bytes.
cassandra.key_cache.hits		count	Total number of cache hits.
cassandra.key_cache.requests (featured metric)		count	Total number of cache requests.
cassandra.key_cache.hit_rate (featured metric)		count	All time cache hit rate.
cassandra.compactionstats.pending_tasks		count	The number of pending compactions.
cassandra.threadpool.ReadStage.active		count	Number of tasks being actively worked on by this pool. Local reads run on this thread pool on this ReadStage.
cassandra.threadpool.ReadStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.ReadStage.completed		count	Number of tasks completed.
cassandra.threadpool.ReadStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.MiscStage.active		count	Number of tasks being actively worked on by this pool. Miscellaneous tasks run on this stage.
cassandra.threadpool.MiscStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.MiscStage.completed		count	Number of tasks completed.
cassandra.threadpool.MiscStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.CompactionExecutor.active		count	Number of tasks being actively worked

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			on by this pool. Compactions are run on these threads.
cassandra.threadpool.CompactionExecutor.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.CompactionExecutor.completed		count	Number of tasks completed.
cassandra.threadpool.CompactionExecutor.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.MutationStage.active		count	Number of tasks being actively worked on by this pool. Responsible for all other writes.
cassandra.threadpool.MutationStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.MutationStage.completed		count	Number of tasks completed.
cassandra.threadpool.MutationStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.MemtableReclaimMemory.active		count	Number of tasks being actively worked on by this pool. Memtable recycling.
cassandra.threadpool.MemtableReclaimMemory.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.MemtableReclaimMemory.completed		count	Number of tasks completed.
cassandra.threadpool.MemtableReclaimMemory.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.PendingRangeCalculator.active		count	Number of tasks being actively worked on by this pool. Calculates token range.
cassandra.threadpool.PendingRangeCalculator.pending		count	Number of queued tasks queued up on this pool.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.PendingRangeCalculator.completed		count	Number of tasks completed.
cassandra.threadpool.PendingRangeCalculator.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.GossipStage.active		count	Number of tasks being actively worked on by this pool. Handles gossip requests.
cassandra.threadpool.GossipStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.GossipStage.completed		count	Number of tasks completed.
cassandra.threadpool.GossipStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.SecondaryIndexManagement.active		count	Number of tasks being actively worked on by this pool. Performs updates to secondary indexes.
cassandra.threadpool.SecondaryIndexManagement.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.SecondaryIndexManagement.completed		count	Number of tasks completed.
cassandra.threadpool.SecondaryIndexManagement.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.HintsDispatcher.active		count	Number of tasks being actively worked on by this pool. Performs hinted hand off.
cassandra.threadpool.HintsDispatcher.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.HintsDispatcher.completed		count	Number of tasks completed.
cassandra.threadpool.HintsDispatcher.blocked		count	Number of tasks that were blocked due to queue saturation.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.RequestResponseStage.active		count	Number of tasks being actively worked on by this pool. Coordinator requests to the cluster run on this thread pool.
cassandra.threadpool.RequestResponseStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.RequestResponseStage.completed		count	Number of tasks completed.
cassandra.threadpool.RequestResponseStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.ReadRepairStage.active		count	Number of tasks being actively worked on by this pool. Read repair happens on this thread pool.
cassandra.threadpool.ReadRepairStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.ReadRepairStage.completed		count	Number of tasks completed.
cassandra.threadpool.ReadRepairStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.CounterMutationStage.active		count	Number of tasks being actively worked on by this pool. Responsible for counter writes.
cassandra.threadpool.CounterMutationStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.CounterMutationStage.completed		count	Number of tasks completed.
cassandra.threadpool.CounterMutationStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.MigrationStage.active		count	Number of tasks being actively worked on by this pool. Runs schema migrations.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.MigrationStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.MigrationStage.completed		count	Number of tasks completed.
cassandra.threadpool.MigrationStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.MemtablePostFlush.active		count	Number of tasks being actively worked on by this pool. Cleans up commit log after memtable is written to disk.
cassandra.threadpool.MemtablePostFlush.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.MemtablePostFlush.completed		count	Number of tasks completed.
cassandra.threadpool.MemtablePostFlush.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.PerDiskMemtableFlushWriter_0.active		count	Number of tasks being actively worked on by this pool. Responsible for writing a spec (there is one of these per disk 0-N).
cassandra.threadpool.PerDiskMemtableFlushWriter_0.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.PerDiskMemtableFlushWriter_0.completed		count	Number of tasks completed.
cassandra.threadpool.PerDiskMemtableFlushWriter_0.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.ValidationExecutor.active		count	Number of tasks being actively worked on by this pool. Performs validation compaction or scrubbing.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.ValidationExecutor.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.ValidationExecutor.completed		count	Number of tasks completed.
cassandra.threadpool.ValidationExecutor.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.Sampler.active		count	Number of tasks being actively worked on by this pool. Responsible for re-sampling the index summaries of *SStables*.
cassandra.threadpool.Sampler.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.Sampler.completed		count	Number of tasks completed.
cassandra.threadpool.Sampler.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.MemtableFlushWriter.active		count	Number of tasks being actively worked on by this pool. Writes memtables to disk.
cassandra.threadpool.MemtableFlushWriter.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.MemtableFlushWriter.completed		count	Number of tasks completed.
cassandra.threadpool.MemtableFlushWriter.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.InternalResponseStage.active		count	Number of tasks being actively worked on by this pool. Responsible for intra-cluster callbacks.
cassandra.threadpool.InternalResponseStage.pending		count	Number of queued tasks queued up on this pool.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.InternalResponseStage.completed		count	Number of tasks completed.
cassandra.threadpool.InternalResponseStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.ViewMutationStage.active		count	Number of tasks being actively worked on by this pool. Responsible for materialized view writes.
cassandra.threadpool.ViewMutationStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.ViewMutationStage.completed		count	Number of tasks completed.
cassandra.threadpool.ViewMutationStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.AntiEntropyStage.active		count	Number of tasks being actively worked on by this pool. Builds merkle tree for repairs.
cassandra.threadpool.AntiEntropyStage.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.AntiEntropyStage.completed		count	Number of tasks completed.
cassandra.threadpool.AntiEntropyStage.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.threadpool.CacheCleanupExecutor.active		count	Number of tasks being actively worked on by this pool. Cache maintenance performed on this thread pool.
cassandra.threadpool.CacheCleanupExecutor.pending		count	Number of queued tasks queued up on this pool.
cassandra.threadpool.CacheCleanupExecutor.completed		count	Number of tasks completed.

metrics-cassandra metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cassandra.threadpool.CacheCleanupExecutor.blocked		count	Number of tasks that were blocked due to queue saturation.
cassandra.message_type.READ.dropped		count	Number of dropped messages. Regular reads.
cassandra.message_type.RANGE_SLICE.dropped		count	Number of dropped messages. Token range read.
cassandra.message_type._TRACE.dropped		count	Number of dropped messages. Tracing writes.
cassandra.message_type.HINT.dropped		count	Number of dropped messages. Hint replay.
cassandra.message_type.MUTATION.dropped		count	Number of dropped messages. Regular writes.
cassandra.message_type.COUNTER_MUTATION.dropped		count	Number of dropped messages. Counter writes.
cassandra.message_type.BATCH_STORE.dropped		count	Number of dropped messages. Batchlog write.
cassandra.message_type.BATCH_REMOVE.dropped		count	Number of dropped messages. Batchlog cleanup (after successfully applied).
cassandra.message_type.REQUEST_RESPONSE.dropped		count	Number of dropped messages. RPC Callbacks.
cassandra.message_type.PAGED_RANGE.dropped		count	Number of dropped messages. Paged read.
cassandra.message_type.READ_REPAIR.dropped		count	Number of dropped messages. Read repair.
cassandra.system_traces.read_count		count	Number of read for this table.
cassandra.system_traces.read_latency			Local read latency for this table.
cassandra.system_traces.write_count		count	Number of writes for this table.

Directory Scan monitoring default checks and policies

The Agent Client Collector provides the following default checks and policies for Directory Scan monitoring.

© 2026 ServiceNow, Inc. All rights reserved.

Windows OS Events - Extended policy

Type	Check	Description	Usage and Usage Example	Output
Event	check-directory-file-count	Checks the number of files present in a given directory and compares it to the provided warning and critical thresholds. Returns a CRITICAL, WARNING, or OK event based on the critical and warning thresholds. **Note:** • Counts the number of files inside the directory, not including files in subdirectories. • The agent requires read and execute permissions on the directory being monitored.	check-directory-file-count.rb (options) -d, --dir Absolute path to the directory to count the files (required) -w, --warning Warning threshold (required) -c, --critical Critical threshold (required) -H, include_hidden_files Set active to **true** to include hidden files while counting (default is **false**) **Usage Example:** `check-directory-file-count.rb -d /path/to/directory -w 50 -c 100`	DirectoryFileCount CRITICAL: <path to dir> has 165 files.
Event	check-directory-integrity	Compares the last modified time of the directory with the current time to determine if any updates have occurred within a defined time interval. Based on this comparison, the	commonchecks check-directory-integrity (options) -d, --dirpath DIRPATH: Absolute path to the directory to check (required). -i, --interval INTERVAL:	Common Checks CRITICAL: Directory Integrity: CHANGES DETECTED for <path to file> within the last 180 seconds (Last Modified: Wed, 04 Dec

Windows OS Events - Extended policy (continued)

Type	Check	Description	Usage and Usage Example	Output
		check returns a CRITICAL or OK event. **Note:** The agent requires read and execute permissions on the directory being monitored.	Time interval in seconds to check for recent updates (required). Default value can be set to 180 seconds. **Usage example:** `commonchecks check-directory-update -d /path/to/directory -i 180`	2024 12:18:55 EST).
Event	check-file-age	Evaluates the age of a specified file by comparing its last modification time with the current time. Raises an alert if the file exceeds the defined critical or warning age thresholds. **Note:** The agent requires read and execute permissions on the file being monitored.	commonchecks check-file-age (options) -f, --filepath FILEPATH: Absolute path to the file to check (required). -c, --critical CRITICAL: Critical age threshold in minutes for the file (required). -w, --warning WARNING: Warning age threshold in minutes for the file (required). **Usage example:**`commonchecks check-file-age -f /path/to/file.txt -c 120 -w 60`	Common Checks OK: File <path to file> age: 30 minutes.

Windows OS Events - Extended policy (continued)

Type	Check	Description	Usage and Usage Example	Output
Event	check-file-response-time	Compares the time needed to read a specified file and compares it with the critical and warning thresholds. Based on this comparison, the check returns a CRITICAL or OK event. **Note:** The agent requires read and execute permissions on the file being monitored.	commonchecks check-file-response-time (options) -f, --filepath FILEPATH: Absolute path to the file to check (required). -c, --critical CRITICAL: Critical threshold in seconds for file response time (required). -w, --warning WARNING: Warning threshold in seconds for file response time (required). -t, --timeout TIMEOUT: Maximum time allowed for reading the file content, specified in seconds. Time out value must be greater than the critical threshold value. **Usage example:** `commonchecks check-file-response-time -f /var/log/servicenow/agent-client-collector/acc.log -c 10 -w 5 -t 20`	Common Checks OK: File read response time: 0.0020 seconds for the file_name: /var/log/servicenow/agent-client-collector/acc.log.

Windows OS Events - Extended policy (continued)

Type	Check	Description	Usage and Usage Example	Output
Event	check-file-size	Measures the size of a file (the actual amount of data it contains) and compares it against specified thresholds. Returns a CRITICAL, WARNING, or OK event based on the comparison of the file size and the thresholds. **Note:** The agent requires read and execute permissions on the file being monitored.	commonchecks check-file-size (options) -f, --filepath FILEPATH Absolute path to the required file (required). -c, --critical CRITICAL. Critical threshold in kilobytes. Provide as a number without units (for example, 1000 for 1000 KB) (required) -w, --warning WARNING. Warning threshold in kilobytes. Provide as a number without units (for example, 500 for 500 KB) (required) **Usage example:** `commonchecks check-file-size -f C:\ProgramData\ServiceNow\agent-client-collector\config\acc.yml`	Common Checks OK: For File <path to file> size: 4.72 KB is within thresholds
Event	check-file-space	Measures the size of a file on disk against specified thresholds, returning a CRITICAL, WARNING, or OK	commonchecks check-file-space (options) -f, --filepath FILEPATH: Absolute path to the relevant file (required).	Common Checks OK: File <path to file> space: 8.00 KB is within threshold

			Usage example: `linuxchecks check-directory-space -d /path/to/directory -c 10 -w 5 -t 30`	

Google Cloud Platform (GCP) metrics

The following table lists and describes the metrics that are gathered by the *acc_grp_metrics_list.json* configuration data file. The file is uploaded to a check definition or check instance, and the metrics in the file are monitored by the check for its agent.

GCP metrics

Metric name	Metric type	Service	Description
CPU utilization	appengine.googleapis.com/flex/cpu/utilization	app engine	Fractional utilization of allocated CPU across an App Engine flexible environment version.
Response count	appengine.googleapis.com/http/server/response_count		Delta HTTP response count
Free disk space percent	file.googleapis.com/nfs/server/free_bytes_percent	file	Free disk space as a percentage of the total space.
Circuit Operational Status	interconnect.googleapis.com/network/interconnect/link/operational	interconnect	Whether the operational status of the circuit is 'up'. This metric is specific to individual physical circuits
Operational Status	interconnect.googleapis.com/network/interconnect/operational		Whether the operational status of the interconnect is 'up'. This metric is specific to the aggregate LACP bundle.
Instance group size	compute.googleapis.com/instance_group/size	compute	The number of VMs in the instance group.
CPU utilization	compute.googleapis.com/instance/cpu/utilization		Fractional utilization of allocated CPU on this instance. Values are typically

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GCP metrics (continued)

Metric name	Metric type	Service	Description
			numbers between 0.0 and 1.0 (but can exceed 1.0). Charts display the values as a percentage between 0% and 100% (or more).
CPU usage time	compute.googleapis.com/instance/cpu/usage_time		Delta CPU usage time in seconds. Cumulative CPU usage time since instance start.
CPU scheduler wait time	compute.googleapis.com/instance/cpu/scheduler_wait_time		Wait time is the time a vCPU is runnable but not scheduled to run by the hypervisor.
CPU reserved cores	compute.googleapis.com/instance/cpu/reserved_cores		Number of cores reserved for the instance.
Disk queue length	compute.googleapis.com/guest/disk/queue_length		Number of requests waiting to be handled by the disk.
Uptime	compute.googleapis.com/instance/uptime		Delta of how long the VM has been running, measured in seconds. For availability monitoring, use uptime checks instead.
Disk read bytes	compute.googleapis.com/instance/disk/read_bytes_count		Delta count of bytes read from disk.
Disk max read operations	compute.googleapis.com/instance/disk/max_read_ops_count		Maximum number of read operations that can be performed per second.
Disk write bytes	compute.googleapis.com/instance/disk/write_bytes_count		Delta count of bytes written to disk.
Disk max write operations	compute.googleapis.com/instance/disk/max_write_ops_count		Maximum number of write operations that can be performed per second.
Disk read operations	compute.googleapis.com/instance/disk/read_ops_count		Delta count of disk read IO operations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GCP metrics (continued)

Metric name	Metric type	Service	Description
Disk write operations	compute.googleapis.com/instance/disk/write_ops_count		Delta count of disk write IO operations.
Memory balloon RAM size	compute.googleapis.com/instance/memory/balloon/ram_size		The total amount of memory allocated to the guest's balloon driver in bytes. Memory ballooning enables the hypervisor to reclaim memory from the guest VM.
Memory balloon RAM used	compute.googleapis.com/instance/memory/balloon/ram_used		Memory currently used by the guest RAM, excluding memory used by the balloon itself, measured in bytes.
Memory swap in	compute.googleapis.com/instance/memory/balloon/swap_in_bytes_count		The amount of memory (in bytes) swapped in from disk to memory.
Memory swap out	compute.googleapis.com/instance/memory/balloon/swap_out_bytes_count		The amount of memory (in bytes) swapped out from memory to disk.
Network received bytes	compute.googleapis.com/instance/network/received_bytes_count		Delta count of bytes received from the network.
Network sent bytes	compute.googleapis.com/instance/network/sent_bytes_count		Delta count of bytes sent over the network.
Network received packets	compute.googleapis.com/instance/network/received_packets_count		Delta count of packets received from the network.
Network sent packets	compute.googleapis.com/instance/network/sent_packets_count		Delta count of packets sent over the network.
Anonymous memory used	compute.googleapis.com/guest/memory/anonymous_used		Anonymous memory usage in bytes. Anonymous memory represents memory that is not backed by a file.
Memory bytes used	compute.googleapis.com/guest/memory/bytes_used		Total memory usage in bytes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GCP metrics (continued)

Metric name	Metric type	Service	Description
Dirty memory used	compute.googleapis.com/guest/memory/dirty_used		Dirty memory usage in bytes. Dirty pages are pages in memory that have been modified but not yet written to disk.
Page cache used	compute.googleapis.com/guest/memory/page_cache_used		Page cache memory usage in bytes. Page cache is used to cache file data.
Unevictable memory used	compute.googleapis.com/guest/memory/unevictable_used		Unevictable memory usage in bytes. Unevictable memory is memory that cannot be swapped out.
Disk operation bytes	compute.googleapis.com/guest/disk/operation_bytes_count		Delta count of bytes transferred in disk operations.
System problem state	compute.googleapis.com/guest/system/problem_state		Indicates whether the system is experiencing problems. 1 means there is a problem, 0 means no problem.
System uptime	compute.googleapis.com/guest/system/uptime		Delta of system uptime in seconds.
System problem count	compute.googleapis.com/guest/system/problem_count		Delta count of system problems detected.
CPU limit utilization	kubernetes.io/anthos/container/cpu/limit_utilization	anthos	The fraction of the CPU limit that is currently in use on the instance.
Memory limit utilization	kubernetes.io/anthos/container/memory/limit_utilization		The fraction of the memory limit that is currently in use on the instance.
Executions	cloudfunctions.googleapis.com/function/execution_count	cloudfunctions	Count of function executions broken down by status.
Tunnel established	n.googleapis.com/tunnel_established	vpn	Indicates successful tunnel establishment if > 0.
RTT latencies per internal TCP/UDP load balancer	loadbalancing.googleapis.com/l3/internal/rtt_latencies	loadbalancing	A distribution of RTT measured over TCP connections for

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GCP metrics (continued)

Metric name	Metric type	Service	Description
			internal TCP/UDP load balancer flows.
Unacked messages by region	pubsub.googleapis.com/subscription/num_unacked_messages_by_region	pubsub	Number of unacknowledged messages in a subscription, broken down by Cloud region.
Disabled for network	firebasedatabase.googleapis.com/network/disabled_for_overages	firebasedatabase	Indicates if the Firebase database has been disabled for network overages.
Disabled for storage	firebasedatabase.googleapis.com/storage/disabled_for_overages		Indicates if the Firebase database has been disabled for storage overages.
Database load	firebasedatabase.googleapis.com/io/database_load		Fraction of database load, grouped by type.
CPU utilization	cloudsql.googleapis.com/database/cpu/utilization	cloudsql	Current CPU utilization represented as a percentage of the reserved CPU that is currently in use.
Disk utilization	cloudsql.googleapis.com/database/disk/utilization		The fraction of the disk quota that is currently in use.
Instance state	cloudsql.googleapis.com/database/instance_state		The current serving state of the Cloud SQL instance.
Memory utilization	cloudsql.googleapis.com/database/memory/utilization		The fraction of the memory quota that is currently in use.
Server up	cloudsql.googleapis.com/database/up		Indicates if the server is up.
CPU utilization by priority	spanner.googleapis.com/instance/cpu/utilization_by_priority	spanner	Percent utilization of provisioned CPU, by priority.
Smoothed CPU utilization	spanner.googleapis.com/instance/cpu/smoothed_utilization		24-hour smoothed utilization of provisioned CPU.
Storage used	spanner.googleapis.com/instance/storage/used_bytes		Storage used in bytes. Sampled every 60 seconds.
CPU usage percent	memcache.googleapis.com/node/cpu/utilization	memcache	CPU usage percent by Memcached node.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GCP metrics (continued)

Metric name	Metric type	Service	Description
Cache memory usage	memcache.googleapis.com/node/cachememory		Bytes allotted for the Memcached cache in this node, grouped by whether that memory is used.
Used memory	redis.googleapis.com/redis.googleapis.com/stats/memory/usage_ratio	redis	Total number of bytes allocated by Redis.
Memory usage ratio	redis.googleapis.com/stats/memory/usage_ratio		Memory usage as a ratio of maximum memory.
CPU load	bigtable.googleapis.com/cluster_cpu_load	bigtable	CPU load of a cluster.
Disk load	bigtable.googleapis.com/cluster_disk_load		Utilization of HDD disks in a cluster.
Storage utilization	bigtable.googleapis.com/cluster_storage_utilization		Storage used as a fraction of total storage capacity.
HDFS storage utilization	dataproc.googleapis.com/cluster/hdfs/storage_utilization	dataproc	The percentage of HDFS storage currently used.
Unhealthy HDFS blocks by status	dataproc.googleapis.com/hdfs/unhealthy_blocks		Indicates the number of unhealthy blocks inside the cluster.
Processes	agent.googleapis.com/processes/count_by_state	processes	Count of processes in the given state. Relevant for Linux only.
Process CPU	agent.googleapis.com/processes/cpu_time		Time taken by CPU to complete a given process.
TCP connections	agent.googleapis.com/processes/network	network	Current count of TCP connections.

Glassfish default checks and policies

Agent Client Collector provides the following default checks and policies for Glassfish monitoring.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Glassfish metrics policy

Type	Check	Description	Usage and usage example	Output

Metric	glassfish.metric-jvm-level	Retrieves the Glassfish server's JVM metrics.
		
		Requires basic authentication credentials.
			`-i, --instance Glassfish Monitoring Instance Name (required)`
			`-p, --password Glassfish password`
			`-P, --port Glassfish API port`
			`--ssl Enable secure connnection to Glassfish`
			`-u –username Glassfish username`
			
			Usage example:
			`metric-glassfish-jvm-level.rb {{if .labels.params_port}} -P {{.labels.params_port}} {{end}} -i {{.labels.params_glassfish_server_ins`
				`glassfish.jvm.garbage-collectors.Scavenge.Col 200 0 1652959788`

Metric	glassfish.metric-server-requests	Provides http-request metrics for all applications deployed on the Glassfish server.	`-i, --instance Glassfish Monitoring Instance Name`	`glassfish.http-service.server.request.C 200 0 1652959788`

GlassFish metrics

The following table lists the metrics that are gathered as output from GlassFish checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

glassfish.metrics-deployed-apps metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.applications.{Deployed Application}.TotalServletsLoaded	Deployed Application	count	Total number of Servlets loaded so far.
glassfish.applications.{Deployed Application}.ServletProcessingTimes	Deployed Application	ms	Cumulative Servlet processing times.
glassfish.applications.{Deployed Application}.ActiveServletsLoaded	Deployed Application	count	Number of Servlets loaded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glassfish.metrics-deployed-apps metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.applications.{Deployed Application}.ExpiredSessionsTotal (featured metric)	Deployed Application	count	Total number of sessions expired so far.
glassfish.applications.{Deployed Application}.PassivatedSessionsTotal	Deployed Application	count	Total number of sessions passivated so far.
glassfish.applications.{Deployed Application}.ActivatedSessionsTotal	Deployed Application	count	Total number of sessions activatedso far.
glassfish.applications.{Deployed Application}.SessionsTotal	Deployed Application	count	Total number of sessions created so far.
glassfish.applications.{Deployed Application}.RejectedSessionsTotal (featured metric)	Deployed Application	count	Total number of sessions rejected so far.
glassfish.applications.{Deployed Application}.PersistedSessionsTotal	Deployed Application	count	Total number of sessions persisted so far.
glassfish.applications.{Deployed Application}.ActiveSessions (featured metric)	Deployed Application	count	Number of active sessions.
glassfish.applications.{Deployed Application}.RequestCount	Deployed Application	count	Cumulative number of requests processed so far
glassfish.applications.{Deployed Application}.MaxTime (featured metric)	Deployed Application	ms	Longest response time for a request; not a cumulative value, but the largest response time from among the response times.
glassfish.applications.{Deployed Application}.ErrorCount (featured metric)	Deployed Application	count	Cumulative value of the error count, with error count representing the number of cases where the response code was greater than or equal to 400.
glassfish.applications.{Deployed Application}.ProcessingTime	Deployed Application	ms	Average request processing time.

glassfish.metrics-deployed-apps metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.applications.{Deployed Application}.TotalJspCount	Deployed Application	count	Total number of JSP pages loaded so far.
glassfish.applications.{Deployed Application}.JspCount	Deployed Application	count	Number of active JSP pages.
glassfish.applications.{Deployed Application}.JspErrorCount (featured metric)	Deployed Application	count	Total number of errors triggered by JSP page invocations.
glassfish.applications.{Deployed Application}.JspReloadedCount	Deployed Application	count	Total number of reloaded JSP pages.

glassfish.metrics-deployment-lifecycle metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.deployment.lifecycle.ActiveApplicationsDeployed (featured metric)		count	Total number of applications deployed so far.
glassfish.deployment.lifecycle.TotalApplicationsDeployed (featured metric)		count	Number of applications deployed.

glassfish.metric-server-requests metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.http-service.server.request.Count200		count	Number of responses with a status code equal to 200.
glassfish.http-service.server.request.Count2xx		count	Number of responses with a status code in the 2xx range.
glassfish.http-service.server.request.Count302		count	Number of responses with a status code equal to 302.
glassfish.http-service.server.request.Count304		count	Number of responses with a status code equal to 304.

glassfish.metric-server-requests metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.http-service.server.request.Count3xx		count	Number of responses with a status code equal in the 3xx range.
glassfish.http-service.server.request.Count400		count	Number of responses with a status code equal to 400.
glassfish.http-service.server.request.Count401		count	Number of responses with a status code equal to 401.
glassfish.http-service.server.request.Count403		count	Number of responses with a status code equal to 403.
glassfish.http-service.server.request.Count404		count	Number of responses with a status code equal to 404.
glassfish.http-service.server.request.Count4xx		count	Number of responses with a status code equal in the 4xx range.
glassfish.http-service.server.request.Count503		count	Number of responses with a status code equal to 503.
glassfish.http-service.server.request.Count5xx		count	Number of responses with a status code equal in the 5xx range.
glassfish.http-service.server.request.MaxTime		ms	Longest response time for a request; not a cumulative value, but the largest response time from among the response times.
glassfish.http-service.server.request.CountBytesReceived (featured metric)		count	Number of bytes received.
glassfish.http-service.server.request.CountBytesTransmitted (featured metric)		count	Number of bytes transmitted.
glassfish.http-service.server.request.RequestCount (featured metric)		count	Cumulative number of requests processed so far.
glassfish.http-service.server.request.CountOpenConnections		count	Number of open connections.

glassfish.metric-server-requests metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.http-service.server.request.ProcessingTime (featured metric)		ms	Average request processing time.

glassfish.metric-jvm-level metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.jvm.garbage-collectors.Scavenge.CollectionCount		count	Total number of collections that have occurred.
glassfish.jvm.garbage-collectors.Scavenge.CollectionTime		ms	Approximate accumulated collection elapsed time in milliseconds.
glassfish.jvm.garbage-collectors.MarkSweepCompact.CollectionCount		count	Total number of collections that have occurred.
glassfish.jvm.garbage-collectors.MarkSweepCompact.CollectionTime		ms	Approximate accumulated collection elapsed time in milliseconds.
glassfish.jvm.memory.CommittedHeapSize		bytes	Amount of memory in bytes that is committed for the Java virtual machine to use.
glassfish.jvm.memory.CommittedNonHeapSize		bytes	Amount of memory in bytes that is committed for the Java virtual machine to use.
glassfish.jvm.memory.InitHeapSize		bytes	Amount of memory in bytes that the Java virtual machine initially requests from the operating system for memory management.
glassfish.jvm.memory.InitNonHeapSize		bytes	Amount of memory in bytes that the Java virtual machine initially requests from the operating

glassfish.metric-jvm-level metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			system for memory management.
glassfish.jvm.memory.MaxHeapSize (featured metric)		bytes	Maximum amount of memory in bytes that can be used for memory management.
glassfish.jvm.memory.MaxNonHeapSize		bytes	Maximum amount of memory in bytes that can be used for memory management.
glassfish.jvm.memory.ObjectPendingFinalizationCount		Count	Approximate number of objects for which finalization is pending.
glassfish.jvm.memory.UsedHeapSize		bytes	Amount of used memory in bytes.
glassfish.jvm.memory.UsedNonHeapSize		bytes	Amount of used memory in bytes.

glassfish.metric-transaction-service metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfish.transaction-service.ActiveCount (featured metric)		count	Provides the number of transactions that are currently active.
glassfish.transaction-service.CommittedCount (featured metric)		count	Provides the number of transactions that have been committed.
glassfish.transaction-service.RolledBackCount (featured metric)		count	Provides the number of transactions that have been rolled back.

glassfish.metric-server-resources metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfis.resources.{PoolName}.AverageConnWaitTime	PoolName	ms	Average wait-time-duration per successful connection request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glassfish.metric-server-resources metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfis.resources.{PoolName}.ConnRequestWaitTime	PoolName	ms	The longest and shortest wait times of connection requests. The current value indicates the wait time of the last request that was serviced by the pool.
glassfis.resources.{PoolName}.NumConnAcquired	PoolName	count	Number of logical connections acquired from the pool.
glassfis.resources.{PoolName}.NumConnCreated	PoolName	count	The number of physical connections that were created since the last reset.
glassfis.resources.{PoolName}.NumConnDestroyed	PoolName	count	Number of physical connections that were destroyed since the last reset.
glassfis.resources.{PoolName}.NumConnfailedValidation	PoolName	count	The total number of connections in the connection pool that failed validation from the start time until the last sample time.
glassfis.resources.{PoolName}.NumConnFree	PoolName	count	The total number of free connections in the pool as of the last sampling.
glassfis.resources.{PoolName}.NumConnnotSuccessfullyMatched	PoolName	count	Number of connections rejected during matching.
glassfis.resources.{PoolName}.NumConnReleased	PoolName	count	Number of logical connections released to the pool.
glassfis.resources.{PoolName}.NumConnSuccessfullyMatched	PoolName	count	Number of connections successfully matched.
glassfis.resources.{PoolName}.NumConnTimedOut	PoolName	count	The total number of connections in the pool that timed out between the start time and the last sample time.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glassfish.metric-server-resources metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
glassfis.resources.{PoolName}.NumConnUsed	PoolName	count	Provides connection usage statistics. The total number of connections that are currently being used, as well as information about the maximum number of connections that were used (the high water mark).
glassfis.resources.{PoolName}.NumPotentialConnLeak (featured metric)	PoolName	count	Number of potential connection leaks.
glassfis.resources.{PoolName}.WaitQueueLength (featured metric)	PoolName	count	Number of connection requests in the queue waiting to be serviced.

HAProxy default checks and policies

Agent Client Collector provides the following default checks and policies for HAProxy monitoring.

HAProxy events policy

Type	Check	Description	Usage	Output
Event	check-haproxy	Retrieves the details of the HAProxy load balancer to determine whether it is running.	`commonchecks check-haproxy (options) -h host host -P port Port on which the HAProxy server is running -A all services all services -q Path on which HAProxy Stats URI is`	`CheckHAProxy OK: UP: 50% of 4 // services, DOWN: backend/nginx1[L4CON], backend/BACKEND`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HAProxy events policy (continued)

Type	Check	Description	Usage	Output
			configured -use ssl ssl Usage example: check-haproxy.rb -h localhost -P 8080 -A true -q stats -use_ssl false	

HAProxy metrics policy

Type	Check	Description	Usage	Output
Metric	metrics-check-haproxy	Retrieves the HAProxy load balancer metrics to determine whether it is running.	commonchecks metrics-check-haproxy (options) -q host Path on which HAProxy Stats URI is configured -P port Port on which the HAProxy server is running -c host host name Usage example: metrics-check-haproxy.rb -q stats	<hostname>.haproxy.frontend.session_current 0 1652265603 <hostname>.haproxy.frontend.session_total 0 1652265603 <hostname>.haproxy.backend.session_current 0 1652265603 <hostname>.haproxy.backend.session_total 1 1652265603

HAProxy metrics policy (continued)

Type	Check	Description	Usage	Output
			`-P 8080 -c localhost`	

HAProxy metrics

The following table lists the metrics that are gathered as output from HAProxy checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

Front-end metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
haproxy.frontend.session_current (featured metric)		count	The current number of sessions being used to issue requests.
haproxy.frontend.session_total (featured metric)		count	Total number of sessions
haproxy.frontend.bytes_in (featured metric)		count	The total number of bytes recieved by the server in the last second from the client.
haproxy.frontend.bytes_out (featured metric)		count	The total number of bytes sent by the server in the last second.
haproxy.frontend.connection_errors (featured metric)		count	The number of requests that encountered an error trying to connect to a server.
haproxy.frontend.warning_retries		count	The number of times a connection to a server was retried.
haproxy.frontend.warning_redispatched		count	The number of times a request was redispatched to another server.
haproxy.frontend.response_1xx		count	HAProxy exposes the number of responses by HTTP status code - 1xx
haproxy.frontend.response_2xx		count	HAProxy exposes the number of responses

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Front-end metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			by HTTP status code - 2xx
haproxy.frontend.response_3xx		count	HAProxy exposes the number of responses by HTTP status code - 3xx
haproxy.frontend.response_4xx		count	HAProxy exposes the number of responses by HTTP status code - 4xx
haproxy.frontend.response_5xx		count	HAProxy exposes the number of responses by HTTP status code - 5xx
haproxy.frontend.response_other		count	HAProxy exposes the number of responses by non-HTTP application
haproxy.frontend.queue_time		count	The average queue time over the last 1024 requests.
haproxy.frontend.connect_time		count	The average connect time over the last 1024 requests.
haproxy.frontend.response_time (featured metric)		count	The response time to the client
haproxy.frontend.average_time (featured metric)		count	The average time taken for the sessions.

Back-end metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
haproxy.backend.session_current (featured metric)		count	The current number of sessions being used to issue requests.
haproxy.backend.session_total (featured metric)		count	Total number of sessions
haproxy.backend.bytes_in (featured metric)		count	The total number of bytes recieved by the server in the last second from the client.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Back-end metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
haproxy.backend.bytes_out (featured metric)		count	The total number of bytes sent by the server in the last second.
haproxy.backend.connection_errors (featured metric)		count	The number of requests that encountered an error trying to connect to a server.
haproxy.backend.warning_retries		count	The number of times a connection to a server was retried.
haproxy.backend.warning_redispatched		count	The number of times a request was redispatched to another server.
haproxy.backend.response_1xx		count	HAProxy exposes the number of responses by HTTP status code - 1xx
haproxy.backend.response_2xx		count	HAProxy exposes the number of responses by HTTP status code - 2xx
haproxy.backend.response_3xx		count	HAProxy exposes the number of responses by HTTP status code - 3xx
haproxy.backend.response_4xx		count	HAProxy exposes the number of responses by HTTP status code - 4xx
haproxy.backend.response_5xx		count	HAProxy exposes the number of responses by HTTP status code - 5xx
haproxy.backend.response_other		count	HAProxy exposes the number of responses by non-HTTP application
haproxy.backend.queue_time		count	The average queue time over the last 1024 requests.

Back-end metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
haproxy.backend.connect_time		count	The average connect time over the last 1024 requests.
haproxy.backend.response_time (featured metric)		count	The response time to the client
haproxy.backend.average_time (featured metric)		count	The average time taken for the sessions.
haproxy.backend.num_up		count	

HTTP default checks and policies

Agent Client Collector provides the following policies for HTTP health monitoring. Policies come with the checks specified in the tables below.

HTTP entry point events policy

Type	Check	Description	Usage and Usage Example	Output
Event	util.check-http-follow-redirect	Verifies that redirection links can be followed in a set number of requests.	Usage check-head-redirect.rb (options): • -A, --auth-first-only: Use basic auth on first request only. • -aws-access-key-id: AWS Access Key. Either set ENV["AWS_ACCESS_KEY_ID"] or provide it as an option on agent. • -r -aws-region: AWS Region (defaults to us-east-1). • --aws-secret-access-key: AWS Secret Access Key. Either set ENV["AWS_SECRET_ACCESS_KEY"] or provide it as an option on agent.	Check Head Redirect OK

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTTP entry point events policy (continued)

Type	Check	Description	Usage and Usage Example	Output
			• -R --redirect: Follow first <N> redirects • -g --get-redirects: Follow first <N> redirects with GET requests. • -s, --s3-config-bucket: S3 config bucket to get configuration. • -k, --s3-config-key: S3 config key to get configuration. • -u, --url: URL needs to be updated in `Monitoring HTTP Entrypoint/cmdb_ci_endpoint_http_list.do` for the CI. The Aws-region, aws-secret-key, aws-access-key ,s3-config, s3-config-key parameters are useful if you do not want to configure connection information in other check parameters. If a bucket and key have access to the environment in which the Sensu check executes in, provide an AWS key and token and the checks pull the specified

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTTP entry point events policy (continued)

Type	Check	Description	Usage and Usage Example	Output
			JSON file from S3 and merge the JSON config into the current check configuration. Usage example: `command:check-head-redirect.rb -R 10 -u 'https://servicenow.com'`	
Event	util.check-http-response	Verifies URL response time and raises a CRITICAL/WARNING event if elapsed time exceeds provided CRITICAL/WARNING thresholds. Otherwise, it raises an OK event.	Usage: check-head-redirect.rb (options) • -R, --redirect: Follow first <N> redirects. • -w --timeout_warning: Set the timeout threshold for warning in milliseconds. • -c --timeout_critical: Set the timeout threshold for critical in milliseconds. • -u, --url URL needs to be updated in `Monitoring HTTP Entrypoint/cmdb_ci_endpoint_http_list.do` for the CI. Usage example: `command:check-head-redirect.rb -R 10 -u 'https://servicenow.com'`	Check Head Redirect OK

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTTP entry point events policy (continued)

Type	Check	Description	Usage and Usage Example	Output
			`-w 3000 -c 5000`	

HTTP entry point metrics policy

Type	Check	Description	Usage and Usage Example	Output
Metric	util.metrics-http-curl	Retrieves metrics on HTTP endpoints using curl. This check requires a proxy agent.	Usage: • -a, --curl_args "CURL ARGS": Additional arguments to pass to curl. • s, --scheme SCHEME: Metric naming scheme, text to append to metric (Default: hostname). • -u, --url: URL needs to be updated in `Monitoring HTTP Entrypoint/cmdb_ci_endpoint_http_list.do` for the CI. Usage example: `metrics-curl.rb -u myURL.com -a -Lk`	Check run successfully. Output: ws10.curl_timings.time_total 0.219622 1642749209 ws10.curl_timings.time_namelooku 0.145494 1642749209 ws10.curl_timings.time_connect 0.151103 1642749209 ws10.curl_timings.time_pretransfe 0.168569 1642749209 ws10.curl_timings.time_redirect 0.095899 1642749209 ws10.curl_timings.time_starttransfe 0.219351 1642749209 ws10.curl_timings.http_code 200 1642749209

HTTP entry point metrics

The following table lists the metrics that are gathered as output from HTTP entry point checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

HTTP entry point metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
http_code (featured metric)			Status code of the request.
time_total (featured metric)		milliseconds	The total time the operation lasted.
time_namelookup (featured metric)		seconds	Time to resolve the name in the URL.
time_connect (featured metric)		seconds	Time to complete the connection to the remote host or proxy.
time_pretransfer (featured metric)		seconds	Time between start and beginning of file transfer. Includes all pre-transfer commands and negotiations.
time_starttransfer (featured metric)		seconds	Time between the start and the transfer of the first byte. Includes *time_pretransfer* and the time the server used to calculate the result.
time_redirect (featured metric)		seconds	Time for all redirection steps including: • name lookup • connect • pretransfer • transfer Shows the complete execution time for multiple redirections.

HTTP response code check

Agent Client Collector provides the following additional check for HTTP response code. This check is not associated with any policy.

© 2026 ServiceNow, Inc. All rights reserved.

HTTP response code check

Type	Name	Description	Usage and usage example	Output

Event	util.check-http-response-code	Raises a critical event if the URL response code doesn't match the regex.
		
		Pass credentials (username and password) using secure parameters.
			`-u, --url URL needs to be updated in the Monitoring HTTP Entrypoint/cmdb_ci_endpoint_http_list.do for the CI`
			`-r, --response-code Regex string to match the response code. Otherwise, a critical event is raised. Default: 200`
			`-f, --follow_redirects Follows redirect URLs`
			
			Usage example:
			`command: check-response-code.rb -u 'https://servicenow.com' -r 2.. -f`
				`CheckResponseCode OK : URL is in OK state. HTTP Response code is 200, matches regex`

Internet Information Services (IIS) metrics

The following table lists the metrics that are gathered as output from IIS checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
iis._Total.Web_Service(_Total).Current_Connections (featured metric)		count	Total number of current connections to IIS.
iis._Total.Web_Service(_Total).Total_Get_Requests (featured metric)		count	Total of HTTP GET requests received by the IIS server.
iis._Total.Web_Service(_Total).Total_Post_Requests (featured metric)		count	Total of HTTP POST requests received by the IIS server.
iis._Total.Web_Service(_Total).Get_Requests/sec (featured metric)		count per second	Rate of all HTTP GET requests received by the IIS server.
iis._Total.Web_Service(_Total).Post_Requests/sec (featured metric)		count per second	Rate of all HTTP POST requests received by the IIS server.

Linux default checks and policies

Agent Client Collector provides the following default checks and policies for Linux Metrics monitoring.

Linux monitoring metrics checks

Linux metrics policy

Check	Metric Name	Resource	Description	Units	Featured Metric	Anomaly Detection
os.linux.metrics.process-usage	proc.acc.running	process-name	Number of processes running with this name(acc)	count		
	proc.acc.cpuPercent	process-name	Percentage of cpu taken by the process.	percent		
	proc.acc.memPercent	process-name	Percentage of memory taken by the process.	percent		
os.linux.metrics.reboot-count-today	reboot.count.today	empty	Number of reboot done on today	count		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linux metrics policy (continued)

Check	Metric Name	Resource	Description	Units	Featured Metric	Anomaly Detection
os.linux.metrics-system-cpu	cpu.total.user	total	Normal processes executing in user mode; cpu.total.user is the total of the cpuN.user metrics.	count		
	cpu.total.nice	total	Niced processes executing in user mode; cpu.total.nice is the total of the cpuN.nice metrics.	count		
	cpu.total.system	total	Time the CPU spent running the kernel; cpu.total.system is the total of the cpuN.system metrics.	sec		
	cpu.total.idle	total	Total time the CPU spent in an idle state.; cpu.total.idle is the total of the cpuN.idle metrics.	sec		
	cpu.total.iowait	total	Total time the CPU spent waiting for IO operations to complete.;	sec		

© 2026 ServiceNow, Inc. All rights reserved.

Linux network monitoring checks

Note: When upgrading from an earlier version, manually add the checks in this table to the Linux metrics policy.

Linux metrics policy

Type	Check	Description	Usage and usage example	Metrics collected	Featured Metric
Metric	os.linux.metrics-network-interface	Retrieves all network interface related metrics for Linux servers.	Usage: • -x, excludeinterface: List of interfaces to exclude	• rxBytes (featured metric) • rxPackets (featured metric) • rxErrors	yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linux metrics policy (continued)

Type	Check	Description	Usage and usage example	Metrics collected	Featured Metric
			(comma separated) • -i, includeinterface: List of interfaces to include (comma separated) • -I, includeinterfaceregex: Regex matching interfaces to include • -X, excludeinterfaceregex: Regex matching interfaces to exclude Usage example: `command: metrics-network-interface.rb`	• rxDrops (featured metric) • rxFifo • rxFrame • rxCompressed • rxMulticast • rxBytes (featured metric) • rxPackets (featured metric) • rxErrors • rxDrops (featured metric) • rxFifo • rxColls • rxCarrier • rxCompressed	
Metric	os.linux.metrics-netstat-tcp	Retrieves metrics on TCP socket states from netstat. Useful on high-traffic web or proxy servers with large numbers of short-lived TCP connections coming and going.	Usage: • -p, port: The port from which you want to receive metrics. Value range = 1-65535. • -t, type: The port type from which to receive metrics. Values=local or remote. Default = local	• tcp.UNKNOWN • tcp.ESTABLISHED • tcp.SYN_SENT • tcp.SYN_RECV • tcp.FIN_WAIT1 • tcp.FIN_WAIT2 • tcp.TIME_WAIT • tcp.CLOSE • tcp.CLOSE_WAIT • tcp.LAST_ACK • tcp.LISTEN • tcp.CLOSING	no

Linux metrics policy (continued)

Type	Check	Description	Usage and usage example	Metrics collected	Featured Metric
			• -d, disabletcp6: Disables the tcp6 check. Enter a value to set disabletcp6 = true. Usage example: `metrics-netstat-tcp.rb`		

Linux log monitoring default checks and policies

Agent Client Collector provides the following policy for Linux log monitoring.

Type	Check	Description	Usage and Usage Example	Output
Event	util.check-logs	Enables monitoring log files owned by a regular user.	Usage: • -i --icase: Run a case insensitive match. • -c, --crit N: Critical level (if pattern has a group). • --encode-utf16u: Encode line with utf16 before matching. • -e, --encoding ENCODING-PAGE: Specific encoding page to read log file with. • -E, --exclude PAT: Pattern to exclude from matching.	CheckLog CRITICAL: 0 warnings, 8 criticals for pattern SEVERE|Exception in log file /var/log/servicenow/agent-client-collector/acc.log

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type	Check	Description	Usage and Usage Example	Output
			• -F, --filepattern FILE: Check a pattern of files, instead of one file. For REGEX, first test it on `https://rubular.com/` to get the expected outcomes and then pass it inside quotes as a parameter. For example, to get all *`.log`* extension files, pass `"(.)*\.log$"` as REGEX. • -f, --log-file FILE: Path to log file. • -l, --log-pattern PAT: Log format of each log entry: • -o, --warn-only Warn instead of critical on match. • -q, --pattern PAT Pattern to search for.To search for multiple patterns, separate each pattern with pipe(|) and put inside quotes (For example: "SEVERE|404"). • -r, --return: Return matched line. • -L, --return-length N:

			specified path. Default = False. • -w, --warn N: Warning level if pattern has a groupWarning level if pattern has a group. • must_sudo: Enables the servicenow user to run the command with sudo permissions. Usage example: `command: check-log.rb -c 2 -w 1 -q "SEVERE|Exception" -s /tmp/cache/check-log -f /var/log/servicenow/agent-client-collector/acc.log`	

Linux metrics

The following table lists the metrics that are gathered as output from Linux checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

os.linux.metrics-process-usage metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
proc.acc.running			Number of processes running with this name (acc).
proc.acc.cpuPercent			Percentage of CPU taken by the process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

os.linux.metrics-process-usage metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
proc.acc.memPercent			Percentage of memory taken by the process.

os.linux.metrics-reboot-count-today metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
reboot.count.today			Number of reboots today.

os.linux.metrics-system-cpu metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cpu.total.user			Normal processes executing in user mode; *cpu.total.user* is the total of the *cpuN.user* metrics.
cpu.total.nice			Niced processes executing in user mode; *cpu.total.nice* is the total of the *cpuN.nice* metrics.
cpu.total.system			Time the CPU spent running the kernel; *cpu.total.system* is the total of the *cpuN.system* metrics.
cpu.total.idle			Total time the CPU spent in an idle state; *cpu.total.idle* is the total of the *cpuN.idle* metrics.
cpu.total.iowait			Total time the CPU spent waiting for IO operations to complete; *cpu.total.iowait* is the total of the

os.linux.metrics-system-cpu metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			cpuN.iowait metrics.
cpu.total.irq			Total time that the processor is spending on Interrupts; *cpu.total.irq* is the total of the *cpuN.irq* metrics.
cpu.total.softirq			Time spent servicing soft interrupt requests; *cpu.total.softirq* is the total of the *cpuN.softirq* metrics.
cpu.total.steal			Total time the virtual CPU spent waiting for the Hypervisor to service another virtual CPU. Applies only to virtual machines.
cpu.total.guest			Total time the CPU spent running the virtual processor. Applies only to Hypervisors.
cpu.total.guest_nice			Total time the CPU spent running as nice guest OS; *cpu.total.guset_nice* is the total of the *cpuN.guest_nice* metrics
cpu.<cpu-core>.user			Time spent with normal processing in user mode.
cpu.<cpu-core>.nice			Time spent with niced processing in user mode.
cpu.<cpu-core>.system			Time spent running in kernel mode.
cpu.<cpu-core>.idle			Time spent idle.
cpu.<cpu-core>.iowait			Time spent waiting for I/O to complete. Also considered idle time.

os.linux.metrics-system-cpu metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cpu.<cpu-core>.irq			Time spent serving hardware interrupts.
cpu.<cpu-core>.softirq			Time spent serving software interrupts.
cpu.<cpu-core>.steal			Time stolen by other operating systems running in a virtual environment.
cpu.<cpu-core>.guest			Time spent running a virtual CPU or guest OS under the control of the kernel.
cpu.<cpu-core>.guest_nice			Total time the CPU spent running as nice guest OS.
cpu.intr			Interrupts serviced since boot time.
cpu.ctxt			Total number of context switches across all CPUs.
cpu.btime			Boot time.
cpu.processes			The number of processes and threads created, which includes (but is not limited to) those created by calls to the fork() and clone() system calls.
cpu.procs_running			The total number of processes running on all CPUs.
cpu.procs_blocked			The number of processes currently blocked and waiting for I/O to complete.
cpu.cpu_count			The number of CPUs on the system.
cpu.<cpu-core>.cores			The number of CPU cores.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

os.linux.metrics-system-cpu-load metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
load_avg.one (featured metric)			The average system load over one minute.
load_avg.five (featured metric)			The average system load over five minutes.
load_avg.fifteen (featured metric)			The average system load over fifteen minutes.
load_avg.norm.one			The average system load over one minute normalized by the number of CPUs.
load_avg.norm.five			The average system load over five minutes normalized by the number of CPUs.
load_avg.norm.fifteen			The average system load over fifteen minutes normalized by the number of CPUs.

os.linux.metrics-system-cpu-percentage metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cpu.avgutilization_percentage			The average percentage of CPU used.
cpu.user_percentage (featured metric)			Percentage of time total CPU was used by normal processes in user mode.
cpu.nice_percentage (featured metric)			Percentage of time all CPUs used by niced processes in user mode.
cpu.system_percentage (featured metric)			Percentage of time the CPU spent running the kernel.
cpu.idle_percentage (featured metric)			Percentage of time all CPIUs were idle.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

os.linux.metrics-system-cpu-percentage metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cpu.iowait_percentage (featured metric)			Percentage of time all CPUs waited for I/O to complete.
cpu.irq_percentage (featured metric)			Percentage of time all CPUs serviced interrupts.
cpu.softirq_percentage (featured metric)			Percentage of time all CPIs serviced software interrupts.
cpu.steal_percentage (featured metric)			Percentage of time all CPUs serviced virtual-host operating systems.
cpu.guest_percentage (featured metric)			Percentage of time all CPUs serviced guest operating systems.

os.linux.metrics-system-disk metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
disk.<disk-name>.reads (featured metric)			Total number of reads completed successfully.
disk.<disk-name>.readsMerged			Total number of reads merged.
disk.<disk-name>.sectorsRead			Total number of sectors read successfully.
disk.<disk-name>.readTime		milliseconds	Total number of milliseconds spent by all reads.
disk.<disk-name>.writes (featured metric)			Total number of writes completed successfully.
disk.<disk-name>.writesMerged			Total number of writes merged.
disk.<disk-name>.sectorsWritten			Total number of sectors written successfully.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

os.linux.metrics-system-disk metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
disk.<disk-name>.writeTime		milliseconds	Total number of milliseconds spent by all writes.
disk.<disk-name>.ioInProgress			Total number of I/Os currently in progress.
disk.<disk-name>.ioTime (featured metric)			Total time spent on I/Os.
disk.<disk-name>.ioTimeWeighted			Total time spent on I/Os. This can provide a measure of both I/O completion time and the backlog that might be accumulating.

os.linux.metrics-system-disk-capacity metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
disk.<file-system-name>.total			The total size of the file system.
disk.<file-system-name>.used			The total amount of space allocated to existing files in the file system.
disk.<file-system-name>.avail			The total amount of space available within the file system.
disk.<file-system-name>.used_percentage			The percentage of the available space that is currently allocated to all files on the file system.
disk.<file-system-name>.itotal			The total number of *inodes* on the file system.
disk.<file-system-name>.iused			The number of used *inodes*.
disk.<file-system-name>.iavail			The number of free (unused) *inodes*.
disk.<file-system-name>.iused_percentage			The percentage of used *inodes*.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

os.linux.metrics-system-disk-usage metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
disk_usage.<disk>.total			Total amount of space available on the disk.
disk_usage.<disk>.used			Total amount of space used in the disk.
disk_usage.<disk>.avail			Total amount of space available on the disk.
disk_usage.<disk>.used_percentage (featured metric)			The percentage of space used on the disk.

os.linux.metrics-system-memory metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
memory.total			Total usable RAM.
memory.free			Total free RAM.
memory.available			An estimate of how much memory is available for starting new applications without swapping.
memory.buffers			Temporary storage used for raw disk blocks.
memory.cached			In-memory cache for files read from disk (the page cache). Does not include *mem_swapcached*.
memory.swapTotal (featured metric)			Total amount of swap space available.
memory.swapFree (featured metric)			Amount of swap space that is currently unused.
memory.dirty			Memory which is waiting to be written back to the disk.
memory.swapUsed (featured metric)			The amount of swap space in use.
memory.used			The amount of RAM in use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

os.linux.metrics-system-memory metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
memory.usedWOBuffersCaches			The amount of memory in use.
memory.freeWOBuffersCaches			Value of *`MemAvailable`* from */proc/meminfo* if present, but falls back to free + buffered + cached memory if not.
memory.swapUsedPercentage			Percent of swap space used.

os.linux.metrics-system-memory-percent metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
memory_percent.free (featured metric)			Percentage of free RAM.
memory_percent.available (featured metric)			Percentage of memory available
memory_percent.buffers (featured metric)			Percentage of memory used for raw disk blocks.
memory_percent.cached (featured metric)			Percentage of memory used with in-memory cache for files read from disk.
memory_percent.dirty (featured metric)			Percentage of memory waiting to be written back to the disk.
memory_percent.swapUsed (featured metric)			Percentage of swap space used.
memory_percent.usedWOBuffersCaches (featured metric)			Percentage of memory used.
memory_percent.freeWOBuffersCaches (featured metric)			Percentage of memory available.

os.linux.metrics-system-uptime metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
system.uptime(sec)			The amount of time the system has been working and available.

os.linux.metrics-memory-vmstat metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmstat.nr_free_pages			Pages that are currently unused by the system.
vmstat.nr_alloc_batch			Pages allocated to other domains due to insufficient memory in each domain of each non-uniform memory access (NUMA) node.
vmstat.nr_inactive_anon			Memory pages in each domain of each NUMA node that have not been accessed.
vmstat.nr_active_anon			Anonymous virtual memory pages that have been recently used.
vmstat.nr_inactive_file			The memory page corresponding to the file that has not been accessed in each domain of each NUMA.
vmstat.nr_active_file			The memory page corresponding to the file that has been recently accessed.
vmstat.nr_unevictable			The number of pages in the unevictable (non-)LRU list.
vmstat.nr_mlock			Pages mapped into a VM_LOCKED VMA that are a class of unevictable pages.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

os.linux.metrics-memory-vmstat metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmstat.nr_anon_pages			Memory mapped pages that are not part of a file.
vmstat.nr_mapped			The number of memory mapped pages.
vmstat.nr_file_pages			
vmstat.nr_dirty			Pages waiting to be written to disk.
vmstat.nr_writeback			Pages currently being written to disk.
vmstat.nr_slab_reclaimable			Pages from the kernel slab memory usage that can be reclaimed.
vmstat.nr_slab_unreclaimable			Pages from the kernel slab memory usage that cannot be reclaimed.
vmstat.nr_page_table_pages			Pages allocated to page tables.
vmstat.nr_kernel_stack			Amount of memory allocated to kernel stacks.
vmstat.nr_unstable			The number of unstable pages in each domain of each NUMA node.
vmstat.nr_bounce			
vmstat.nr_vmscan_write			The number of dirty pages written back during a scan of LRUs.
vmstat.nr_vmscan_immediate_reclaim			
vmstat.nr_writeback_temp			
vmstat.nr_isolated_anon			The number of anonymous memory pages isolated in each domain of each NUMA node.
vmstat.nr_isolated_file			The number of file storage pages isolated in each

os.linux.metrics-memory-vmstat metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			domain of each NUMA node.
vmstat.nr_shmem			The number of shared memory pages.
vmstat.nr_dirtied			The number of dirty pages in each domain of each NUMA node.
vmstat.nr_written			
vmstat.numa_hit			The number of pages that were successfully allocated to this node.
vmstat.numa_miss			The number of pages that were allocated to this node because of low memory on the intended node.
vmstat.numa_foreign			The number of pages initially intended for this node that were allocated to another node.
vmstat.numa_interleave			The number of interleave policy pages successfully allocated to this node.
vmstat.numa_local			The number of pages successfully allocated on this node by a process on this node.
vmstat.numa_other			The number of pages allocated on this node by a process on another node.
vmstat.workingset_refault			
vmstat.workingset_activate			
vmstat.workingset_nodereclaim			
vmstat.nr_anon_transparent_hugepages			
vmstat.nr_free_cma			Free continuous memory allocator pages in each domain of each NUMA.
vmstat.nr_dirty_threshold

os.linux.metrics-memory-vmstat metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmstat.nr_dirty_background_threshold			
vmstat.pgpgin			The number of pages brought in from disk.
vmstat.pgpgout			The number of pages written out to disk.
vmstat.pswpin			The number of pages brought in from swap space.
vmstat.pswpout			The number of pages swapped out into swap space.
vmstat.pgalloc_dma			
vmstat.pgalloc_dma32			
vmstat.pgalloc_normal			
vmstat.pgalloc_movable			
vmstat.pgfree			The number of pages free since the last boot.
vmstat.pgactivate			Number of page activations since the last boot.
vmstat.pgdeactivate			Number of page deactivations since the last boot.
vmstat.pgfault			Minor faults since the last boot.
vmstat.pgmajfault			Major faults since the last boot.
vmstat.pglazyfreed			
vmstat.pgrefill_dma			
vmstat.pgrefill_dma32			
vmstat.pgrefill_normal			Number of page refills since the last boot.
vmstat.pgrefill_movable			
vmstat.pgsteal_kswapd_dma			
vmstat.pgsteal_kswapd_dma32			
vmstat.pgsteal_kswapd_normal			
vmstat.pgsteal_kswapd_movable

os.linux.metrics-memory-vmstat metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmstat.pgsteal_direct_dma			
vmstat.pgsteal_direct_dma32			
vmstat.pgsteal_direct_normal			
vmstat.pgsteal_direct_movable			
vmstat.pgscan_kswapd_dma			
vmstat.pgscan_kswapd_dma32			
vmstat.pgscan_kswapd_normal			Number of pages scanned by *kswapd* since boot.
vmstat.pgscan_kswapd_movable			
vmstat.pgscan_direct_dma			
vmstat.pgscan_direct_dma32			
vmstat.pgscan_direct_normal			Number of pages reclaimed since boot.
vmstat.pgscan_direct_movable			
vmstat.pgscan_direct_throttle			
vmstat.zone_reclaim_failed			
vmstat.pginodesteal			
vmstat.slabs_scanned			
vmstat.kswapd_inodesteal			
vmstat.kswapd_low_wmark_hit_quickly			
vmstat.kswapd_high_wmark_hit_quickly			
vmstat.pageoutrun			Number of times *kswapd* called page reclaim.
vmstat.allocstall			Number of times page reclaim was called directly (low memory).
vmstat.pgrotated			
vmstat.drop_pagecache			
vmstat.drop_slab			
vmstat.numa_pte_updates			
vmstat.numa_huge_pte_updates			
vmstat.numa_hint_faults			
vmstat.numa_hint_faults_local

os.linux.metrics-memory-vmstat metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmstat.numa_pages_migrated			
vmstat.pgmigrate_success			
vmstat.pgmigrate_fail			
vmstat.compact_migrate_scanned			
vmstat.compact_free_scanned			
vmstat.compact_isolated			
vmstat.compact_stall			The number of times a process stalls when running memory compaction so that a huge page is free for use.
vmstat.compact_fail			The number of times the system attempted to compact memory but failed.
vmstat.compact_success			The number of times the system compacted memory and freed a huge page for use.
vmstat.htlb_buddy_alloc_success			
vmstat.htlb_buddy_alloc_fail			
vmstat.unevictable_pgs_culled			
vmstat.unevictable_pgs_scanned			
vmstat.unevictable_pgs_rescued			
vmstat.unevictable_pgs_mlocked			
vmstat.unevictable_pgs_munlocked			
vmstat.unevictable_pgs_cleared			
vmstat.unevictable_pgs_stranded			
vmstat.thp_fault_alloc			The number of huge pages successfully allocated to handle a page fault.
vmstat.thp_fault_fallback			The number of page fault fails to allocate a huge page before falling back to using small pages.

os.linux.metrics-memory-vmstat metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
vmstat.thp_collapse_alloc			The number of pages collapsed into one huge page with the successful allocation of a new huge page to store the data.
vmstat.thp_collapse_alloc_failed			The number of pages collapsed into one huge page but failed allocation.
vmstat.thp_split			The number of base pages to split from a huge page.
vmstat.thp_zero_page_alloc			The number of successful allocations of huge zero pages.
vmstat.thp_zero_page_alloc_failed			The number of times the kernel failed to allocate a huge zero page and falls back to using small pages.
vmstat.balloon_inflate			
vmstat.balloon_deflate			
vmstat.balloon_migrate			

os.linux.metrics-process-status metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
proc.<process>.VmSize			The total amount of virtual memory used by the process.
proc.<process>.VmRSS			The non-swapped physical memory used by a process.
proc.<process>.VmSwap			The total amount of swap space used.

MongoDB default checks and policies

Agent Client Collector provides the following policies for MongoDB health monitoring. Policies come with the checks specified in the indicated table. Policies and checks are available for both Windows and Linux.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MongoDB Events

Type	Check	Description	Usage	Command	Output

Event	app.mongodb.check-mongodb-alive	Monitors whether the MongoDB server is alive and creating alerts for the MongoDB server health status.	`commoncheck check-mongodb-alive -H db_host -p db_port`
			
			Where:
			• `db_host` = Host where server is running.
			• `db_port` = Port to connect to the MongoDB server.
			
			Usage example:
			`command: commonchecks check-mongodb-alive -H 10.***.***.*** -p 27017`
				`commoncheck check-mongodb -p {{.labels.params_port}} -H {{.labels.params_host}}`	`Check mongodb Alive OK: Indicates that the server is in good health`

Event	app.mongodb.check-mongodb-metrics	Creates alerts for any of the MongoDB metrics, based on the threshold limit. To trigger the alerts for any MongoDB server metric, pass the whole metric name in the parameter.	`commoncheck check-mongodb-metrics -H Hostname -p port -w warning -c critical -d database -m MetricName` Where: • `Hostname` = Host where	`commoncheck check-mongodb-metrics -c {{.labels.params_critical}} -d {{.labels.params_database}} -w {{.labels.params_warning}} -H {{.labels.params_host}} -p {{.labels.params_port}} -m {{.labels.params_metric}}`	`Check mongodb Metrics OK: Indicates that the mongodb.connection.cu value is within the acceptable threshold`

MongoDB Events (continued)

Type	Check	Description	Usage	Command	Output
			server is running. • `port` = Port to connect to the MongoDB server. • `warning` = Warning threshold value. • `critical` = Critical threshold value. • `database` = Database name. • `MetricName` = Specific metric to monitor. Usage example: `command: commonchecks check-mongodb-alive -H 10.***.***.*** -p 27017`		

MongoDB Metrics

Type	Check	Description	Usage	Command	Output
Metric	app.mongodb.metrics-mongodb	Returns metrics of the MongoDB server and all databases. Sample metrics:	`commoncheck check-mongodb` Where: • `host` = Hostname where the MongoDB	`commoncheck metrics-mongodb -p {{.labels.params_port}} -H {{.labels.params_host}} -d {{.labels.params_database}}`	`<hostname>.mongodb.co 20632 1639498004`

MongoDB Metrics (continued)

Type	Check	Description	Usage	Command	Output
		• `mongodb.connections.totalCreated`: Incoming connections • `mongodb.locks.Database.acquireCount_IX` : Intent Exclusive lock mode • `mongodb.locks.Database.acquireCount_X` : Exclusive lock mode • `mongodb.locks.Database.acquireCount_IS` : Intent shared lock mode	server is running. • `port` = Port to connect to the MongoDB server. • `database` = Database name.		

MongoDB metrics

The following table lists the metrics that are gathered as output from MongoDB checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

metrics-mongodb metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mongodb.asserts.msg (featured metric)		count	Number of message assertions raised since the MongoDB process started. Examine the log file for more information about these messages.
mongodb.asserts.regular (featured metric)		count	Number of regular assertions raised since the MongoDB process started. Examine the log file for more information about these messages.
mongodb.asserts.rollovers		count	Number of times that the rollover counters have rolled over since the last time the

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			MongoDB process started.
mongodb.asserts.tripwire			Number of tripwire assertions raised since the MongoDB process started.
mongodb.asserts.user		count	Number of "user asserts" that occurred since the last time the MongoDB process started.
mongodb.asserts.warning (featured metric)		count	Number of warnings raised since the MongoDB process started.
mongodb.connections.available		count	Number of unused incoming connections available.
mongodb.connections.current		count	Number of incoming connections from clients to the database server.
mongodb.connections.totalCreated		count	Count of all incoming connections created to the server.
mongodb.cursor.open.noTimeout		count	Number of open cursors with the option `DBQuery.Option.noTimeout` set to prevent timeout after a period of inactivity.
mongodb.cursor.open.pinned		count	Number of "pinned" open cursors.
mongodb.cursor.open.total (featured metric)		count	Number of cursors that MongoDB is maintaining for clients. Because MongoDB exhausts unused cursors, typically this value is small or zero. However, if there is a queue, stale tailable cursors, or a large number of

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			operations, this value may increase.
mongodb.cursor.timedOut		count	Total number of cursors that have timed out since the server process started.
mongodb.databaseSizes.avgObjSize	admin	bytes	Average size of each document in bytes.
mongodb.databaseSizes.avgObjSize	config	bytes	Average size of each document in bytes.
mongodb.databaseSizes.avgObjSize	local	bytes	Average size of each document in bytes.
mongodb.databaseSizes.collections	admin	count	Number of collections in the database.
mongodb.databaseSizes.collections	config	count	Number of collections in the database.
mongodb.databaseSizes.collections	local	count	Number of collections in the database.
mongodb.databaseSizes.dataSize	admin	bytes	Total size of the uncompressed data held in the database. The *`dataSize`* decreases when you remove documents. For databases using the *`WiredTiger`* storage engine, *`dataSize`* may be larger than *`storageSize`* if compression is enabled. The *`dataSize`* decreases when documents shrink.
mongodb.databaseSizes.dataSize	config	bytes	Total size of the uncompressed data held in the database.
mongodb.databaseSizes.dataSize	local	bytes	Total size of the uncompressed data held in the database.
mongodb.databaseSizes.indexes	admin	count	Total number of indexes across all

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			collections in the database.
mongodb.databaseSizes.indexes	config	count	Total number of indexes across all collections in the database.
mongodb.databaseSizes.indexes	local	count	Total number of indexes across all collections in the database.
mongodb.databaseSizes.indexSize	admin	bytes	Sum of the space allocated to all indexes in the database, including free index space.
mongodb.databaseSizes.indexSize	config	bytes	Sum of the space allocated to all indexes in the database, including free index space.
mongodb.databaseSizes.indexSize	local	bytes	Sum of the space allocated to all indexes in the database, including free index space.
mongodb.databaseSizes.objects	admin	count	Number of objects (specifically, documents) in the database across all collections.
mongodb.databaseSizes.objects	config	count	Number of objects (specifically, documents) in the database across all collections.
mongodb.databaseSizes.objects	local	count	Number of objects (specifically, documents) in the database across all collections.
mongodb.databaseSizes.storageSize	admin	bytes	This value does not decrease as you remove or shrink documents. This value may be smaller than *dataSize*

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			for databases using the *WiredTiger* storage engine with compression enabled. *storageSize* does not include space allocated to indexes. See *indexSize* for the total index size.
mongodb.databaseSizes.config	config	bytes	Sum of the space allocated to all collections in the database for document storage, including free space.
mongodb.databaseSizes.local	local	bytes	Sum of the space allocated to all collections in the database for document storage, including free space.
mongodb.globalLock.activeClients.readers (featured metric)		count	Number of active client connections performing read operations.
mongodb.globalLock.activeClients.total		count	Total number of internal client connections to the database, including system threads as well as queued readers and writers. This metric will be higher than the total of *activeClients.readers* and *activeClients.writers* due to the inclusion of system threads.
mongodb.globalLock.activeClients.writers (featured metric)		count	Number of active client connections performing write operations.
mongodb.globalLock.currentQueue.readers (featured metric)		count	Number of operations that are currently queued and waiting for the read lock.

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			A consistently small read queue, particularly of shorter operations, is not a cause for concern.
mongodb.globalLock.currentQueue.total		count	Total number of operations queued waiting for the lock (i.e., the sum of *globalLock.currentQueue.rea* and *globalLock.currentQueue.wri* A consistently small queue, particularly of shorter operations, is not a cause for concern. The *globalLock.activeClients* readers and writers information provides context for this data.
mongodb.globalLock.currentQueue.writers (featured metric)		count	Number of operations that are currently queued and waiting for the write lock. A consistently small write queue, particularly of shorter operations, is not a cause for concern.
mongodb.globalLock.totalTime		microseconds	Time, in microseconds, since the database last started and created the *globalLock*. This is approximately equivalent to the total server uptime.
mongodb.locks.Collection.acquireCount_r		count	Number of times the collection lock was acquired in the Intent Shared (IS) lock mode.
mongodb.locks.Collection.acquireCount_w		count	Number of times the collection lock was acquired in the Intent Exclusive (IX) lock mode.

© 2026 ServiceNow, Inc. All rights reserved.

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mongodb.locks.Collection.acquireCount_W		count	Number of times the collection lock was acquired in the Exclusive (X) lock mode.
mongodb.locks.Database.acquireCount_r		count	Number of times the database lock was acquired in the Intent Shared (IS) lock mode.
mongodb.locks.Database.acquireCount_w		count	Number of times the database lock was acquired in the Intent Exclusive (IX) lock mode.
mongodb.locks.Database.acquireCount_W		count	Number of times the database lock was acquired in the Exclusive (X) lock mode.
mongodb.locks.Global.acquireCount_r		count	Number of times the global lock was acquired in the Intent Shared (IS) lock mode.
mongodb.locks.Global.acquireCount_w		count	Number of times the global lock was acquired in the Intent Exclusive (IX) lock mode.
mongodb.locks.Global.acquireCount_W		count	Number of times the global lock was acquired in the Exclusive (X) lock mode.
mongodb.mem.pageFaults		count	Total number of page faults. The *extra_info.page_faults* counter may increase dramatically during moments of poor performance and may correlate with limited memory environments and larger data sets. Limited and sporadic page faults do not

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			necessarily indicate an issue.
mongodb.mem.resident (featured metric)		mebibyte	This value is roughly equivalent to the amount of RAM, in mebibyte (MiB), currently used by the database process. During normal use, this value tends to grow. In dedicated database servers, the number tends to approach the total amount of system memory.
mongodb.mem.virtual		mebibyte	The quantity, in mebibyte (MiB), of virtual memory used by the mongod process.
mongodb.metrics.document.deleted		count	Total number of documents deleted.
mongodb.metrics.document.inserted		count	Total number of documents inserted.
mongodb.metrics.document.returned		count	Total number of documents returned by queries.
mongodb.metrics.document.updated		count	Total number of documents updated.
mongodb.metrics.getLastError.wtime_num (featured metric)		count	Total number of *getLastError* operations with a specified write concern (w) that wait for one or more members of a replica set to acknowledge the write operation (a w value greater than 1.)
mongodb.metrics.getLastError.wtime_totalMillis (featured metric)		miliseconds	Total amount of time in milliseconds that the mongod has spent performing *getLastError*

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			operations with write concern (w) that wait for one or more members of a replica set to acknowledge the write operation (a w value greater than 1.)
mongodb.metrics.getLastError.wtimeouts (featured metric)		count	Number of times that write concern operations have timed out as a result of the *`wtimeout`* threshold to *`getLastError`*. This number increments for both default and non-default write concern specifications.
mongodb.metrics.operation.scanAndOrder		count	Total number of queries that return sorted numbers that cannot perform the sort operation using an index.
mongodb.metrics.queryExecutor.scanned		count	Total number of index items scanned during queries and query-plan evaluation. This counter is the same as *`totalKeysExamined`* in the output of explain().
mongodb.metrics.queryExecutor.scannedObjects		count	Total number of documents scanned during queries and query-plan evaluation. This counter is the same as *`totalDocsExamined`* in the output of explain().
mongodb.metrics.record.moves			A document that reports on data related to record allocation in the on-disk memory files.

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mongodb.metrics.repl.a	pply.batches_num	count	Total number of batches applied across all databases.
mongodb.metrics.repl.a	pply.batches_totalMillis	count	Total amount of time in milliseconds the mongod has spent applying operations from the oplog.
mongodb.metrics.repl.a	pply.ops	count	Total number of oplog operations applied. *metrics.repl.apply.ops* is incremented after each operation.
mongodb.metrics.repl.b	uffer.count	count	Current number of operations in the oplog buffer.
mongodb.metrics.repl.b	uffer.maxSizeBytes	bytes	Maximum size of the buffer. This value is a constant setting in the mongod, and is not configurable.
mongodb.metrics.repl.b	uffer.sizeBytes	bytes	Current size of the contents of the oplog buffer.
mongodb.metrics.repl.n	etwork.bytes	count	Total amount of data read from the replication sync source.
mongodb.metrics.repl.n	etwork.getmores_num	count	Reports the total number of *getmore* operations, which are operations that request an additional set of operations from the replication sync source.
mongodb.metrics.repl.n	etwork.getmores_totalMillis	count	Total amount of time required to collect data from *getmore* operations.
mongodb.metrics.repl.n	etwork.ops	count	Total number of operations read from the replication source.
mongodb.metrics.repl.n	etwork.readersCreated	count	Total number of oplog query processes

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			created. MongoDB creates a new oplog query any time an error occurs in the connection, including a timeout, or a network operation. Furthermore, *metrics.repl.network.reade* increments every time MongoDB selects a new source for replication.
mongodb.metrics.ttl.deletedDocuments		count	Total number of documents deleted from collections with a *ttl* index.
mongodb.metrics.ttl.passes		count	Total number of documents deleted from collections with a *ttl* index.
mongodb.network.bytesIn		count	Total number of bytes that the server has received over network connections initiated by clients.
mongodb.network.bytesOut		count	Total number of bytes that the server has sent over network connections initiated by clients.
mongodb.network.numRequests		count	Total number of distinct requests that the server has received. Use this value to provide context for the *network.bytesIn* and *network.bytesOut* values to ensure that MongoDB's network utilization is consistent with expectations and application use.

metrics-mongodb metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mongodb.opcounters.command		count	Total number of commands issued to the database since the mongod instance last started. *opcounters.command* counts all commands except the write commands: insert, update, and delete.
mongodb.opcounters.delete		count	Total number of delete operations since the mongod instance last started.
mongodb.opcounters.getmore		count	Total number of *getMore* operations since the mongod instance last started. This counter can be high even if the query count is low. Secondary nodes send *getMore* operations as part of the replication process.
mongodb.opcounters.insert		count	Total number of insert operations received since the mongod instance last started.
mongodb.opcounters.query		count	Total number of queries received since the mongod instance last started.
mongodb.opcounters.update		count	Total number of update operations received since the mongod instance last started.
mongodb.opcountersRepl.command		count	Total number of replicated commands issued to the database since the mongod instance last started.
mongodb.opcountersRepl.delete		count	Total number of replicated delete

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			operations since the mongod instance last started.
mongodb.opcountersRepl.getmore		count	Total number of getMore operations since the mongod instance last started.
mongodb.opcountersRepl.insert (featured metric)		count	Total number of replicated insert operations since the mongod instance last started.
mongodb.opcountersRepl.query (featured metric)		count	Total number of replicated queries since the mongod instance last started.
mongodb.opcountersRepl.update		count	Total number of replicated update operations since the mongod instance last started.

MS Exchange default checks and policies

Agent Client Collector provides the following default checks and policies for MS Exchange monitoring.

Type	Check	Description	Usage and usage example	Output
Metric	app.msexchange.metrics-msexchange	Retrieves Microsoft Exchange metrics.	`winchecks metric-msexchange (options) -s scheme Replaces the host name with this parameter` Usage example: `winchecks metric-msexchange {{if .labels.params_scheme}} -s`	Metrics from MS Exchange server

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type	Check	Description	Usage and usage example	Output
			`{{if .labels.params_scheme}} {{end}}`	

MSSQL default checks and policies

The Agent Client Collector provides the following default checks and policies for MSSQL Metrics monitoring.

MSSQL Metrics

Type	Check	Description	Usage and Usage Example	Output
Metric	app.metrics-mssql-query	Generic MSSQL query class which accepts a query and dumps metrics.	winchecks metrics-mssql-query (options) -d, --database DATABASE Database schema to connect to (required) -q ,--query The query to execute, should return a list metric name and value, for example SELECT METRIC_NAME, VALUE FROM GV $SYSMETRIC -h, --host HOST Host name to connect to, defaults to localhost -r, --port PORT Port to connect to, defaults to 1433 -s, --scheme SCHEME Metric naming scheme, text to prepend to .$parent. $child, **Usage Example** `.winchecks metrics-`	Custom metrics defined in the parameters, which also contain value and timestamp.

Network ping default checks and policies

Agent Client Collector provides the following default checks and policies for Network ping monitoring. Policies and checks are available for both Windows and Linux.

Network-ping metrics policy

Check	Description	Usage	Command	Output

util.metrics-ping	Runs on the ip address discovered in the ServiceNow instance. Pings the host and collects metrics.
	
	The monitored CI type is *cmdb_ci_hardware* and is bound to the relevant server.
	
	A proxy agent is required.
		metrics-ping.rb (options)
		
		`c --count COUNT Ping count`
		
		`-h Host to ping`
		
		`-t_--timeout TIMEOUT Timeout`
		
		Example: ./metrics-ping.rb -h 10.196.121.11
				`c7inc000473 83.ping.packets_transmitted 5 1675923 886`
				
				`c7inc0047 383.ping.packets_received 5 1675923 886`

Network ping metrics

The following table lists the metrics that are gathered as output from Network ping checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

network-ping metrics

Metric type	Units	Metric type description
ping.packets_transmitted	count	Number of data packets sent to the target host during the ping test.
ping.packets_received	count	Number of data packets successfully received by the target host.
ping.packet_loss	percentage	Percentage of data packets that failed to reach the target host.
ping.time	ms	Amount of time for the data packets to travel to the destination and back.
ping.min	ms	Shortest amount of time for a series of ping requests on the data packets.
ping.avg	ms	Average amount of time for a series of ping requests on the data packets.
ping.max	ms	Longest amount of time for a series of ping requests on the data packets.
ping.mdev	ms	Mean deviation (measure of the variability or dispersion) of the round-trip time (RTT) of the packets sent during the ping test.

Network host availability check

Agent Client Collector provides the following default check for network ping monitoring. The check is available for both Windows and Linux.

util.check-ping check

Check	Description	Usage	Command	Output
util.check-ping	Checks the network host availability via ICMP (ping) requests.	`check-ping.rb -h <ip-address>` (options) `-h host`: Host to ping		`ICMP ping unsuccessful for host: 192.168.1.1`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

util.check-ping check (continued)

Check	Description	Usage	Command	Output
	Generates an OK event if the ping success ratio exceeds the Warning threshold (-W, default 50%). Generates a Warning event if the ping success ratio is between the warning threshold (-W, default 50%) and the critical threshold (-C, default 20%). Generates a Critical event if the ping success ratio falls below the critical threshold (-C, default 20%). A proxy agent is required.	(Required). Default=<localhost> `-c count`: Number of ping requests sent to the host. Default=1 `-T timeout`: The timeout (in seconds) for each ping request. If the timeout expires before a reply is received, the ping is considered failed. Default=5 `-6 ipv6`: Enables IPv6 pinging. Ping uses IPv4 when this flag is not used. Default=False `-i interval`: Interval (in seconds) between each ping request. Default=1 `-W ratio`: The success ratio threshold for a Warning state. If the successful ping responses are below this ratio and above the -C ratio, the script returns a Warning. Default=0.5 `-C ratio`: The success ratio threshold for a Critical state. If the		`(successful: 0/5)`

util.check-ping check (continued)

Check	Description	Usage	Command	Output
		successful ping responses are below this ratio, the script returns a Critical failure. Default=0.2 `-r report`: Flag to append to the failure message of an MTR (My Trace Route) report if the ping fails. When MTR runs, a network diagnostic report generates. Default=false		

Nginx default checks and policies

Agent Client Collector provides the following policies for Nginx health monitoring. Policies come with the checks specified in the indicated table. Policies and checks are available for both Windows and Linux.

Nginx Events policy

Check	Description	Usage	Command	Output

nginx.check-nginx-alive	Verifies whether Nginx server is alive.
	
	Note: Use basic authentication for events.
		`check-nginx-status.rb`
		-h, --host
		Nginx hostname
		-p, --port
		Nginx port
		
		Note: Use basic authentication for events.
				Successful
				`CheckNginxStatus OK: Nginx is Alive and healthy`
				
				Failure
				`CheckNginxStatus CRITICAL: Nginx is Down`

Nginx Metrics policy

Check	Description	Usage	Command	Output

nginx.metrics-nginx-server	Retrieves the following information:
	nginx.active_connections
	Total number of active connections on server.
	nginx.accepts
	The accepted connections.
	nginx.handled
	Handled connections, which normally equals the number of accepted connections.
	nginx.requests
	Total number of handled requests by the server.
	nginx.read
	Shows whether the server is reading requests.
	nginx.writing
	Shows whether the
		`metrics-nginx.rb`
		Options:
		`-u --url` Full URL to the server status page. For example: `https://yoursite.com/nginx_status`
				`ws19-INC0047517.nginx.active_connections 1 1640135552`
				`ws19-INC0047517.nginx.accepts 5746 1640135552`
				`ws19-INC0047517.nginx.handled 5746 1640135552`
				`ws19-INC0047517.nginx.requests 9603 1640135552`
				`ws19-INC0047517.nginx.reading 0 1640135552`
				`ws19-INC0047517.nginx.writing 1 1640135552`
				`ws19-INC0047517.nginx.waiting 0 1640135552`

Nginx Metrics policy (continued)

Check	Description	Usage	Command	Output
	server is writing responses to the client. **nginx.waiting** Idle connections waiting for a request. **Note:** Use basic authentication for metrics.			

Nginx metrics

The following table lists the metrics that are gathered as output from Nginx checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

metrics-nginx metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
nginx.active_connections (featured metric)	admin	count	Total number of connections opened on the server, including waiting connections (*`nginx.waiting`* value). It reflects the number of current users on the website. There can be multiple connections opened for a single user.
nginx.accepts (featured metric)	admin	count	Represents the total established connections when `https://yoursite.com/nginx_status` is triggered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

metrics-nginx metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
nginx.handled (featured metric)	admin	count	Total number of connections handled by the Nginx server.
nginx.requests (featured metric)	admin	count	Total number of requests handled by the Nginx server.
nginx.reading (featured metric)	admin	count	Current number of connections where Nginx server is reading the request header.
nginx.writing (featured metric)	admin	count	Represents the current number of connections where the Nginx server is writing the response back to the client.
nginx.waiting (featured metric)	admin	count	Number of idle client connections waiting for a request.

PostgreSQL default checks and policies

Agent Client Collector provides the following default checks and policies for PostgreSQL health monitoring.

PostgreSQL checks

Type	Check	Description	Command
Event	postgresql.check-alive	Triggers an alert on the status of the PostgreSQL database.	`commonchecks check-postgres-alive -d {{.labels.params_database}} -p {{.labels.params_port}} -H {{.labels.params_host}}`
Event	postgresql.check-connections	Triggers an alert on the total connection load on the PostgreSQL database, based on the configured threshold.	`commonchecks check-postgres-connections -d {{.labels.params_database}} -c {{.labels.params_critical}} -p {{.labels.params_port}} -H {{.labels.params_host}}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PostgreSQL checks (continued)

Type	Check	Description	Command
			`-w {{.labels.params_warning}} -a {{.labels.params_use_percer`
Metric	postgresql.metric-active-connections	Provides metrics on the total active connection on the PostgreSQL database.	`commonchecks metric-postgres-connections -p {{.labels.params_port}} -d {{.labels.params_database}} -H {{.labels.params_host}}`
Metric	postgresql.metric-dbsize	Provides metrics on the total size for each of the server's PostgreSQL databases.	`commonchecks metric-postgres-dbsize -d {{.labels.params_database}} -H {{.labels.params_host}} -p {{.labels.params_port}}`
Metric	postgresql.metric-locks	Provides metrics on the locks in the PostgreSQL database/tables.	`commonchecks metric-postgres-locks -p {{.labels.params_port}} -d {{.labels.params_database}} -H {{.labels.params_host}}`
Metric	postgresql.metric-relation-size	Provides metrics on the database table size on the server.	`commonchecks metric-postgres-relation-size -p {{.labels.params_port}} -l {{.labels.params_limit}} -H {{.labels.params_host}} -d {{.labels.params_database}}`
Metric	postgresql.metric-statsbgwriter	Provides metrics related to buffer allocations.	`commonchecks metric-postgres-statsbgwriter -p {{.labels.params_port}} -d`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PostgreSQL checks (continued)

Type	Check	Description	Command
			`{{.labels.params_database}} -H {{.labels.params_host}}`
Metric	postgresql.metric-statsdb	Provides metrics related to commits/ rollbacks/tuples transactions / deadlocks/query conflicts count.	`commonchecks metric-postgres-statsdb -d {{.labels.params_database}} -H {{.labels.params_host}} -p {{.labels.params_port}}`
Metric	postgresql.metric-statsio	Provides table based metrics related index reads/total hits to a table index.	`commonchecks metric-postgres-statsio -s {{.labels.params_scope}} -H {{.labels.params_host}} -p {{.labels.params_port}} -d {{.labels.params_database}}`
Metric	postgresql.metric-statstable	Provides metrics related to CRUD operations.	`commonchecks metric-postgres-statstable -d {{.labels.params_database}} -H {{.labels.params_host}} -s {{.labels.params_scope}} -p {{.labels.params_port}}`

PostgreSQL metrics

The following tables list and describe the metrics that are gathered as output from the specified PostgreSQL checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

postgresql.check-connections metrics

Metric	Description
pgsql.connections.active (Featured metric)	Provides metrics on the total active connections in the PostgreSQL database.
pgsql.connections.idle	Provides metrics on the total idle connections on the PostgreSQL database.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

postgresql.check-connections metrics (continued)

Metric	Description
(Featured metric)	

postgresql.metric-dbsize metrics

Metric	Description
pgsql.db.size (Featured metric)	Provides metrics on the total disk size utilization for each of the PostgreSQL databases on the server.

postgresql.metric-locks metrics

Metric	Description
pgsql.locks.AccessShareLock	Provides metrics on read-lock mode acquired automatically from queried tables.
pgsql.locks.ExclusiveLock	Provides metrics on read-lock mode acquired by LOCK TABLE table for IN EXCLUSIVE MODE statements.

postgresql.metric-relation-size metrics

Metric	Description
pgsql.tables_size (Featured metric)	Provides metrics on the database table size on the server.

postgresql.metric-statsbgwriter metrics

Metric	Description
pgsql.statsbgwriter.buffers_alloc	Provides metrics related to the number of allocated buffers.
pgsql.statsbgwriter.buffers_backend	Provides metrics related to the number of buffers written directly by a backend.
pgsql.statsbgwriter.buffers_backend_fsync	Provides metrics related to the number of times a backend had to execute its own fsync call (normally the background writer handles those, even when the backend performs its own write).
pgsql.statsbgwriter.buffers_checkpoint	Provides metrics related to the number of buffers written during checkpoints.
pgsql.statsbgwriter.buffers_clean	Provides metrics related to the number of buffers written by the background writer.
pgsql.statsbgwriter.checkpoint_sync_time	Provides metrics related to the total amount of time spent in the portion of checkpoint

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

postgresql.metric-statsbgwriter metrics (continued)

Metric	Description
	processing where files are synchronized to disk, in milliseconds.
pgsql.statsbgwriter.checkpoint_write_time	Provides metrics related to the total amount of time spent in the portion of checkpoint processing where files are written to disk, in milliseconds.
pgsql.statsbgwriter.checkpoints_req (Featured metric)	Provides metrics related to the number of requested checkpoints that have been performed.
pgsql.statsbgwriter.checkpoints_timed (Featured metric)	Provides metrics related to the number of scheduled checkpoints that have been performed.
pgsql.statsbgwriter.maxwritten_clean	Provides metrics related to the number of times the background writer stopped a cleaning scan because it had written too many buffers.

postgresql.metric-statsdb metrics

Metric	Description
pgsql.statsdb.blk_read_time (Featured metric)	Provides metrics related to the time spent reading data file blocks by backends in this database, in milliseconds.
pgsql.statsdb.blk_write_time (Featured metric)	Provides metrics related to the time spent writing data file blocks by backends in this database, in milliseconds.
pgsql.statsdb.blks_hit (Featured metric)	Provides metrics related to the number of times disk blocks were found in the buffer cache, so that a read was not necessary. This only includes hits in the PostgreSQL buffer cache, not the operating system's file system cache.
pgsql.statsdb.blks_read	Provides metrics related to the number of disk blocks read in this database.
pgsql.statsdb.checksum_failures	Provides metrics related to the number of data page checksum failures detected in this database (or on a shared object), or 0 if data checksums are not enabled.
pgsql.statsdb.conflicts	Provides metrics related to the number of queries canceled due to conflicts with recovery in this database. Conflicts occur only on standby servers.
pgsql.statsdb.deadlocks (Featured metric)	Provides metrics related to the number of deadlocks detected in this database.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

postgresql.metric-statsdb metrics (continued)

Metric	Description
pgsql.statsdb.numbackends	Provides metrics related to the number of backends currently connected to this database. This is the only column in this view that returns a value reflecting the current state; all other columns return the accumulated values since the last reset.
pgsql.statsdb.temp_bytes	Provides metrics related to the total amount of data written to temporary files by queries in this database. All temporary files are counted, regardless of why the temporary file was created, and regardless of the *log_temp_files* setting.
pgsql.statsdb.temp_files	Provides metrics related to the number of temporary files created by queries in this database. All temporary files are counted, regardless of why the temporary file was created (such as sorting or hashing), and regardless of the *log_temp_files* setting.
pgsql.statsdb.tup_deleted	Provides metrics related to the number of rows deleted by queries in this database.
pgsql.statsdb.tup_fetched	Provides metrics related to the number of rows fetched by queries in this database.
pgsql.statsdb.tup_inserted	Provides metrics related to the number of rows inserted by queries in this database.
pgsql.statsdb.tup_returned	Provides metrics related to the number of rows returned by queries in this database.
pgsql.statsdb.tup_updated	Provides metrics related to the number of rows updated by queries in this database.
pgsql.statsdb.xact_commit	Provides metrics related to the number of transactions in this database that have been committed.
pgsql.statsdb.xact_rollback	Provides metrics related to the number of transactions in this database that have been rolled back.

postgresql.metric-statsio metrics

Metric	Description
pgsql.statsio.heap_blks_hit (Featured metric)	Provides metrics related to the number of buffer hits in this table.
pgsql.statsio.heap_blks_read	Provides metrics related to the number of disk blocks read from this table.
pgsql.statsio.idx_blks_hit	Provides metrics related to the number of buffer hits in all indexes in this table.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

postgresql.metric-statsio metrics (continued)

Metric	Description
pgsql.statsio.idx_blks_read	Provides metrics related to the number of disk blocks read from all indexes in this table.
pgsql.statsio.tidx_blks_hit	Provides metrics related to the number of buffer hits in this table's TOAST table index (if any).
pgsql.statsio.tidx_blks_read	Provides metrics related to the number of disk blocks read from this table's TOAST table index.
pgsql.statsio.toast_blks_hit	Provides metrics related to the number of buffer hits in this table's TOAST table (if any).
pgsql.statsio.toast_blks_read	Provides metrics related to the number of disk blocks read from this table's TOAST table (if any).

postgresql.metric-statsio metrics

Metric	Description
pgsql.statstable.idx_scan	Provides metrics related to the number of index scans initiated on this table.
pgsql.statstable.idx_tup_fetch	Provides metrics related to the number of live rows fetched by index scans.
pgsql.statstable.n_dead_tup	Provides metrics related to the estimated number of dead rows.
pgsql.statstable.n_live_tup	Provides metrics related to the estimated number of live rows.
pgsql.statstable.n_tup_del	Provides metrics related to the number of deleted rows.
pgsql.statstable.n_tup_hot_upd	Provides metrics related to the number of rows HOT updated (that is, with no separate index update required).
pgsql.statstable.n_tup_ins	Provides metrics related to the number of inserted rows.
pgsql.statstable.n_tup_upd	Provides metrics related to the number of updated rows.
pgsql.statstable.seq_scan	Provides metrics related to the number of sequential scans initiated on this table.
pgsql.statstable.seq_tup_read	Provides metrics related to the number of live rows fetched by sequential scans.

RabbitMQ default checks and policies

Agent Client Collector provides the following default checks and policies for RabbitMQ health monitoring. You must perform RabbitMQ discovery before executing the checks. RabbitMQ checks are available only in a Windows environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RabbitMQ Events policy

Type	Check	Description	Command
Event	check-rabbitmq-alive	Verifies whether the RabbitMQ server is alive, using the REST API. If the server is down, an alert triggers.	`check-rabbitmq-alive.rb --host {{.labels.params_host}} --port {{.labels.params_port}} -v {{.labels.params_vhost}}`
Event	check-rabbitmq-cluster-health	Verifies whether the RabbitMQ server's cluster nodes are running. If the nodes are down, an alert triggers.	`check-rabbitmq-cluster-health.rb --host {{.labels.params_host}} --port {{.labels.params_port}}`
Event	check-rabbitmq-consumers	Verifies the number of consumers on the RabbitMQ server and triggers an alert based on the configured threshold.	`check-rabbitmq-consumers.rb {{if .labels.params_warn}} --warn {{.labels.params_warn}} {{end}} {{if .labels.params_critica --critical {{.labels.params_critical}} {{end}} --host {{.labels.params_host}} --port {{.labels.params_port}}`
Event	check-rabbitmq-messages	Verifies the total number of messages queued on the RabbitMQ server and triggers an alert based on the threshold.	`check-rabbitmq-messages.rb --critical {{.labels.params_critical}} --port {{.labels.params_port}} --warn {{.labels.params_warn}} --host {{.labels.params_host}}`
Event	check-rabbitmq-network-partitions	Verifies whether the RabbitMQ network partition has occurred and triggers an alert based on the threshold.	check-rabbitmq-network-partitions.rb --host {{.labels.params_host}} --port {{.labels.params_port}}
Event	check-rabbitmq-node-health	Verifies whether the RabbitMQ server node is in a running state.	`check-rabbitmq-node-health.rb --host {{.labels.params_host}} {{if .labels.`

RabbitMQ Events policy (continued)

Type	Check	Description	Command
			{{end}} {{if .labels.params_fdwarn}} --fwarn {{.labels.params_fdwarn}} {{end}} {{if .labels.params_memwarn}} mwarn {{.labels.params_memwarn}} {{end}}
Event	check-rabbitmq-queue-drain-time	Verifies the time it will take for each queue on the RabbitMQ server to drain, based on the current message exit rate. For example, if a queue has 1,000 messages in it but only 1 message exits per second, an alert generates because the default critical level of 360 seconds has been exceeded.	check-rabbitmq-queue-drain-time.rb --host {{.labels.params_host}} --port {{.labels.params_port}} --warn {{.labels.params_warn}} --critical {{.labels.params_critical}}
Event	check-rabbitmq-queues-synchronised	Verifies that all mirrored queues with secondary queues are synchronised.	check-rabbitmq-queues-synchronised.rb --host {{.labels.params_host}} --port {{.labels.params_port}}
Event	check-rabbitmq-stomp-alive	Verifies whether the RabbitMQ server is alive and responding to STOMP.	check-rabbitmq-stomp-alive.rb --host {{.labels.params_host}} --queue {{.labels.params_queue}} --port {{.labels.params_port}}

RabbitMQ Metrics policy

Type	Check	Description	Command
Metric	metrics-rabbitmq-overview	Provides RabbitMQ overview statistics.	`metrics-rabbitmq-overview.rb --port {{.labels.params_port}} --host {{.labels.params_host}}`
Metric	metrics-rabbitmq-queue	Provides RabbitMQ metrics per queue.	`metrics-rabbitmq-queue.rb --port {{.labels.params_port}} --host {{.labels.params_host}} {{if .labels.params_vhost}} --vhost {{.labels.params_vhost}} {{end}}`

RabbitMQ metrics

The following table lists the metrics that are gathered as output from RabbitMQ checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

metrics-rabbitmq-overview metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
rabbitmq.queue_totals.messages.count		count	Provides metrics on the total number of messages (ready plus unacknowledged).
rabbitmq.queue_totals.messages.rate (featured metric)		rate / sec	Provides metrics on the total number of messages (ready plus unacknowledged)
rabbitmq.queue_totals.messages_ready.count		count	Provides metrics on the number of messages ready for delivery.
rabbitmq.queue_totals.messages_ready.rate		rate / sec	Provides metrics on the number of messages ready for delivery.
rabbitmq.queue_totals.messages_unacknowledged.count		count	Provides metrics on the number of

metrics-rabbitmq-overview metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			unacknowledged messages.
rabbitmq.queue_totals.messages_unacknowledged.rate		rate / sec	Provides metrics on the number of unacknowledged messages.
rabbitmq.message_stats.deliver_get.count		count	Provides metrics on messages recently delivered to consumers.
rabbitmq.message_stats.deliver_get.rate (featured metric)		rate / sec	Provides metrics on messages recently delivered to consumers.
rabbitmq.message_stats.deliver_no_ack.count		count	Provides metrics on unacknowledged messages recently delivered to consumers.
rabbitmq.message_stats.deliver_no_ack.rate		rate / sec	Provides metrics on unacknowledged messages recently delivered to consumers.
rabbitmq.message_stats.publish.count		count	Provides metrics on recently published messages.
rabbitmq.message_stats.publish.rate		rate / sec	Provides metrics on the recently published messages.
rabbitmq.object_totals.channels.count		count	Provides metrics on the total number of channels.
rabbitmq.object_totals.connections.count (featured metric)		count	Provides metrics on the total number of connections.
rabbitmq.object_totals.consumers.count (featured metric)		count	Provides metrics on the total number of consumers.
rabbitmq.object_totals.exchanges.count		count	Provides metrics on the total number of exchanges.

metrics-rabbitmq-overview metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
rabbitmq.object_totals.queues.count (featured metric)		count	Provides metrics on the total number of queues.

metrics-rabbitmq-queue metrics

rabbitmq.queue.{{QueueName}}.avg_egress_rate (featured metric)	Queue Name	count	Provides queue specific metrics on the rate at which unacknowledged message records enter RAM for the given queue.
rabbitmq.queue.{{QueueName}}.consumers	Queue Name	count	Provides queue specific metrics on the total consumers for the given queue.
rabbitmq.queue.{{QueueName}}.messages	Queue Name	count	Provides queue specific metrics on the total messages in the given queue.
rabbitmq.queue.{{QueueName}}.drain_time	Queue Name	count	Provides queue specific metrics on the message drain time for the given queue.

URL Monitoring default checks and policies

Agent Client Collector provides policies for URL Monitoring. Polices come with embedded checks.

URL Monitoring uses the HTTP Entry Point default policies. For details, see HTTP default checks and policies.

Varnish default checks and policies

Agent Client Collector provides the following default checks and policies for Varnish monitoring.

Varnish metrics policy

Type	Check	Description	Usage	Output
Metric	app.varnish.metrics.varnish	Collects Varnish metrics from the host.	`linuxchecks metrics-varnish (options)` where:	`hostname.MAIN_sess_conn 175 1649420020`

© 2026 ServiceNow, Inc. All rights reserved.

Varnish metrics

The following table lists the metrics that are gathered as output from Varnish checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

Varnish metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
MAIN_sess_conn (featured metric)		count	Cumulative number of accepted client connections by Varnish Cache.
MAIN_sess_drop (featured metric)		count	Number of connections dropped due to a full queue.
MAIN_client_req (featured metric)		count	Cumulative number of received client requests. Increments after a request is received, but before Varnish responds.
MAIN_cache_hit		count	Cumulative number of times a file was served from Varnish's cache.
MAIN_cache_hitpass		count	Cumulative number of hits for a "pass" file.
MAIN_cache_miss		count	Cumulative number of times a file was requested but was not in the cache, and was therefore requested from the backend.
MAIN_backend_conn		count	Cumulative number of successful TCP connections to the backend.
MAIN_backend_unhealthy (featured metric)		count	Cumulative number of backend connections which were not attempted because the backend has been marked as unhealthy.
MAIN_backend_busy		count	Cumulative number of times the maximum amount of connections to the

Varnish metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			backend has been reached.
MAIN_backend_fail (featured metric)		count	Cumulative number of failed connections to the backend.
MAIN_backend_reuse (featured metric)		count	Cumulative number of connections that were reused from the keep-alive pool.
MAIN_backend_recycle		count	Cumulative number of current backend connections which were put back to a pool of keep-alive connections and have not yet been used.
MAIN_threads (featured metric)		count	Number of threads in all pools.
MAIN_threads_limited		count	Number of times a thread needed to be created but couldn't because varnishd maxed out its configured capacity for new threads.
MAIN_threads_created		count	Number of times a thread has been created.
MAIN_threads_failed (featured metric)		count	Number of times that Varnish unsuccessfully tried to create a thread.
MAIN_thread_queue_len		count	Current queue length: number of requests waiting on worker thread to become available.
MAIN_sess_queued		count	Number of times Varnish has been out of threads and had to queue up a request.
MAIN_n_expired (featured metric)		count	Cumulative number of expired objects for example due to TTL.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Varnish metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
MAIN_n_lru_nuked (featured metric)		count	Least Recently Used Nuked Objects: Cumulative number of cached objects that Varnish has evicted from the cache because of a lack of space.
MAIN_backend_req (featured metric)		count	Number of requests to the backend.

vSphere default checks and policies

Agent Client Collector provides the following default checks and policies for vSphere monitoring.

vSphere virtualMachine metrics policy

Type	Check	Description	Usage	Output
Metric	vsphere.metric-VirtualMachine	Retrieves metrics for a vSphere virtual machine. Must use a proxy agent.	`commonchecks metric-vsphere -H hostname -R VirtualMachine -v vm_id -r true -i 20` where: • -H = hostname Instance Hostname • -i = intervalId 20 for real time metrics; 300 for 5 minutes older aggregate metrics (default 300) • -r = resourceLevelMetric To enable resource level metrics (default=false)	`vsphere.VirtualMachine.c 8 1654755994`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

vSphere Datastore Metrics policy

Type	Check	Description	Usage	Output
Metric	vSphere.metric-Datastore	Retrieves Metrics for vSphere Datastore. Must use a proxy agent.	`commonchecks metric-vsphere -H hostname -R Datastore -v vm_id -r` where: • -H = hostname Instance Hostname • -r = resourceLevelMetric To enable resource level metrics (default=false)	`vsphere.Datastore.disk.c 21474836480 1655182836`

vSphere Datacenter Metrics policy

Type	Check	Description	Usage	Output
Metric	vsphere.metric-Datacenter	Retrieves metrics for the vSphere datacenter.	`commonchecks metric-vsphere -H hostname -R Datacenter -v vm_id -r` where: • -H = hostname Instance Hostname • -r = resourceLevelMet To enable resource level metrics (default=false)	`vsphere.Datacenter.vmop.numChangeDS.latest.total 217 1655194924 vsphere.Datacenter.vmop.numChangeHost.latest.total 1373 1655194924 vsphere.Datacenter.vmop.numChangeHostDS.latest.total 9 1655194924 vsphere.Datacenter.vmop.numClone.latest.total 192`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

vSphere Datacenter Metrics policy (continued)

Type	Check	Description	Usage	Output
				1655194 924

vSphere ESX Server Metrics policy

Type	Check	Description	Usage	Output
Metric	vsphere.metric-ESX_Server	Retrieves metrics for vSphere ESX server or HostSystem. Must use a proxy agent.	`commonchecks metric-vsphere -H hostname -R HostSystem -v vm_id -r` where: • -H = hostname Instance Hostname • -r = resourceLevelMet To enable resource level metrics (default=false)	vsphere.HostSystem.net.broadcastRx.summation.total 63885 1655198166 vsphere.HostSystem.net.broadcastTx.summation.total 196 1655198166 vsphere.HostSystem.net.bytesRx.average.total 5924 1655198166

vSphere metrics

The following table lists the metrics that are gathered as output from vSphere checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

vsphere.metric-VirtualMachine metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
net.broadcastRx.summation	network adapter	packets	Number of broadcast packets received.
net.broadcastTx.summation	network adapter	packets	Number of broadcast packets transmitted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

vsphere.metric-VirtualMachine metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
net.bytesRx.average	network adapter	KiB	Average amount of data received per second.
net.bytesTx.average	network adapter	KiB	Average amount of data transmitted per second.
net.droppedRx.summation	network adapter	packets	Number of received packets dropped.
net.droppedTx.summation	network adapter	packets	Number of transmitted packets dropped.
net.multicastRx.summation	network adapter	packets	Number of multicast packets received.
net.multicastTx.summation	network adapter	packets	Number of multicast packets transmitted.
net.packetsRx.summation	network adapter	packets	Number of packets received.
net.packetsTx.summation	network adapter	packets	Number of packets transmitted.
net.received.average	network adapter	KiB	Average rate at which data was received during the interval. This represents the bandwidth of the network.
net.transmitted.average	network adapter	KiB	Average rate at which data was transmitted during the interval. This represents the bandwidth of the network.
net.usage.average (featured metric)	network adapter	KiB	Network utilization (combined transmit- and receive-rates).
disk.maxTotalLatency.latest (featured metric)	drive	millisecond	Highest latency value across all disks used by the host.
disk.read.average	drive	KiB	Average number of kilobytes read from the disk each second.
disk.usage.average (featured metric)	drive	KiB	Aggregated disk I/O rate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

vsphere.metric-VirtualMachine metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
disk.usage.maximum	drive	KiB	Maximum disk I/O rate.
disk.usage.minimum	drive	KiB	Minimum disk I/O rate.
disk.write.average	drive	KiB	Average number of kilobytes written to the disk each second.
cpu.costop.summation	cpu-core	millisecond	Time the virtual machine is ready to run, but is unable to run due to co-scheduling constraints.
cpu.demand.average	cpu-core	megahertz	The amount of CPU resources a virtual machine would use if there were no CPU contention or CPU limit.
cpu.demandEntitlementRatio.latest	cpu-core	percent	CPU resource entitlement to CPU demand ratio.
cpu.entitlement.latest	cpu-core	megahertz	CPU resources devoted by the ESXi scheduler.
cpu.idle.summation	cpu-core	millisecond	Total time that the CPU spent in an idle state.
cpu.latency.average	cpu-core	percent	Percent of time the virtual machine is unable to run because it is contending for access to the physical CPU(s).
cpu.maxlimited.summation	cpu-core	millisecond	Time the virtual machine is ready to run, but is not running because it has reached its maximum CPU limit setting.
cpu.overlap.summation	cpu-core	millisecond	Time the virtual machine was interrupted to perform system services on

vsphere.metric-VirtualMachine metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			behalf of itself or other virtual machines.
cpu.readiness.average	cpu-core	percent	Percentage of time that the virtual machine was ready, but could not get scheduled to run on the physical CPU.
cpu.ready.summation	cpu-core	millisecond	Milliseconds of CPU time spent in ready state.
cpu.run.summation	cpu-core	millisecond	Time the virtual machine is scheduled to run.
cpu.swapwait.summation	cpu-core	millisecond	CPU time spent waiting for swap-in.
cpu.system.summation	cpu-core	millisecond	Amount of time spent on system processes on each virtual CPU in the virtual machine.
cpu.usage.average (featured metric)	cpu-core	percent	Percentage of CPU capacity being used.
cpu.usagemhz.average	cpu-core	megahertz	CPU usage, as measured in megahertz.
cpu.used.summation	cpu-core	millisecond	Time accounted to the virtual machine. If a system service runs on behalf of this virtual machine, the time spent by that service (represented by cpu.system) should be charged to this virtual machine. If not, the time spent (represented by cpu.overlap) should not be charged against this virtual machine.
cpu.wait.summation (featured metric)	cpu-core	millisecond	Total CPU time spent in wait state.The wait total includes time spent the CPU Idle,

vsphere.metric-VirtualMachine metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			CPU Swap Wait, and CPU I/O Wait states.
cpu.usage.vcpus.average	cpu-core	percent	Percentage of vcpus capacity being used.
cpu.utilization.average	cpu-core	percent	Percentage of CPU capacity being used.
mem.active.average	memory	KiB	Amount of memory that is actively used, as estimated by VMkernel based on recently touched memory pages.
mem.activewrite.average	memory	KiB	Estimate for the amount of memory actively being written to by the virtual machine.
mem.compressed.average	memory	KiB	Kilobytes of memory that have been compressed.
mem.compressionRate.average	memory	KiB	Rate of memory compression for the virtual machine.
mem.consumed.average	memory	KiB	Amount of host physical memory consumed by a virtual machine, host, or cluster.
mem.decompressionRate.average	memory	KiB	Rate of memory decompression for the virtual machine.
mem.entitlement.average	memory	KiB	Amount of host physical memory the virtual machine is entitled to, as determined by the ESX scheduler.
mem.granted.average	memory	KiB	Amount of host physical memory or physical memory that is mapped for a virtual machine or a host.
mem.latency.average	memory	KiB	Percentage of time the virtual machine is waiting to

vsphere.metric-VirtualMachine metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			access swapped or compressed memory.
mem.llSwapInRate.average	memory	KiB	Rate at which memory is being swapped from host cache into active memory.
mem.llSwapOutRate.average	memory	KiB	Rate at which memory is being swapped from active memory to host cache.
mem.llSwapUsed.average	memory	KiB	Space used for caching swapped pages in the host cache.
mem.overhead.average	memory	KiB	Host physical memory consumed by the virtualization infrastructure for running the virtual machine.
mem.overheadMax.average	memory	KiB	Host physical memory reserved for use as the virtualization overhead for the virtual machine.
mem.overheadTouched.average	memory	KiB	Actively touched overhead host physical memory (KB) reserved for use as the virtualization overhead for the virtual machine.
mem.shared.average	memory	KiB	Amount of guest physical memory that is shared with other virtual machines, relative to a single virtual machine or to all powered-on virtual machines on a host.
mem.usage.average (featured metric)	memory	percent	Memory usage as percent of total configured or available memory.
mem.vmmemctl.average	memory	KiB	Amount of memory allocated by the virtual

			machine memory control driver.
mem.vmmemctltarget.average	memory	KiB	Target value set by VMkernal for the virtual machine's memory balloon size. In conjunction with vmmemctl metric, this metric is used by VMkernel to inflate and deflate the balloon for a virtual machine.
mem.zero.average	memory	KiB	Memory that contains 0s only. Included in shared amount. Through transparent page sharing, zero memory pages can be shared among virtual machines that run the same operating system.
power.energy.summation	power	joule	Total energy (in joule) used since last stats reset.
power.power.average	power	watt	Current power usage.
sys.heartbeat.latest	system	number	Number of heartbeats issued per virtual machine.
sys.osUptime.latest	system	seconds	Total time elapsed, in seconds, since last operating system boot-up.
sys.uptime.latest	system	seconds	Total time elapsed since last system startup.
virtualDisk.read.average	virtual disk	KiB	Average number of kilobytes read from the virtual disk each second.
virtualDisk.write.average	virtual disk	KiB	Average number of kilobytes written to the virtual disk each second.

vsphere.metric-Datastore metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
datastore.siocActiveTimePercentage.average (featured metric)	Datastore	percent	Percentage of time Storage I/O Control actively controlled datastore latency.
datastore.sizeNormalizedDatastoreLatency.average	Datastore	microsecond	Storage I/O Control size-normalized I/O latency.
datastore.throughput.contention.average	Datastore	millisecond	Average amount of time for an I/O operation to the datastore or LUN across all ESX hosts accessing it.
datastore.throughput.usage.average	Datastore	KiB	The current bandwidth usage for the datastore or LUN.
datastore.totalReadLatency.average	Datastore	millisecond	Average amount of time for a read operation from the datastore.
datastore.totalWriteLatency.average	Datastore	millisecond	Average amount of time for a write operation from the datastore.
datastore.unmapIOs.summation	Datastore	Number	Number of Unmap operations.
datastore.unmapSize.summation	Datastore	Number	Total UnMap size.
datastore.write.average (featured metric)	Datastore	KiB	Rate of writing data to the datastore.
disk.busResets.summation	disk	Number	Number of SCSI-bus reset commands issued.
disk.capacity.latest	disk	KiB	Configured size of the datastore.
disk.capacity.contention.average	disk	KiB	The amount of storage capacity overcommitment for the entity, measured in percent.
disk.capacity.provisioned.average	disk	KiB	Provisioned size of the entity.
disk.capacity.usage.average	disk	KiB	The amount of storage capacity currently

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			being consumed by or on the entity.
disk.commands.summation	disk	Number	Number of SCSI commands issued.
disk.commandsAborted.summation	disk	Number	Number of SCSI commands aborted.
disk.commandsAveraged.average	disk	Number	Average number of SCSI commands issued per second.
disk.deltaused.latest	disk	KiB	Storage overhead of a virtual machine or a datastore due to delta disk backings.
disk.deviceLatency.average	disk	millisecond	Average amount of time it takes to complete an SCSI command from physical device.
disk.deviceReadLatency.average	disk	millisecond	Average amount of time it takes to complete read from physical device.
disk.deviceWriteLatency.average	disk	millisecond	Average amount of time to write from the physical device.
disk.kernelLatency.average	disk	millisecond	Average amount of time spent by VMkernel to process each SCSI command.
disk.kernelReadLatency.average	disk	millisecond	Average amount of time spent by VMkernel to process each SCSI read command.
disk.kernelWriteLatency.average	disk	millisecond	Average amount of time spent by VMkernel to process each SCSI write command.
disk.maxQueueDepth.average (featured metric)	disk	Number	Maximum queue depth.
disk.maxTotalLatency.latest	disk	millisecond	Highest latency value across all disks used by the host.

vsphere.metric-Datastore metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
disk.numberRead.summation	disk	Number	Number of disk reads during the collection interval.
disk.numberReadAveraged.average	disk	Number	Average number of read commands issued per second to the datastore.
disk.numberWrite.summation	disk	Number	Number of disk writes during the collection.
disk.numberWriteAveraged.average	disk	Number	Average number of write commands issued per second to the datastore.
disk.provisioned.latest	disk	KiB	Amount of storage set aside for use by a datastore or a virtual machine. Files on the datastore and the virtual machine can expand to this size but not beyond it.
disk.queueLatency.average	disk	millisecond	Average amount of time spent in VMkernel queue (per SCSI command).
disk.queueReadLatency.average (featured metric)	disk	millisecond	Average amount of time spent in the VMkernel queue per SCSI read command.
disk.queueWriteLatency.average	disk	millisecond	Average amount of time spent in the VMkernel queue per SCSI write command.
disk.read.average	disk	KiB	Average number of kilobytes read from the disk each second.
disk.scsiReservationCnflctsPct.average	disk	Number	Number of SCSI reservation conflicts for the LUN as a percent of total commands during the collection interval.
disk.scsiReservationConflicts.summation	disk	Number	Number of SCSI reservation conflicts

			created or not, and other such factors.
disk.write.average	disk	KiB	Average number of kilobytes written to the disk each second.

vsphere.metric-ESX_Server metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
cpu.coreUtilization.average (featured metric)	cpu-core	percent	CPU utilization of the corresponding core (if hyper-threading is enabled) as a percentage.
cpu.reservedCapacity.average	cpu-core	megahertz	Total CPU capacity reserved by virtual machines.
cpu.totalCapacity.average	cpu-core	megahertz	Total CPU capacity reserved by and available for virtual machines.
datastore.maxTotalLatency.latest	datastore	millisecond	Highest latency value across all datastores used by the host.
hbr.hbrDiskReadLatency.average	host-based replication	millisecond	Average Disk read latency.
hbr.hbrDiskStallLatency.average	host-based replication	millisecond	Average Disk stall latency.
hbr.hbrNetRx.average	host-based replication	KiB	Average amount of data received per second.
hbr.hbrNetTx.average	host-based replication	KiB	Average amount of data transmitted per second.
hbr.hbrNumVms.average	host-based replication	Number	Number of powered-on virtual machines running on this host that currently have host-based replication protection enabled.
mem.heap.average	memory	KiB	VMkernel virtual address space

vsphere.metric-ESX_Server metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			dedicated to VMkernel main heap and related data.
mem.heapfree.average	memory	KiB	Free address space in the VMkernel main heap.Varies based on number of physical devices and configuration options.
mem.llSwapIn.average	memory	KiB	Amount of memory swapped-in from host cache.
mem.llSwapOut.average	memory	KiB	Amount of memory swapped-out to host cache.
mem.lowfreethreshold.average	memory	KiB	Threshold of free host physical memory below which ESX/ESXi will begin reclaiming memory from virtual machines through ballooning and swapping.
mem.reservedCapacity.average	memory	MiB	Total amount of memory reservation used by powered-on virtual machines and vSphere services on the host.
mem.sharedcommon.average	memory	KiB	Amount of machine memory that is shared by all powered-on virtual machines and vSphere services on the host.
mem.state.latest	memory	KiB	One of four threshold levels representing the percentage of free memory on the host.
mem.swapin.average	memory	KiB	Amount of memory swapped-in from disk.
mem.swapinRate.average	memory	KiB	Rate at which memory is swapped from disk into active memory.

vsphere.metric-ESX_Server metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mem.swapout.average	memory	KiB	Amount of memory swapped-out to disk.
mem.swapoutRate.average	memory	KiB	Rate at which memory is being swapped from active memory to disk.
mem.swapused.average	memory	KiB	Amount of memory that is used by swap. Sum of memory swapped of all powered on VMs and vSphere services on the host.
mem.sysUsage.average	memory	KiB	Amount of host physical memory used by VMkernel for core functionality, such as device drivers and other internal uses. Does not include memory used by virtual machines or vSphere services.
mem.totalCapacity.average	memory	KiB	Total amount of memory reservation used by and available for powered-on virtual machines and vSphere services on the host.
mem.unreserved.average	memory	KiB	Amount of memory that is unreserved. Memory reservation not used by the Service Console, VMkernel, vSphere services and other powered on VMs user-specified memory reservations and overhead memory.
mem.vmfs.pbc.capMissRatio.latest (featured metric)	Datastore	percent	Trailing average of the ratio of capacity misses to compulsory misses for the VMFS PB Cache.

vsphere.metric-ESX_Server metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mem.vmfs.pbc.overhead.latest	memory	KiB	Amount of VMFS heap used by the VMFS PB Cache.
mem.vmfs.pbc.size.latest	memory	MiB	Space used for holding VMFS Pointer Blocks in memory.
mem.vmfs.pbc.sizeMax.latest	memory	MiB	Maximum size the VMFS Pointer Block Cache can grow to.
mem.vmfs.pbc.workingSet.latest	memory	TiB	Amount of file blocks whose addresses are cached in the VMFS PB Cache.
mem.vmfs.pbc.workingSetMax.latest	memory	TiB	Maximum amount of file blocks whose addresses are cached in the VMFS PB Cache.
net.errorsRx.summation (featured metric)	network adapter	Number	Number of packets with errors received.
net.errorsTx.summation (featured metric)	network adapter	Number	Number of packets with errors transmitted.
net.unknownProtos.summation	network adapter	KiB	Number of frames with unknown protocol received.
power.powerCap.average	power	watt	Maximum allowed power usage.
rescpu.maxLimited1.latest	rescpu	percent	Amount of CPU resources over the limit that were refused, average over 1 minute.
rescpu.maxLimited15.latest	rescpu	percent	Amount of CPU resources over the limit that were refused, average over 15 minutes.
rescpu.maxLimited5.latest	rescpu	percent	Amount of CPU resources over the limit that were refused, average over 5 minutes.

vsphere.metric-ESX_Server metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
storageAdapter.maxTotalLatency.latest (featured metric)	Storage adapter	millisecond	Highest latency value across all storage adapters used by the host.
storagePath.maxTotalLatency.latest (featured metric)	Storage adapter	millisecond	Highest latency value across all storage paths used by the host.

Windows default checks and policies

Agent Client Collector provides the following default checks and policies for Windows health monitoring.

Windows event monitoring checks

Windows OS Events policy

Check	Description	Usage and Example	Output
os.windows.check-event-log	Measures the Windows event log against parameter thresholds and returns a *CRITICAL | WARNING | OK* event.	Usage: • -w warning - Triggers a WARNING event if the event log count matching the pattern is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the event log count matching the pattern is above the CRITICAL parameter value specified in the check parameter. • -e event level - Specifies the severity level of the event. Possible values: Information, Verbose, Critical, Warning, Error. • -i - Unique event ID	Check Event Log OK: The Event Log that matches the pattern is <matched count>

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
		• -d - The duration of time, in hours, in which you want to retrieve events from the Windows event log. Usage example: `winchecks check-windows-event-log -w 5 -c 10 -e "Information" -l "Application" -d 24`	
os.windows.check-event-log-count	Measures the Windows event log against parameter thresholds and returns a CRITICAL \WARNING\OK event. Provides information on the number of events that have occurred within a specified duration for a single log file and a single ID. Also indicates the filters to be applied to retrieve events for a specific single-valued windows event level and provider name. Retrieving events from multiple log files is not supported. The number of events is provided, without details of each and every event.	Usage: • -w warning - Triggers a WARNING event if the event log count matching the pattern is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the event log count matching the pattern is above the CRITICAL parameter value specified in the check parameter. • -l log_file - The log file to be monitored. Name of the file is written in double quotation marks. • -r regex_pattern - The regex pattern which filters out the description in the event log. Written in double quotation marks.	Check Event Log OK: The Event Log that matches the pattern is <matched count>

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
		• -e event level - Specifies the severity level of the event. Possible values: Information, Verbose, Critical, Warning, Error. • -i id - Unique event ID • -d duration_hour - The duration of time, in hours, in which you want to retrieve events from the Windows event log. Decimal points can be used; for example, 30 minutes - 0.5. • -p provider_name - Source of the event, written in double quotation marks. Usage example: `winchecks check-windows-event-log -w 5 -c 10 -e "Information" -l "Application" -d 24`	
os.windows.check-event-log-details	Collects and filters Windows Event logs based on the `duration_hour`, `event_log_level` and `log_file` values. Retrieves and filters Windows event logs according to the provided parameters. It returns details about the events with CRITICAL, WARNING, or OK status, based	Usage: • -d duration_hour - Duration (in hours) from the current time to filter events (Default: 24). • -e event_log_level - Filter the events based on the event level. Possible values are: Information, Verbose, Critical, Warning, Error. Multiple values	Check Event Log Details WARNING: Type: Information, Category: Application, Machine: ws19-inc0061393.LOCAL.LAB, Event_ID: 1704, Message: Security policy in the Group policy objects has been applied successfully., TimeCreated: 10/14/2024 12:09:35 AM.

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
	on the specified severity level.	are comma-separated (Default: Information). For example: Information, Warning • -i id - Filters events based on the specified event IDs. For multiple IDs, values are comma-separated and enclosed in double quotation marks. For example: "1257, 1001" • -l log_file - Specifies the log file name to filter events. The name of the file is written in double quotation marks. Supports creating custom files and multiple values are comma-separated. (Default: Application). For example: "Application, System" • -p provider_name - The name of the event provider, enclosed in double quotation marks. • -r regex_pattern - Filters events by matching the event message with the specified pattern. Value must be enclosed in double quotation marks. • -s servicenow_event_severity - Creates a servicenow event with the value given in this parameter.	Type: Information, Category: Application, Machine: ws19-inc0061393.LOCAL.LAB, Event_ID: 16384, Message: Successfully scheduled Software Protection service for restart at 2124-09-20T06:25:44Z. Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
		Possible values are: Critical, Warning and OK. Usage example: `winchecks check-windows-event-log-details -d 24 -l Application -e Warning -r "*" -s Warning`	
os.windows.check-disk-name	Takes the storage drive name as input and verifies if the drive is present. Returns a *CRITICAL | WARNING | OK* value based on the parameter provided.	winchecks check-windows-disk-name <options> -d : Disk name (Default = C) Usage example:`winchecks check-windows-disk-name -d C`	Windows Checks OK: Disk storage C is present.
os.windows.check-processor-queue-length	Measures the process queue length against thresholds and returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -w warning - Triggers a WARNING event if the processor queue length count matching the pattern is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the processor queue length count matching the pattern is above the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-`	Processor Queue Length OK: The Processor Queue length is 0.00

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
		`processor-queue-length -w 5 -c 10`	
os.windows.check-system-cpu-load	Checks CPU Load by using typeperf. Measures the CPU load against configured thresholds and returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -w warning - Triggers a WARNING event if the CPU load count matching the pattern is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the CPU load count matching the pattern is above the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-cpu-load -w 85 -c 95`	CPU Load OK: The total CPU utilization is 26.92%
os.windows.check-system-disk	Measures the free physical memory against thresholds and returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -w warning - Triggers a WARNING event if the event log percentage matching the pattern is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the event log percentage matching the pattern is above	Disk Usage Check OK: The disk usage is %

Check	Description	Usage and Example	Output
		the CRITICAL parameter value specified in the check parameter. • -t fs_type - Checks only volumes with the specified filesystem types. • -m mount_points - Checks only the specified mount points. • -x ignore_type - Skip volumes with the specified filesystem types. • -i ignore_mnt - Skip the specified mount points when collecting disk usage. Returns an error if a specified mount point does not exist in the system. • -r ignore_mnt_regex - Skip volumes whose names match the given regular expression. • -l ignore_label - Skip volumes whose labels match the given regular expression. Usage example: `winchecks check-windows-disk -w 85 -c 95`	
os.windows.check-system-memory-percent	Collects the RAM usage. Measures the memory usage against configured thresholds and returns a CRITICAL \WARNING\OK event	Usage: • -w warning - Triggers a WARNING event if the memory use percentage matching the	RAM Usage OK: The total memory utilization is 84%

Check	Description	Usage and Example	Output
	according to the thresholds given in the accompanying parameters.	pattern is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the memory use percentage matching the pattern is above the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-ram -w 85 -c 95`	
os.windows.check-system-process	Query running processes to find running processes that match the given arguments (pattern, name, both pattern and name. At least one must be given). Measures the running processes against configured thresholds and filters, returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -n name - Process executable name to check the process execution. • -p pattern - Pattern (sub string) to search for in the command that invoked the process. Produces valid results only if the user running the Agent owns the queried process has view permissions for the queried process. • -w warnover - Triggers a WARNING status if the query returns more processes than those specified by the argument. • -W warnunder - Triggers a WARNING status	Check Process OK: OK Found 1 matching running processes named explorer

Check	Description	Usage and Example	Output
		if the query returns fewer processes than those specified by the argument. • -c critover - Triggers a CRITICAL event if the query returns more processes than those specified by the argument. • -C critunder - Triggers a CRITICAL event if the query returns fewer processes than those specified by the argument. Usage example: `winchecks check-windows-processes -n explorer`	
os.windows.check-directory	Verifies whether a Windows directory exists.	Usage: -d --directory Path to the relevant directory; use '\' for separation. Usage example: `winchecks check-windows-directory -d dir_path`	Check Directory OK: The directory 'C:/Users/Public' exists
os.windows.check-pagefile	Collects the *Pagefile* usage and compares it against the WARNING and CRITICAL thresholds.	Usage: • -w warning - Triggers a WARNING event if the *Pagefile* usage is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the *Pagefile*	Check Windows Page File OK: Page file usage at 31.63%

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
		usage is above the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-pagefile -w 75 -c 85`	
os.windows.check-free-physical-memory	Measures the free physical memory against configured thresholds and returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -w warning - Triggers a WARNING event if the free physical memory is under the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the free physical memory is under the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-free-physical-memory -w 10 -c 5`	Free Physical Memory OK: The Free Physical Memory is 20.25%
os.windows.check-free-virtual-memory	Measures the free virtual memory against configured thresholds and returns a CRITICAL \WARNING\OK event according to the thresholds given in the accompanying parameters.	Usage: • -w warning - Triggers a WARNING event if the free virtual memory is above the WARNING parameter value specified in the check parameter.	Free Virtual Memory OK: The Free Virtual Memory is 25.66%

Check	Description	Usage and Example	Output
	thresholds given in the accompanying parameters.	• -w warning - Triggers a WARNING event if the process memory usage is above the WARNING parameter value specified in the check parameter. • -c critical - Triggers a CRITICAL event if the process memory usage is above the CRITICAL parameter value specified in the check parameter. Usage example: `winchecks check-windows-process-memory -p acc -c 95 -w 85`	
os.windows.check-user-account	Takes the list of user names as an input and verifies whether the user account is active. Returns a CRITICAL\WARNING \OK value.	winchecks check-windows-user-disabled (options) -u : Comma separated List of User Name Usage example: `winchecks check-windows-user-disabled- u Administrator,Guest`	User Name and Status
os.windows.check-windows-service	Verifes whether a Windows Service is present and returns the actual service state and service type reported by the Windows Service Control Manager (`sc query`), for example: `Service: 'X', Status:`	Usage: • -s, service - The service to check if running (triggers an event with default severity of WARNING if the service is not running).	`Service: '[ ]', Status: '[RUNNING/STOPPED/etc.]', Startup Type: '[WIN32_OWN_PROCESS/etc.]'`

Windows OS Events policy (continued)

Check	Description	Usage and Example	Output
	`'RUNNING', Startup Type: 'WIN32_OWN_PROCESS'` Possible values: • RUNNING • STOPPED • START_PENDING • STOP_PENDING • CONTINUE_PENDING • PAUSE_PENDING • PAUSED	• -e, non_running_services_event_severity - Sets the severity level for reporting events when the service is not running. The values can be either CRITICAL or WARNING (Default: WARNING). • -G, skip_events_for_nonexistent - Skips the event creation if the given service does not exist on the system when the parameter is active and value is true. Usage example: `winchecks check-windows-service -s W3SVC -G false`	

Windows metric monitoring checks

Windows OS Metrics policy

Check	Description	Usage and Example	Output
os.windows.check-processor-queue-length	Measures the processor queue length.	Usage: -s scheme - Replaces output's hostname + process with the given value (example: hostname.process) Usage example: `command: winchecks metric-windows-processor-queue-length --scheme hostname.proc`	win2019-dc-64bit.cpu.queuelength 0.00 1645371109

Windows OS Events - Extended policy (continued)

Check	Description	Usage and Example	Output
	• AvailableMemory • TotalVisibleMemorySi:	Usage example: `command: winchecks metric-windows-memory --scheme hostname.proc`	8588898304.00 1645372274 win2019-dc-64bit.mem.free_virtual(KB) 1747636.00 1645372274 win2019-dc-64bit.mem.total_virtual(KB) 12263156.00 1645372274 win2019-dc-64bit.mem.available(KB) 1202032640.00 1645372274 win2019-dc-64bit.mem.total_visible(KB) 8387596.00 1645372274
os.windows.check-process-status	Collects windows process status with CPU and memory data used by the process.	Usage: • -n, process - Process name to collect status metric. • —scheme, scheme - Replaces output's hostname+process with the given value (example: hostname.process).	win2019-dc-64bit.Process.Status 67 1645372421 win2019-dc-64bit.Process.CpuPercent 0 1645372421 win2019-dc-64bit.Process.Memory(KB) 1226444 1645372421

Windows metrics

The following table lists the metrics that are gathered as output from Windows checks. Entries indicated as **Featured metrics** are high-visibility metrics that are displayed in the Operator Workspace Metric tab after an alert is generated. These metrics provide the operator with additional information to help them further explore the specified issue.

Windows metrics

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
Process.Status			Windows process status including CPU and memory data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
Process.CpuPercent			Percentage of CPU used by the process.
Process.Memory(KB)		KB	Memory used by the given process.
cpu.queuelength (featured metric)			Processor queue length.
cpu.loadavgsec (featured metric)			Average CPU load per second.
disk.AvgDisksec/Read		seconds	Average time of a read from the disk.
disk.AvgDisksec/Write		seconds	Average time of a write to the disk.
disk.DiskReadBytes/sec		byte/sec	Rate at which bytes are transferred from the disk during read operations.
disk.DiskWriteBytes/sec		byte/sec	Rate at which bytes are transferred to the disk during write operations.
disk_usage.avail(GB)		GB	Disk available.
disk_usage.used(GB)		GB	Disk used.
disk_usage.total(GB)		GB	Disk total.
disk_usage.used_percentage (featured metric)			Disk used in percentage.
mem.free_physical_percentage			Percent of free physical memory.
mem.free_virtual_percentage			Percent of free virtual memory.
ram.usage_percentage (featured metric)			Percent of RAM used.
mem.free_physical(KB)		KB	Amount of free physical memory.
mem.total_physical(KB)		KB	Total physical memory.
mem.free_virtual(KB)		KB	Amount of free virtual memory.
mem.total_virtual(KB)		KB	Total virtual memory.
mem.available(KB)		KB	Total amount of virtual memory available.

Windows metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
mem.total_visible(KB)		KB	Total amount of physical memory accessible to the operating system.
system.uptime(Sec)		seconds	Duration that the system has been operational.
system.network.Bytes_Received/sec (featured metric)		byte/sec	Bytes received per second for active network adapters.
system.network.Bytes_Sent/sec (featured metric)		byte/sec	Bytes sent per second for active network adapters.
system.network.Bytes_Total/sec (featured metric)		byte/sec	Sum of the bytes received and sent per second.
system.network.Current_Bandwidth		bit/sec	Estimate of the network interface bandwidth.
system.network.Offloaded_Connections			Number of IPv4 and IPv6 TCP connections currently handled by the TCP chimney offload capable network adapter.
system.network.Output_Queue_Length			Length of the output packet queue.
system.network.Packets/sec			Rate that packets are sent and received on the network.
system.network.Packets_Outbound_Discarded			Number of outbound packets that were discarded.
system.network.Packets_Outbound_Errors			Number of outbound packets that could not be sent becuase of errors.
system.network.Packets_Received/sec			Rate that packets are received.
system.network.Packets_Received_Discarded			Number of inbound packets that were discarded.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
system.network.Packets_Received_Errors			Number of inbound packets that could not be sent because of errors.
system.network.Packets_Received_Non-Unicast/sec			Rate that non-unicast (subnet broadcast or subnet multicast packets) are delivered to a higher-layer protocol.
system.network.Packets_Received_Unicast/sec			Rate that unicast (subnet) packets are delivered to a higher-layer protocol.
system.network.Packets_Received_Unknown			Number of packets that were received, but discarded, because of an unknown or unsupported protocol.
system.network.Packets_Sent/sec			Rate that packets are sent.
system.network.Packets_Sent_Non-Unicast/sec			Rate that packets are requested for transmission to non-unicast (subnet broadcast or subnet multicast) addresses by higher-layer protocols. Includes packets that were discarded or not sent.
system.network.Packets_Sent_Unicast/sec			Rate that packets are requested to for transmission to subnet-unicast addresses by higher-layer protocols. Includes packets that were discarded or not sent.
system.network.TCP_Active_RSC_Connections			Number of IPv4 and IPv6 TCP connections currently receiving large packets from the

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows metrics (continued)

Metric type	Resource (name of specific database, where relevant)	Units	Metric type description
			RSC-capable network adapter.
system.network.TCP_RSC_Average_Packet_Size		byte	Average size of received packets across all TCP connections.
system.network.TCP_RSC_Coalesced_Packets/sec			The large-packet receive rate across all TCP connections.
system.network.TCP_RSC_Exceptions/sec			The RSC exception rate for received packets across all TCP connections.

Windows log monitoring default checks and policies

Agent Client Collector provides the following policy for Windows log monitoring.

Windows log monitoring policy

Type	Check	Description	Usage and Usage Example	Output
Event	os.windows.check-log	Enables monitoring log files on a Windows server.	Usage: • -c crit N: Critical level if pattern has a group. • -f -log-file FILE: Path to log file. • -o --warn-only: Warn instead of critical on match. • -q pattern PAT: Pattern to search for. To search for multiple patterns, separate each pattern with a pipe (|) and put inside quotes. For example: "SEVERE|404"	Windows Log CRITICAL: Found 4 criticals, 0 warnings for pattern SEVERE|Exception|404|Errorin file C:\ProgramData\ServiceNow\agent-client-collector\log\acc.log

Windows log monitoring policy (continued)

Type	Check	Description	Usage and Usage Example	Output
			• -w warn N: Warning level if pattern has a group.	

Azure metrics script

When creating a new policy for Azure cloud metrics, create a .json script to determine the metrics to be monitored. The format for the script appears below, followed by a table explaining the script contents.

```
{
  "namespace": "Microsoft.Network/loadBalancers",
  "metrics": [
          "AllocatedSnatPorts",
          "ByteCount",
          "DipAvailability",
          "PacketCount",
          "SnatConnectionCount",
          "SYNCount",
          "UsedSnatPorts",
          "VipAvailability"
  ],
  "time_grain": "PT1M"
}
```

Resources and their metrics are retrievable from the Supported metrics for Azure resources page.

Header	Description
namespace	The name of the resource being monitored.
metrics	The metrics being retrieved from the monitored resource.
time_grain	The granularity of how often metrics are to be collected. Possible values are: • PT1M: Metric values are collected every minute. • PT5M: Metric values are collected every 5 minutes. • PT15M: Metric values are collected every 15 minutes. • PT30M: Metric values are collected every 30 minutes.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header	Description
	• PT1H: Metric values are collected every hour. • PT1D: Metric values are collected daily.

Windows event log filter parameters

The configurable values on the Check Parameters tab of the os.windows.check-event-log check.

Check Parameters tab values

Parameter	Type	Description
provider_name	String	Name of the provider that generated the event. **Note:** If you do not specify a *log_file* value together with the *provider_name*, the system searches all available log files, which increases the time it takes to receive results.
log_file	String	The name of the Windows event log file from which you retrieve events. Possible values are: • Application • System **Note:** If you do not specify a *provider_name* value together with the *log_file*, the system searches all events from the log file, which increases the number of retrieved events.
id	Integer	The numerical id of the event. Possible values are 0-65535.
warning	Integer	Any value above the specified parameter generates a Warning event.
event_level	String	The severity level of the event. Possible values: • Critical • Error

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check Parameters tab values (continued)

Parameter	Type	Description
		• Warning • Information • Verbose
regex_pattern	String	The regex pattern to be used in searching the event logs. The value must be enclosed in double quotation marks. For example, "error".
duration_hour	Integer	The time period for which you want to retrieve events from the Windows event log. Value is specified in hours; fractions of hours are specified with decimals.
critical	Integer	Any value equal to or above the specified parameter generates a Critical event.

Parameters of MID Server distributed cluster

The following MID Server parameters support the MID Server Distributed cluster type.

You can access these parameters in the **Configuration Parameters** related list of a MID Server. To add and set any of these parameter, see Add a MID Server parameter.

Parameter	Description
mid.distributed.cluster.striped.threadpool.size	Size of striped threadpool in MID Server distributed cluster. • **Type**: integer • **Default value**: Number of cores on the virtual machine or server.
mid.distributed.cluster.log.level	Logging level for MID Server distributed cluster, which can help troubleshooting. However, logging impacts the performance of Metric Intelligence. An empty value designates no logging. • **Type**: integer • **Default value**: none • **Other possible values**: info, debug, trace

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description

mid.distributed.cluster.global.timeout	Global timeout in seconds for MID Server distributed cluster.
	
	• **Type**: integer
	• **Default value**: 180
	• **Other possible values**:
	  ○ **Minimum value**: 60 (not enforced)
	  ○ **Maximum value**: 300 (not enforced)

mid.distributed.cluster.node.max.off.heap.memory	The amount of off heap memory used by Metric Intelligence to process data series per minute. The default 4 GB of space is the amount of off heap memory needed for processing 800,000 data series per minute. Adjust this value proportionally to the amount of actual data series. For example, to process 400,000 data series per minute, you can change the value to 2048. • **Type**: integer • **Default value**: 4096

Scheduled jobs included with MID Server distributed cluster

The following MID Server scheduled job is included with the MID Server Distributed cluster type.

Name	Description
Validate MID distributed cluster	Validates status of the cluster node for each MID Server in the cluster. For a MID Server that is down and its status is not stopped, updates the node status to stopped. Also, validates overall status of the cluster. During this validation, the job stops the cluster if there are multiple sub-clusters in a single cluster.

Components installed with Metric Intelligence

Several types of components are installed with activation of the Metric Intelligence (com.snc.sa.metric) plugin, including tables, scheduled jobs, and properties.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Scheduled jobs installed

Name	Description
Metric Intelligence — Metric Learner job	Runs daily and builds the statistical models used for anomaly detection.
Metric Intelligence — Purge old metric schemas and anomaly scores	Cleans up the *sa_metric_anomaly_score* and the *sa_metric_schema_definition* tables.
Metric Intelligence — Sync metric schema to mid	Synchronizing data from the instance to the MID Server in the metric schema table *sa_metric_schema_definition*.
Metric Intelligence — Sync tables with mid	Synchronizing data from the instance to the MID Server in tables.
Metric Intelligence — Table cleanup	Cleaning up tables related to various deletion operations.
Metric Intelligence — Observation Interval Learner job	Calculates the observation interval using collected data points for all data series.
Metric Intelligence — Process Stale Anomaly Score – Daily	Daily job that cleans stale anomaly scores, for a specified window of time, in the Metric Anomaly Score [sa_metric_anomaly_score] table. Uses the properties *sa_metric.anomaly_score_stale_interval_in_days* and *sa_metric.anomaly_score_next_stale_interval_in_days* to calculate the window of time for cleaning.
Metric Intelligence — Sync CI Anomaly Scores	Keeps anomaly scores up to date with any deletion of metrics.
Metric Intelligence — Metric configuration job	Synchronizes metric configurations from the instance to all Metric Intelligence MID Servers.
Metric Intelligence — Local level kalman filter model learner job	Builds local level kalman filter models on which to run change detection.
Metric Intelligence — Anomaly Model Test	On-demand scheduled job which runs when user clicks **Run Anomaly Test**.
Metric Intelligence — Validate MID Distributed cluster	**1.** Checks the status of the cluster node. If status is **Started** and the status of the Metric Intelligence extension is not any of **Started**/**Starting**/**Warning** [warning with specific errors], then the job changes the status of the cluster node to **Stopped**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	This happens when MID Server stops unexpectedly without notifying the instance that it is stopping. **2.** Checks the status of all cluster nodes on all MID Servers in the cluster. ○ If the status of all nodes is **Stopped** and the status of the cluster itself is **Started**, then the job changes the status of the cluster to **Stopped**. ○ If the status of the cluster is **Stopped** but there are MID Servers with a cluster node that is running, then the job changes the status of the cluster to **Started**. **3.** Checks the number of Cluster Leaders: If two are detected, then the job stops the entire cluster. This happens when MID Servers are not able to connect with other members of the cluster and form multiple sub-clusters.
Event Management - process metric binding events [1000-1020]	Process Metric Intelligence metric binding events separately from Event Management events (bucket range 1000-1020).
Event Management - process metric binding events [1020-1040]	Process Metric Intelligence metric binding events separately from Event Management events (bucket range 1020-1040).
Event Management - process metric binding events [1040-1060]	Process Metric Intelligence metric binding events separately from Event Management events (bucket range 1040-1060).
Event Management - process metric binding events [1060-1080]	Process Metric Intelligence metric binding events separately from Event Management events (bucket range 1060-1080).
Event Management - process metric binding events [1080-1100]	Process Metric Intelligence metric binding events separately from Event Management events (bucket range 1080-1100).
Metric Intelligence - Stationary nonparametric model learner job	Learns the stationary nonparametric model.
Metric Intelligence - Combined Model Learner Job	Constructs all the information required for performing real time anomaly detection (calculating data frequency and building statistical models) on a subset of all series for which data is being collected.

Tables installed

Table	Description
Metric Time Series Model [sa_time_series]	Statistical models built for metric data.
Alert Anomaly [em_alert_anomaly]	Anomaly alerts that were created from anomaly events that were sent by Metric Intelligence so users can review. Anomaly alerts are kept separately from regular system alerts.
Metric Anomaly Score [sa_metric_anomaly_score]	Stores anomaly scores for the metric.
Metric To CI Mapping Deleted SysIds [sa_metric_map_deleted]	SysIds of deleted metric-to-CI mapping records.
Metric To CI Mapping [sa_metric_map]	Mappings currently in effect of metric types to CIs.
SA Metric Type Registration [sa_metric_registration]	Details about metric type registration.
Metric Type Registration Deleted SysIds [sa_metric_registration_deleted]	SysIds of records that were deleted from the SA Metric Type Registration [sa_metric_registration] table.
Metric Schema Definition [sa_metric_schema_definition]	Map of metrics being received based on CI class. It is used to optimize the metric data payload being sent from the MID Server to the instance.
Metric Type [sa_metric_type]	Metric type source.
Monitoring System Metric Type Deleted SysIds [sa_source_metric_type_deleted]	SysIds of deleted monitoring system metrics.
Monitoring System Metric Type [sa_source_metric_type]	Metric types per CI class, active/inactive status, and metric source.
Metric Settings [sa_metric_config_setting]	Default configuration settings for Metric Intelligence MID Servers.
Metric Configuration Rules [sa_metric_config_rule]	Rules to override configuration settings for MID Servers.
Metric overridden configurations	Maps overridden configurations to custom defined rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[sa_metric_config_rule_setting]	
Metric Staged Configurations [sa_metric_config_staging]	Saved encoded configurations for the MID Servers.
Metric learned parameters [sa_metric_learned_param]	Parameters learned for CI/metric combinations, that will be synced to the MID Servers.
Metric To CI Mapping Deleted Details [sa_metric_map_deleted_detail]	Details about deleted entries from metric to CI mapping table. Includes CI, metric, and SysId of the deleted entry in the Metric To CI Mappings [sa_metric_map] table.
Track unique CIs created in metric map [sa_metric_ci_tracker]	All unique CIs for which metric map entry was created.
Metric Class [sa_metric_class]	Metric classes that can be associated with specific metrics to override bounds and widths learned values.
Metric Change Score [sa_metric_change_score]	Change events information.
Anomaly Test Rules [sa_metric_anomaly_test_rule]	Anomaly test rules used for anomaly model testing.
Anomaly test results [sa_metric_anomaly_test_result]	Results from anomaly model testing, such as bounds and anomaly scores.
Metric anomaly test config customized parameters [sa_metric_anomaly_test_config_custom_param]	Customized parameters for selected series in anomaly model testing.
Metric Intelligence Properties [sa_metric_property]	Metric Intelligence properties by domain.
Track host name with metric CI [sa_metric_ci_host]	CIs that are bind with node name from the binding event.
Functions supported by metric expression language [sa_metric_expr_function]	Functions supported by metric expression language.
Argument types for functions supported by metric expression language [sa_metric_expr_func_arg]	Argument types for functions supported by metric expression language.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Track CI Types to metric entries valid for different sources [sa_metric_ci_type_map]	Track CI Types to metric entries that are valid for different sources.
CI Type To Resource Class [sa_ci_type_to_resource_class]	Contains mappings of CI type to resource class. Used for resource binding during resource lookups given a CI and a `resource_path` in the event. The [sa_ci_type_to_resource_class] table contains some default mapping records, and the evt_mgmt_admin role is required to manage this table.
CI Resource [ci_resource]	Parent table used for resource binding.
CI Resource Hardware [ci_resource_hardware]	An extension of the CI Resource [ci_resource] table, used for resource binding.
CI Resource Application [ci_resource_appl]	An extension of the CI Resource [ci_resource] table, used for resource binding.
CI Resource Service [ci_resource_service]	An extension of the CI Resource [ci_resource] table, used for resource binding.
CI Resource VM [ci_resource_vm_object]	An extension of the CI Resource [ci_resource] table, used for resource binding.
CI Resource Database [ci_resource_database]	An extension of the CI Resource [ci_resource] table, used for resource binding.
Series Event History [sa_series_event_history]	Information about CIs start and end maintenance mode. Metric Intelligence stores historical information about the times CIs enter and exit maintenance mode if the system property sa.model_learner.maint_event_record_history_enabled is set to true (default). And if the system property sa_metric.maint_exclusion is also set to true (default), metrics from CIs that are in maintenance mode are excluded from model learning.
Metric Dashboard Metadata [sa_metric_dashboard_metadata]	Chart configurations per CI class, for the metrics that are displayed for a CI associated with an alert, in Agent Workspace.
Metric Config Anomaly Detection Staging [sa_metric_config_anomaly_detection_staging]	Internal table that is used to help calculate the action level for each entry in the Metric to CI Mapping [sa_metric_map] table.

Properties installed

Note: To open the System Property [sys_properties] table, enter `sys_properties.list` in the navigation filter. To open the Metric Settings [sa_metric_config_setting] table, enter `sa_metric_config_setting.list` in the navigation filter.

Property	Usage
sa.metric.map.with.ci.expiration.sec	Length of time (in seconds) that records for mapping of CIs remains in effect if the mapping to CI is found. • **Type**: numeric • **Default value**: 432000 • **Location**: System Property [sys_properties] table • **Learn more**: Metric Intelligence
sa.metric.map.without.ci.expiration.sec	Length of time (in seconds) that records for mapping of CIs remains in effect if the mapping to CI is not found. • **Type**: numeric • **Default value**: 86400 • **Location**: System Property [sys_properties] table • **Learn more**: Metric Intelligence
sa_metric.anomaly_score_stale_interval_in_days	The starting day of the window of time that the *Opera Metrics - Process Stale Anomaly Score* scheduled job uses when checking staleness status of score. The window of time spans from today, until the past nu specified in this property. • **Type**: numeric • **Default value**: 3 • **Location**: System Property [sys_properties] table
sa_metric.anomaly_score_next_stale_interval_in_days	Number of days by which to extend the window of time *Operational Metrics - Process Stale A Score - Daily* scheduled job. Applies if the job runs, but fails to return any data using the window of time specified by the *sa_metric.anomaly_score_stale_interva* property. • **Type**: numeric • **Default value**: 7 • **Location**: System Property [sys_properties] table
max_records_per_rest_request	Maximum number of records to download from the inst MID Server in each synchronization cycle.

	  ○ **Maximum value**: 20000
	• **Location**: Metric Settings [sa_metric_config_setting]

normalized_metric_max_queue_size	Size of metrics queue. Anomaly detector reads through
	and determines for each metric whether it is anomalou
	
	This property is for internal use.
	
	• **Type**: integer
	• **Default value**: 3000000
	• **Other possible values**:
	  ○ **Minimum value**: 1000000
	  ○ **Maximum value**: 5000000
	• **Location**: Metric Settings [sa_metric_config_setting]

normalized_metric_queue_consumer_count	Number of threads that concurrently perform anomaly
	
	This property is for internal use.
	
	• **Type**: integer
	• **Default value**: 12
	• **Other possible values**:
	  ○ **Minimum value**: 8
	  ○ **Maximum value**: 16
	• **Location**: Metric Settings [sa_metric_config_setting]

ignite_data_streamer_thread_count	Number of threads that data streamers use to write data
	cache.
	
	The data streamer creates batches from individual data
	adds these batches to the cache.
	
	This property is for internal use.
	
	• **Type**: integer
	• **Default value**: 8
	• **Other possible values**:
	  ○ **Minimum value**: 8
	  ○ **Maximum value**: 32
	• **Location**: Metric Settings [sa_metric_config_setting]

Property	Usage

ignite_data_streamer_flush_frequency	Frequency of automatic flush of data streamers.
	
	The data streamer creates batches from individual data adds these batches to the cache.
	
	This property is for internal use.
	
	• **Type**: integer
	• **Default value**: 1000
	• **Other possible values**:
	  ○ **Minimum value**: 0
	  ○ **Maximum value**: 30000
	• **Location**: Metric Settings [sa_metric_config_setting]

ignite_data_streamer_buffer_size	Buffer size of data streamers.
	
	The data streamer creates batches from individual data adds these batches to the cache.
	
	This property is for internal use.
	
	• **Type**: integer
	• **Default value**: 102400
	• **Other possible values**:
	  ○ **Minimum value**: 1024
	  ○ **Maximum value**: 1024000
	• **Location**: Metric Settings [sa_metric_config_setting]

ignite_data_streamer_batch_size	Size of the batch that is added to a data streamer.
	
	The data streamer creates batches from individual data adds these batches to the cache.
	
	This property is for internal use.
	
	• **Type**: integer
	• **Default value**: 5000
	• **Other possible values**:
	  ○ **Minimum value**: 1
	  ○ **Maximum value**: 10000
	• **Location**: Metric Settings [sa_metric_config_setting]

ignite_data_streamer_batch_flush_frequency	Frequency of automatic flush of internal batching befor data to data streamers. The data streamer creates batches from individual data adds these batches to the cache. This property is for internal use.

Property	Usage
	Adjust the setting of this property if there are related pe issues. • **Type**: integer • **Default value**: 1000 • **Location**: System Property [sys_properties] table • **Learn more**: Understanding Metric Intelligence
sa_metric.scheduled_jobs_to_monitor_sys_id_list	Contains the sys_ids of the 3 scheduled jobs that self-h monitoring for Metric Intelligence monitors: • Metric Intelligence — Metric configuration job • Metric Intelligence — Sync tables with mid • Metric Intelligence — Validate MID Distributed cluste

Quick start tests for Metric Intelligence

Validate that Metric Intelligence still works after you make any configuration change such as apply an upgrade or develop an application. Copy and configure these quick start tests to pass when using your instance-specific data.

Metric Intelligence quick start tests require activating the Metric Intelligence plugin (com.snc.sa.metric).

Metric Intelligence quick start tests

Test	Description	Release version
OI: Health Metrics Collection	An individual test that verifies the following: • There is at least one Metric Intelligence Metrics extension that is running. • There are entries for the 'Health Metrics' in the Metric to CI table. • For each of the Metric Intelligence Metrics extensions that are currently running, that there is data stored in MetricBase. If the test initially fails, wait until the Metric Intelligence Metrics extension runs for at least 10-15 minutes. Then try again.	Madrid

Event severities

The event severity numbers correspond to actual severities on the Metric Anomaly Score to Event Severity Maps page.

Event severity mapping

Event Severity Number	Event Severity
0	Clear (OK)
1	Critical
2	Major
3	Minor
4	Warning

Agent Client Collector for Visibility - Content reference

Review this information for details on OS query scripts, data collected, and definition of terms.

OS module scripts for Agent Client Collector for Visibility - Content (ACC-VC)

These platform-specific plugins invoke platform-specific module scripts. Each script outputs to a standard JSON payload regardless of the platform.

Operating System family/plugin	Name of module script
Linux: acc-f-modules	basic_inventory.rb (Starting with ACC-F version 2.10.1, this will not be used.)
	data_collection.rb
	running_processes.rb
	tcp_connections.rb
Windows: acc-f-modules	basic_inventory.rb (Starting with ACC-F version 2.10.1, this will not be used.)
	data_collection.rb
	running_processes.rb
	tcp_connections.rb
macOS Operating Systems: acc-f-modules	basic_inventory.rb (Starting with ACC-F version 2.10.1, this will not be used.)
	running_processes.rb
	tcp_connections.rb
Linux: acc-visibility-modules	installed_software.rb
	file_systems.rb
	storages_devices.rb (support for getting physical disk and corresponding disk partitions only)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operating System family/plugin	Name of module script
	network_adapters.rb
	local_users.rb
	enhanced_inventory.rb
	cloud.rb
Windows: acc-visibility-modules	installed_software.rb
	file_systems.rb
	storages_devices.rb (support for getting physical disk and corresponding disk partitions only)
	network_adapters.rb
	local_users.rb
	enhanced_inventory.rb
	cloud.rb
	sam_advanced.rb
	sam_processor.rb
	intel_ema.rb
macOS Operating Systems: acc-visibility-modules	installed_software.rb
	file_systems.rb
	storages_devices.rb (support for getting physical disk and corresponding disk partitions only)
	network_adapters.rb
	local_users.rb
	enhanced_inventory.rb
	cloud.rb

Note:

running_processes.rb and tcp_connections.rb are interdependent. For an efficient Discovery, keep both tcp_connections.rb and running_processes.rb together. Both the files are needed to get the complete data. If one is not there, it will not populate the other data.

To fetch information about all the running_processes on the macOS, you must provide sudo access to osquery. If this configuration is not made, then running_processes.rb will only fetch what is triggered by _servicenow user. For tcp_connections.rb, you must add 'sudo lsof' command in the sudoers file. If this is not done, tcp_connections.rb will only fetch what is triggered by _servicenow user.

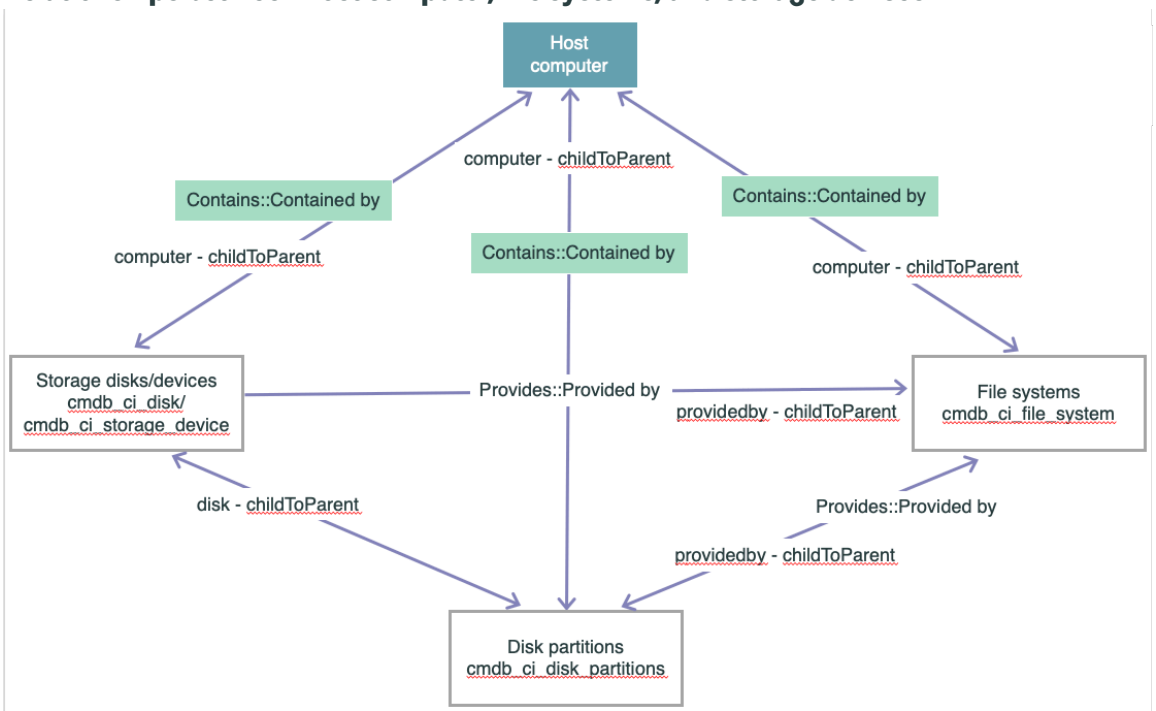
Data collected

ACC-VC uses the same classification criteria as IP-based Discovery for classifying as computer or server. The subset of collected data includes the following categories:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Basic inventory – Starting with ACC-F version 2.10.1, this will not be used.
- Data collection - Collects the necessary data for classification and identification of a host CI. This includes host name, serial numbers, and OS information.
- Installed Software – cmdb_sam_sw_install (if SAM enabled) and cmdb_software_instance (if SAM not enabled)
- File Systems – cmdb_ci_file_system
- Storage Devices – cmdb_ci_disk and cmdb_ci_storage_device
- Serial Numbers – cmdb_serial_number
- Network Adapters – cmdb_ci_network_adapter and cmdb_ci_ip_address
- TCP Connections – cmdb_tcp
- Running Processes – cmdb_running_process (ACC-VC also classifies the running processes and creates application CIs in cmdb_ci_appl, where possible)
- Local User – cmdb_os_user (Populates the local users for all the Operating Systems that ACC-VC supports by adding a new module called local_user)
- Enhanced inventory – Collects enhanced data (such CPU info, start_date, object_id) which is not necessary for identifying a unique host.

Relationships between host computer, file systems, and storage devices



Agent Client Collector terms

Agent Client Collector (ACC)

The software component installed on target hosts that communicates with the MID Server. Sometimes referred to as Agent. This component is a ServiceNow derivative of Sensu-Go.

Agent Client Collector Framework (ACC-F)

A ServiceNow base scoped application that leverages ACC and provides core capabilities (including Check Types, Check Definitions, Policies, and so on) enabling other ACC scoped applications, including ACC-M and ACC-VC.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector Monitoring Monitoring (ACC-M)

A ServiceNow scoped application enabling monitoring use cases.

Agent Client Collector for Visibility - Content (ACC-VC)

A ServiceNow scoped application that implements push-based Discovery leveraging ACC and ACC-F.

Horizontal IP-based Discovery

Traditional Discovery available to customers prior to ACC-VC. It discovers data via Probes and Patterns through the MID Server, requiring the Discovery Plugin.

Modules

A subset of discovered data that is populated as part of Discovery. Examples of Modules include: Data Collection, Installed Processes, Serial Numbers, File Systems, Storage Devices, Network Adapters, Running Processes, and TCP Connections.

Push-based Discovery

Discover data via ACC, ACC-F, ACC-VC, and the MID Server with a direct push of data from the target host. Discovery does not require specific IP range configuration on a Discovery Schedule or providing Discovery Credentials for target host.

Sensu-Go agent

The Free and Open Source project which ACC is derived from.

Virtual Machine Instance

A virtual target host running inside of a hypervisor, either on-premise or within a cloud service provider like AWS, GCP, or Microsoft Azure.

Virtual Machine Image

A snapshot of a live virtual machine instance persisted to a file system or cloud storage.

Agent Client Collector for Visibility - Content default checks and policies

Agent Client Collector for Visibility - Content (ACC-VC) provides various checks and policies as well as a business rule.

Policies

Note: ACC-VC policies execute at a frequency of once per day. The total data ingested would be approximately 572KB. This takes into consideration an average of approximately 1500 installed software applications and approximately 500 running processes other than CI data per machine.

ACC-VC policies

Name	Description	Checks definitions
Enhanced Discovery	Runs on a schedule, by default every 24 hours (86400 seconds). The policy interval can be adjusted, for example to run every 4 hours (set the interval to 14400). The ACC-VC policy configuration is synced to all agents based on the policy filter defined by	Enhanced Discovery

ACC-VC policies (continued)

Name	Description	Checks definitions
	ACC-VC. Update the following ACC-F system properties, if needed: • *sn_agent.disco_minimum_threshold_for_rediscovery_minu* to avoid discovering the system too frequently. • *sn_agent.disco_disable_ci_clobber_of_agentless_disco* to avoid Discovery conflicts. • *sn_agent.disco_ci_clobber_of_agentless_disco_thresho* to avoid Discovery conflicts.	
SAM Discovery	Responsible for capturing the software installed on any endpoint device, such as Windows desktops or macOS servers.	Software installations and usage metrics
SAM background	Enables a background job for processing the Osqueryd logs for SAM on Windows and macOS endpoint devices.	SAM background log check
SAM background (Non OsqueryD)	Enables a background job to collect SAM information using osqueryi instead of osqueryd.	SAM Background Policy (Non OsqueryD)
Software installed	Responsible for capturing the software installed on all devices except for Windows endpoint devices. The data collected is stored in the [cmdb_sam_sw_install] table. Scheduled to run every 24 hours.	installed software
File-based Discovery background policy	Takes the config file as input from the instance to an agent. Scans the system using config file parameters and stores the output in two separate files on the agent. • FBDSAMOutput.json: Stores metadata related to the set of file names generated from the *samp_file_name* table. • FBDFileOutput.json: Stores metadata related to files scanned by a wildcard extension.	File-based discovery background

ACC-VC policies (continued)

Name	Description	Checks definitions
	Runs on the agent when file-based discovery is invoked. For details, see Agent Client Collector File-Based Discovery. Default: false. To activate, navigate to **All** > **Discovery Definition** > **Configuration Console** and in the **File Based Discovery** section, activate the Enable File Based Discovery toggle switch.	
File-based Discovery - SAM	Discovers known software files on the endpoint. Uses an allowlist of recognized software filenames maintained by ServiceNow. When a file on disk matches an allowlist entry, FBD uses the FileBasedDiscovery API to identify the collected software metadata (file name, path, size, and version), identifies the software package it belongs to and records the installation on the instance. Unrecognized files are tracked in the unidentified file records table (cmdb_unidentified_file_set). Runs daily. Default: false. To activate, navigate to **All** > **Discovery Definition** > **Configuration Console** and in the **File Based Discovery** section, activate the Enable File Based Discovery toggle switch.	File-based discovery - SAM
File-based Discovery - SWID tag	Enables SWID tag scanning on a Windows, Linux or macOS platform. When enabled, the scanner looks for `.swid`, `.swidtag`, and `.cmptag` files in the configured scan directories. Stores results in the following tables:	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACC-VC policies (continued)

Name	Description	Checks definitions
	• cmdb_swid_tag: Parsed SWID tag records • cmdb_file_information: Individual file records • cmdb_sam_sw_install: Individual software records Default: false. To activate, navigate to **All** > **Discovery Definition** > **Configuration Console** and in the **File Based Discovery** section, activate the Enable File Based Discovery toggle switch.	
File-based Discovery - File management	Discovers files based on customer-defined rules. Administrators configure which file extensions to look for and define filename matching rules such as exact match, starts with, ends with, or contains. This policy builds a device-level file inventory based on the organization's specific needs. Results are stored in the sn_acc_vis_content_device_file_information table. Configure rules in the File Matching rules (sn_acc_vis_contet_file_config) and File extensions (sn_acc_vis_content_file_extension) properties. For details on these properties, see Agent Client Collector File-Based Discovery properties. File Management supports delta scanning; after the initial full scan, only added, modified, and deleted files are sent on subsequent runs. For details on delta scanning, see Agent Client Collector File-Based Discovery. Default: false. To activate, navigate to **All** > **Discovery Definition** > **Configuration**	File-based discovery - File management

ACC-VC policies (continued)

Name	Description	Checks definitions
	Console and in the **File Based Discovery** section, activate the Enable File Based Discovery toggle switch.	
VISC Get application metric	Retrieves the SaaS application metrics from the agents. For details on enabling SaaS usage monitoring with ACC-VC, see the SaaS Usage Monitoring with Agent Client Collector [KB2320193] article in the Now Support Knowledge Base.	VISC Get application metric
VISC Get browser extension device init	Initializes the DEX browser extension with the host sysID.	VISC Get browser extension device init
VISC Get browser extension init	Initializes the DEX browser extension with logged-in users.	VISC Get browser extension init
VISC Get URL metrics	Controls the collection of web usage data from Windows and macOS managed devices. Runs daily. Default: Inactive. To activate the policy, set the *sn_acc_vis_content.enable_full_monitoring* property to **true**. For details on web usage data system properties, see Web usage data collection tables and fields.	VISC Get URL metrics

Note: Windows endpoint devices include devices that have a Windows operating system and belong to CI class: computer.

See System properties for more details. For more details on policies, see Checks and policies.

Check type

ACC-VC has the following check types: *Enhanced Discovery*, *SAM Advanced Discovery*, and *Installed Software*.

Enhanced Discovery

This check type is responsible for invoking the EnhancedDiscoveryHandler script include that processes the payload produced by endpoint_discovery.rb as executed by ACC.

Used by File-base Discovery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SAM Advanced Discovery

This check type is for the SAM Discovery policy that invokes the EnhancedDiscoveryHandler script include for processing the SAM data produced by the sam_advanced.rb file.

Installed Software

This check type for the *Software installed policy* that invokes the EnhancedDiscoveryHandler script include for processing the installed software data produced by the installed_software.rb file.

Check definitions

ACC-VC check definitions

Name	Description

Enhanced Discovery	Synced to all agents based on the policy filter defined by ACC-VC. The Check definition is configured to run with certain assets and determines what gets synced between the agent and the MID Server. For more details on policies, see Checks and policies.
	
	Note:
	
	For the agent to retrieve the OS serial numbers and TCP connections along with associated running processes, sudo access for "dmidecode" and "ss" is required on Linux systems. For example, this content could be added to /etc/sudoers or to an individual file in `/etc/sudoers.d/`:
	
	`Cmnd_Alias AGENT_ACC_V = /usr/sbin/dmidecode -s baseboard-serial-number,/usr/sbin/dmidecode -s chassis-serial-number,/usr/sbin/dmidecode -s system-serial-number,/usr/sbin/dmidecode -s system-uuid,/usr/sbin/ss -tanp`
	`servicenow ALL=(root) NOPASSWD:AGENT_ACC_V`

SAM background log check	Runs every 8 minutes and performs inline aggregation of data generated from Osqueryd logs. After collecting the data, it writes all the intermediate data results into a temporary marker file which is reused in the next run. This reuse limits the number of log files and disk space needed on target systems.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ACC-VC check definitions (continued)

Name	Description
	Note: You may notice a spike in system resource consumption, as the background aggregation check runs every interval.
Software installations and usage metrics	Collects data every 24 hours.
Installed software	Fetches installed software data for all devices other than Windows and macOS endpoint devices.
File-based discovery background	Runs a file scanning background job on the agent.
File-based discovery	Fetches the file data from the agent.

Business rule

The *Enhanced Discovery - On CI Delete* business rule triggers the Endpoint Discovery Check when the CI associated with a given CI is deleted from sn_agent_cmdb_ci_agent.

Agent Client Collector MID-less installation command parameters

Description of the command line parameters used during MID-less Agent Client Collector installation.

Installation command line parameters

Parameter	Description
CONNECT_WITHOUT_MID	Specify **true** to enable MID-less Agent Client Collector installation. If you don't specify a value, the regular MID Server websocket installation is invoked.
ACC_CNC	Specify a public gateway endpoint for Agent Client Collector.
REGISTRATION_KEY	Active and valid registration key for the agent to communicate with.
INSTANCE_URL	ServiceNow instance that the agent is registered with.
ACC_ALLOW_LIST	Optional string; to disable the allow list, set *ACC_ALLOW_LIST=0*. By default, the allow list is enabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Installation command line parameters (continued)

Parameter	Description
	Note: Disabling the allow list compromises your system's security and is intended as a temporary measure while you're updating the allow list. After completing the update, enable the allow list by setting **ACC_ALLOW_LIST=1**.
ACC_VALIDATE_SIG	Optional string; to disable verification of the installer certification validation, set *ACC_VALIDATE_SIG=0* that you can add to disable the verification of the installer certification validation. By default, validation is enabled. **Note:** Disable the certification validation only when using non-standard signature validation tools.

Data collected during Agent Client Collector for Visibility - Content file-based Discovery

The following tables describe the data collected during Agent Client Collector for Visibility - Content file-based Discovery.

Java Audit [ora_java_audit]

Field	Description
Name	Name of the record. For example: Java@hostname
Physical Machine Name	Name of the host CI
Machine Type	Either Server(S) or Desktop(D)
Java Publisher/Runtime Vendor	Java Vendor name
Operating System	Operating system in which the java is run
Environment Type	Production or Development or QA environment
Java Release/Version/Build	Java Version
Installation Path	Absolute installation path of the java binary
Installation Date (DateTime)	The date and time of the java binary file created on the file system
Release File (Y / N)	Indicates if a *release.md* file exists in the installation
Processor Make/Model	Processor model name

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Java Audit [ora_java_audit] (continued)

Field	Description
Sockets (Integer)	Number of CPU sockets
Cores (Integer)	Number of CPU cores
V6 and earlier	Indicates if you have a 6 or earlier java version
Open Source	Indicates if you have an open-source java installation
Unlock Commercial features	Indicates if you have the commercial features (like JFR) enabled. Not collected during ACC-VC file-based discovery (FBD).
Mission Control	Indicates if the mission control plugin is enabled
AMC Agent	Indicates if the AMC agent plugin is enabled. Not collected during ACC-VC file-based discovery (FBD).
Usage Tracker	Indicates if the Usage Tracker feature is enabled
Virtual Machine Object ID	Object ID of the Virtual machine instance
PID	Running process PID
IP Address	IP address of the host/VM
First Discovered	The date of the first discovery
Most recent discovery	The date of the most recent discovery
Discovery Source	The discovery method
Application	Reference to the [cmdb_ci_appl] table
Software installation	Reference to the [cmdb_sam_sw_install] table
Java evidence	Reference to the [cmdb_ora_java_evidence] table
Host	Reference to the [cmdb_ci] table

Java Evidence [ora_java_evidence]

Field	Description
Running process	Reference to the [cmdb_running_process] table
Host CI	Reference to the [cmdb_ci_computer] table
File information	Provides a reference to the [cmdb_file_information] table. Relevant only for file-based discovery (FBD); in pattern-based discovery, this field remains empty.

File based discovery system properties

Property	Description
File matching rules (*sn_acc_vis_content_file_config*)	Defines the filename matching rules. Each rule specifies: • File name: The pattern to match. • Condition: `exact_match`, `starts_with`, `ends_with`, or `contains`. • Extension: Reference to the *sn_acc_vis_content_file_extension* property.
File extensions (*sn_acc_vis_content_file_extension*)	Defines which file extensions to scan for File Management (such as .exe, .dll, .msi, .pkg, and so forth). Each record specifies an extension and the platform it applies to (Windows, Mac, or All).
Full Scan Mode (*sn_acc_vis_content.file_disovery.enable_file_config*)	When false (strict mode), only files that match a rule in the *File Config* table are discovered. When true, all files with a matching extension are discovered only if no specific rule exists for them. Default: false
Delta Scan Frequency (*sn_acc_vis_content.file_discovery.force_full_scan_frequency_count*)	The number of delta scans to perform before forcing a full scan. This ensures data accuracy over time. For details on delta scanning, see Agent Client Collector File-Based Discovery.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File based discovery system properties (continued)

Property	Description
	Default: 5
MME Types (Linux only) (*sn_acc_vis_content.file_discovery.linux_types*)	Colon-separated list of MIME types to scan on Linux (for example, `application/x-pie-executable:text/x-shellscript`). On Linux, File Management uses MIME type detection instead of extension-based matching.
Running process-based discovery (*sn_acc_vis_content.file_discovery.rbd_process_scan_enabled*)	Running process-based discovery enables the ACC-VC agent to detect software running outside of standard scan directories, including applications that a directory-only scan can't detect. Default: false
Archive file scanning (*sn_acc_vis_content.file_discovery.archive_scan_enabled*)	Archive file scanning extends file-based discovery to look inside ZIP and JAR archive files and report the files contained within them. This enables discovery of software artifacts that are distributed in compressed packages without requiring the archive to be extracted on the endpoint. Default: false

Performance throttling

The throttling properties control how File-Based Discovery manages system resources during scanning operations. The throttle size determines how many files are processed in each batch, while the sleep time controls the pause duration between batches to prevent excessive system load.

Path configuration

Path properties support environment variables and wildcards for flexible directory specification. Use pipe separators (|) for Windows paths and colon separators (:) for Linux and macOS paths. The ignore path properties allow you to exclude specific directories from scanning to improve performance and avoid unnecessary data collection.

Web usage data collection tables and fields

Description of the tables and their fields used when gathering web usage data from your Windows and macOS machines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collection tables

Name	Description
User Web Usage (sn_acc_vis_content_user_web_usage)	Stores per-user, per-device, per-domain web usage records, including page visit counts and data measured by each day.
Application Domain (sn_acc_vis_content_application_domain)	Stores domain-level information. Updated with aggregated totals (total page views, total users, daily trends) by the daily aggregation job. Domains not previously configured are automatically created here when collected via full monitoring.
Application (sn_acc_vis_content_application)	Stores service application records that group one or more domains. Each application is linked to a CMDB service and a source.

User web usage table fields

Name	Description
Domain (domain)	The application domain of the visited website.
Device (device_id)	The computer (cmdb_ci_computer) from which the website was accessed.
User (user)	User that accessed the website.
Last Accessed (last_accessed)	Date and time that the website was last accessed.
Page Visits (page_visits)	Number of page visits for the current user-domain-device combination.
Page Visits Daywise (page_visits_daywise)	A JSON object storing page visit counts, broken down by day for the retention period (for example, {"2026-03-15": "12", "2026-03-16": "8"})

Application Domain table fields

Name	Description
Application (application)	Application record that the domain belongs to.
Domain (domain)	Domain name that can be monitored (such as `example.com`). The display field. Must be unique.
Category (category)	The URL category (sn_acc_vis_content_url_category) for the domain.
Domain Type (domain_type)	Indicates whether the domain is internal or external. Default: external

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application Domain table fields (continued)

Name	Description
CMDB endpoint http (endpoint_http)	The CMDB HTTP endpoint (cmdb_ci_endpoint_http) for SaaS applications.
Metric monitoring (monitored)	Indicates whether the domain is monitored for metrics. Default: false
Total accessed time (total_accessed_time)	Total accumulated access duration for the domain.
Total users (total_users)	Total number of unique users who accessed the domain. Updated by the daily aggregation job.
Last accessed time (last_accessed_time)	Date and time that the domain was last accessed.
Total page views (total_page_views)	Total number of page views for the domain. Updated by the daily aggregation job.
Total page views daywise (total_page_views_day_wise)	A JSON object storing total page view counts broken down by day (for example, {"2026-03-15": "120", "2026-03-16": "85"}). Updated by the daily aggregation job.

Application table fields

Name	Description
Service (ci_id)	The CMDB service (cmdb_ci_service) associated with the application. The display field.
SAMP product (samp_sw_product)	The Software Asset Management product (samp_sw_product) for the application.
Source (source)	The source (sn_acc_vis_content_source) that discovered or created the application.
Type (type)	Type of application: web or installed Default: web
Metric monitoring (monitored)	Indicates whether the application is monitored for metrics. Read-only. Default: false

Archive file scanning filtering rules and limits

Reference information for the filtering rules and performance safeguards that apply when Agent Client Collector for Visibility - Content scans ZIP and JAR archive files during File-Based Discovery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filtering rules

Archive entries are filtered using the same rules as files found on disk, with the following differences.

Archive file scanning filtering rules

Capability	Regular files	Archive entries
SAM allowlist matching	Yes	Yes
File Management extension rules	Yes	Yes
MIME type detection (Linux)	Yes	No. The file does not exist on disk, so the system can't inspect its content type
Version detection	Yes	No. Version can't be queried for a file that hasn't been extracted
SWID tag support	Yes	No. Archive contents aren't decompressed or read, so SWID tags inside ZIP or JAR files aren't processed

Note: On Linux, File Management matching relies on MIME type detection rather than extension rules. As a result, archive entries can only be matched by SAM rules, not by MIME type.

Performance safeguards

The following limits are enforced to prevent archive scanning from affecting agent performance or endpoint stability.

Archive file scanning performance safeguards

Safeguard	Limit	Behavior when exceeded
Maximum archive file size	500 MB	Archive is skipped entirely
Maximum entries per archive	50,000 files	Scanning stops after the limit; entries discovered so far are retained
Per-archive timeout	30 seconds	Scanning of that archive is aborted; entries discovered so far are retained
Corrupt or password-protected archives	Not applicable	Detected automatically, logged, and skipped
Nested archives (archive inside an archive)	Not applicable	Not scanned. Only top-level archives on disk are inspected
Global file limit (*maxFiles*)	Configured per policy	Archive entries count toward the global file limit; scanning stops when the limit is reached

License key discovery and access control tables

Reference information for the tables, fields, access control, and scheduled job used by license key discovery in Agent Client Collector for Visibility - Content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables

License key discovery uses the following tables.

License key discovery tables

Table	Label	Purpose
sn_acc_vis_content_license_registry_config	License Registry Configuration	Admin-managed list of registry paths and value names to collect from managed endpoints.
sn_acc_vis_content_license_keys	License Keys	Stores the license key values collected from endpoint devices.

License Keys table fields

The **License Keys** [sn_acc_vis_content_license_keys] table stores the following fields for each discovered key.

License Keys form

Field	Description
Configuration Item	Device the key was collected from. Table: cmdb_ci_computer.
Product	SAM product associated with this key. Table: samp_sw_product.
User	This field is automatically set to the user assigned to the CI. Table: sys_user.
License Key Config	Configuration rule that discovered this key. Table: sn_acc_vis_content_license_registry_config.
Resolved Registry Path	Exact registry path the key was read from on the endpoint.
License Key	Discovered key value.
Last Scanned	Date the key was last detected by the agent.
Absent	Selected when the key is no longer found on the device. Records are never deleted, they are marked **Absent** instead.

License Registry Configuration form fields

The following table describes the fields in the License Registry Configuration [sn_acc_vis_content_license_registry_config] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

License Registry Configuration form

Field	Description
Product	SAM product this license key belongs to. Links to the SAM Professional product catalog.
Registry Path	Windows registry path where the key is stored. For example, HKLM\SOFTWARE\Microsoft\Office\16.0\Registration.
Registry Value Name	Specific registry value to read. For example, DigitalProductId.
Name	This field is automatically set to a combination of the **Product** and **Registry Value Name** values.
Description	Notes about this configuration record.
Active	Indicator of whether this record is included in future collections. Clearing this check box removes the record from future collections.

Note: The combination of **Product**, **Registry Path**, and **Registry Value Name** must be unique across all configuration records.

Access control

The following table shows which roles can access each license key discovery table.

License key discovery role access

Role	License Registry Configuration table	License Keys table
ACC application admin (agent_client_collector_admin)	Read, write, create	Read only
Discovery admin (discovery_admin)	Read, write, create	Read only
SAM admin (sam_admin)	Read only	Read only
All other roles	No access	No access

Scheduled job

The following scheduled job supports license key discovery.

License key discovery scheduled job

Job	Schedule	Condition
Refresh License Key Config File	Daily at 8:30 a.m. UTC	Runs only when the *sn_acc_vis_content.enable_license_key_discovery* property is set to `true` and the SAM Professional plugin (com.snc.samp) is activated.

Running process-based discovery platform coverage and properties

Platform coverage identifies which operating systems are supported and what privileges the agent needs for full coverage. The system property controls whether the feature is enabled or disabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Platform coverage

Coverage depends on the privileges available to the agent on each operating system.

Platform coverage for running process-based discovery

Platform	Default coverage	Requirement for full coverage
Windows	Full coverage of all running processes.	The ACC service must run as the Local System account. Set the ACC service's **Log On As** to **Local System**.
Linux	Limited to processes owned by the agent service account.	The agent service account must have permission to query process information for processes owned by other users. The `servicenow` user must be able to run `osqueryi` without a password. For more information about `servicenow` user permissions for `osqueryi`, see Configure ServiceNow sudoers file.
macOS	Limited to processes owned by the agent service account.	The agent service account must have permission to query process information for processes owned by other users. The `_servicenow` user must be able to run `osqueryi` without a password. For more information about `_servicenow` user permissions for `osqueryi`, see Configure ServiceNow sudoers file.

Note: On Linux and macOS, if the additional privilege is not granted, the feature still runs but discovers directories only for processes owned by the agent service account. The daily scan continues normally on your configured directories. No errors are raised.

System property

The following property controls whether running process-based discovery is active. You can configure it from the System Properties page (**All** > **System Properties** > **All Properties**).

Running process-based discovery system property

Property	Default	Description
sn_acc_vis_content.file_discovery.fbd_process_scan_enabled	`false`	Primary on/off control for running process-based discovery. When set to `true`, the agent policy that collects process directories is activated

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Running process-based discovery system property (continued)

Property	Default	Description
		and the daily FBD scan includes process-discovered directories. When set to `false`, collection stops and the daily scan uses only your configured scan directories.

Agent Client Collector Log Analytics

Agent Client Collector Log Analytics (ACC-L) enables you to stream log data from Linux and Windows hosts to a ServiceNow instance, using the Agent Client Collector.

As with Agent Client Collector Framework (ACC-F), the Agent Client Collector connects to a MID Server. A single MID Server may support multiple agents, while a single agent works with one MID Server at a time and switches to a different MID Server when necessary to provide failover protection.

Use the Agent Client Collector to stream log data to your ServiceNow® instance by means of a log shipper. The log data is mapped and structured in the ServiceNow® Health Log Analytics application. For more information, see the Health Log Analytics product documentation.

Agent Client Collector Log Analytics has a dependency on the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store. Streaming log data from Windows hosts is supported in Agent Client Collector Log Analytics Version 3.1.0 and later.

The Agent Client Collector Log Analytics (ACC-L) application, Version 3.2.0, August 2022, has a dependency on the Agent Client Collector Framework (ACC-F) application, Version 2.10.1, August 2022.

To enable Agent Client Collector Log Analytics, you enable log analytics on the Agent Client Collector, as described in Set up Agent Client Collector Log Analytics without using guided setup.

Dependencies

For a list of Agent Client Collector Log Analytics plugin dependencies, see Plugins or applications installed with ITOM AIOps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up additional ACC data inputs

Data inputs for streaming log messages to your ServiceNow instance using the Agent Client Collector are created automatically as part of the Agent Client Collector setup. Set up additional ACC data inputs manually as needed using the Health Log Analytics data input setup flow.

Before you begin

- The Agent Client Collector Log Analytics application has a dependency on the following ServiceNow applications, available from the ServiceNow Store:
  - Health Log Analytics, Version 22.0.12 - December 2021 and later releases.
  - Agent Client Collector -Framework, Version 2.7.0 - December 2021 and later releases.
- Verify that a MID Server is installed and configured. For more information, see MID Server system requirements.
- The MID Server must be configured to work with the Agent Client Collector. For more information, see Enable Agent Client Collector monitoring on the MID Server.

Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

Role required: evt_mgmt_admin

About this task

It is important to configure an ACC data input for every MID Server to which Agent Client Collectors can connect, even if no agent is currently connected to it. An agent works with one MID Server at a time, but is connected to a different MID Server when necessary to provide failover protection.

Important: As part of the standard Health Log Analytics data input setup, you can define JavaScript functions for mapping and preprocessing raw log data. The JavaScript function must be identical for all ACC data inputs, because agents will switch to a different ACC data input when the system connects them to a different MID Server to provide failover protection. The latest published JavaScript function is provided to all existing and future ACC data inputs and replaces the previous one. This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store.

Procedure

1. Set up additional ACC data inputs manually using the Health Log Analytics data input setup flow.
   For more information, see Configure ACC data inputs manually.
2. Identify and address log streaming issues to ensure that your data inputs are streaming data properly.
   For more information, see Ensure that the data input is streaming data.
3. Determine how Health Log Analytics handles raw log data that is streaming into your instance. By default, every incoming log line is auto-mapped to the correct tag. If properties aren't discovered automatically, map the data input sources manually by defining a JavaScript function. For more information, see Map the raw data.
4. **Optional:** Modify raw log data and drop or break up log messages before they are processed. Define a JavaScript function that modifies your raw log data before Health Log Analytics maps and structures it. For more information, see Edit your raw log data before processing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** Refine the source type structure to make sure that Health Log Analytics extracts and classifies all properties correctly.
   For more information, see Refine the source type structure in Health Log Analytics.

Configure ACC data inputs manually

Agent Client Collector setup automatically creates an ACC data input for streaming log messages to your ServiceNow instance. You can set up additional ACC data inputs manually as needed.

Before you begin

- The Agent Client Collector Log Analytics application has a dependency on the following ServiceNow applications, available from the ServiceNow Store:
  - Health Log Analytics, Version 22.0.12 - December 2021 and later releases.
  - Agent Client Collector -Framework, Version 2.7.0 - December 2021 and later releases.
- Verify that a MID Server is installed and configured. For more information, see MID Server system requirements.
- The MID Server must be configured to work with the Agent Client Collector. For more information, see Enable Agent Client Collector monitoring on the MID Server.

Important: Health Log Analytics does not support IPv6. To work with the application, configure the MID Server to IPv4.

Note: Currently, this setup only supports basic authentication with the MID Server. mTLS is not supported.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Data Inputs**.
2. Select **New**.
3. On the form, fill in the fields.
   For a description of the fields, see ACC data input configuration fields.
4. **Optional:** Select **Advanced** to set additional configuration fields.
5. Select **Save**.
   Health Log Analytics adds the data input record to the Data Inputs table.
6. Ensure that the data input is configured correctly by selecting **Test connection**.

   Health Log Analytics tries to connect the MID Server to the data repository.

   - If the connection was established, the **Test connection** button is turned off and the **Publish** button is enabled.
   - If the connection failed, the reason for the failure displays in the **Error message** field. This field displays only when a streaming error has occurred.

     Resolve the issue, select **Save** if you modified the configuration, and then select **Test connection** to test the connection again.

     Note: You can only publish the data input configuration when the connection is created successfully.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can revert to the last published configuration by selecting **Revert Changes**. This option is available only when you're modifying a configuration that has been published previously.

7. Select **Publish** to publish the data input to the MID Server.

Result

The new data input is ready to stream logs.

Note: The data input record includes these related lists:

- Agents – Lists all active agents connected to the MID Server for this data input.
- Streaming Sources – Lists all sources for this data input and the MID Server that receives logs from it.

What to do next

Ensure that the data input is streaming data.

ACC data input configuration fields

Description of the fields on the ACC data input configuration form.

Basic configuration

Field	Description
MID	The MID Server to which the logs stream. **Note:** • Only one ACC data input can be defined per MID Server. You can select only MID Servers with AgentClientCollector capability that support basic authentication. MID Servers that support mTLS are not listed. • The default maximum number of data inputs streaming logs to a single MID Server is 10. You can modify this number in the MID Server properties. However, when 10 data inputs that are not ACC data inputs have been defined for a MID Server, one ACC data input can still be defined for it, making a total of 11 data inputs defined for that MID Server. • When you submit the form, this field becomes read-only. This field is required.
Port	The port on the MID Server. The port must be configured and active. It must not be occupied by another process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic configuration (continued)

Field	Description
	Make sure that your organization's security team opens the port before you assign it. **Note:** When you update the port, the system updates the Agent Client Collector with the new port configuration. Log streaming continues seamlessly without log loss after 1-3 minutes. This field is required.
Description	Description of the data input.

The fields in the following table show read-only information.

Field	Description
Name	The name of the data input: Agent Log Analytics. **Note:** All ACC data inputs have the same name. You can identify an ACC data input by the name of the MID Server that is defined for it.
Status	The status of the data input.
Transport	The protocol used to send the log data. The ACC data input sends data using a ServiceNow Agent.
Sources count	The total number of log sources originating from all ACC data inputs together. This feature is supported in the Health Log Analytics application, Version 22.0.12 - December 2021 and later, available from the ServiceNow Store.
Disabled since	The time when the data input stopped or failed.
Last log time	The time when the last log streamed in the data input.
Error message	The streaming error. This field is populated automatically. It displays only when a streaming error has occurred.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced configuration

Field	Description	Default value
Look up hostnames	Option for selecting to perform DNS lookup to resolve IPs to hostnames.	false
Use SSL	Option for selecting to use SSL.	true
Client inactivity timeout (sec)	The timeout, in seconds, to close an inactive channel.	15
Worker thread count	The number of threads that handle incoming data.	4
Default time zone	The default time zone of events. The system uses this default when the log does not specify a time zone.	GMT
Sub sample drop ratio	The ratio of events to drop.	-1
Sub sample receive ratio	The ratio of events to receive.	-1
Max length in bytes	The maximum length of log messages, in bytes.	32,766
Character encoding	The character encoding for this data input.	UTF-8
Drop if queue is full	Option for selecting to discard logs if many processes are waiting in the queue to access the MID Server.	false

Agent Client Collector log policies

Agent Client Collector data inputs stream log messages to your ServiceNow instance using the ServiceNow Agent Client Collector. The Agent Client Collector Log Analytics (ACC-L) application provides predefined log policies for collecting log data from the CIs monitored by the ACC.

You can work with Agent Client Collector log policies in the following ways:

- Use the system's predefined log policies.

  The default ACC-L log policies consist of the monitored CIs and the check that runs on those CIs. For a complete list of the predefined log policies and monitored CI types, see Agent Client Collector Log Analytics default policies and checks.

- Edit a predefined log policy.

  For example, you can modify a default policy if your organization always uses a specific non-default log path. For more information, see Edit a log policy.

- Customize a published log policy by creating a child policy from it.

  You can use an existing log policy (the parent policy) as a template to create a new log policy (the child policy). You then customize the parameters that the child policy inherits from the parent to focus on a subgroup of its CIs or services. For example, create a child policy if your

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

organization saves a subset of IIS Server logs to a different location. For more information, see Create a child log policy.

Note: The child policy is inherently more specific than its parent policy. When Agent Client Collector matches a condition defined in the child policy, it will not try to match the parent policy.

- Define a new log policy when no policy exists for the CI that you want Agent Client Collector to monitor.

  For more information, see Create an Agent Client Collector log policy. For a general explanation of Agent Client Collector policies, see Checks and policies.

Agent Client Collector Log Analytics default policies and checks

Agent Client Collector Log Analytics provides various default policies and checks.

Streaming log data from Windows hosts is supported in Agent Client Collector Log Analytics Version 3.1.0 and later.

Default ACC-L policies

Name	OS	Description	Check
Apache on Linux Logs	Linux	Collects logs from Apache servers running on a Linux OS and sends them to the MID Server for further analysis.	log shipper
Apache on Windows Logs	Windows	Collects logs from Apache servers running on a Windows OS and sends them to the MID Server for further analysis.	log shipper
IIS logs	Windows	Collects logs from Microsoft IIS web servers and sends them to the MID Server for further analysis.	log shipper
JBoss/WildFly Application Server on Linux Logs	Linux	Collects logs from JBoss/WildFly application servers running on a Linux OS and sends them to the MID Server for further analysis.	log shipper
JBoss/WildFly Application Server on Windows Logs	Windows	Collects logs from JBoss/WildFly application servers running on a Windows OS and sends them	log shipper

Name	OS	Description	Check
		servers and sends them to the MID Server for further analysis. **Note:** • The log path that WebLogic uses has two environment variables, as described in the WebLogic documentation. For more information, see Environment variables. • On both Windows and Linux, Agent Client Collector Log Analytics adds a default environment variable from the WebLogic documentation to the log path. You can either use this default environment variable to get the full directory, or change it manually if you prefer to use a known direct directory. For information about customizing the environment variable, see Edit log path configurations.	
WebSphere Application Server on Linux Logs	Linux	Collects logs from WebSphere application servers running on a Linux OS	log shipper

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	OS	Description	Check
		and sends them to the MID Server for further analysis.	
Windows OS Event Logs	Windows	Collects Windows event logs from Windows servers and sends them to the MID Server for further analysis.	log shipper for win events

Environment variables

The log path used for collecting logs from certain servers may contain environment variables. It's important to note that on Linux systems, the ACC Agent can only access environment variables that reside in the `/etc/environment` file. Add the environment variables that the agent must access to the `/etc/environment` file using the format *<NAME>='<VALUE>'*. On Windows systems, you can create environment variables in the usual manner.

Default ACC-L checks

Agent Client Collector Log Analytics (ACC-L) provides the following default **Type=Log** checks.

- The *`log shipper`* check launches a background process that sends logs from servers to an agent data input, according to the check's configured log path. When access permissions are lacking or the log path is configured incorrectly, the system sends an alert to the instance. For proper log configuration, ensure that the *`servicenow`* user has permissions to access the configured log path on the machine that is hosting the agent, and that the log path is configured correctly.
- The *`log shipper for win events`* check is similar to the *`log shipper`* check, but sends event logs from Windows OS servers to the agent data input.

> **Note:** To collect Security Windows event logs, *`servicenow`* users on an agent hosting machine must have admin privileges.

Create an Agent Client Collector log policy

Create a new ACC log policy when no default policy exists for the CI that you want Agent Client Collector to monitor.

Before you begin

- The Agent Client Collector Log Analytics (ACC-L) application, available from the ServiceNow Store, must be installed. For more information, see Agent Client Collector installation.
- The Agent Client Collector comes with the default *`servicenow`* user. Ensure that this user has read access to enable Agent Client Collector to view all the configured log paths. For example, the Agent Client Collector *`servicenow`* user that comes installed with the base system does not have permissions to view the paths to `/var/log/` in Linux and `C:\Windows\System32` in Windows. For information about configuring permissions for the *`servicenow`* user, see the ACC-L Permission Denied issues [KB1117271] article in the Now Support Knowledge Base.

Role required: agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Log Policies**.
   The **Policies** page displays all Log Analytics policies. For a list of the policies that come with the base system, see Agent Client Collector Log Analytics default policies and checks.
2. Click **New**.

   Note: For general information about creating an ACC policy, see Create a new Agent Client Collector policy.

3. On the form, fill in the fields.

   Policy Definition Form

Field	Description
Name	A descriptive name for the policy.
Description	Description of the policy.
Publish status	Hard coded as **Draft**, which means that the policy has not yet been published. You cannot edit this field.
Hierarchy	Hard coded as **None**. When a child policy is added to the policy, the value changes to **Parent**. Child policies have a value of **Child**.

4. On the **Checks** tab, associate the log policy with the relevant log shipper check.
   - For Linux and Windows, except for Windows event logs, select the *`log shipper`* check definition.
   - For Windows event logs only, select the *`log shipper for win events`* check definition.
5. On the **Monitored CIs** tab, specify the CIs to which the policy applies.

   a. Choose the CI type to be monitored.
   - **Monitored CI type by filter**: Select the monitored CI type. You can narrow down the CIs that will be monitored by using filter conditions.
   - **Monitored CI type by script**: Specify the monitored CIs by using a script.
   - **Monitored CI type by CMDB Group**: Specify the monitored CIs by using CMDB group queries.

   For more information about choosing monitored CI types, see Create a new Agent Client Collector policy.

   b. **Optional:** Monitor only CIs that are associated with an Application Service by selecting **Filter Monitored CIs by Application Service**.
   You can specify the Application Services to be monitored by using filter conditions. Agent Client Collector will only retrieve the logs of CIs that are associated with these Application Services.

6. Save the log policy.
   In the Check instances related list, a check instance record is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Open the relevant check instance record and then select **Edit in Sandbox**.
8. Select the Log path configurations related list.
9. Add a log path for the check instance.

> **Note:** A check must have at least one log path configured for it to enable streaming logs. For more information about checks, see Checks and policies.

a. Select **New**.

b. On the form, fill in the fields.

New path configuration form

Field	Description
Path	The full path from where the logs are streamed. You can use a wildcard. This field is required.
Component	The device type or stack layer that provides a context for the logs, used for anomaly detection and correlation. For example: Tomcat.
Source Type	Defines how Health Log Analytics handles a specific log type and parses the log data. For example: Tomcat Catalina.

c. **Optional:** For shipping multiline logs using Filebeat, configure the following properties.

(Optional) These parameters control how Agent Client Collector Log Analytics (ACC-L) handles messages that span multiple lines of text.

For more information, see Manage multiline messages in the Elastic documentation.

Field	Description
multiline.pattern (regex)	The regular expression to match. **Note:** You must define this property before you can configure the multiline.match and multiline.negate properties.
multiline.match	How ACC-L combines matching lines into a single log line. (Optional) The available options are None, Before, and After. Default is None.
multiline.negate	Option for determining whether the pattern identified in the log lines is negated. (Optional) The available options are None, True, and False. Default is None.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Optional: Define the following properties that control the Filebeat YML configuration.

Field	Description
Fields	Field that enables you to include and exclude information in the output. For example, you can add a field for filtering the log data. (Optional) Add more Field rows by selecting the plus icon next to the Value field: ⊕. Remove a Field row by selecting the minus icon: ⊖. For more information, see the Log input Fields description in the Elastic documentation.
Configuration Options	Field that enables you to add configuration options to the log lines. For example, you can add the encoding to use. **Note:** Define only configuration options that are supported by Filebeat. For more information, see the Log input Configuration options description in the Elastic documentation.

e. Select **OK**.
The log path is created.

10. Select **Return to Policy**.
11. On the policy form, select **Publish**.
The policy's Publish status changes to **Published**.
12. **Optional:** Activate the policy by selecting **Activate**.

What to do next
Ensure that the data input is streaming data.

Create a child log policy

Refine an existing log policy to focus on a subset of CIs or services by creating a child policy.

Before you begin
Role required: agent_client_collector_admin

About this task
A published log policy (the parent policy) can be used as a template for creating a new log policy (the child policy). You can customize the parameters that the child policy inherits from the parent to focus on a subgroup of its CIs or services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The child policy inherits parameters from its parent policy that are modified after the child policy's creation, unless you disable this option in the child policy. You can choose to review these modified parameters in draft mode in each child policy before accepting them.

Note: The child policy is inherently more specific than its parent policy. When Agent Client Collector matches a condition defined in the child policy, it will not try to match the parent policy.

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Log Policies**.
2. On the **Policies** page, select a published policy with a Hierarchy value of either **None** or **Parent**.
3. Select **Create Child**.
   A new policy opens with the same parameters as the published policy. The name of the new policy is *<Policy name><date and time created>*.

   For example, MySQL DB on Linux Logs 2022-02-13 04:44:12.

   The following fields are read-only:

   Child policy fields

Field	Value
Publish status	Draft
Hierarchy	Child
Parent	<Name of the parent policy>

   The **Order** field value indicates the priority by which the agent attaches itself to the child policy in relation to its sibling policies. A lower number indicates a relatively higher priority for this child policy. By default, each new child policy takes on a higher value (and hence, a lower priority) than the one preceding it. You can modify the order value as needed.
4. Customize the child policy's parameters.
   For a description of the parameters, see Create an Agent Client Collector log policy.
5. Select **Save** to create the child policy.
6. **Optional:** Select **Disable inherit option** to disable automatically inheriting modified parameters from the parent policy.
7. Select **Publish** to publish the child policy.

Result

The child policy is published and appears on the **Child Policies** tab of the parent policy.

Edit a log policy

You can edit published Agent Client Collector log policies. For example, modify a default log policy if your organization always uses a specific non-default log path.

Before you begin

Role required: agent_client_collector_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Log Policies**.
2. Select a policy for which the **Publish status** is **Published**.
3. Select **Edit in Sandbox**.
   The policy is now in **Draft view**, and its fields and check instances are editable.

   Note: Although the policy is in **Draft view**, its publish status remains **Published**.

4. On the **Monitored CIs** tab, edit the CIs to which the policy applies as needed.

   a. Choose the CI type to be monitored.

   - **Monitored CI type by filter**: Select the monitored CI type. You can narrow down the CIs that will be monitored by using filter conditions.
   - **Monitored CI type by script**: Specify the monitored CIs by using a script.
   - **Monitored CI type by CMDB Group**: Specify the monitored CIs by using CMDB group queries.

   For more information about choosing monitored CI types, see Create a new Agent Client Collector policy.

   b. **Optional:** Monitor only CIs that are associated with an Application Service by selecting **Filter Monitored CIs by Application Service**.
   You can specify the Application Services to be monitored by using filter conditions. Agent Client Collector will only retrieve the logs of CIs that are associated with these Application Services.

5. **Optional:** In the **Check Instances** table, select the log shipper check instance record and edit it.
   For more information, see Edit log path configurations.
6. Select **Save** to save the changes you entered into the Sandbox policy fields.
   The policy remains in **Draft view**, and the **Publish status** is **Published***. The asterisk (*) indicates that the current published version is not the most up to date one, because it contains saved changes that have not yet been published.
7. Select **Republish** to publish the updates.
   The policy returns to **Published** state and opens as the published policy.

   Note: This option appears only after entering updates into the policy fields, for a policy whose **Publish status** is **Published***.

8. Determine the active status of the policy by selecting either **Activate** or **Deactivate**.
9. **Optional:** Select **Delete** to delete both the Published and the draft policies.

Edit log path configurations

Modify a log path configuration in the log shipper check instance.

Before you begin

Role required: evt_mgmt_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **ACC Log Analytics** > **ACC Log Policies**.
2. Select a policy record.
3. In the Check instances related list, select the log shipper check instance record.
4. Select **Edit in Sandbox** to enable editing the record.
5. On the Log path configuration related list, edit a log path configuration.

   a. Select the log path configuration that you want to edit.

   b. Edit the configuration.

   - You can add custom fields, allowing you to include additional information in the output.
   - You can add extra configuration options, such as `encoding`, `include_lines`, and `exclude_lines`, to filter your log data. For information about discovering file encoding, see the How to Detect File Encoding on Windows, Linux and Mac [KB1702770] article in the Now Support Knowledge Base.

     These configuration options impact all the files that the data input streams to your instance.

     Note: Define only configuration options that are supported by Filebeat. For more information, see the Log input Configuration options description in the Elastic documentation.

   c. Select **Update** to save your edits.

6. **Optional:** Add an environment variable or edit an existing one in the **Path** field.
   Use the relevant format for its name:
   - On Linux, capitalize the name and precede it with a dollar sign: $. For example: `$HOME`. The name is case sensitive.
   - On Windows, surround the name with percentage signs: %. For example: `%HOMEPATH%`. The name is not case sensitive.

   Important: The servicenow user and ACC agent must have access to the environment variable. On Linux systems, only environment variables that reside in the `/etc/environment` file are accessible. Add the environment variable to this file using the format *<NAME>='<VALUE>'*.

7. **Optional:** Delete a log path.

   a. Check the box next to the log path configuration that you want to delete.

   Note: You can select multiple log path configurations, but a check must have at least one log path configured for it to enable streaming logs. For more information about checks, see Checks and policies.

   b. Select **Delete**.

8. Select **Return to policy** to go back to the log policy record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Select **Republish** and then confirm to publish the policy again with the updated log path configurations.
   The changes take effect in a few minutes.

CI association to a dynamic CI Group in Agent Client Collector Log Analytics

When the Agent Client Collector Log Analytics (ACC-L) application discovers a CI that is not associated to an application service, the application creates a dynamic CI Group and associates the CI to it.

A dynamic CI Group is a group of CIs that are organized by attribute, such as the CI type. By default, Agent Client Collector log policy checks monitor only CIs that are associated to an application service. The Agent Client Collector Log Analytics application inspects the CIs that the Agent Client Collector discovers. When it discovers a CI that is not associated to an application service, the application creates a dynamic CI Group and associates the CI to it.

If the CI is later associated to an actual application service, its association to the dynamic CI Group is automatically deleted. The baseline for the CI is lost in this process. While the system is establishing the new baseline, it doesn't issue alerts for the application service to which the CI is now associated.

You can choose to disable the association of unassociated CIs to a dynamic CI group by changing the default setting of the relevant system property, *sn_accl.dynamic_service.creation.enabled*, to false. The Agent Client Collector Log Analytics application will then not associate unassociated CIs to dynamic CI Groups. In this case, logs are not streamed for CIs that are not associated to an application service.

View live CI data with Agent Client Collector

View live data for incident-related CIs through Agent Client Collector for information that can help resolve the incidents.

Before you begin

- Collecting running processes for a macOS system requires `sudo` privileges. If `sudo` privileges aren't granted, only processes run by the Agent Client Collector are collected.

  To enable `sudo` privileges for osqueryi, add the following strings to either the `/etc/sudoers` file or to an individual file in the `/etc/sudoers.d` directory:

  - `Cmnd_Alias LIVE_CI_VIEW = /Library/Application\ Support/servicenow/agent-client-collector/osquery/bin/osqueryi`
  - `_servicenow ALL=(ALL) NOPASSWD:LIVE_CI_VIEW`
- To enable the OSQuery executable to retrieve information on logged-in users in a Windows environment, the agent must run as a local SYSTEM account.

Verify that you have installed Agent Client Collector Framework and Service Operations Workspace on your instance.

Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Lists icon ( ).
3. Select **Incidents** > **All**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select an incident from the list.
5. On the <name of incident> form, select the **Live CI Data** tab.
   The CI data is displayed in the cards described in the following table.

Live CI Data tab cards

Card	Description
Device details	General details about the CI.
Memory Usage	Amount of memory being used by the CI.
Top 5 running processes by CPU usage	The five CI processes using the most CPU.
Top 5 running processes by memory usage	The five CI processes using the most memory.
Disk Usage %	Percentage of disk space in use on the CI.
Logged-in users	Users logged in to the CI. Whether this data is visible depends on your OS privileges. ○ MacOS: Requires sudo privileges ○ Windows system: Requires administrator privileges ○ Linux: No special privileges are required

Related topics

View live CI data logs

Assign a problematic CI to its incident to view live CI data

View live CI data logs

View CI logs to receive additional details on an incident when viewing live CI data. For example, viewing log information for a process with high CPU usage can help you pinpoint when the usage went up, helping you determine the root cause of the issue.

Before you begin

Ensure that you have installed Agent Client Collector Framework and Service Operations Workspace on your instance.

Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Lists icon ( ).
3. Select **Incidents** > **All**.
4. Select an incident from the list.
5. Select the **Live CI Data** tab.
6. Select the **Logs** link on the right side of the pane.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Logs link

Note: The **data last refreshed** value follows the instance time zone and not your local system time zone. Therefore, ensure that your local system time zone matches the instance time zone.

The logs appear on the **Log** page.

Assign a problematic CI to its incident to view live CI data

Retrieve live CI data to help troubleshoot the issues that caused an incident by assigning the problematic CI to its incident. An incident typically is associated with the CI that caused the incident, but if this was omitted during the incident creation, you can assign the CI manually.

Before you begin

Ensure that you have installed Agent Client Collector Framework and Service Operations Workspace on your instance.

Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Lists icon ( ) icon.
3. Select **Incidents** > **All**.
4. Select an incident with a value of **Configuration item = (empty)**.
5. Select the **Live CI Data** tab.
6. Enter the first several characters of the CI that caused the incident in the **Primary configuration item** field.
   A list of CIs matching the string appears.
7. Select the relevant CI from the list.
   The name of the CI appears in the **Primary configuration item** field, and the CI's live data appears on the **Live CI Data** tab.

Metric Intelligence

ServiceNow® Metric Intelligence provides the ability to capture, and then explore and analyze operational metrics data, identifying and indicating anomalies. Metric Intelligence generates anomaly alerts that can be promoted to IT alerts and appear on the Service Operations Workspace and service health dashboard. You can leverage this analysis to prevent potential service outages.

- Configuring Metric Intelligence
- Optimizing Metric Intelligence
- Metric Intelligence reference

Understanding Metric Intelligence

Use Metric Intelligence to identify and prevent potential service outages. Metric Intelligence, based on historical metric data, indicates anomalous behavior of CIs which events might not capture. Anomaly alerts can be promoted to regular IT alerts and appear on the Service Operations Workspace and service health dashboard for preventive actions.

Anomaly detection

Metric data is collected by various data sources such as SCOM, SolarWinds monitoring system, or Nagios XI server (some partially configured for metric collection by default). These monitoring systems collect metric data from the source environment regularly. Metric Intelligence captures the raw data from these monitoring systems, and uses event rules and the CMDB identification engine to map data to existing CIs and their resources. The data is then analyzed to detect anomalies and to provide other statistical scores.

Metric Intelligence uses historical metric data to build statistical models. These models facilitate projection of expected metric values along with upper and lower bounds. Metric Intelligence then uses these projections to detect statistical outliers and to calculate anomaly scores.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Anomalies are scored on a range of 0-10. High anomaly scores for CI metrics can indicate that a CI is at risk of causing a service outage.

After processing, the Insights Explorer shows metric statistics and charts, and the Anomaly Map shows correlated scores for CIs with the highest anomaly scores, across a timeline.

You may want to disable anomaly detection during system maintenance, as anomalies may be irrelevant when detected while maintenance is in progress. To do so, set the *mid.mi.anomaly_detection.disable* property to **true**.

To customize displaying anomalies for metrics classified as near-constant, contact customer support.

Metric Intelligence is available when you activate the Metric Intelligence (com.snc.sa.metric) plugin.

Terms used with Metric Intelligence

Source metric type

A metric such as '% Free Space' or 'Current Bandwidth' that can be measured by a data source for a CI. For each data source, you can choose which of all possible source metric types are processed. For example, there are about 380 source metric types that are active by default for the SCOM data source.

Anomaly

Data that is outside the control bounds is considered a statistical outlier. These outliers are used to compute an anomaly score, which is a value between 0–10 that indicates the degree to which the metric appears unlikely. When an anomaly score is above a threshold, an anomaly alert is generated. Anomaly alerts are reported separately from regular IT alerts.

Resource

A component of a CI that consists of multiple individual components of similar type, where each subcomponent can be monitored separately. For example, individual Web pages, or specific disks such as 'Disk C:' and 'Disk D:'.

Time series

A series of values (such as metric values) over a time range, associated with a CI and a metric type. Because an anomaly score is evaluated for each metric, the series of anomaly scores over a period of time are also a time series. Time series are computed by the statistical model built for a metric data series, and are used with metric data values, anomaly scores, and upper and lower control bounds.

Statistical models

Metric Intelligence jobs learn from past metric data (up to 32 days old). A model training process analyzes historical data to construct a model that projects future values. Typically, models are in effect until the next time the model learning process runs. These models are used to calculate upper and lower bounds. Incoming values that are beyond those bounds, and that deviate with statistical significance from expected values, generate anomalies. Each model is uniquely patterned and is labeled with a classifier that illustrates the general behavior of the model. This classification determines if anomaly detection can be applied. For most models, it is possible to project which future values deviate from expected values. Such models are associated with control bounds and anomaly detection can be applied (if enabled).

However, for some models, there is insufficient data to determine which values are anomalous and anomaly detection cannot be applied without additional information (even if anomaly detection is enabled).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The learned data models are stored in the Metric Time Series Models [sa_time_series] table.

The following statistical models and classifiers are used in anomaly detection:

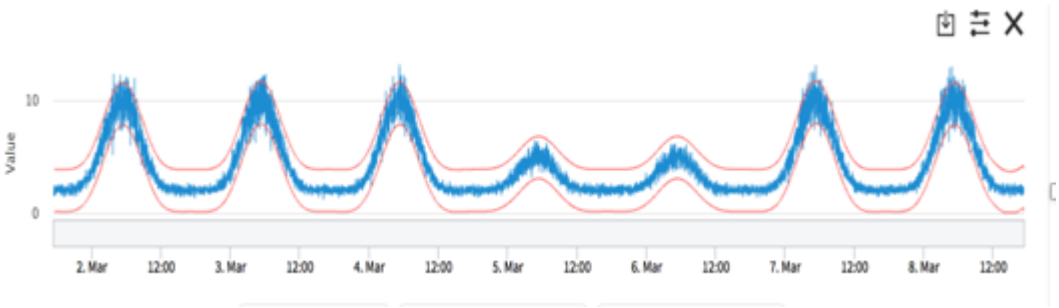
Time Series statistical model

After it is established, a time series model does not adjust to changes in the incoming metric data. Therefore, if the pattern of incoming data changes, those changes are likely to be identified as anomalous. Upper and lower control bounds, after they are learned, persist until the next time the learning process runs (data is learned every day).

Weekly

Data with a pattern that repeats itself over weekly intervals (seasonal model).

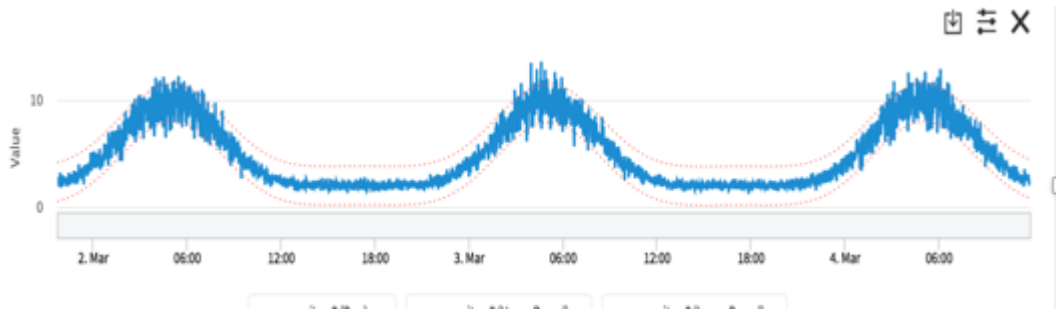
Requires a minimum of 15 days of data in the series, as set by the weekly_model_min_days configuration setting.



Daily

Data with a pattern that repeats itself over a daily interval (seasonal model).

Requires a minimum of 3 days of data in the series, as set by the daily_model_min_days configuration setting.

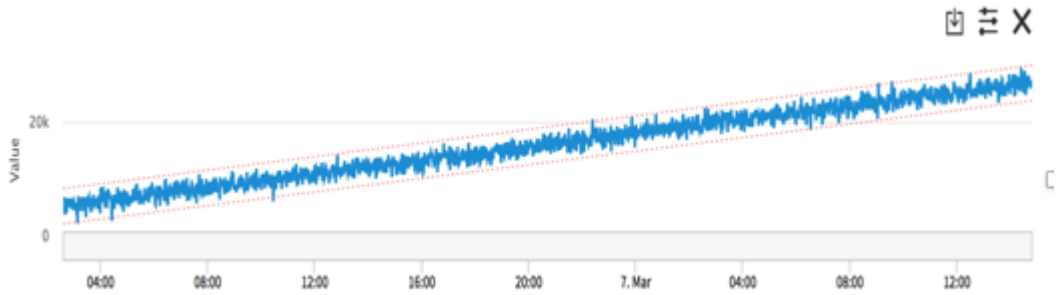


Trendy

Data that has a linear trend with some slope and with some noise.

Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.

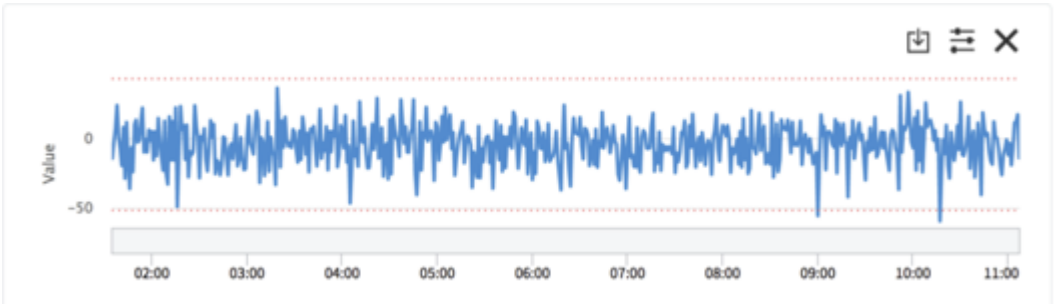
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Noisy

Typical noisy data that is a basic pattern classification in a data model. The pattern cannot be identified with a specific trend or seasonality.

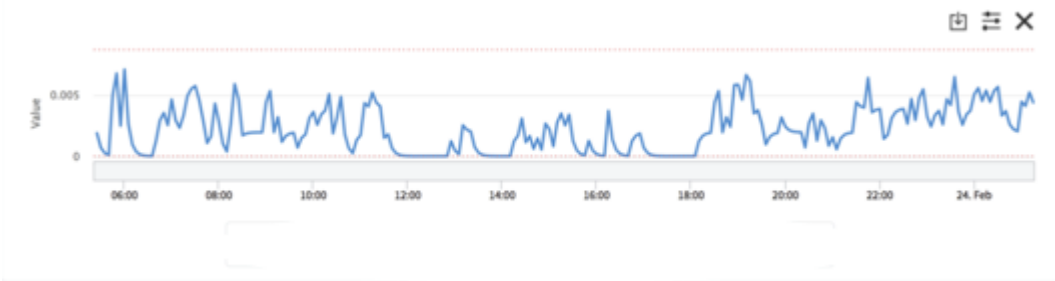
Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.



Positive clipped noisy

Similar to the noisy classifier other than the lower bound that is fixed on 0.

Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.



Centered noisy

Noisy data that typically spreads symmetrically between user-specified upper and lower bounds. The formula that is used to set bounds and width values, ignores the statistical data, and the lower and the upper widths have an identical value.

Requires that the number of data points in the series is zero.

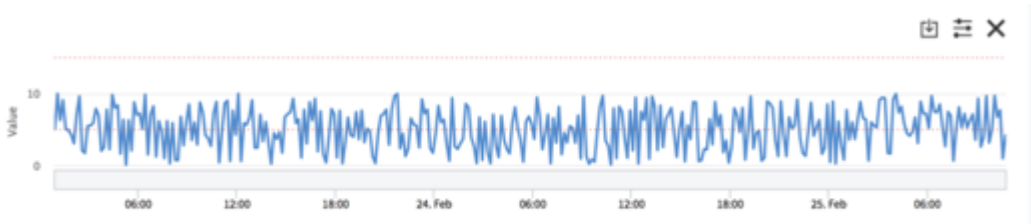
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To retrieve alerts for metrics with this model, create metric rules for static bounds definitions. For details, see Create metric rules.

Skewed noisy

Noisy data that is not evenly spread between user-specified upper and lower bounds, but instead tends to concentrate closer to one of the bounds. The median of the data is used to separately compute an upper width and a lower width.

Requires a minimum of one data point in the series.



To retrieve alerts for metrics with this model, create metric rules for static bounds definitions. For details, see Create metric rules.

Skewed noisy - Generalized Extreme Value (GEV) Distribution

Noisy data that is spread unevenly between user-specified upper and lower bounds, and concentrates closer to one of the bounds. In addition, the data distribution demonstrates a long or heavy tail. The median of data derived from the tail of the distribution is used to separately compute an upper width and a lower width. There must be at least one data point in the series.

Accumulator

Data pattern similar to the trendy classifier but with a monotonous increase and without noise. For this classifier, there is no data model and no anomaly detection.

Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.

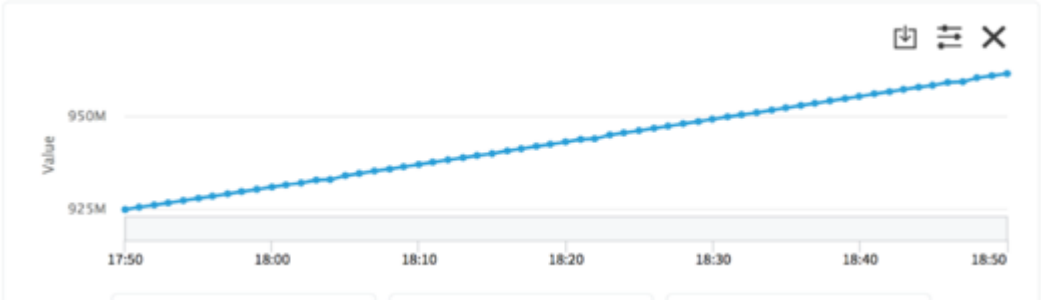
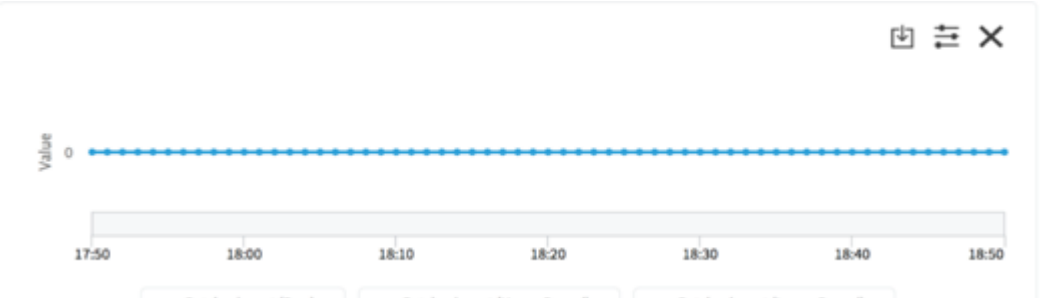
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Near Constant

Nearly constant data, in which most values are a specific constant value. For this classifier, there is no data model and no anomaly detection.

Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.



Detected Constant

Enables checking near-constant metrics for anomalies. To do so, you must move the metrics to the detected-constant model, via a system token. To add tokens to the token list and enable more metrics to be measured for anomalies, contact customer support.

Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.

Enabled when the `metric_name_analysis.add_detected_constant_candidate` system property is set to **true**. To overwrite the value of this property for a specific metric type, update the **Detected Constant Candidate** field in the Metric Types table by doing the following:

1. Enter `sa_metric_type.list` in the instance navigation field.
2. In the **Detected Constant Candidate** column, select the relevant value for the entry you want to update.

Detected Constant Candidate values

Value	Description
<empty>	An algorithm automatically decided whether the metric is to be considered for the detected constant model. This is the default value.

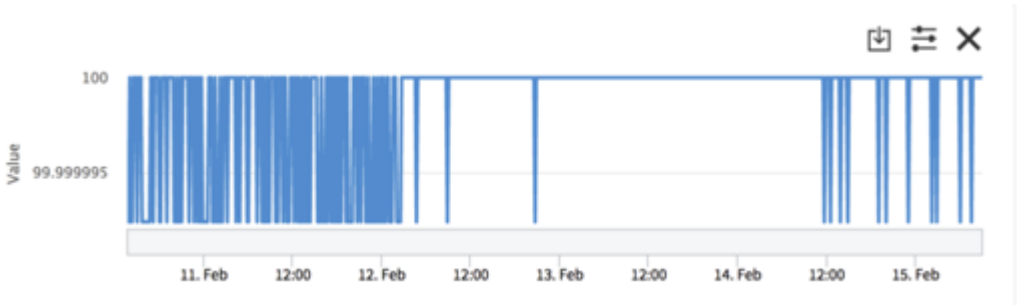
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Value	Description
Yes	The metric is considered for the detected constant model.
No	The metric is not considered for the detected constant model.

Multinomial

Data pattern in which all values are one of a relatively small number of values. For example, values are always 100 or 99.9. For this classifier, there is no data model and no anomaly detection.

Requires a minimum of 400 data points in the series, calculated as 10 times the value of the multinomial_count_threshold configuration setting.



Corrupt

Data has insufficient data points to identify a pattern. For this classifier, there is no data model and no anomaly detection.

Requires that the number of data points in the series is less than the value of the corrupt_data_count_threshold configuration setting (30 by default).

Kalman Filter statistical model

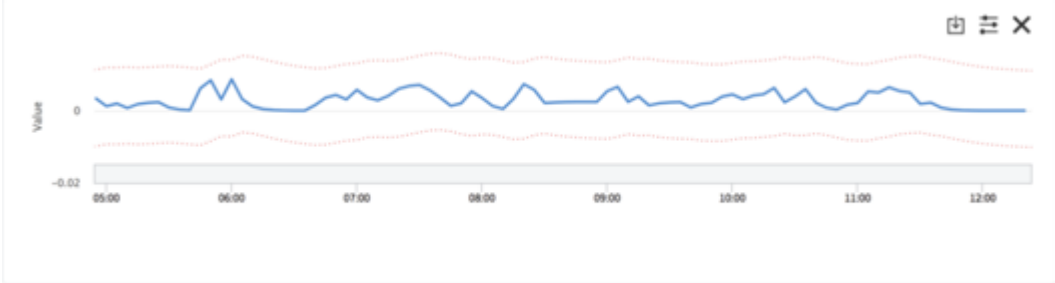
Add on to the time series statistical model and applicable only to the noisy and positive noisy classifiers. This model is a general method of estimating model parameters from a stream of data where level is the only parameter in the model. The Kalman Filter model can adjust to new values in incoming metric data. When there are no clear patterns in the noise or if there is too much noise, the Kalman Filter model is not used.

Local level

When incoming data clusters around a new value according to the current control bounds, the Learner adjusts the data model to accommodate a permanent change. This clustering is detected as a new value in the data model so that most incoming data is again within the control bounds rather than anomalous. Such change detection is useful when for example, cores or memory are added to a server, which impact the baselines.

Requires a minimum of 30 data points in the series, as set by the corrupt_data_count_threshold configuration setting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Unrecognized

When data does not fit the local level classifier, time series classifiers are used. This happens when it is not possible to adjust the variance ratio in a learned local level model to reasonable values.

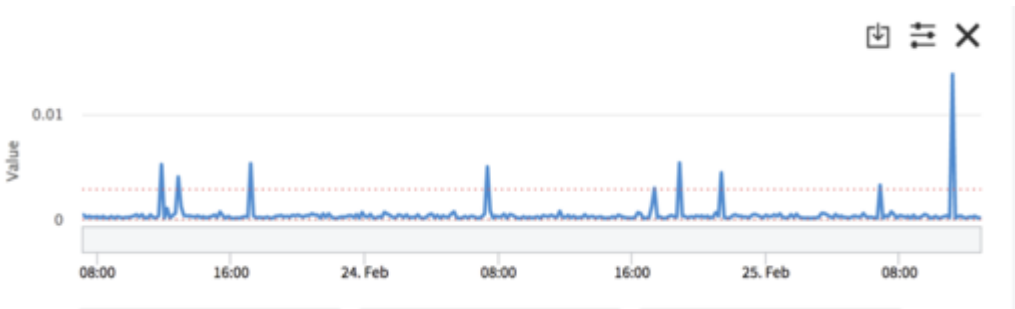
Non-Parametric statistical model

Add on to the positive noisy classifier. In the nonparametric model, noise distribution is not symmetrical and does not fit any seasonal pattern. The nonparametric model creates control bounds that better fit the actual data, and once learned, the control bounds persist until the next learning cycle. This model does not adjust itself to changes in the data, and it takes longer for a deviation to be identified as an anomaly.

Stationary Non-Parametric

Data that is not time-dependent meaning that there is no significant shift in parameters such as mean and variance when shifting data in time.

Requires a minimum of 5000 data points in the series, as set by the snpm_minimum_data_count configuration setting.



Unrecognized

When data does not fit the stationary classifier, time series classifiers are used.

Median Absolute Deviation (MAD) statistical model

An add-on to the skewed noisy classifier. In this type of data, noise distribution is not symmetrical and does not fit any seasonal pattern. In addition, data reflects a heavy or long-tailed distribution. The MAD statistical model creates control bounds that better fit the data, and once learned, the control bounds persist until the next learning cycle. Using this model enhances the deciphering of data collection with approximately 30% greater efficiency.

MID Server and MID Server distributed cluster for Metric Intelligence

Using Metric Intelligence requires at least one MID Server distributed cluster which contains a single MID Server that is configured for Metric Intelligence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When using a single Metric Intelligence MID Server, that server must be added to a MID Server distributed cluster.

To support the specified throughput, create a distributed cluster with a single MID Server that meets the Metric Intelligence MID Server requirements. When using a virtual machine (VM), only a single MID Server can run that supports Metric Intelligence. When working with Agent Client Collector, a MID Server can also be connected to multiple agents (ACC-M and ACC-L).

A MID Server supporting Discovery can also be used with other applications.

For details on setting up Metric Intelligence, see Get started with Metric Intelligence.

MID Server distributed clusters

Activating Metric Intelligence (com.snc.sa.metric), automatically activates MID Server distributed cluster (com.snc.agent.distributed.cluster). A MID Server distributed cluster supports the Distributed MID Server cluster type which is used exclusively with Metric Intelligence.

If automatic creation of a MID Server distributed cluster fails, you can configure the cluster manually. For details, contact Customer Support.

Metric Intelligence MID Server

The Metric Intelligence MID Server supports the Metric Intelligence feature by processing data and detecting anomalies. The MID Server transmits batches of processed data to the instance. If an anomaly is detected, then information about the anomaly along with the raw data is sent immediately to the instance.

Each Metric Intelligence MID Server must be configured with the following settings:

- Metric Intelligence as a supported application
- The Metrics capability
- Running the Metric Intelligence Metrics extension

Note: The Metric Intelligence MID Server does not support IPv6.

The Metric Intelligence application that the Metric Intelligence MID Server is configured with enables you to add additional supported applications to the same MID Server. By default, Metric Intelligence is included in the definition of the MID Server ALL option. For information about modifying the behavior of the ALL option when selecting supported applications, see Configure applications included in ALL Applications.

If Domain Support - Domain Extensions Installer is activated, then you can configure a MID Server with the Metrics capability, per domain. In this case, metrics for a business service are processed on the MID Server that is in the same domain as the business service. Otherwise, a MID Server from the global domain is used.

Ensure that the MID Server that you want to configure for Metric Intelligence:

- Is validated. For more information, see Validate a MID Server
- Is in running state
- Meets all software, hardware, and configuration requirements

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Hardware requirements for the virtual machine/host on which the MID Server runs (scaled for 5000 CIs with 100 metrics per CI)

Requirement	
One MID Server with: • Memory: 12 GB • Processor: 4 cores	Supports approximately up to a total of 1.2 million metrics (12,000 CIs with 100 metrics per CI).
One MID Server with: • Memory: 24 GB • Processor: 8 cores	Supports approximately up to a total of 1.7 million metrics (17,000 CIs with 100 metrics per CI).

Software requirements

Software	Supported versions	Additional requirements
Windows	32-bit and 64-bit versions: • Windows 2008 R2 • Windows Server 2012 R2 • Windows Server 2019	32-bit or 64-bit version of the MID Server
Linux	• Red Hat Enterprise Edition Linux 6.6 or later • CentOS Linux 6.6 or later	32-bit or 64-bit version of the MID Server

Configuration requirements

Configuration	Requirement
MID Server service logon user (required only for pulling)	Must be set to a user with read access to the SCOM database (OperationsManagerDW). **1.** On the MID Server, open the MID Server **Properties** dialog box. **2.** Click the **Log On** tab. **3.** Select **This account**, and enter credentials for a user with the required access. **4.** Click **Apply**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Server throttling mechanism

The MID Server throttling mechanism protects against data bursts to the instance. Data burst protection prevents overloading the instance, while ensuring that you do not lose any data.

The MID Server throttling mechanism is enabled by default. You may want to disable this mechanism when troubleshooting, to ensure that the mechanism is not causing system malfunction.

The throttling parameters are MID Server configuration parameters. Configure these parameters on the MID Server record, on the **Configuration Parameters** tab. When you add a configuration parameter, select the matching `mid.oi` parameter from the **Parameter name** list.

- To disable this feature for metrics, set the `mid.oi.metric_token_bucket_enabled` parameter to `false`.
- To disable this feature for anomalies, set the `mid.oi.anomaly_token_bucket_enabled` parameter to `false`.

Configuration Override

Use the `../agent/conf/wrapper-override.conf` file to configure Java override parameters, such as the garbage collector and IPv4.

To configure the garbage collector, override the existing garbage collector parameter. For example, replace `-XX:+UseParallelGC` with `-XX:+UseG1GC`.

To force IPv4, add the following parameter, using the next available `wrapper.java.additional` number:

```
wrapper.java.additional.<number>=-Djava.net.preferIPv4Stack=true
```

Note: Do not renumber existing `wrapper.java.additional` lines. Parameters 101 through 200 are reserved for ServiceNow out-of-the-box parameters. Only override those parameters by uncommenting the existing lines and changing the values.

Use the `../agent/conf/wrapper.conf` file to configure memory for Metric Intelligence. Update the following parameters:

- `wrapper.java.initmemory=1024` or higher
- `wrapper.java.maxmemory=4096` or higher

Optionally, if a server has additional RAM available, for example 16 GB RAM, you can replace `4096` with `8192` in `wrapper.java.maxmemory=4096`.

Metric Configuration Rules

Metric configuration rules enable you to determine how incoming metrics from the Agent Client Collector are to be processed.

When a new metric arrives from an Agent Client Collector, a new record is created in the Metric to CI Mappings table, with the value, **Anomaly Detection Action Level = Bounds**.

To trigger execution of a metric configuration rule, navigate to the Metric Configuration Rules table (**Event Management** > **Anomaly Detection** > **Metric Config Rules**) and select the **Sync to MID** button at the top of the page. This also synchronizes all MID Servers connected to the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When executing the rule, the anomaly detection action level defined in the rule (set by the *anomaly_detection_action_level* parameter) retroactively overrides the anomaly detection action level configured for the metric in the Metric to CI Mappings table.

If you do not trigger the rule execution, retroactive overriding of the *Anomaly detection action level* parameter is performed during execution of the hourly scheduled **Metric Intelligence - Metric configuration** job.

When configuring a metric configuration rule, rules with a filter run before rules with no filter. When multiple rules have the same priority, the most recently configured rule runs first.

For details on creating configuration settings rules, see Create a configuration settings rule.

For details on the available anomaly detection action levels, see Configure the action level for anomaly detection.

Metric bounds sensitivity

When measuring metrics in Insights Explorer, metric bounds may be overly sensitive, creating an abnormally large number of anomalies. When this happens, the system adjusts itself to ensure that fewer anomalies are created.

For example, if 95% of a CI's metric values fall within 2 standard deviations (STDs) of the mean metric values, those are considered *sensitive bounds*. Sensitive bounds generate a large number of anomalies, some of which may be irrelevant. When sensitive bounds are detected, the system adjusts to measure metric values within 5 STDs, to generate fewer anomalies.

If sensitive bounds are not detected, (that is, 95% of metrics do not fall within 2 STDs of the mean metric value), the system measures metric values within 3 STDs. Any metric values falling outside the configured bounds become anomalies.

The previous values are set by default. For details on customizing these values, see Sensitivity bounds properties for Insights Explorer metrics.

Metric collection sources

When setting up Metric Intelligence, you must configure a source for metric collection. Metric collection can be performed either by the Agent Client Collector, or by metric connectors.

The metric collection source determines where Metric Intelligence gathers metrics from. For details on gathering metrics using Agent Client Collector, see Enable metrics collection and evaluation.

When gathering metrics with connectors, use either a SCOM or Dynatrace connector. For details on connecting metrics using a SCOM connector, see Configure the SCOM connector instance.

For details on connecting metrics using a Dynatrace connector, see Configure the Dynatrace metrics connector instance.

Metric binding

After metric data is collected, Metric Intelligence identifies the CIs and the resources to bind the data to.

The data that is collected on the MID Server is raw and does not relate to any specific CI or resource in the CMDB. To be useful, the data goes through a **normalization** process that uses CMDB identification rules and event rules to uniquely identify CIs, and to map and bind them to the raw data. Raw data can also be mapped and bound to resources, if binding to a CI is successful and if resource binding is configured.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Records for mapping raw data to CIs are automatically generated and remain in effect for a specified length of time determined by the properties:

- *sa.metric.map.with.ci.expiration.sec*: If the mapping to the CI was found. Set by default to be valid for five days.
- *sa.metric.map.without.ci.expiration.sec*: If mapping to the CI was not found. Set by default to be valid for 24 hours.

When similar metric data arrives within that time period, the existing mapping is used to match the data to CIs. At the end of the time period, metric-to-CI records expire. Also, a change in the event rules triggers an immediate expiration of the respective metric-to-CI records. Next time that raw metric data arrives, it will be normalized again. When Discovery adds or removes CIs, mappings are adjusted to reflect these changes at the next cycle.

All the information about the recent existing mapping is saved under metric-to-CI records in the sa_metric_map table, as shown below. You can access the Metric to CI table by navigating to **All > Event Management > Metrics > Metric to CI**.

Metric binding to resources

Bind metrics to resources to simplify metric events binding by enabling binding to resources such as specific disks or web pages, in addition to binding to CIs.

Metric Intelligence models metric series in either of the following methods:

- Binding a metric series to a CI and to the metric being monitored for that CI using a 'CI/Metric' format. For example, 'win_server_001/response_time_mean'.
- Binding a metric series to a CI, a resource within that CI, and the metric being monitored for that resource, using a 'CI/Resource/Metric' format. For example, 'win_server_001/Disk — C/disk_usage'. This method is referred to as *resource binding*.

The first method enables modeling, storing, aggregating, and querying data at the CI level. However, resource binding creates resource records for specific monitored entities, such as an individual web page or a disk. Therefore, resource binding is more efficient when there are multiple resources of similar types within a CI, and metrics applicable to a category of these resources are mapped to these resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use cases:

- Common examples are disks, processors, and network interfaces. In cases in which these entities are being monitored but do not exist in the CMDB, using resources for metric binding is useful.
- Some monitoring solutions capture metric data within services such as KPIs for individual web pages in an application. In such cases where the entity being monitored is not a configuration item, metric binding to resources can be helpful.

In those situations, using resource binding results in more meaningful aggregations across similar metrics (such as: avg disk_usage for a host across all disks).

Resource binding process

The MID Server generates metric binding events that are processed by the instance. When processing a metric binding event, there is an attempt to identify the CI to which this metric binding event belongs. If this attempt is successful, then the metric binding event is bound to the identified CI and binding to a resource is attempted. The following steps describe the attempt to bind a metric binding event to a resource:

1. Identify the CI class of the CI that was bound to the metric binding event.
2. Locate the resource class which is mapped to that CI class (using the CI Type To Resource Class [sa_ci_type_to_resource_class] table).
3. Read the *resource_path* attribute value in the **additional_information** field in the metric binding event.
4. Check if a resource record exists in the resource class table, in which *name* is equal to *resource_path* and *cmdb_ci* is equal to the CI that was bound to the metric binding event.
5. If such resource record exists, then the metric binding event is bound to that resource. Otherwise, a new resource record is created with the preceding values and the metric binding event is bound to the newly created resource.

Configure resource binding

- Ensure that the sa.metric.use.resource.binding system property is set to true (default).
- For series intended to be bound to resources, ensure that the *resource_path* attribute is populated by doing either step:
  - Use an event rule to add the *resource_path* attribute to the **Additional information** field in events. For more information, see Creating an event rule to map metrics to specific CIs.
  - Populate the *resource_path* attribute as a part of the respective CI identifier when data is sent to the MID Server for processing.
- Review the default mappings in the CI Type To Resource Class [sa_ci_type_to_resource_class] table and adjust as needed. It is critical that mappings are set as desired prior to data processing.

  Managing the CI Type To Resource Class table requires the evt_mgmt_admin role.

Resource tables

Resource binding uses an underlying hierarchy structure of resources which is a subset of the [cmdb_ci] hierarchy. Metric Intelligence installs the following resource tables:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- CI Resource [ci_resource] (parent table):
- Tables that extend CI Resource [ci_resource]:
  - ci_resource_hardware
  - ci_resource_appl
  - ci_resource_service
  - ci_resource_vm_object
  - ci_resource_database

Mapping CIs to resources

Mappings of CI classes to resource classes are stored in the CI Type To Resource Class [sa_ci_type_to_resource_class] table. This table is installed with Metric Intelligence, and is used during metric binding to resources.

Mappings in the CI Type To Resource Class table (default)

CI class	Resource class
cmdb_ci_hardware	ci_resource_hardware
cmdb_ci_appl	ci_resource_appl
cmdb_ci_service	ci_resource_service
cmdb_ci_database	ci_resource_database
cmdb_ci_vm_object	ci_resource_vm_object

Creating an event rule to map metrics to specific CIs

Create event rules to map incoming raw metric data to specific CIs, to optionally modify metric names, and to populate the *`resource_path`* attribute for resource binding.

The system generates events for every new raw metric data for which there are no CI binding specifications. You can create event rules that filter those events to map the incoming metric data to specific CIs. In such event rules, you can for example define a filter that is based on the monitoring object (such as SCOM).

To use resource binding, the *`resource_path`* attribute of events must be populated. You can configure an event rule to ensure that the *`resource_path`* attribute is included in the **Additional information** field in events. For more information about configuring and using resource binding, see resource binding.

For example, in the Event Rule designer you can update the event rule **SCOM IIS Web Server** as follows:

- On the **Event Filter** tab, define filter to match only IIS Web Servers.
- On the **Binding** tab, set **Class** to `Microsoft IIS Web Server`.

Get started with Metric Intelligence

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CIs in maintenance mode

Configure anomaly detection to exclude metrics for CIs that are in maintenance mode from model learning.

You can change the settings of system properties to include or exclude metric data for CIs while they are in maintenance mode.

When the system property sa.model_learner.maint_event_record_history_enabled is set to true (default), Metric Intelligence stores historical information about the times CIs enter and exit maintenance mode. When the system property sa_metric.maint_exclusion is set to true (default), metrics from CIs that are in maintenance mode are excluded from model learning.

Anomaly model testing

Use anomaly model testing to apply and evaluate anomaly detection for a small set of CIs and metrics, using actual metric data. Compare test results to expected results, then fine-tune the anomaly detection model before enabling anomaly detection for the tested CIs and metrics in the production environment.

For example, before enabling anomaly detection for Linux Servers, you can use anomaly model testing with actual metric data collected for those Linux Servers. Existing alerts might indicate an anomaly for a specific metric and CI. You can create an anomaly test rule to test anomaly detection for those CIs and metrics, and then check if the expected anomaly is detected. You can also examine the bounds calculated by the anomaly model to see if they match expected bounds. After you fine-tune the test model, you can enable anomaly detection for Linux Servers.

Anomaly model testing supports up to 20 time series, which can include 20 metric types for the same CI, the same metric type for 20 different CIs, or any combination of those options.

View test results in the Insights Explorer

Upon completion of a test run, a URL to an Insights Explorer becomes available. The anomaly model testing results appear in this trimmed-down version of the Insights Explorer. This Insights Explorer is pre-loaded with the charts and scores for the metric series specified in the anomaly test rule. You cannot add any CMDB groups or application services to this Insights Explorer.

Each chart in the Insights Explorer, contains the Anomaly Test Statistics section in its **Chart Settings**. This section is specific to anomaly model testing and provides the following options:

- **Show Bounds**: Displays a computed upper and lower bound for the metric in an anomaly model testing, based on learning of past metric values. The upper and lower bounds always appear together.
- **Show Anomaly Scores**: Displays anomaly scores on a virtual axis of 0-10, for an anomaly model test. Color code is based on the score thresholds that are defined in the Anomaly Score to Event Severity Map [sa_metric_anomaly_score_to_event_severity_map] table.

Use test results to fine-tune anomaly detection

Anomaly model testing uses the upper and lower bounds configured for selected series in the anomaly test rule. The anomaly model test results show how many anomaly alerts would have been generated based on the specified settings, if anomaly detection was enabled for the tested CIs and metrics. You can then decide if this result is acceptable. Fine-tune the bounds so that the number of anomaly alerts that are generated is not excessive, but sufficient to accurately indicate an out of bounds score.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced Promotion Engine

You can create a definition for the Advanced Promotion Engine so that you can define the conditions for promoting the anomaly alerts to the All Alerts table. By promoting the alerts that meet the conditions, only the most relevant anomaly alerts move to the table.

The Advanced Promotion Engine moves the most relevant alerts from the list of anomaly alerts to the All Alerts table. When a group of anomaly alerts on a configuration item (CI) meets the conditions that you set in the definition that you created for the Advanced Promotion Engine, the grouping mechanism groups the promoted alerts in the All Alerts table. For example, you can create a condition indicating that only the anomaly alerts that belong to a specific CI class with a minimum severity of Major are to be promoted to the All Alerts table.

The All Alerts table is the table that contains the issues that need your immediate attention. The anomaly alerts on the different metrics within a CI in a specific time period indicate an issue that needs to be promoted to the All Alerts table.

Anomaly alerts indicate a deviation from projected metric values for monitored CIs. For details, see View anomaly alerts.

The Advanced Promotion Engine is activated automatically as part of the Metric Intelligence application.

You can use the Advanced Promotion Engine definitions that come with the base system (for the Linux server and for the Windows server), or you can create definitions on the different CI classes. The base system definitions indicate that the CIs on the Linux and Windows servers are operational, and those CIs that have a minimum severity of Major are to be promoted to the All Alerts table.

All Advanced Promotion Engine tasks require the evt_mgmt_admin role. The evt_mgmt_user role enables you to view definitions and properties only.

Metric Explorer

Metric Explorer provides an easy-to-navigate interface where service agents can view the health of a CI associated with an alert. Health details for a CI include various metric charts with control bounds, and aggregations in a time period.

The set of metric charts that appear for a CI class in Metric Explorer is determined by metric chart configurations in the Metric Dashboard Metadata [sa_metric_dashboard_metadata] table. The Metric Dashboard Metadata table is initially populated with configurations for common classes and important metrics for those classes. A user with the admin or evt_mgmt_admin role can update the default metric chart configurations in the Metric Dashboard Metadata table.

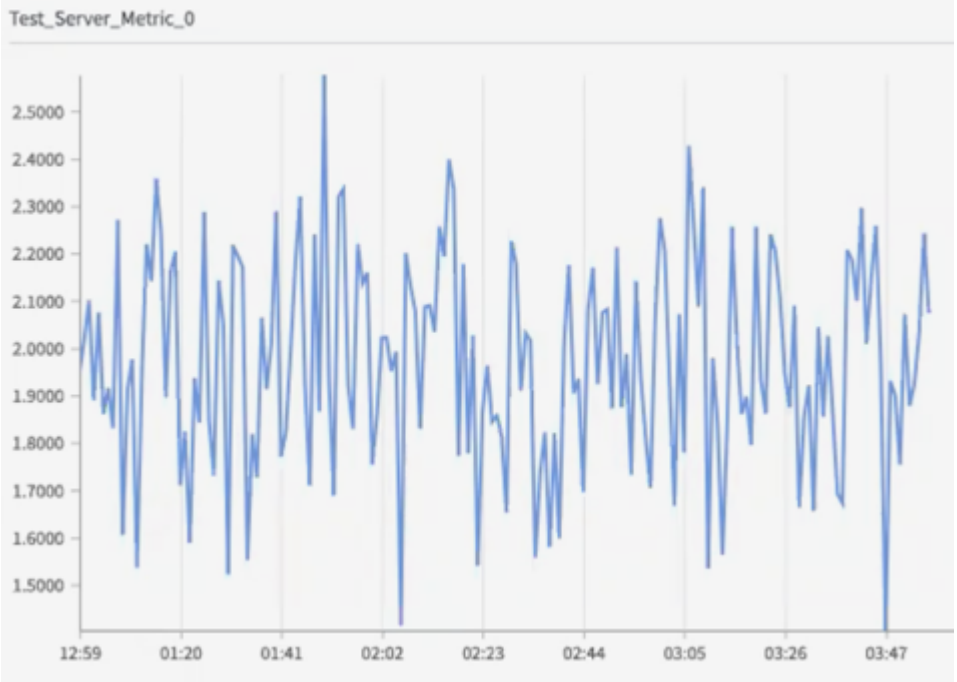
There can be up to 10 active metric charts configured for a class at any point.

Chart types

A metric chart that appears in the metric charts form in Metric Explorer can be a **time-series** chart or a **single-score** chart.

Time-series chart

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The time-series chart type is a graph of all data points in the specified time range, for the metrics of the CI associated with the chart. Time-series charts are similar to charts in Insights Explorer, and depending on settings, show lower and upper bounds.

Single-score chart

The single-score chart type shows a single number which is an aggregation of the data points in the time series for the metric and CI of the chart. The aggregation is an average of the data points, or the maximum, minimum, or last data point in the time series.

Templates

The ITOM Service Operations Workspace Metric Explorer template enables metric chart drill-down from Digital Analytics (DA) dashboards to Metric Explorer. For details, see Express list overview on the ServiceNow® Developer portal.

Self-health monitoring for Metric Intelligence

Use Event Management self-health monitors to monitor the health of Metric Intelligence infrastructure components and processes, and to alert about potential issues. Self-health monitoring allows you to proactively remediate issues and minimize data loss.

Metric Intelligence is pre-configured to use Event Management self-health monitors to ensure that essential components and processes are functioning properly. If a monitor detects a failure, then the Event Management self-health monitoring system creates an event for the issue. These events are then converted into an Event Management alert or get appended to a previous alert. Metric Intelligence self-health monitors run every 60 seconds.

For example, if an Metric Intelligence MID Server distributed cluster experiences an issue, an event is generated with the status of **Major**. Then, this event is converted into an alert. Later, when the issue is resolved, a new event is generated with the status of **Info** and the original alert is closed.

Monitored components and processes

Component/Process Check	Error Condition
Metric Intelligence extension is running properly	Monitor checks the *status* field of the *ecc_agent_ext_context_metric* table to detect a state of **Error** or **Warning**.
Metric Intelligence MID Server distributed cluster is running properly	Monitor checks the *status* field of the *ecc_agent_cluster* table to detect a state of **Error**, **Segmented**, or**Stopped**. **Note:** For a state of **Stopped**, an event is created only if the *error_message* field is not empty.
Metrics are collected by active connectors that are configured for metrics collection	For each connector with the *Metrics collection* flag set to **true**: Monitor checks the status of the *last_kpi_status* field in the *em_connector_instance* table to detect a status of **Error**.
Essential Metric Intelligence scheduled jobs are active	Monitor checks the following essential scheduled jobs, to detect if any is inactive: • Metric Intelligence — Metric configuration job • Metric Intelligence — Sync tables with mid • Metric Intelligence — Validate MID Distributed cluster

For more information about enabling or disabling an Metric Intelligence self-health monitor, see Configure a self-health monitor.

Scheduled jobs installed with Metric Intelligence

Domain separation and Metric Intelligence

Domain separation is supported in Metric Intelligence. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

How domain separation works in Metric Intelligence

When domains are separated in Metric Intelligence, users can view and manage alerts and events only in their own (tenant) domain. After the binding process has finished, the domain of the configuration item (CI) is used so that users within that domain can explore metric data. A domain column is present for Metric Intelligence tables that are provided in the base system. The domain column shows the name of the domain to which the CI belongs.

Note: If the domain column does not appear in the list, click (Personalize List) and add the required column. In addition, you can add a column that displays the domain path.

The following Metric Intelligence features have limited domain separation support.

Feature	Support
Metric types	Supported at global level. The instance owner can control the metric types for all domains.
Metric type registration	Supported at global level. The instance owner can control the metric type registration for all domains.
Metric class	Supported at global level.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Feature	Support
	The instance owner can control the metric classes that are used for all domains.
Configuration settings rules	Supported at global level. The instance owner can control the configuration settings rules for all domains

Domain separation for service providers

Configuring Metric Intelligence

Plan and configure your Metric Intelligence implementation.

Configuration overview

Metric Intelligence configuration typically follows these steps:

1. Install the AIOps Experience plugin [sn_sow_aiops].
2. Manually configure a MID Server for Metric Intelligence.
3. Activate Metric Intelligence.
4. Stream metrics to the instance, via the relevant data source or connector.
5. Choose and configure metrics to monitor.
6. Ensure that metrics are properly bound to CIs.
7. Configure the action level for anomaly detection.
8. Define an advanced promotion rule, to determine the conditions for promoting an anomaly alert to an IT alert.

Get started with Metric Intelligence

Complete the following setup and initial configuration steps to start using Metric Intelligence.

Before you begin

Activate the Metric Intelligence plugin (com.snc.sa.metric).

Role required: evt_mgmt_admin

About this task

Metrics have an expiration date. You can continue receiving data without interruption when a metric's expiration date arrives by pushing ahead the expiration date. For details, contact customer support.

Metric Intelligence guided setup provides a sequence of tasks that help you configure Metric Intelligence on your ServiceNow instance. To open Metric Intelligence guided setup, navigate to **Guided Setup** > **ITOM Guided Setup**, and click **Continue**. Then scroll to **Metric Intelligence**, and click **Continue**. For more information about using the guided setup interface, see Using guided setup.

Alternatively, you can complete the following procedure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Configure a MID Server for Metric Intelligence.
   For details, see MID Server and MID Server distributed cluster for Metric Intelligence.
2. Use the Automated Metric Intelligence setup.
3. Choose a source for collecting metrics.
4. Choose and configure metrics to monitor.
5. Create event rules to map raw metric data to specific CIs and Create an event rule to bind metric events to host CIs.
6. About 10 minutes after the Metric Intelligence Metrics extension has started, run the quick start tests for Metric Intelligence to verify functionality.

Activating Metric Intelligence

Metric Intelligence enables you to capture, explore and analyze operational metrics data, identifying and indicating anomalies. This analysis can prevent potential service outages.

View and work with Metric Intelligence data in the Insight Explorer, Agent Workspace, and Service Operations Workspace interfaces.

For details on the plugins activated with Metric Intelligence, see Plugins or applications installed with ITOM AIOps.

Automated Metric Intelligence setup

When you initially set up Metric Intelligence, you can automate many of the setup steps. For example, the automated setup configures a MID Server for Metric Intelligence and creates a MID Server distributed cluster which contains that MID Server.

Before you begin

Role required: evt_mgmt_admin

About this task

When the following conditions are met, the related link **Setup Metric Intelligence** appears on the MID Server form, enabling automated setup:

- The MID Server has been validated.
- The MID Server is in a running state.
- The property *sa.metric.display.mid.setup.action* is set to true (default value).

The Metric Intelligence automated setup performs the following setup tasks:

1. Configures the MID Server with the *Operation Intelligence* application
2. Adds the *Metrics* capability to the MID Server
3. Creates a new MID Server cluster of type 'distributed' set with a default port of 47100 for Apache Ignite
4. Adds the MID Server to the new MID Server distributed cluster
5. Creates a Metric Intelligence Metrics Extension and starts it
6. Opens the Metric Intelligence Metrics Context form. On this form, you can click the **Setup REST Listener** UI action to create the MID Web Server extension configured with the 'Enable REST Listener' option and default port 8097

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If automatic setup fails, you can create a MID Server distributed cluster manually, as described in the Use the **Setup Metric Intelligence** link only to create the first MID Server distributed cluster that contains a single MID Server, with default values. After the automated setup completes, you have to manually create any additional MID Server distributed clusters or add Metric Intelligence MID Servers.

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
2. Select the MID Server that you want to configure as a Metric Intelligence MID Server.
3. On the MID Server form, select **Setup Metric Intelligence** in the Related Links section.
4. In the newly created Metric Intelligence Metrics Extension form:
   a. Wait for the Status value to be **Started**.
   b. If configuring the MID Server for pushing, select the UI action **Setup REST Listener**.
   A notification appears about the MID Server extension being created. The **MID Web Server Extension** field appears and **Enable REST Listener** is checked. You can preview the MID Server Extension record to verify that its Status value is **Started**.

MID Server and MID Server distributed cluster for Metric Intelligence

Manually configure a MID Server for Metric Intelligence

To use Metric Intelligence, configure at least one MID Server with Metric Intelligence as a supported application, with the Metrics capability, and which runs the Metric Intelligence Metrics extension. Then, add that Metric Intelligence MID Server as a member to a MID Server distributed cluster.

Before you begin

Ensure that the MID Server meets all software, hardware, and configuration requirements to be configured for Metric Intelligence.

Role required: To access the MID Server - mid_server. To configure a MID Server in an instance (for example, to add a supported application), refer to the MID Server documentation.

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
2. Click the MID Server that you want to configure for Metric Intelligence.
3. Add the Metric Intelligence application:
   a. At the center of the MID Server form, click **Supported Applications**.
   b. In the **Supported Applications** section, click **Edit**.
   c. In the slushbucket, select **OperationalIntelligence** and click the **>** add button.
   d. Click **Save**.
4. Add the Metrics capability:
   a. At the center of the MID Server form, click **Capabilities**.
   b. In the **Capabilities** section, click **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the slushbucket, select **Metrics** and click the '>' add button.

d. Click **Save**.

5. Click **Update**.

What to do next

Create a MID Server distributed cluster, and add the Metric Intelligence MID Server as a member to that cluster.

Manually configure the Metric Intelligence extension

Configure the MID Server Metric Intelligence extension to enable the MID Server to pull raw metrics from external systems, to detect anomalies and report anomalies to the instance along with raw data. This MID Server Metric Intelligence extension is required and must be running in order for your system to be able to collect Metric Intelligence data.

Before you begin

See Get started with Metric Intelligence for the high level steps of setting up Metric Intelligence.

Role required: evt_mgmt_admin

About this task

The MID Server Metric Intelligence extension normalizes the raw data and then transmits the data to the instance. If the extension detected any anomalies above a specified threshold, they are sent to the instance. The extension runs for as long as it is enabled. This provides a persistent connection to the MID Server to constantly listen for raw Metric Intelligence data from external systems.

The MID Server Metric Intelligence extension:

- Receives raw metric data, batches them and sends them to the instance at specified intervals.
- Detects anomalies and sends a report to the instance.
- The information that is sent to the ServiceNow instance is relevant for Metric Intelligence, so data processing is efficient.

The MID Server Metric Intelligence extension does not provide any API calls. However, when the **Enable REST Listener** option is selected, the extension adds a handler for the supported REST APIs.

Note:

- Only upon configuring the Metric Intelligence extension, the Metric Intelligence MID Servers actually join the distributed cluster for Metric Intelligence.
- After the initial configuration, the first metric is not included in the metrics data.
- There is a delay of one minute in receiving metric information from the synchronization of the instance with the MID Server.

Procedure

1. Navigate to **All** > **MID Server** > **Profiles and Deployments** > **Metric Intelligence**.
2. In the Metric Intelligence Metrics Contexts list, click **New**.
3. Fill in the fields, as appropriate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	A unique name for this extension for easy identification.
Short description	A description of this extension.
Status	This field is auto-populated with the status of the extension. The field is blank until the extension is started. After issuing a command to the extension, one of the following values is displayed: ○ **Started**: The extension is running. ○ **Stopped**: The extension is not running. ○ **Offline**: The MID Server is down. ○ **Error**: The extension failed with an error (the error message is displayed in **Error Message**). ○ **Warning**: A run-time exception has occurred. The extension continues to work.
Error Message	Message describing any error that causes a command, such as **Start** or **Stop**, to fail. This field appears when the value in the **Status** field is **Error** and also when the value in the **Status** field is **Warning**.
Execute on	Location for running this extension. When configuring this option for use with Metric Intelligence, set to **Specific MID Server**. Then specify the MID Server with *`Operationalintelligence`* as a supported application and the *`Metrics`* capability.
MID Server	The name of the designated MID Server, which is configured with *`Operationalintelligence`* as a supported application and the *`Metrics`* capability.
Executing on	[Read-Only] The name of the MID Server on which the extension is running. This field shows the name of the MID Server even if the MID Server is down. If the user stops the extension, this field is empty.

4. When using the Push method for collecting Metric Intelligence data, the MID Server Metric Intelligence extension must be configured with the **Enable REST Listener** enabled. This option enables a listener so that a REST endpoint can receive raw metric data. The raw metric data is then placed in the regular data flow where the data is sent to the instance and the anomaly detector looks for anomalies. When selected, it adds a handler to the web server to listen for any metrics that are pushed to the MID Server. When this option is selected, the Web Server

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

extension, which starts a Web Server on the MID Server, must also be configured. For more information, see Configure the MID Web Server extension.

5. Right-click the form heading and select **Save**.
6. Under **Related Links** click **Start** to save the Metric Intelligence data in this extension and start the extension.

Commands available in the MID Server Metric Intelligence extension

Related Link	Description
Start	Starts the extension on the configured MID Server if it is currently not running.
Stop	Stops the running extension on the configured MID Server. No action is taken if the extension is not running.
Restart	Stops, then starts the extension on the configured MID Server.
Test	The test is not relevant to Metric Intelligence. Parameters are not tested or validated when **Test** is run.
Update parameters	Sends the latest saved parameters to the extension.

Activate the Advanced Promotion Engine

Before you can use the Advanced Promotion Engine feature, you must activate it from the list of plugins.

Before you begin

Role required: evt_mgmt_admin

About this task

To activate the *var.adv-promo-eng*, you also need to install a plugin for ACC-M, which includes the Metric Intelligence plugin.

If you don't plan to use ACC-M, install Metrics Intelligence plugin only, as described in Get started with Metric Intelligence.

Procedure

1. Navigate to **System Definition** > **Plugins**.
2. Locate **Advanced Promotion Engine** (id: sn_metric_promote).
3. Select the entry and review the app details on the **Store Application Advanced Promotion Engine** form.
4. Select **Activate/Upgrade** in the Related Links section.
5. Select **Activate**.

Configure domain separation for Metric Intelligence

Configure Metric Intelligence for domain separation to create logically defined domains that limit unauthorized access to data.

Before you begin

Role required: evt_mgmt_admin and evt_mgmt_integration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Activate the Domain Support – Domain Extension Installer plug-in.
2. Configure the MID Server for Operational Intelligence as a user that belongs to the desired domain with the role 'mid_server' assigned to it.
3. Configure a MID Server distributed cluster in the domain you desire and add Operational Intelligence MID Servers that belong to the same domain.
   For more information about setting up MID Servers for Metric Intelligence , see MID Server and MID Server distributed cluster for Metric Intelligence.

> **Note:** The Event Management's binding events are configured using the domain of the logged-in MID Server user. Once the process has finished, the record's domain is updated to use the domain from the CI so that any user within that domain can see the metric data.

Optimizing Metric Intelligence

You can perform a variety of tasks to optimize your use of Metric Intelligence.

Create an anomaly test rule

To use the anomaly model testing, create an anomaly test rule in which you specify up to 20 metric series to test anomaly detection for. Run the anomaly test, and after it completes, use the provided URL to open the Insights Explorer which is pre-loaded with the model testing results.

Before you begin

Role required: evt_mgmt_user

Procedure

1. Navigate to **All** > **Event Management** > **Anomaly Detection** > **Anomaly Model Testing**.
2. Select an existing anomaly test rule to edit and run again, or click **New** and fill out the Anomaly Test Rules form.

Field	Description
Name	Name for the model test rule.
Applies to	The table from which to select CI/metric pairs for the model test rule. The table used is Metric To CI Mapping [sa_metric_map].
Rule	Filter conditions to specify pairs of CIs/metrics for the anomaly model testing. If the rule yields more than 20 pairs of CIs/metrics, then the list is truncated to 20.
Start date/End data	The time period for which to apply the anomaly detection testing. The time period must be within the past 7 days.
Status	Status of the test, automatically updated by the system during a test run. Status is initially Scheduled and eventually changes to Complete.

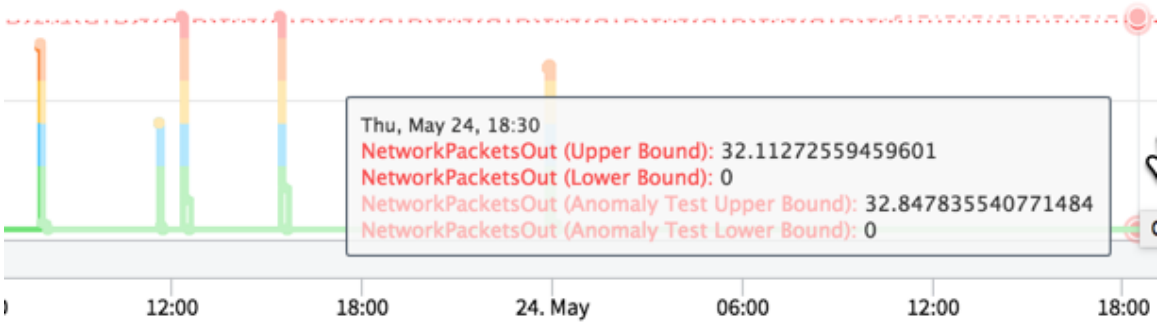
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
URL	URL to the Insights Explorer in which the anomaly model test results are pre-loaded.
Notes	Logging summary, automatically updated by the system with details of each test run of the anomaly test rule.

3. Click **Run Anomaly Test**.
   During the test run, the **Status**, **URL**, and **Notes** fields are automatically updated to reflect the progression of the job.
4. After **Status** changes to Complete, click the **URL** link to open the Insights Explorer to see the results of the test.

Result

The bounds and the chart for the anomaly model test, appear in faint colors in Insights Explorer. Also, the upper and lower bounds that are calculated by the test, use a line pattern that is different than line pattern used for actual anomaly detection results. These differences let you distinguish between actual anomaly detection and anomaly model test results, if both are selected in the chart settings.



What to do next

- Modify the date range for the test or choose different time series, and click **Run Anomaly Test** again to continue and fine-tune the model.
- Click the **Chart Settings** icon for a chart to toggle the display of statistics and aggregations on the chart. Select **Show Bounds** and **Show Anomaly Scores** in the Anomaly Test Statistics and in the Anomaly Statistics sections, to display test results next to actual anomaly detection results.

  Note: Anomaly Model Testing results might be very similar to actual anomaly detection results. If you configure the chart to display both at the same time, as you move the mouse over the chart, it might be difficult to identify points of differences.

- When you are satisfied with the anomaly test results, enable anomaly detection in the production environment, for the metrics and CIs specified in the test. See Choose and configure metrics to monitor for more details.

Specify custom upper and lower metric bounds

Use the Bounds Settings wizard to override learned control bounds by specifying custom upper and lower bounds for an Metric Intelligence metric.

Before you begin

Role required: evt_mgmt_admin

About this task

Metric Intelligence calculates upper and lower **control bounds** for metrics using statistical models learned from historical metric data. Upper and lower bounds are then used in the analysis for detecting anomalous CIs or resources, affecting anomaly scores. Based on historical data, some CIs, resources, or metrics might have values that you specifically want or do not want to be notified about, despite the calculated ranges. For example, trying to meet an SLA without allowing a metric to exceed or be below a certain value for too long without being notified. When concrete upper or lower bound values are known for a metric, you can configure that metric with custom bounds to override the calculated bounds. For example, a CPU metric which does not exceed 85%.

Use the Bounds Settings wizard to specify custom static bounds or ranges of bounds, and to preview anomaly analysis of actual data based on the custom settings. The metric class and the configuration setting rule that custom bounds must be associated with, are both automatically generated by the Bounds Settings wizard.

In the Bounds Settings wizard, you can choose one of the following options for custom control bounds:

Static upper and lower bounds

Custom static upper and lower bound values are used as the control bounds in effect, completely overriding the learned values for upper and lower bounds for the metric. The median of the metric data must be within the specified static bounds range, otherwise the static bounds are not applied.

Ranges for upper and lower bounds

Custom upper and lower bounds, each expressed as a range of values. The bounds in effect are a combination of the custom minimum and maximum values that define the bound range, and the learned upper and lower bounds:

- If a learned bound value for a point in time is within the custom range of upper or lower bound, then the learned bound value is in effect.
- If a learned bound value for a point in time is outside the custom range, then the **Max** or the **Min** values of the custom range are in effect respectively. If the learned value exceeds the custom range, then the custom **Max** value is in effect, and if below then the **Min** custom value is in effect.

When a metric value is outside a control bound, the deviation from the control bound is normalized by a **width** value that the system calculates from data. Lower and upper width values determine how much a metric value needs to exceed the control bounds to be anomalous. Changing a width for the control bounds affects the speed of reaching a high anomaly score and being notified about the anomaly. In addition to setting custom control bounds, you can override width values by specifying custom deviation and time values that the system uses to calculate custom widths values.

The system stores custom control bounds and custom widths for a metric in a **metric class**. Custom values in a metric class override the learned bounds and widths for the metric, and are then used in subsequent anomaly analysis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Anomaly Detection** > **Bounds Settings**.
2. In the Bounds Settings list view, click **Add** to open the Bounds Settings wizard.
3. On the **Select Scope** tab, configure the following settings and then click **Next**.

Field	Description
Source Metric Type(s)	Source metric type that this bounds setting applies to. Select an item from the drop-down list, and then click the Add Source Metric Type icon (**+**) to add the selected item to **Selected Source Metric Types**.
Scope	Scope of CIs or resources that this bounds setting applies to. You can set the scope to **All CIs**, **Specific CI or class**, or **Specific Resource or Resource class**. Depending on the setting, you can then further filter the scope.

4. On the **Apply Bounds Settings** tab, configure the following settings and then click **Next**.

Field	Description
Bounds setting name	Unique name for this bounds setting.
Bounds type	Method for specifying the custom static bounds: ○ Set static upper and lower bounds ○ Set ranges for upper and lower bounds
Show advanced settings	The following fields appear: ○ **If lower bound is** and **And metric value is below lower bound by** ○ **If upper bound is** and **And metric value is above upper bound by** ○ **Send critical alert after duration (min.)** Specify the deviation for anomalous values (in absolute values), and the duration for sending an anomaly alert. These values are used internally to calculate the width value for the metric.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: ○ If the metric class specified for the bounds setting, is configured with width override values from an upgraded release, you cannot set advanced settings. To set advanced settings, accept the notification that appears, agreeing that those width override values be deleted. ○ All fields must contain values. If you do not want to set a metric value, you must enter 0 in either the **And metric value is below lower bound by** or in the **And metric value is above upper bound by** field. ○ The minimum number of minutes you can enter is 2.
Lower bound	Static lower bound value that replaces the learned lower bound for the metric. Applies to the `Static upper and lower bounds` setting.
Upper bound	Static upper bound value that overrides the learned upper bound for the metric. Applies to the `Static upper and lower bounds` setting. Value must be greater than **Lower Bound**.
Lower Bound Range	**Min** and **Max** of the custom lower bound range. Applies to the `Set ranges for upper and lower bounds` setting.
Upper Bound Range	**Min** and **Max** of the custom upper bound range Applies to the `Set ranges for upper and lower bounds` setting.

5. On the **Preview and Confirm** tab:

   a. Select a **Source Metric Type**.

   b. **Optional:** Select a **Metric Type** for the preview.

   c. **Optional:** Enter a **CI Name** and a **Resource Name** that you want to include in the preview. If you specify a CI or a resource, it must be within the scope that was previously specified.

   d. Click **Preview** to perform anomaly detection for the specified metric and CI, using the newly specified custom bounds.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Examine the preview results and if the results are as expected, click **Finish**.
Otherwise, go back to the previous **Apply Bounds Settings** tab, adjust settings, and then preview again. The preview results are a stripped-down version of anomaly model testing. For more details about the results, and changing chart settings, see Anomaly model testing.

Create a configuration settings rule

View metric to CI and resource binding

View the metric to CI and resource binding results, including details for failed bindings which you can use to mitigate the failure. If Metric Intelligence cannot map and bind a metric to a CI or to a resource, then that CI or resource is not included in anomaly detection until it is properly mapped.

Before you begin

Role required: evt_mgmt_admin

If resource binding is not enabled, then no resource binding results appear.

About this task

Metric Intelligence uses event rules to map metric data with the specific CI or resource that is associated with the metric event. The results of these mappings are stored in the Metric to CI Mappings [sa_metric_map] table. If mapping fails, then the binding status for the metric indicates the general reason for the failure and further details about the failure are provided. Examine the details for a mapping failure and mitigate the problem to improve accurate and effective metric data processing.

- If mapping to a CI is successful, then the mapped CI appears in the **Configuration Item** column. If resource binding was attempted but failed, then the mapped CI does not appear, even if the mapping to a CI was successful. Missing or duplicate CIs can cause CI mapping to fail.
- If mapping to a resource is successful, then the mapped resource appears in the **Resource** column. Missing a resource table that is mapped to the CI type to which the event is bound, or a missing *`resource_path`* attribute in the event, cause resource binding to fail.

Records in the CI Mappings [sa_metric_map] table remain in effect for 24 hours (by default, if mapping to the CI is not successful), or for 5 days (by default, if mapping to the CI is successful). Later, if within that time period raw data arrives for a metric/CI pair that already has a record, the existing mapping is used to match the data to an existing CI. After Metric to CI Mappings records expire, incoming new raw data requires remapping. These records expire when:

- The 24-hour or 5-day cycle ends.
- An event rule has changed — Triggering an immediate expiration of the respective mapping record.

Adjusting mappings to reflect the addition or removal of CIs by Discovery, takes effect only upon the beginning of the next cycle.

Procedure

1. Navigate to **All** > **Event Management** > **Anomaly Detection** > **Metric to CI**.
The **Metrics to CI Mappings** page appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Source	Data source for the metric.
Metric Type Id	Metric that is measured for the CI, such as disk% and cpu%.
Metric Identifier	A string in the form of CI/resource/metric that uniquely identifies a CI and a metric.
Configuration Item	The CI in the CMDB that is mapped to a metric. A missing value indicates that: ○ The mapping of the metric to a CI was unsuccessful. ○ Resource binding is enabled, but has failed. **Configuration Item** is missing even though binding to a CI was successful.
Resource	The resource that is mapped to a metric. If resource binding is enabled, then a missing value indicates that the mapping of the metric to a resource was unsuccessful.
Expiration Date	Record expiration date.
Anomaly Detection Action Level	The level of anomaly detection processing and analysis applied to CIs and metrics. The available options are: ○ **Metrics Only**: Only gather metrics from the data source without any further processing. ○ **Bounds**: Includes the Metrics Only processing level, and also creates a statistical model and shows bounds in Insights Explorer. ○ **Anomaly Scores**: Includes the Bounds processing level, and also calculates and displays anomaly scores. ○ **Anomaly Alerts**: Includes the Anomaly Scores processing level, and also creates anomaly alerts, as applicable. ○ **IT Alerts**: Includes the Anomaly Alerts processing level, and also creates IT alerts which are based on anomaly alerts, as applicable.
Binding Status	Status of the mapping of the metric to a CI or resource. A **CI Found** status indicates that the mapping was successful, in which case the mapped CI appears in the **Configuration Item** column. Any other status indicates that the mapping failed, and a general reason for the failure is provided. Further details about the failure

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	are provided in the **Binding Failure Reason** column.
Binding Failure Reason	Specific details about the mapping that failed, such as class and host names, and the queries that were used. Click the respective **Event** link to see further details in the **Processing Notes** field.

2. Examine the **Binding Status** and **Binding Failure Reason** as appropriate.
Use the details provided to remediate the problem:

Binding Status	Remediation
Host CI Missing	Run Discovery or use any other method to populate the CMDB with the missing host CI.
Non-Host CI Missing	Run Discovery or use any other method to populate the CMDB with the missing non-host CI.
Non-Host CI Duplicate	Use the Duplicate CI Remediator to remediate the duplication.
Dependent CI Duplicate	Use the Duplicate CI Remediator to remediate the duplication.
Dependent CI Missing	Run Discovery or use any other method to populate the CMDB with the missing dependent CI.
Duplicate Metric Map Entry Exists	Check **Binding Failure Reason** and compare the metric identifiers associated with the duplicate metric map entries. If metric identifiers have changed (for example, an identifier was added), set the entry for this series in the CI Mappings [sa_metric_map] table to expire or delete the entry. Also check the associated event rule and ensure that it extracts the attributes correctly and that it does not extract the same CI for two different metric identifiers. This error might appear when 2 different metric identifiers map to the same CI/metric.
Resource ID Not Found	Verify that the CI Type To Resource Class [sa_ci_type_to_resource_class] table contains a mapping record for the respective CI type, or for one of its parents. Then ensure that a table with the name of resource class for this record, exists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Group **Binding Failure Reason** by **Binding Status** to create a summary report with the number of records per failure category. Use this report to efficiently remediate the problems.

Related topics

Creating an event rule to map metrics to specific CIs

Disable a metric for a CI

Metric Intelligence can be configured to collect significant amounts of data, some of which might not be necessary. To improve performance, you can disable a specific metric for a specific CI to stop processing data related to the specified metric and CI.

Before you begin

Role required: evt_mgmt_admin

About this task

Note: The *Active* setting (true or false) for a source metric in the Monitoring System Metric Types [sa_source_metric_type] table takes precedence over the setting for the corresponding metric in the Metric To CI Mappings [sa_metric_map] table. If a source metric type in the Monitoring System Metric Types [sa_source_metric_type] table is disabled, all records related to the corresponding metrics are removed from the Metric To CI Mappings [sa_metric_map] table.

Procedure

1. Navigate to **All** > **Event Management** > **Anomaly Detection** > **Metric to CI**.
2. Locate the record for the metric/CI that you want to disable, and set its **Active** column to **false**.

Disable event collection

For performance reasons, you might want to disable the collection of events from a data source from which metric data is also collected. You can disable event collection for data sources such as Nagios XI server, SolarWinds monitoring system, and Zabbix server.

Before you begin

Role required: evt_mgmt_admin

Note: To restart event collection after it has been disabled, you will need to restore the connector's original script.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Select a connector instance for the data source for which to disable event collection.
   For example, select a connector instance for Nagios, SolarWinds, or Zabbix.
3. Set **Event collection schedule (seconds)** to a large value such as 20,000,000.
   Such setting avoids unnecessary communication with the MID Server, optimizing performance.
4. Click **Update**.
5. Navigate to **MID Server** > **Script Includes** and extend the connector's script (such as *NagiosMetrics_JS*, *SolarWindsJS*, or *ZabbixJS*) by overriding the *execute* method.
   Add a code snippet such as the following, and then click **Update**:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Snippet for Nagios

```
var NagiosJSCustom = Class.create();

// Extending Nagios default script
NagiosJSCustom.prototype = Object.extendsObject(NagiosJS, {

// Override execute method
                    execute: function() {
        var retVal = {};
        retVal['status'] = SUCCESS.toString();
       retVal['error_message'] = "Disabled by custom Class,
 'Last event collection status' will be 'error' and this is
 normal. To achieve success status, enable event pull in custom
 class(NagiosJSCustom)";

        return retVal;
    });
```

For the SolarWinds connector use:

```
var SolarWindsJSCustom = Class.create();

// Extending solarwinds default script
SolarWindsJSCustom.prototype =
 Object.extendsObject(SolarWindsJS, {
```

For the Zabbix connector use:

```
var ZabbixJSCustom = Class.create();

// Extending zabbix default script
ZabbixJSCustom.prototype = Object.extendsObject(ZabbixJS, {
```

Configure anomaly score thresholds

Metric Intelligence scores anomalies on a range 0-10. This range is broken down to the five levels of event severities, each represented by a different color in the Insights Explorer and in the Anomaly Map. You can configure the anomaly score threshold for each level of severity.

Before you begin

Role required: evt_mgmt_admin

About this task

Anomaly score thresholds are defined in the table Anomaly Score to Event Severity Map [sa_metric_anomaly_score_to_event_severity_map]. For example, by default, anomaly scores from 8 through 9 are severity 2 (Major), and are displayed by dark orange color in the Insights Explorer and in the Anomaly Map.

For information on the event severities that each number corresponds to, see Event severities.

Procedure

1. Navigate to **All** > **Event Management** > **Anomaly Detection** > **Anomaly Score to Severity Mapping**.
2. In the **Metric Anomaly Score to Event Severity Maps** list view, double-click the event severity that you want to modify.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Modify the range of anomaly scores that map to the respective event severity.
4. Click **Update**.

View anomaly alerts

Anomaly alerts indicate deviation from projected metric values for monitored CIs. Anomaly alerts are separate from regular IT alerts. They appear in the Service Operations Workspace but not in Express List. You can define an anomaly alert promotion rule to generate an IT alert that is based on anomaly alerts.

Before you begin

Role required: evt_mgmt_user

About this task

The statistical model is used to calculate standard deviations, upper and lower bounds, and statistical outliers which are then used to detect anomalies. An anomaly occurs when metric values are out of the projected values according to the statistical model. The system monitors the frequency and persistence of statistical outliers across time to compute a score between 0-10 that indicates how abnormal a deviation is.

Metric Intelligence constantly generates anomaly alerts whenever the anomaly score is above zero. If there is a score that is above four and which has changed from the previous score, then it is sent to the instance. On the instance, the entire sequence of anomaly scores over time can then be displayed in the Insights Explorer.

Metric Intelligence monitors historical data to ensure that metric bounds are accurate and that the alerts close when the anomalous behavior stops. Metric Intelligence also ignores irrelevant anomalies based on the metric's labels. For example, if the available CPU increases from its upper bound of 50% to 60%, the *`available`* label is identified as an indicator that the behavior should not register as an anomaly. This is because the increase in available CPU represents a favorable outcome, even though the metric of 60% would otherwise represent an anomaly.

Procedure

1. Navigate to **All** > **Event Management** > **Metrics** > **Anomaly Alerts**.
2. In the **Alerts Anomalies** list view, double-click an alert that you want to view.
   Information about an anomaly alert includes details such as the metric value, promotion parameter, events relevant to the alert (which appear in the alert's work notes), and upper and lower bounds (lower bounds cannot be less than 0). Description includes details about why the anomaly alert was generated, and other details such as the metric name and the anomaly score.

What to do next

Create an Advanced Promotion Engine Definition, to define the conditions which must be met to promote anomaly alerts to IT alerts. For details, see Create a definition for the Advanced Promotion Engine.

View metric values in the Insights Explorer

Metric Intelligence calculates statistics for CI metric data. Insights Explorer displays these metric values as metric charts for the CIs in the CMDB. Insights Explorer lets you overlap any metrics for any CIs in a single chart to create a multi-layered view of metric values across a time range.

Before you begin

Role required: evt_mgmt_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

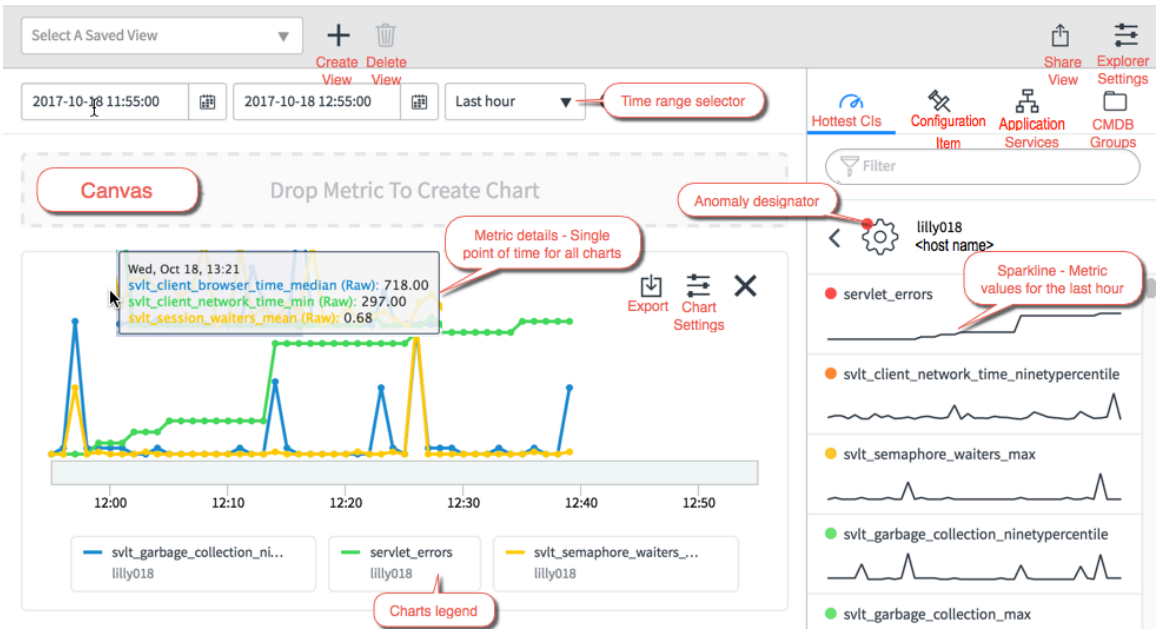
About this task

The Insights Explorer provides a canvas to which you can drag various metrics for CIs and create charts. You can place a single metric on the canvas, for an individual metric for a CI. For a more comprehensive chart, you can layer several metrics for a single CI or for different CIs to create a multi-metric chart. In such layered chart, each metric is distinguished by a unique color, which lets you compare metric values across CIs within a specific time range.

Insights Explorer displays metric boundaries according to the most recently configured model. Therefore, legacy anomalies from a previous build may still appear as anomalies, even though according to the current boundaries, the alert does not qualify as an anomaly.

You can also access the Insights Explorer from the business service map. For details, see View metrics from a business service map.

Insights Explorer



If the host name of the CI is available, it appears underneath the CI name. Host name is populated by retrieving the node information from the generated binding event as part of metric binding.

To navigate to a CI for which to display metrics:

- Use Hottest Configuration Items ( ) to quickly access the 10 most anomalous CIs.
- Use Configuration Items ( ) to create a separate custom list of any CIs from the CMDB and then add the metrics for these CIs to the canvas.
- Use Application services ( ) to create a custom list of application services that let you drill into the CIs of these services. You can then add metrics for these CIs to the canvas.
- Use CMDB Groups ( ) to create a custom list of CMDB Groups that let you drill into the CIs of these groups. You can then add metrics for these CIs to the canvas.

The following colors, which are based on color settings for alert severities, indicate anomaly severities:

Red

Critical severity (highest severity).

Orange

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Major severity.

Yellow

Minor severity.

Blue

Warning severity (lowest severity).

Green

Informational. No severity.

The dots at the upper left on the CI icons indicate general anomaly tracking status:

- Grey: Metrics are being tracked for the CI, but none of those metrics have ever had an anomaly.
- Green: Metric for CI had at least one anomaly in the past, but anomaly score is currently 0.
- Colored: Corresponds to the last recorded severity level according to the configuration of the color band ranges.
- No dot: There are no metrics for the CI and there is no data to drill into.

Note: **Configuration Items** and **Application Services** are likely to include CIs for which there is no metric data.

Metric Intelligence does not track changes to an anomaly score if it is within the green band range.

As you create charts, a legend for each series chart automatically appears underneath the chart. For a single-metric chart, the legend has entries for the aggregations in the chart. For a multi-metric chart, the legend has entries for the metrics in the chart.

Modifications in the Insights Explorer remain during the session, and once the Insights Explorer is refreshed it returns to its initial state.

Procedure

1. Navigate to **All** > **Event Management** > **Metrics** > **Insights Explorer**.
2. Click a CI to drill down to its associated list of metrics, ordered by their most recent anomaly scores.

   For each metric, a sparkline displays metric values for the CI for the last hour. Point to the sparkline to display the metric value at each point of time.

   If resource binding is enabled, then the list of series being monitored for a CI also contains series that belong to a resource and metric. The naming convention for such series is '<resource name>/<metric name>'. For a series that is only bound to a CI, the naming convention is '<metric name>'.

3. Drag a metric to the **Drop Metric To Create Chart** area on the canvas and point to the chart to display the exact metric value at each point of time.
   The metric chart displays data for the specified time period, according to the chart settings. By default, raw data is displayed. If the time period is longer than a week or earlier than the last week, then average data is displayed. Drag subsequent metric to the canvas as follows:
   - In the **Drop Metric To Create Chart** area, so it is displayed individually in a new chart.
   - Onto an existing chart, in the **Replace Chart** highlighted block to overwrite the existing chart.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Onto an existing chart, in the **Add Metric** highlighted block to overlap it with the existing metrics in the chart.

  When you display multiple metrics in a single chart, the same aggregation selection applies to all the metrics, and statistics settings are not available. For example, if **Average** is selected in the **Chart Settings**, then averaged values are displayed for all the metrics in the chart.

4. Use the **Search** box to search and filter for specific configuration items, application services, or CMDB groups that are not listed by default.
   In the SEARCH RESULTS section, click the + icon next to an item that you want to add to the ADDED ITEMS section. Or, use advanced search:

   - Select and then click **Add Configuration Item** to add any specific CIs. In the Add Configuration Items dialog box, select a **CI Class Type** such as Linux Server.
   - Select and then click **Add Application Service** to add all CIs included in a specified application services. In the Add Application Services dialog box, select `Discovered Service` or `Manual Service` as the **CI Class Type** and then specify filter conditions to narrow down the search.

     Note: You can add an application services only if its *`Operational Status`* is 'operational'.

   - Select and then click **Add CMDB Group** to add all CIs included in a specified CMDB group. In the CMDB Groups dialog box specify filter conditions such as **[GroupName] [starts with] [d]**, to narrow down the search.

   After selecting the items that you want to add, click **Add**.

5. Add related CIs:

   a. Click the **Add related CIs** ( ) icon next to a CI.
   The Add Related Configuration Items dialog box appears, displaying all relationships in which the selected CI is a parent or a child.

   b. To further filter the list, you can define specific conditions that must be met.

   c. Select the relationships from which you want to add the parent or the child CI, whichever is not the selected CI.

   d. Click **Add**.

   The CIs from the selected relationships, which are not the selected CI, are added to the list of CIs in the Insights Explorer.

6. Point to a legend item and click its '**X**' icon to remove the corresponding metric from the chart, or to disable the corresponding series from the **Chart Settings**.
7. Click the cog **Settings** icon to open application settings:
   - Enable, disable, or set the frequency for refreshing anomaly data on the Insights Explorer.
   - Activate or deactivate the display of related lists such as All Alerts, Incidents, and Problems. For more information, see Create or modify map indicators.
8. Click the **Chart Settings** icon to toggle the display of statistics and aggregations on the chart. Enabling or disabling an item to add or to remove metrics from a chart, also updates the legend of the chart to reflect the change.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart Setting	Description
Show Bounds	Displays a computed upper and lower bound for the metric, based on learning of past values. The upper and lower bounds always display together.
Show Anomaly Scores	Displays anomaly scores on a virtual axis of 0-10. Color code is based on the score thresholds that are defined in the Anomaly Score to Event Severity Map [sa_metric_anomaly_score_to_event_severity_map] table.
Average	Displays aggregated average metric values calculated in one hour intervals. Aggregated averages are displayed as follows: ○ For data that is up to 8 days old: Displays 10-minute aggregation windows. ○ For data that is up to 94 days old: Displays 10-minutes aggregation windows. ○ For older data: Displays 1-hour aggregation windows.
Minimum	Displays aggregated minimum metric values calculated per one hour time periods. For data that is up to 8 days old: Displays 10-minute aggregation windows.
Maximum	Displays aggregated maximum metric values calculated for one hour time periods. For data that is up to 8 days old: Displays 10-minute aggregation windows.
Raw	Displays the raw, unaggregated metric values. These values are kept only for the last 8 days.

What to do next

- Point to the icon of a CI in the right-hand side bar to display the CI type.
- Zoom in or out by changing the default **Last Hour** time range selection. Select one of the preset time periods to display anomaly scores for the last **6 Hours** for example, or specify a custom time period for up to 90 days back.

  To zoom in, highlight a section of a chart by pointing to the upper left corner of the section and dragging the mouse device to the lower right corner of the section. The time range of the chart changes accordingly. If there are other charts on the canvas, they are all automatically synchronized to display data for the same time range. The time range in the title bar automatically updates to reflect the new time range.
- Right-click on a CI in the right-hand side bar and select **View Form** to open its CI form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Click the map icon next to an application service listed in the **Application Services** tab, to open its application service map.
- Click Remove ( ) next to a CI to remove it from the Insights Explorer.
- Click the Export icon in a chart to download it as a .png or .svg image, or as a .pdf document.

Related topics

Create an Insights Explorer view

Create an Insights Explorer view

You can create a custom view in the Insights Explorer that saves any metric charts that were added to the canvas, and any added configuration items. After you create a view, you can share a link to the view.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Event Management** > **Metrics** > **Insights Explorer**.
2. Click **Create View** ( ), and enter a **Name** in the Create New View dialog box.
   If you are already creating a view, then you can choose **Create With Existing** to load an existing view to work with rather than starting with a blank canvas.
3. Click **Create**.
4. Add items to be included in the view:
   a. Drag metrics and create charts on the canvas.
   b. Add configuration items.
   While modifying a view, it is automatically saved every time you update it. The time settings are not saved in views, and when a saved view is loaded, its time period is always set to **Last hour** displaying current information.

What to do next

- Share a view: Click **Share View** ( ), and then in the Share dialog box, click **Copy Link**. Send or paste the link to make it accessible to whoever you want to share the view with. A shared link captures the time range of the view, the charts that were added to the canvas, and any added configuration items.
- Display a saved view: Open the **Select a Saved View** drop down list, and select a previously saved view that you want to display.

View metric charts in Agent Workspace

Agent Workspace for Metric Intelligence provides easy access to metric charts for a CI. On an alert form, you can drill down to important metric charts for the CI that is associated with the alert.

Before you begin

- The CI that you want to view metric charts for, must be associated with an alert.
- The Metric Dashboard Metadata [sa_metric_dashboard_metadata] table must contain active chart configurations for the CI class for which you want to view metric charts.

Role required: workspace_user and itil

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
The set of metric charts, chart types, and other chart characteristics, is determined by the chart configurations in the Metric Dashboard Metadata [sa_metric_dashboard_metadata] table, for the CI class.

Procedure
1. Navigate to **Agent Workspace** and click **Agent Workspace Home**.
2. In Agent Workspace, click **List** and in the **Lists** panel, select one of the **Alerts** categorized lists such as **All Alerts** or **Top Priority**.
3. In the alerts list view, open an alert.
   The alert must have a **Configuration item** associated with it.
4. In the **Details** tab of the alert form, click **Metrics**.

Result
All metric charts that are configured for the CI associated with the alert, and that are active, appear on the metric charts form in the **Metrics** tab. The calculation of the default time range for the charts is based on the times that the first and last events that generated the alert, occurred.

What to do next
- Modify the time range for the charts by changing **Start Time** and **End Time**. When you modify the time range, all charts are updated to reflect the new time range.
- Click the cog wheel **Open settings** icon and change the settings for all charts:
  - **Show bounds**: Show the bounds in the chart. Even if enabled, there are no bounds in a chart for aggregated resources.
  - **Show legend**: Show chart legend.
- Click **Insights Explorer** to open the Insights Explorer in a new browser tab. That Insights Explorer opens with the current CI pre-selected and with the current time range settings in Agent Workspace.

Configure metric charts for Agent Workspace

Configure the set of Metric Intelligence metric charts, chart types, and other chart characteristics, that appear in Agent Workspace.

Before you begin
Role required: admin or evt_mgmt_admin

About this task
Up to 10 metric charts for a class can be configured to appear in the Metric Intelligence metric charts form in Agent Workspace. Metric chart configurations are stored in the Metric Dashboard Metadata [sa_metric_dashboard_metadata] table, determining which metric charts appear for a CI that is associated with an alert. By default, the Metric Dashboard Metadata contains pre-configured metric charts for several classes.

If resource binding is enabled and you specify a **Resource Type** in the metric chart configuration, then all the resources for the CI are included in the chart. The class table for the resource class (such as *`ci_resource_metric_extension`*) that you specify is used for retrieving all the resources for the CI. Then, for each point in time in the data series, the values of resources are aggregated into a single data point which is the average of the metric values of all resources for that point of time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart aggregation

Aggregation is applied differently, depending on the setting of **Chart Type***, and on whether resources are included in the chart as indicated by the setting of* **Resource Type***:*

Chart type	Resources	Aggregation
Time_Series	No	No aggregation
Time_Series	Yes	Resources are averaged per data point.
Single_Score	No	Data points are aggregated according to the **Chart Aggregate** setting.
Single_Score	Yes	Resources are averaged per data point and then data points are aggregated according to the **Chart Aggregate** setting.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Metrics View Configuration**.
2. In the Metric Dashboard Metadatas (Dashboard Metadata) list view, select an existing configuration or click **New**.
3. Fill out the Metric Dashboard Metadata form.

Field	Description
Active	Include the chart on the Metric Intelligence charts form in Agent Workspace.
Resource Type	Resource class associated with the CI and for which to retrieve and aggregate all resources.
Configuration Item Type	CI class that the chart applies to such as *cmdb_ci_metric_extension*.
Chart Aggregate	Type of aggregation that is applied for single-score charts. Aggregation can be the average of the data points in the time series. Or, the minimum, maximum, or the last data point in the time series.
Source Metric Type	Metric such as '% Free Space' that is being monitored for the CI type.
Order	Order in which the metric chart appears within all metric charts specified for the class. For proper appearance and alignment, all single-score charts always appear after any time-series charts, regardless of order settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Chart Type	○ Time_Series: Charts all the data points in the time series for the metric and CI of the chart. ○ Single_Score: A single number which is the aggregation of all data points in the time series for the metric and CI of the chart. Aggregation is determined by the setting of **Chart Aggregate**.

View self-health monitoring statistics for Metric Intelligence

Monitor the status of components and processes of Metric Intelligence. Use the XMLStats page to view statistics and diagnostic details that can help with troubleshooting issues with Metric Intelligence.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Open a browser and enter the URL to the instance.
   Type in: `http://<instance name>.service-now.com`
2. Append the following text to the instance URL: `xmlstats.do?include=XMLStatsOI`.
   The complete URL format is: `http://<instance name>.service-now.com/xmlstats.do?include=XMLStatsOI`
3. Hit Enter.

Result

Details are separated between two sections, instance level statistics and node level statistics. Details in the node section are specific to the node in the URL.

Node section

Entry	Description
batches_recieved	Number of batches of metrics that the node received from the MID Server.
batches_processed	Number of batches of metrics processed on the node.

Details in the instance section are for the entire instance, showing the status of the self-health monitors.

Instance section

Entry	Description
scheduled_jobs_monitor	Status of the self-health monitor that checks if the essential Metric Intelligence scheduled jobs are active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instance section (continued)

Entry	Description
distributed_cluster_monitor	Status of the self-health monitor that checks if the Metric Intelligence MID Server distributed cluster is running properly.
oi_extension_monitor	Status of the self-health monitor that checks if the Metric Intelligence extension is running properly.
metrics_collection_monitor	Status of the self-health monitor that checks if metrics are being collected by active connectors that are configured for metrics collection.

Verify that the definitions for the Advanced Promotion Engine are active

Verify that the Advanced Promotion Engine definitions that come with the base system are active.

Before you begin
Role required: evt_mgmt_admin

About this task
The active definitions promote a group of anomaly alerts to the All Alerts table when all of the definition's conditions are met.

You can't modify the conditions of the definitions that come with the base system. For information on creating customized definitions, see Create a definition for the Advanced Promotion Engine.

Procedure
1. Navigate to **All** > **Advanced Promotion Engine** > **Advanced Promotion Definitions**.
2. Select the Advanced Promotion Engine definition that you want to be active:
   - Windows Server
   - Linux Server
3. Verify that the **Active** check box is selected.
4. Select **Save**.

Create a definition for the Advanced Promotion Engine

Create a definition for the Advanced Promotion Engine so that you can define the conditions for promoting the anomaly alerts to IT alerts. By promoting the alerts that meet the conditions, only the most relevant alerts move to the table.

About this task
IT Alerts appear in the Express List and are addressed by an operator.

Only metrics that are associated with a metric configuration rule that has **Anomaly score level = Anomaly alerts** are considered for promotion to IT alerts. For details on metric configuration rules, see Metric Configuration Rules.

Before you begin
Ensure that the Metric Intelligence plugin (com.snc.sa.metric) is installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Advanced Promotion Engine** > **Advanced Promotion Definitions**.
2. Select **New**.
3. In the **Name** field, enter a descriptive name for the definition.
4. In the **Order** field, set the execution order for the definition.
   The definitions with a lower order are executed first.
5. Activate the definition by selecting the **Active** check box.
6. On the **CIs** tab, fill in the fields for the CI alerts that you want to consider for promotion.

CIs tab fields

Field	Description
CI class	CI class alerts to be promoted to the All Alerts table.
Filter	Filter to restrict which CIs that the definition applies to. Select **New Criteria** to configure the conditions that the definition applies to. You can add more conditions by selecting either **OR** or **AND**.
Skip CIs that were created less than this number of days ago	Number of days in the past that any CI created during that time is ignored. For example, a value of 7 indicates that any CIs created less than 7 days ago are not considered for promotion to the All Alerts table.

7. On the **Severity** tab, enter the minimum severity of alerts to be considered for promotion.
   Alerts with the indicated severity level and higher levels are considered for promotion.
8. On the **Number of Alerts** tab, in the **Number of alerts on CI** field, enter the minimum number of a CI's alerts with an identical severity level (or higher) to be considered for promotion.
   For example, a value of 3 indicates that at least three alerts with the indicated severity (or higher) must exist on a CI for the alert to be considered for promotion.
9. On the **Time Window** tab:
   - In the **Consider alerts updated at least this number of minutes ago** field, enter the minimum number of minutes old for an alert to be considered for promotion.

     For example, if the value of the field is 5, only alerts that are updated at least five minutes ago are considered for promotion.
   - In the blue box, select the number of minutes link to modify the amount of minutes during which alerts are to be considered for promotion.

     The **Properties** page opens and you modify the value in the **The width of the time...** field.

     Default = 30.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example:

- The current time is 10:05.
- In the **The width of the time...** field, you entered a value of 30.
- In the **Consider alerts updated at least this number of minutes ago** field, you entered 5.

Alerts that occur between 9:30-10:00 are considered for promotion.

What to do next

Ensure that the a metric configuration rule exists which includes metrics you want to be promoted to an IT alert, and that the anomaly score level of the rule is **Anomaly alerts**. For details on configuring a metric configuration rule, see Create a configuration settings rule.

View the promoted events

View the anomaly alerts that the Advanced Promotion Engine promoted to IT events. Viewing IT events enables you to track the source of the event.

Before you begin

Role required: evt_mgmt_user

About this task

The system generates an IT event when an anomaly alert is promoted. Those events then become IT alerts. For details, see View the promoted anomaly alerts.

Procedure

1. Navigate to **All** > **Advanced Promotion Events**.
2. On the Events page, view the IT events that are created from the anomaly alerts by the Advanced Promotion Engine.

View the promoted anomaly alerts

View the anomaly alerts that the Advanced Promotion Engine promoted to events, which are then processed as alerts in the All Alerts table. Viewing alerts in the All Alerts table enables you to track the source of the alert.

Before you begin

Role required: evt_mgmt_user

About this task

The Event Management alert grouping feature takes the anomaly alerts that are promoted to the IT events and groups them into new IT alerts.

The Alerts table displays all of the relevant issues in the system.

Procedure

1. Navigate to **All** > **Advanced Promotion Engine** > **Anomaly Alerts**.
2. In the Is Advanced Promoted column header, view the alerts with a value of **true**.
   The IT alert that is created from the anomaly alert appears in the IT Alert column.
3. **Optional:** Select an alert to receive more information about the alert.
   For details on the displayed additional information, see Alerts in Service Operations Workspace.

Create metric rules

Create a metric rule to determine the metric, the threshold values and ranges, and the severity level of generated events. You can add a filter that determines the Configuration Items (CI) types or resources for which you receive alerts. For example, you can configure a filter to receive alerts only for Windows servers.

Before you begin

Role required: evt_mgmt_admin

About this task

When a metric crosses or falls within the range of a configured threshold, the system creates a single event, which is eventually processed into an IT alert. The severity of the event (and alert) is determined by a defined threshold, and the event is bound to a CI.

Procedure

1. Navigate to **All** > **Event Management** > **Metrics** > **Metric Rules**.
2. Select **New Metric Rule**.
   The **CI selection** page opens.
3. Select the CI class on which to run the rule in the **CI Class** field.
   Only CIs containing metrics are available for selection.
4. **Optional:** Apply a filter within the selected CI class.
   For example, if you selected a CI class of **Linux Server**, you can apply a filter to indicate that the rule applies only to those servers with a host name that starts with a specified string.
5. Select **Next**.
   The **Alert criteria** page opens.
6. Select the metric and criteria to create an alert.

   a. Select the alert severity that you want to configure in the **Alert severity** field.
      Choose from the following:
      - Critical
      - Major
      - Minor
      - Warning

   b. Select the metric for the alert severity to apply to in the **Metric** field.

   c. Select the comparison operator (equals, is greater than, is greater than or equals, and so forth) in the **Comparison operator** field.

   d. Enter a value in the **Value** field.

   For example, you can configure criteria to indicate that when the metric **node_rx_packets** is greater than 10, a Critical alert is generated.

   To define additional alert severities, select **Add another alert severity** and repeat this step.

7. Select when to generate the alert in the **Alert when** section.
   Choose from the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **All sampled values must breach the criteria in the following time period**.

  Select the time period, in minutes.

- **Average of sampled values in the following time period must breach the criteria**.

  Select the time period, in minutes.

- **Any time the sampled values breach the criteria**.

8. Select **Next**.
   The **Name and activation** page opens.
9. Verify the name and details of the metric rule.

   To activate the rule, ensure that the **Active** toggle switch

is activated.
10. Select **Finish**.

Create an event rule to bind metric events to host CIs

Create event rules to explicitly allow binding of metric events to host CIs.

Before you begin

Role required: evt_mgmt_admin

About this task

Starting with the London release, Metric Intelligence no longer relies on the default Event Management binding workflow which binds nodes to host CIs. Event Management is configured to apply the default host binding algorithm when an event rule cannot find a CI to bind to, based on event data. In Metric Intelligence, with a given event rule and two different events, there can be a situation where one event binds to the correct CI and another event cannot bind. In this case, the same metric types would be created for the selected CI and for the host level CI, causing confusion.

For example: With an event rule that binds the disk percentage metric to a storage disk, one event can find a disk CI and another event cannot. This results in the disk percentage metric being created for a disk CI and for a host CI.

To avoid this confusion, Event Management default host binding is disabled for metric events in the base system. To allow host binding for metric events, explicitly create the following event rule in the Event Management event rule designer. The underlying binding functionality of the event rule designer is used to map metrics to CIs.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules** to open the event rule designer.
2. Click **New** and ensure that the **Active** toggle switch is set to the right (Active).
3. On the **Event Rule Info** tab:
   a. Set **Source** to the data source that this rule applies to.
   b. **Optional:** Enter a **Description** such as `Bind metrics at host level`.
4. On the **Event Filter** tab, set a filter condition to indicate that **Classification** is **Metric**.
5. Click **Save**.

Metric Intelligence reference

Reference topics provide additional information about Metric Intelligence settings and properties.

Insights Explorer settings

You can configure Insights Explorer settings to control for example, the refresh frequency or the display of related records.

Click the cog **Settings** icon to open the Application settings dialog box.

Setting	Description
Refresh interval	Enable and set the frequency for refreshing metrics data on the Insights Explorer.
Indicators	Enable any indicator to display related records such as incidents or problems for CIs. The respective icon displays on the timeline in the metric chart, indicating the number of records for the CI. A toggle is available only if the **Active in Metrics** field is selected on the Map Indicator form for the respective table. For example, the **Incident** toggle is available only if **Active in Metrics** is selected on the Map Indicator form for the incident [Incident] table.

Sensitivity bounds properties for Insights Explorer metrics

The following properties can be configured to customize system behavior when detecting sensitive bounds for Insights Explorer metrics. To invoke changes to the default values, navigate to **System Properties** > **All Properties** and add the indicated properties (they are not visible by default).

Sensitive Bounds Properties

Property Name	Description
sa_metric.sensitive_bounds_calculation_enabled	Enable/disable sensitive bounds calculation. Default: True
sa_metric.sensitive_bounds_percentile	Percentile value of sensitivity bounds calculation. If the configured percentage of metric values falls within the number of standard deviations (STDs) indicated in the *sa_metric.sensitive_bounds_sensitivity_fact* property, sensitive bounds are detected and sensitivity calculation changes to the value specified in the

Sensitive Bounds Properties (continued)

Property Name	Description
	sa_metric.sensitive_bounds_control_factor property. Default: 95%
sa_metric.sensitive_bounds_control_factor	The number of standard deviations (STDs) from the mean metric value by which metric bounds are measured after the system detects sensitive bounds. Default: 5.0
sa_metric.sensitive_bounds_sensitivity_factor	The number of standard deviations (STDs) from the mean metric value by which the system tests for sensitive bounds. Default: 2.0

Use agentic AI

Use agentic workflows in Now Assist for ITOM

Important:

- Not all model providers are available for customers with in-country SKUs, and some Now Assist products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some Now Assist products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base . Be sure to check for availability updates in future releases.
- Some Now Assist products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

You can use Now LLM Service, Now LLM Long Term Stable models (LTS), Azure OpenAI, Google Gemini or Anthropic Claude on AWS as the AI model provider for all Now Assist skills and AI agents. Use the Configuration Controls in AI Control Tower to define which options are available, then set the skill-level preferences in the Now Assist Admin console. For more information, see Large language models on the ServiceNow AI Platform®.

Note: Currently, Now Assist for ITOM only analyzes tag-based, rule-based, and Log Analytics alert groups. For all other alert group types, it only analyzes the parent alert.

Dependencies

accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Important: Don't use Now Assist for ITOM for critical security alerts.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the Now Assist documentation.

Explore Now Assist for ITOM

Explore Now Assist for ITOM

The Now Assist for IT Operations Management (ITOM) application uses generative AI to provide alert analyses. Alert analyses include a human-readable brief of the alert and technical information to help you investigate the alert more effectively.

Alert analysis is a crucial feature that completely transforms the alert triage process and can help achieve faster, seamless alert management. Powered by generative AI, it uses a large language model (LLM) to generate human-readable alert titles and detailed descriptions based on enriched and actionable alert data. The AI-generated alert information facilitates quick alert triage and effective analysis for your team, which can lead to a substantial reduction in resolution time.

Alert analysis enhances the efficiency and effectiveness of alert management.

Key features include:

- Automatic generation of clear, easy-to-understand alert descriptions.
- Availability of the analysis in the Alert form and Express List.
- Ability to refresh and regenerate data using card refresh.

Note: Currently, Now Assist for ITOM only supports tag-based, CMDB, Log Analytics, Mixed, Automated, and Network Traffic-based alert groups. For all other alert group types, it only analyzes the parent alert.

Configure Now Assist for ITOM

Enable Event Management users to view alert analyses that Now Assist for ITOM creates using generative AI.

Install the Now Assist for IT Operations Management (ITOM) plugin

Install the ITOM plugin in the ServiceNow® Now Assist feature.

Before you begin

Install the AIOps Experience [sn_sow_aiops] application from the ServiceNow Store. See Install Service Operations Workspace for ITOM application for more information.

Role required: admin

About this task

Install Now Assist plugins to enable generative AI and agentic AI on your instance.

Procedure

1. Go to the ServiceNow Store website.
2. In the search bar, enter `Now Assist for ITOM` and then select **Search**.
3. Select the Now Assist for ITOM widget and then select **Get** to make this application available for installation on your instance(s).
4. Install the Now Assist for ITOM application.
   a. Navigate to **All** > **System Definition** > **Plugins**.
   b. Search for Now Assist for IT Operations Management (ITOM).
   c. Select **Install**.

Related topics

View an alert analysis by Now Assist in Express List

Activate Now Assist AI agents for IT Operations Management (ITOM)

Activate Now Assist AI agents associated with the Triage and analyze alerts agentic workflow, to enable the agentic AI experience.

Before you begin

Before activating the Now Assist AI agents, you must install the Now Assist for IT Operations Management (ITOM) plugin. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.

To get started with AI agents, you must have:

- An instance on Yokohama patch 3 and above.
- A ServiceNow Pro Plus or Enterprise Plus license.
- AI Search enabled on your instance.

Role required: admin

Procedure

1. Activate the Triage and analyze alert agentic workflow in AI Agent Studio.
   a. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
   b. In the table, select **Triage and analyze alerts**.

   The Triage and analyze alerts page in AI Agent Studio lets you manage the agentic workflow, including options for Describe and connect, Define trigger, and Select display.
2. Make the Triage and analyze alerts agentic workflow visible in the Now Assist panel.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Select display**.

b. Next to **Now Assist panel** select the **Display** toggle to turn on the display.

c. Select **Save and test**.

d. Navigate to **All** > **Virtual Agent** > **Designer**.

e. From the **Select assistant** drop-down list, select **Now Assist Panel - Platform(default).**

f. Search for **Triage and analyze alerts**.

g. Select the row Actions icon ( ), and select **Promoted**.

What to do next

To access AI agents in the Now Assist panel, you must enable the panel. For more information, see Activate the Now Assist panel standard chat .

Activate Now Assist skills in Now Assist for IT Operations Management (ITOM)

You can activate the Now Assist skills for use in Now Assist for IT Operations Management (ITOM).

Before you begin

Before activating the Now Assist skills, you must install the Now Assist for IT Operations Management (ITOM) plugin. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.

Role required: admin

About this task

Activate the Now Assist skills in the Now Assist for IT Operations Management (ITOM) plugin to enable generative AI on your instance.

Procedure

1. Navigate to **All** > **Now Assist Admin** > **Skills**.

   If you're already in the Now Assist Admin console, select the **Now Assist Skills** tab.

2. On the navigation panel, select **Technology** > **ITOM** to review the skill set.

   Toggle between the list and grid layouts for optimum viewing experience.

3. Select **Activate skill**.

   After configuring a step, select **Save and continue** to go to the next step. Return to a previous step by selecting **Back**.

4. Choose where to display Now Assist skills.

   You can choose where to display Now Assist skills. It is recommended to enable both **In-product desktop** and **Now Assist panel**. For every display option, you can select the roles to whom the Now Assist skills will be displayed.

   a. Navigate to **Select display**.

   b. Select where you'd like to display the skill by selecting the **Display** toggle to turn on the display.

   c. Select **Save and test**.

Activate the Service Mapping Candidate skill

The Service Mapping Candidate skill provides Now Assist the ability to classify app service candidates and generate a description for them. The skill is active by default. If needed, administrators can activate or deactivate the skill.

About this task

The Service Mapping agentic workflow, Analyze potential impact, uses two Now Assist skills:

- Service Mapping Candidate
- Service Mapping Candidates Impact

The Service Mapping Candidate skill provides names for processes and application service candidates. The skill gets details about the processes within the application service candidate, such as publisher, product, and description. Then, it gets details about the application service candidate, such as name, and description.

Before you begin

Before activating the Now Assist skills, you must install the Now Assist for IT Operations Management (ITOM) plugin. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.

You must configure the following settings:

- ITOM pro plus SKU
- Now Assist for ITOM 9.10
- Service Mapping Plus (minimum version 1.16.3)
- Now Assist for IT Service Management (ITSM)
- Now Assist for Platform (minimum version 9.1.0)

Important: This Now Assist skill is now turned on by default. The skill will be automatically available to appropriate role users for the application. This change simply activates the skill and does not touch the roles that are needed to use the skill. The new default behavior works as follows:

New customers

When you install a Now Assist product, designated skills will turn on automatically.

Existing customers who are upgrading

Any previously unconfigured skill will turn on automatically (the skill was never turned on, then off again).

There is no change to Now Assist skills that are currently enabled and customized.

Previously configured skills that were turned on, then off, will remain inactive.

Role required: admin

Procedure

1. Navigate to **All** > **Now Assist Admin** > **Skills**.
2. On the navigation panel, select **ITOM**.
3. On the Service Mapping Candidate tile, select **Activate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate the Service Mapping Candidates Impact skill

The Service Mapping Candidates Impact skill analyzes connections and effects on servers. It enables generating an impact summary, using Now Assist. The skill is active by default. If needed, administrators can activate or deactivate the skill.

About this task

The Service Mapping agentic workflow, Analyze potential impact, uses two Now Assist skills:

- Service Mapping Candidate
- Service Mapping Candidates Impact

The Service Mapping Candidates Impact skill enables the agent to create a summary of impacted components, following a change request.

Before you begin

Before activating the Now Assist skills, you must install the Now Assist for IT Operations Management (ITOM) plugin. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.

You must configure the following setting:

- ITOM pro plus SKU
- Now Assist for ITOM 9.10
- Service Mapping Plus (minimum version 1.16.3)
- Now Assist for IT Service Management (ITSM)
- Now Assist for Platform (minimum version 9.1.0)

Important: This Now Assist skill is now turned on by default. The skill will be automatically available to appropriate role users for the application. This change simply activates the skill and does not touch the roles that are needed to use the skill. The new default behavior works as follows:

New customers

When you install a Now Assist product, designated skills will turn on automatically.

Existing customers who are upgrading

Any previously unconfigured skill will turn on automatically (the skill was never turned on, then off again).

There is no change to Now Assist skills that are currently enabled and customized.

Previously configured skills that were turned on, then off, will remain inactive.

Role required: admin

Procedure

1. Navigate to **All** > **Now Assist Admin** > **Skills**.
2. On the navigation panel, select **ITOM**.
3. On the Service Mapping Candidates Impact tile, select **Activate**.

Activate the analyze service health skill

The analyze service health skill uses generative AI to provide an analysis of all Service Observability dashboards for the selected service. You need to activate this skill before using it.

Before you begin

Before activating the Now Assist skills, you must install the following:

- Now Assist for IT Operations Management (ITOM) plugin. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- Service Observability. For more information, see Install Service Observability.

You must configure the following settings:

- ITOM pro plus SKU
- Now Assist for ITOM 9.10
- Service Mapping Plus (minimum version 1.16.3)
- Now Assist for IT Service Management (ITSM)
- Now Assist for Platform (minimum version 9.1.0)

Role required: admin

Procedure

1. Navigate to **All** > **Now Assist Admin** > **Skills**
2. On the navigation panel, select **ITOM**.
3. On the **Analyze service health** tile, select **Activate**.

Activate the analyze Service Observability dashboard skill

The analyze Service Observability dashboard skill uses generative AI to provide an analysis of a Service Observability dashboard. You need to activate this skill before using it.

Before you begin

Before activating the Now Assist skills, you must install the following:

- Now Assist for IT Operations Management (ITOM) plugin. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- Service Observability. For more information, see Install Service Observability.

You must configure the following settings:

- ITOM pro plus SKU
- Now Assist for ITOM 9.10
- Service Mapping Plus (minimum version 1.16.3)
- Now Assist for IT Service Management (ITSM)
- Now Assist for Platform (minimum version 9.1.0)

Role required: admin

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Now Assist Admin** > **Skills**
2. On the navigation panel, select **ITOM**.
3. On the **Analyze Service Observability dashboard** tile, select **Activate**.

Configure the manage alerts autonomously agentic workflow

Configure an alert management rule to operate the manage alerts autonomously agentic workflow manually or automatically.

Before you begin

- Install Now Assist for IT Operations Management (ITOM). For more information about installing Now Assist plugins, see Install Now Assist plugins.

Role masking enables users to limit the roles and privileges of agentic workflows during tool execution. Agentic workflows and their AI agents that get installed with Now Assist applications are assigned pre-defined roles. If you select *`Users with specific roles`* for user access, you must configure the security controls to include these roles. Data access settings must also include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

Role required: evt_mgmt_admin, evt_mgmt_operator

About this task

Configure the autonomous workflow alert management rule to operate the manage alerts autonomously agentic workflow manually or automatically. For more information about alert management rules, see Alert management rules for resolving alerts.

When the workflow operates automatically, alerts are addressed as they're created and AI insight information is displayed in Express List.

When the workflow operates manually, users must manually generate AI insights. For more information, see Review AI generated alert information and insights in Express List.

For more information about the manage alerts autonomously agentic workflow, see Manage alerts autonomously agentic workflow.

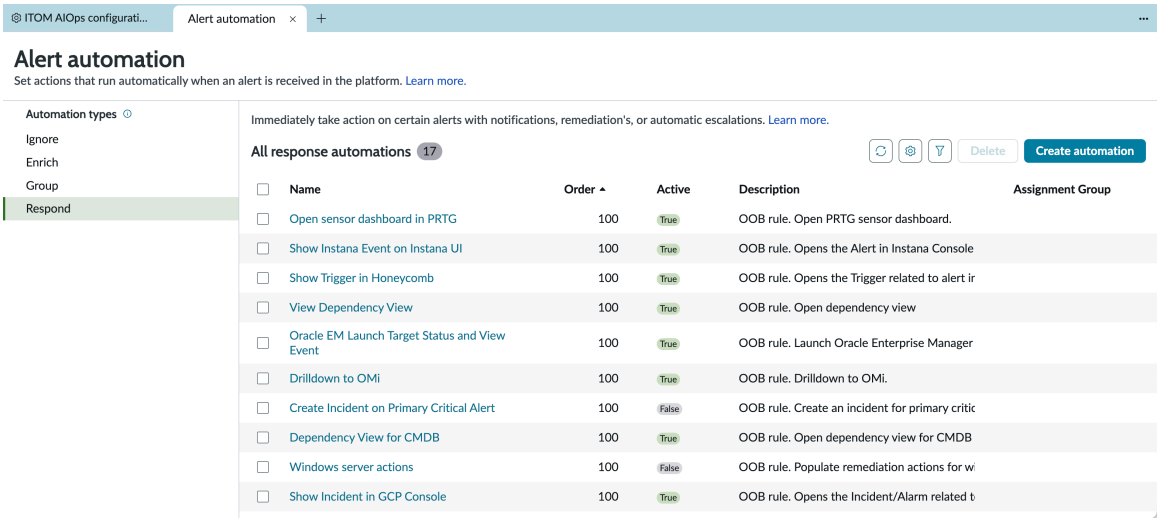
Note:

If you change the alert management rule for the manage alert autonomously workflow, you must update the **sn_aiops_ai_agents.autonomous_alert_rule_sys_id** property, which points to the alert management rule.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the bottom of the navigation pane, select the AIOps configuration center icon.
   The ITOM AIOps configuration center page appears. The configuration center is a centralized workspace. Use it to configure and manage AIOps features from a single place.
3. On the ITOM AIOps configuration center page, under the Optimize section, select **Respond to alerts**.
   The Respond page appears.

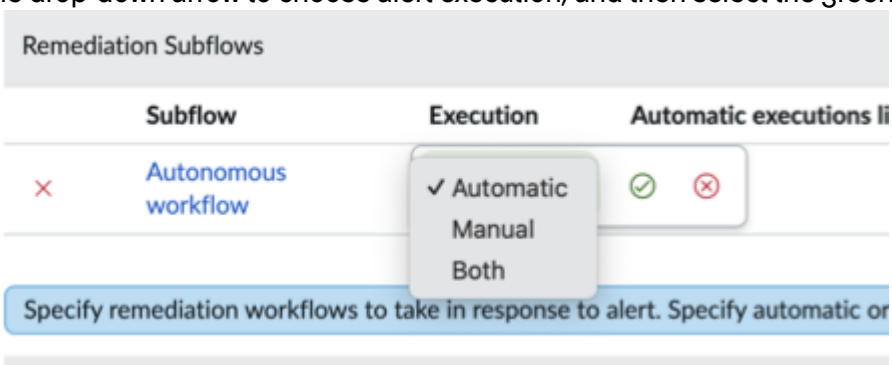
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. In the Name column, select **Autonomous workflow**.
   If the Edit automation pop-up is displayed, select **Open**. The Alert Management Rule form opens to the Alert info tab.

   Note: The **Active** check box is selected when the rule is enabled. To disable the rule and the manage alerts autonomously agentic workflow, select the check box.

5. Configure the execution information for the alert by selecting the **Actions** tab.
6. In the Execution column, double-click the cell for the **Autonomous workflow**.
7. Select the drop-down arrow to choose alert execution, and then select the green check mark to save.



What to do next

To learn more about generating AI insights with the manage alerts autonomously agentic workflow, see Review AI generated alert information and insights in Express List.

Configure the Datadog analysis AI agent

Configure the Datadog analysis AI agent to use the Datadog observability skill in the manage alerts autonomously agentic workflow. Once configured, the skill gathers information to help you investigate alerts.

Before you begin

Before configuring the Datadog analysis AI agent, you must do the following:

- Install Now Assist for IT Operations Management (ITOM).
- Integrate Datadog platform events with Event Management.
- Copy your Datadog API key and application key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: connection_admin and credential_admin

Procedure

1. Navigate to **All** > **sys_alias.LIST**.
2. Search for and select **Datadog analysis AI agent**.
3. Select **Create New Connection & Credential**.
4. On the form, fill in the fields.

Field	Description
Connection Name	Name of your Datadog connection. This name helps you identify it later. For example, Datadog `analysis AI agent connection`.
Connection URL	URL of your Datadog instance. Datadog URLs follow this format: `https://api.datadoghq.com`.
Datadog API key	Your Datadog API key.
Datadog Application key	Your Datadog application key.

5. Select **Create**.
   Your connection appears in the **Connections** tab.

What to do next

Activate the Datadog analysis AI agent to use it in the manage alerts autonomously agentic workflow. In AI Agent Studio, navigate to **Create and manage**, find the Datadog analysis AI agent, and turn on the agent in the Select channels and status screen.

To learn more about using the Datadog analysis AI agent in the manage alerts autonomously agentic workflow, see Manage alerts autonomously agentic workflow.

Configure the Google Gemini Cloud Assist agent

Configure the Google Gemini Cloud Assist agent to use the Gemini Cloud Assistant observability skill in the manage alerts autonomously agentic workflow. Once configured, the skill gathers information to help you investigate alerts.

Before you begin

Before configuring the Google Gemini Cloud Assist agent, you must do the following:

- Install Now Assist for IT Operations Management (ITOM).
- Integrate Google Cloud Platform (GCP) events with Event Management.
- Download the JSON private key file from your Google Cloud project and gather the following credentials: Google project ID, service account email, and private key ID.
- Create a keystore file and password by following the steps in Create a Java KeyStore certificate.
- Set up the following Google Cloud project settings and permissions. For detailed instructions, navigate to the Gemini for Google Cloud documentation and search for `Create a Cloud Assist investigation`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enable the required APIs for your Google Cloud project.
- Assign the Investigation Creator role to the service account.
- Give the service account read-access to the resources that you want it to investigate.

Role required: admin

Procedure

1. Navigate to **All** > **sys_alias.LIST**.
2. Search for and select **Google Gemini Cloud Assist Agent**.
3. Select **Create New Connection & Credential**.
4. On the form, fill in the fields.

Field	Description
Connection Name	Name of your Google Gemini Cloud Assist connection. This name helps you identify it later. For example, `Google Gemini Cloud Assist agent connection`.
Google Project ID (project_id)	Identifier for the Google Cloud project that contains the relevant service account. For ex ample, `project-12345`.
Service Account Email (client_email)	Email address assigned to your Google Cloud service account. The agent uses this email ad dress to authenticate with the Google Cloud project.
Private Key ID (private_key_id)	Identifier for the private key associated with your Google Cloud service account.
Keystore Password	Password that protects the keystore file that you upload below.
Keystore	File that contains your authentication creden tials for the Google Cloud service account. Up load this file in `.jks` format.

5. Select **Create**.
   Your connection appears in the **Connections** tab.

What to do next

Activate the Google Gemini Cloud Assist agent to use it in the manage alerts autonomously agentic workflow. In AI Agent Studio, navigate to **Create and manage**, find the Google Gemini Cloud Assist agent, and turn on the agent in the Select channels and status screen.

To learn more about using the Google Gemini Cloud Assist agent in the manage alerts autonomously agentic workflow, see Manage alerts autonomously agentic workflow.

Configure observability agents for Now Assist

Configure observability agents for third-party application performance monitoring (APM) or network performance monitoring (NPM) vendors. These agents are invoked by the analyze alert impact agentic workflow. You must configure connections to those vendors before they can be invoked.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: This agent is turned on by default. For more information, see Now Assist skills, agents, and agentic workflows on by default.

After you configure the agent(s), they can surface information from alerts generated by third-party systems to help you investigate alerts and incidents in the Service Operations Workspace.

Connections to vendors use MCP when possible, otherwise they use an API connection. You need connection and credential information to complete the connection process as shown in the following tables.

Note: These agents are different from the data sources used in the Service Observability dashboards.

Before you begin

Before configuring the integration agents, you must do the following:

- Install Now Assist for IT Operations Management (ITOM).
- Integrate third-party alerts with Event Management.
- Copy the connection requirements for the vendor as noted in the following tables. You will need these to create credentials and connections to the third-party vendor.

Role required: connection_admin and credential_admin

AWS CloudWatch MCP

Connection information	Value
Agent name	AWS CloudWatch MCP Server Agent
Overview of data returned	Alarm details, metric trend analysis, CloudWatch logs (anomalies, error patterns, log insights queries), CMDB resource context, correlated service metrics, and root cause analysis with recommended next steps
Credential & Connection Alias name	AWS CloudWatch MCP server
Connection type	MCP
Returned data type	APM
Connection URL	`https://your-mcp-server-host/mcp` This assumes you have deployed the CloudWatch MCP server using a MID Server instead of a publicly exposed EC2 instance. For more information about deploying the MCP server, see the AWS CloudWatch MCP Server — MID Server Deployment Guide [KB3030674] article in the Now Support Knowledge Base.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection information	Value
Required credentials	• AWS access key ID • AWS secret access key
Required scope	AWS IAM permissions: • `cloudwatch:Describe*` • `cloudwatch:Get*` • `cloudwatch:List*` • `logs:Describe*` • `logs:Get*` • `logs:StartQuery` • `logs:StopQuery` • `logs:GetQueryResults`

AWS CloudWatch API

Connection information	Value
Agent name	AWS CloudWatch API Agent
Overview of data returned	Alarm details, metric trend analysis, CloudWatch logs (anomalies, error patterns, log insights queries), CMDB resource context, correlated service metrics, and root cause analysis with recommended next steps
Credential & Connection Alias name	AWS CloudWatch API Credentials
Connection type	API (MCP fallback mechanism)
Returned data type	APM
Connection URL	N/A
Credential type	AWS Credentials
Authentication algorithm	AWS CloudWatch Algorithm
Required credentials	• AWS access key ID • AWS secret access key

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection information	Value
Required scope	AWS IAM permissions: • `cloudwatch:Describe*` • `cloudwatch:Get*` • `cloudwatch:List*` • `logs:Describe*` • `logs:Get*` • `logs:StartQuery` • `logs:StopQuery` • `logs:GetQueryResults`

Datadog

Connection information	Value
Agent name	Datadog APM MCP Server Agent
Overview of data returned	Service health, distributed traces, triggered monitors, log analysis, incidents, SLO compliance, deployment events, and service dependencies
Credential & Connection Alias name	Datadog APM MCP Connection
Connection type	MCP
Returned data type	APM
Connection URL	`https://mcp.datadoghq.com/api/unstable/mcp-server/mcp?toolsets=core,alerting,apm,error-tracking`
Required credentials	• Datadog API key • Datadog application key
Required scope	N/A

Dynatrace

Connection information	Value
Agent name	Dynatrace MCP Server Agent
Overview of data returned	Insights about logs, topology, recent changes, root causes, impacted entities, and environments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection information	Value
Credential & Connection Alias name	Dynatrace MCP server
Connection type	MCP
Returned data type	APM
Connection URL	URL of your Dynatrace instance. Dynatrace URLs follow this format: `https://<your-resource-name>.apps.dynatrace.com/platform-reserved/mcp-gateway/v0.1/servers/dynatrace-mcp/mcp`
Required credentials	Platform token (must be prefixed with `Bearer`). For example, `Bearer dt0s01.STABCDEF12345.G3HIJKLMNOP`.
Required scope	IAM policy and group assignment that allows the following scopes: • `davis-copilot:nl2dql:execute` • `davis-copilot:dql2nl:execute` • `davis-copilot:conversations:execute` • `davis:analyzers:read` • `davis:analyzers:execute` • `mcp-gateway:servers:invoke` • `mcp-gateway:servers:read` • `storage:buckets:read` • `storage:logs:read` • `storage:events:read` • `storage:security.events:read` • `storage:metrics:read` • `storage:bizevents:read` • `storage:spans:read` • `storage:entities:read` • `storage:smartscape:read` • `storage:system:read`
Required Dynatrace Intelligence settings	• Enable generative AI • Enable document suggestions • Enable environment-aware queries

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Kentik

Connection information	Value
Agent name	Kentik analysis AI agent
Overview of data returned	Service network performance, connectivity, DDOS attacks, and anomalies
Credential & Connection Alias name	Kentik analysis AI agent
Connection type	API
Returned data type	APM
Connection URL	URL of your Kentik instance. Kentik URLs follow this format: `https://<your-resource-name>.api.kentik.com`
Required credentials	• User email • API token
Required scope	Can view devices

New Relic

Connection information	Value
Agent name	New Relic MCP Server Agent
Overview of data returned	Service and user impact, root cause theories, and responsible teams.
Credential & Connection Alias name	New Relic MCP Connection
Connection type	MCP
Returned data type	APM
Connection URL	`https://mcp.newrelic.com/mcp/`
Required credentials	API key (also known as "User Key") Header name: `api-key`
Required scope	N/A

Prometheus

Connection information	Value
Agent name	Prometheus API Agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection information	Value
Overview of data returned	PromQL metric queries (CPU, memory, disk, network), active alerts, alert rule definitions, and scrape target health
Credential & Connection Alias name	Prometheus connection
Connection type	API
Returned data type	APM
Connection URL	`https://<your-onprem-prometheus-server>`
Required credentials	• MID Server Prometheus is installed on • User name (for outbound connection) • Password (for outbound connection)
Required scope	N/A

SolarWinds

Connection information	Value
Agent name	SolarWinds analysis AI agent
Overview of data returned	On-premises data from SolarWinds Orion: node health/status, CPU/memory, packet loss/latency, interface utilization/errors/discards, active alerts/history, affected entities/services, and trend/baseline metrics used for root-cause investigation
Credential & Connection Alias name	SolarWinds AI Agent
Connection type	API
Returned data type	NPM
Connection URL	`https://<your-onprem-solarwinds-server>`
Required credentials	• MID Server SolarWinds is installed on • User name • Password
Required scope	SolarWinds Orion API/SWQL read access (NPM/APM) via MID Server

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Splunk

Connection information	Value
Agent name	Splunk MCP Server Agent
Overview of data returned	SPL query results from Splunk indexes, index/sourcetype metadata, and structured investigation findings including affected entities, root cause analysis, and recommended actions
Credential & Connection Alias name	Splunk MCP Connection
Connection type	MCP
Returned data type	APM
Connection URL	`https://<your-splunk-instance>.splunkcloud.com`
Required credentials	Splunk MCP token
Required scope	For Splunk token generation: • `mcp_user` role (or any role with `mcp_tool_execute`) required for all MCP tool calls • Search capability and read access to the relevant indexes for running queries • Knowledge object read permissions for Get Knowledge Objects • Token must be generated using the Splunk MCP Server app with `audience = mcp` (not a standard Splunk API token)

ThousandEyes

Connection information	Value
Agent name	ThousandEyes MCP Server Agent
Overview of data returned	Test configuration and status, aggregated metrics (response time, packet loss, latency, jitter, throughput, availability), metric anomalies with deviation analysis, network events and routing changes, ISP/network outages with provider and ASN details, hop-by-hop path visualization, and root cause analysis with ranked probable causes and recommended next steps
Credential & Connection Alias name	ThousandEyes MCP Connection

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection information	Value
Connection type	MCP
Returned data type	NPM
Connection URL	`https://api.thousandeyes.com/mcp`
Required credentials	API key prefixed with `Bearer`. For example, `Bearer <api-key>`.
Required scope	ThousandEyes API access with permissions to read tests, metrics, anomalies, events, outages, and path visualization data

Procedure

1. Navigate to **All** > **sys_alias.LIST**.
2. Search for and select the vendor's connection name as shown in the preceding tables.
3. Select **Create New Connection & Credential**.
4. Fill in the form, using the information in the preceding tables.
5. Select **Create**.

   Your connection appears in the **Connections** tab.

The agents are now ready to be used by the analyze alert impact agentic workflow

Use generative AI in Now Assist for ITOM

Use the ServiceNow® Now Assist for ITOM application to view alert or incident analyses that Now Assist creates using generative AI.

Alert analyses include human-readable briefs of the alert and additional technical information to help you investigate the alert more effectively. The analyses are provided in English, irrespective of the language used in the alert description.

For more information about the ServiceNow® Now Assist for IT Operations Management (ITOM) application, see Now Assist for IT Operations Management (ITOM).

Important: Some Now Assist skills, agents, and agentic workflows are turned on by default. For more information, see Now Assist skills, agents, and agentic workflows on by default.

Domain separation and generative AI

By default, all skills exist in the global domain. When you use Now Assist in a domain-separated environment, users are only able to access data in their domain. For example, if a user uses the summarization skill, Now Assist only uses material that exists in the user's domain when generating that summary. Additionally, there is no co-mingling of data for domain-separated instances when using generative AI skills. The data resides only on the instance, and the shared services used for generative AI do not persist any requests (prompts) and responses. For more information, see Domain separation in the Now Assist Admin console. (Note that global domain is not the same as global scope. For more information, see Exploring Next Experience pickers.)

Documentation in this section

See the following documentation to learn more about using Now Assist for ITOM skills.

View an alert analysis by Now Assist in Service Operations Workspace

View an alert analysis by Now Assist for an alert on the alert's Overview tab in the Service Operations Workspace. Alert analyses include a human-readable brief of the alert and technical information to help you investigate the alert more effectively.

Before you begin

- Install the ITOM plugin in the Now Assist feature. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- View important information about the Now Assist for IT Operations Management (ITOM) application in Now Assist for IT Operations Management (ITOM).

Note: Currently, Now Assist for ITOM only supports tag-based, CMDB, Log Analytics, Mixed, Automated, and Network Traffic-based alert groups. For all other alert group types, it only analyzes the parent alert.

Important: This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see Now Assist skills, agents, and agentic workflows on by default.

Role required: evt_mgmt_user, evt_mgmt_operator

Procedure

1. Navigate to **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
2. Select the List icon ( ).
3. In the Alerts list, select **All Alerts**.
4. Select an alert.
   The alert opens in a separate tab, displaying the **Overview** subtab.
5. In the **Analysis** section, select **Analyze alert**.
6. Review the information provided in the alert analysis.

View an alert analysis by Now Assist in Express List

View an alert analysis created by Now Assist using generative AI. Alert analyses include a human-readable brief of the alert and technical information to help you investigate the alert more effectively.

Before you begin

- Install the ITOM plugin in the Now Assist feature. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- View important information about the Now Assist for IT Operations Management (ITOM) application in Now Assist for IT Operations Management (ITOM).

Note: Currently, Now Assist for ITOM only supports tag-based, CMDB, Log Analytics, Mixed, Automated, and Network Traffic-based alert groups. For all other alert group types, it only analyzes the parent alert.

Important: This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see Now Assist skills, agents, and agentic workflows on by default.

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the navigation bar, select the Express List icon ( ).
3. In the Active alerts list, select the information icon ( ) next to the alert.
4. On the preview panel **Info** tab, select **Analyze** in Alert analysis by Now Assist.
5. View the information provided in the Alert analysis.
6. **Optional:** Use the Alert analysis icons to perform related tasks.

Alert analysis icons

Icon	Description
	Copy the content of the alert analysis to the clipboard.
	Refresh the alert analysis. **Note:** Refreshing regenerates the results. Past results are deleted.

View an alert group analysis by Now Assist in Express List

View an alert group analysis created by ServiceNow® Now Assist using generative AI. The analysis offers a simplified, human-readable description of the alert group and technical information to help you investigate it more efficiently.

Before you begin

Install the ITOM plugin in the Now Assist feature. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.

View important information about the ServiceNow® Now Assist for IT Operations Management (ITOM) application in Now Assist for IT Operations Management (ITOM).

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Express List icon ( ) in the left navigation bar.
3. In the Active alerts list, select the information icon ( ) to the left of an alert group to display the preview panel.
4. On the preview panel Info tab, select **Analyze** in Alert analysis by Now Assist.
5. View the information provided in the Alert analysis.
6. **Optional:** Use the Alert analysis icons to perform related tasks.

Alert analysis icons

Icon	Description
	Copy the content of the alert analysis to the clipboard.
	Refresh the alert analysis. **Note:** Refreshing regenerates the results. Past results are deleted.

Related topics

Viewing an alert group analysis by Now Assist in Express List

View an error analysis by Now Assist in Agent Client Collector

View an error analysis created by Now Assist using generative AI. Error analyses enable asking questions on a specific agent's error or error code.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select the **Agent Client Collector (ACC) Diagnostic** entry.
3. Locate the **Add AI agents that can perform these steps widget** and select the **Agent Client Collector (ACC) Diagnostic** entry.
4. Enable the **Now Assist** option by sliding the **Display** toggle switch to the right.

Display toggle bar

Now Assist retrieves information on errors within agents.

Save the alert analysis summary by Now Assist as alert group description in Express List

Save the human-readable summary generated by Now Assist in the Alert analysis as the description of an alert group.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Express List icon ( ) in the left navigation bar.
3. In the Active alerts list, select the information icon ( ) to the left of an alert.
4. On the preview panel Info tab, select **Analyze** in Alert analysis by Now Assist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Review the human-readable, AI-generated Alert analysis summary.
6. Select **Save description** to save the summary content as the description of the alert group. The AI-generated summary content replaces the original description of the alert group.

Generate an alert group description in Express List using Now Assist

Use Now Assist to generate a meaningful description of an alert group in Express List that encompasses all the alerts within the group. The generated description replaces the original description of the group.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Express List icon ( ) in the navigation bar.
3. In the Active alerts list, select the information icon ( ) for an alert.
4. Below the displayed alert group description, select **Update description**.
   Now Assist generates a comprehensive new description of the alert group, which encompasses all the alerts within the group. If you select **Update**, the generated description replaces the original description of the alert group taken from the earliest, most severe secondary alert in the group.
5. **Optional:** Restore the original alert group description by selecting the revert icon ( ) next to **Update description** and then choosing **Restore**.

Launch an alert analysis from the Now Assist panel

Initiate an alert analysis from the Now Assist panel. The alert analysis displays directly in the Now Assist panel for convenient review.

Before you begin

- Install the ITOM plugin in the Now Assist feature. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- View important information about the ServiceNow® Now Assist for IT Operations Management (ITOM) application in Now Assist for IT Operations Management (ITOM).

For comprehensive information about the Now Assist panel, see Now Assist panel .

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the List icon ( ) in the navigation bar.
3. Select **Lists** > **Alerts** > **All Alerts**.
4. Initiate an alert analysis from the Now Assist panel using one of the available methods.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Launch an alert analysis	Procedure
From the list	**a.** Select the Now Assist panel icon ( ). The Now Assist panel displays. **b.** Enter an alert analysis request, including the alert number, in the field at the bottom of the panel. **Note:** If you provide incomplete in formation, Now Assist prompts you for the missing details. The alert analysis displays in the panel.
From an alert form	**a.** Open an alert. **b.** Select the Now Assist panel icon ( ). The Now Assist panel displays. **c.** Select **Perform alert analysis**. The alert analysis displays in the panel.

5. **Optional:** Enter follow-up questions or requests.
   For example: `Summarize the analysis` or `Show alert severity`.

Create an incident from an alert with Now Assist in Express List

Create an incident with a human-readable, AI-generated description from the Express List pane by using Now Assist.

Before you begin

Note: Currently, Now Assist for ITOM only supports tag-based, CMDB, Log Analytics, Mixed, Automated, and Network Traffic-based alert groups. For all other alert group types, it only analyzes the parent alert.

Role required: evt_mgmt_operator, evt_mgmt_admin

Procedure

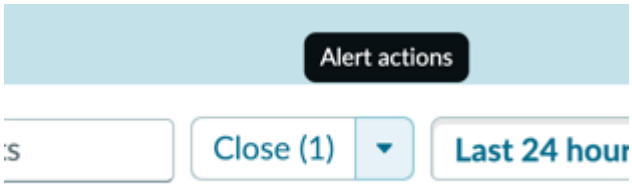
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon: .
3. Create an incident from a selected alert.

   a. In the Express List pane, select the check box for the desired alert.

   Note: To display the individual alerts inside a group, select the chevron icon ( ) at the beginning of the alert group row.

   b. Select the **Alert actions** drop-down list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Under **Response actions**, select **Create Incident with Now Assist**.

An incident with a human-readable, AI-generated description is created from the selected alert and a confirmation message is displayed.

Speed up alert resolution with a Now Assist analysis of past related incidents

Use Now Assist to investigate relevant past incidents and present effective strategies used to resolve them.

Now Assist queries historical records to find past incidents and analyzes their frequency, criticality, work notes, and resolution. It presents a summary of the most relevant related incidents in the Now Assist panel. The summary includes resolution strategies used, as well as contact details for individuals or teams who resolved the incidents and could assist with the current alert. The information provided helps you better understand the context and significance of the current alert and work more efficiently toward resolving it.

Note: An additional Large Language Model (LLM) validation layer is added to the AI search capability to improve the accuracy of results returned by AI skills.

Generate a Now Assist summary of past related incidents

View a Now Assist summary of past incidents on the same or related Configuration Items (CIs) and strategies used to resolve them.

Before you begin

- Install the ITOM plugin in the Now Assist feature. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- Ensure that the Alert investigation skill is active. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- View important information about the ServiceNow® Now Assist for IT Operations Management (ITOM) application in Now Assist for IT Operations Management (ITOM).

For comprehensive information about the Now Assist panel, see Now Assist panel.

Important: This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see Now Assist skills, agents, and agentic workflows on by default.

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the List icon ( ) in the navigation bar.
3. Select **Lists** > **Alerts** > **All Alerts**.
4. Open an alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the Now Assist panel icon ( ).
   The Now Assist panel displays.
6. Request a Now Assist past incidents investigation by selecting **Analyze related incidents**.
   An additional Large Language Model (LLM) validation layer is added to the AI search capability to improve the accuracy of results returned by AI skills.
   A summary of the most relevant related incidents displays in the panel.
7. **Optional:** Inspect the details of a related incident by selecting the relevant link under Related Incidents.
   The incident page opens, showing the Overview tab.

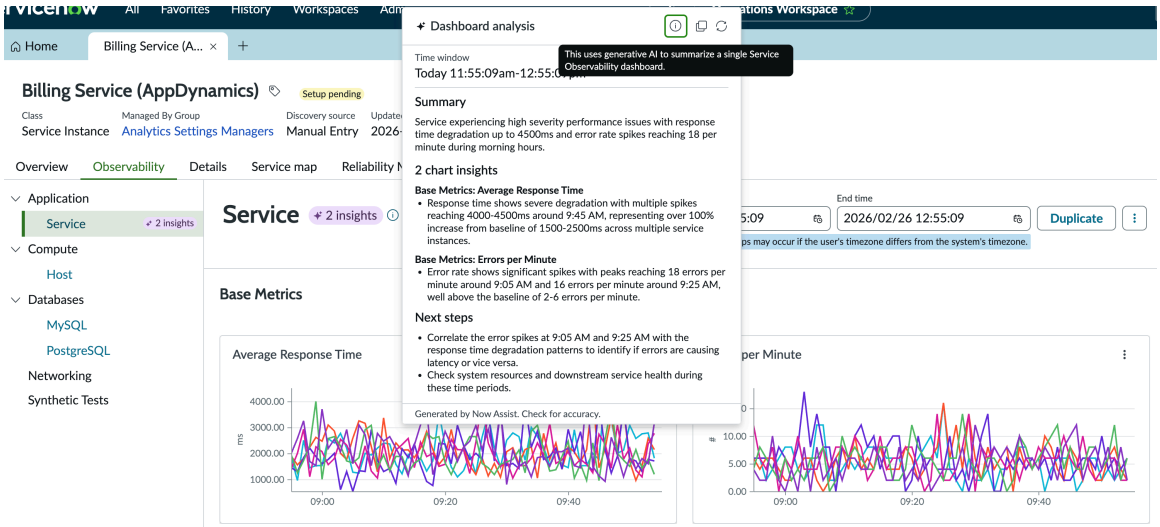
Analyze a dashboard in Service Observability

Use the analyze Service Observability dashboard skill to view an analysis of a single Service Observability dashboard.

About this task

The analyze Service Observability dashboard skill uses generative AI to summarize a single Service Observability dashboard, including calling out insights found in the charts. This summary helps operators quickly orient to and understand a particular dashboard.

When you ask the skill to analyze a dashboard, it generates an optimized version of the Service Observability charts on the dashboard and then analyzes the data, taking the time period shown into account. It then reports any insights it finds.



The skill's results remain available for an hour and don't automatically refresh. You need to rerun the skill to view a new analysis.

Note the following:

- The analysis captures the time range as reflected by the user's set time zone. When sharing analysis data across time zones, be aware that the analysis time period always reflects the time zone originally captured and may not be in sync with your time zone settings.
- The analysis doesn't weigh insights with regards to possible impact to an alert, incident, or overall dashboard health.
- The skill has a maximum number of 50 images that can be analyzed.

Before you begin

You need to manually activate this skill before it can be used. See Activate the analyze Service Observability dashboard skill for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin, operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. To the right of the dashboard name, select **Analyze dashboard**.
   The skill analyzes the data in Service Observability charts, looking for insights in the data that happened within the currently selected time period. Once complete, a badge displays one of the following:
   - **Analysis**: The skill didn't find any insights, but will display a summary of the dashboard.
   - **Insights**: A count of insights found is shown.
   - **Analysis unavailable**: The skill wasn't able to run an analysis.

   Note: Because the skill only analyzes the data in the time period captured by the screen shot, it may produce more accurate results if you lengthen the time period before analyzing. Note that longer time periods result in longer response time. For best results, use time periods less than 48 hours.
3. Select the info icon next to the badge to review the analysis and possible insights.
   The analysis tells you where it found the insights and the next steps you can take to determine the source of the insights.

   The analysis badge remains on the page for 60 minutes, after which the button resets so you can run a new analysis. After five minutes of running or if you change the time period, the analysis shows you a warning that it's out of date. Select the refresh icon to rerun it.

   Note: Select the **Copy** icon to copy the analysis, for example to paste it into work notes for an incident or alert.

Analyze service health in Service Observability

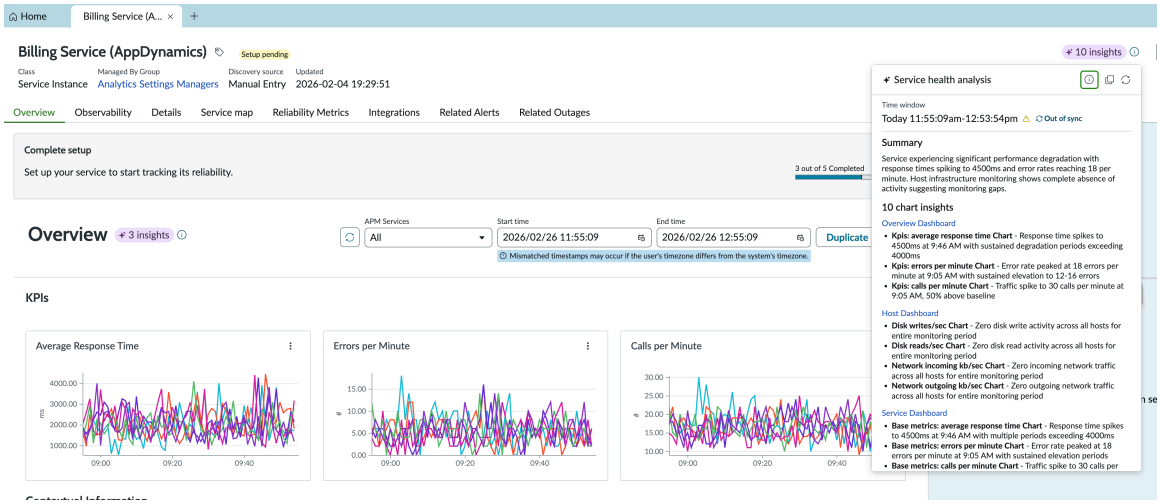
Use the Analyze Service Health skill to view an analysis of all Service Observability dashboards for the selected service.

About this task

The analyze service health skill uses generative AI to analyze all available Service Observability dashboards for the selected service.

When you ask the skill to analyze a service's health, it generates an optimized version of the Service Observability charts for a service, whether or not they are currently displayed. It then analyzes the data, and taking the time period shown into account, detects reports any insights it finds, and analyzes general service health. With these insights on service health, operators can assess service impact, identify root causes, and streamline incident response.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The skill's results remain available for an hour and don't automatically refresh. You need to rerun the skill to view a new analysis.

Once the skill is activated, it automatically runs for you in both alerts and incident investigation. For alerts, it's run as part of the alerts autonomous flow. Note that for performance reasons, the skill analyzes only the Overview dashboard as part of this flow. See Manage alerts autonomously agentic workflow for more information. For incidents, it runs automatically from the **Investigate** tab in Incident Management. See Digital End-User Experience and Service Observability UI experience on investigate tab for more information.

Note the following:

- The analysis captures the time range as reflected by the user's set time zone. When sharing analysis data across time zones, be aware that the analysis time period always reflects the time zone originally captured and may not be in sync with your time zone settings.
- The analysis doesn't weigh insights with regards to possible impact to an alert, incident, or overall dashboard health.
- The skill has a maximum number of 50 images that can be analyzed.

Before you begin

You need to manually activate this skill before it can be used. See Activate the analyze service health skill for more information.

Role required: admin, operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and then navigate to a service record.
   You can access a service record from these pages in the SOW:
   - **Services** list: Choose a service from the list.
   - **Service dashboard**: Choose a service in the dashboard and select **Service Details**.
   - **List**: Navigate to **Application Services** > **Services** and select a service.
   - **Express list** alert: Select a service from the **Impacted services** column.

   The Service Details page opens and the Overview tab is displayed.

   Trouble?
   If charts are displaying error messages, see Chart error states.
2. At the top-right of the record page, select **Analyze service**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The skill optimizes the data on all existing Service Observability charts in dashboards and analyzes the data, looking for insights in the data that happened within the currently selected time period. Once complete, a badge displays one of the following:

- **Analysis**: The skill didn't find any insights, but will display a summary of the dashboard.
- **Insights**: A count of insights found is shown.
- **Analysis unavailable**: The skill wasn't able to run an analysis.

Note: Because the skill only analyzes the data in the time period captured by the screen shot, it may produce more accurate results if you lengthen the time period before analyzing. Note that longer time periods result in longer response time. Additionally, dashboards with more than 10,000 points can't be included as part of the analysis. Reducing very large time windows can help keep this from occurring. For best results, use time periods less than 48 hours.

3. Select the info icon next to the badge to review the analysis.
   The analysis tells you where it found the insights and the next steps you can take to determine the source of the insights.

   The analysis badge remains on the page for 60 minutes, after which the button resets so you can run a new analysis. After five minutes of running or if you change the time period, the analysis shows you a warning that it's out of date. Select the refresh icon to rerun it.

   Note: Select the **Copy** icon to copy the analysis, for example to paste it into work notes for an incident or alert.

Use agentic AI in Now Assist for ITOM

Use the IT Operations Management (ITOM) agentic workflows to complete tasks autonomously.

Available agentic workflows for ITOM AI agent collection

Agentic workflow name	Description	Available AI agents
Triage and analyze alerts	Triages alerts by updating assignments, analyzing alerts, detecting recurring patterns, and differentiating between noise and real alerts.	• Alert handling AI Agent • Alert analysis AI agent • Alert history analysis AI agent • Related incidents analysis AI agent • Alert verification AI agent
Agent Client Collector (ACC) Diagnostic Workflow	Displays error analysis created by Now Assist using generative AI. Error analyses enable asking questions on a specific agent's error or error code.	Agent Client Collector (ACC) Diagnostic

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available agentic workflows for ITOM AI agent collection (continued)

Agentic workflow name	Description	Available AI agents
Analyze alert impact	Investigates an alert and gives you the context that you need to respond efficiently.	• Alert impact summary AI agent • Alert information retrieval AI agent • Observability agents For details about observability agents, see Configure observability agents for Now Assist.
Analyze potential impact	Analyzes the potential impact of a change request on relevant servers and suggested services.	Analyze Potential Impact
TLS Certificate renewal	View all certificates about to expire and renew then automatically all at once.	
Alert grouping recommendations	Provides tag-based group recommendations for selected alerts.	Alert grouping recommendations AI agent
Manage alerts autonomously	Investigates alerts, summarizes alert-related reports, and stores structured insights with key findings in the AI Agent Insight table.	Manage alerts AI agent

Important: Some Now Assist skills, agents, and agentic workflows are turned on by default. For more information, see Now Assist skills, agents, and agentic workflows on by default.

AI model providers

You can use Now LLM Service, Now LLM Long Term Stable models (LTS), Azure OpenAI, Google Gemini or Anthropic Claude on AWS as the AI model provider for all Now Assist skills and AI agents. Use the Configuration Controls in AI Control Tower to define which options are available, then set the skill-level preferences in the Now Assist Admin console. For more information, see Large language models on the ServiceNow AI Platform®.

Security

Enable security settings to run AI agents and agentic workflows using Access Control Lists (ACLs) and user identities. You can configure and manage the ACLs in AI Agent Studio. See Implement access control in Now Assist AI agents for more information.

Installed agents

Looking for an AI agent?

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

Visit the following links to learn about the Now Assist for ITOM agentic workflows.

Triage and analyze alerts agentic workflow

Use the triage and analyze alerts agentic workflow to complete preliminary alert tasks and analysis for alerts.

Triage and analyze alerts agentic workflow overview

The triage and analyze alerts agentic workflow uses AI agents to support alert triage, investigation, and analysis. AI agents can perform the following functions:

- Acknowledge alerts.
- Assign alerts to individual users and assignment groups.
- Summarize alert and alert group data to create a human-readable description and add technical analysis.
- Investigate relevant past incidents to analyze the significance of the alert and present options for resolution.

Note: These functions can also be used for the origin alert of an incident when the workflow is accessed from the incident form or Express List using the Now Assist panel.

Role masking enables users to limit the roles and privileges of agentic workflows during tool execution. Agentic workflows and their AI agents that get installed with Now Assist applications are assigned pre-defined roles. If you select *`Users with specific roles`* for user access, you must configure the security controls to include these roles. Data access settings must also include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

Use the information on this page to learn about the agents related to the triage and analyze alerts agentic workflow. To modify the triage and analyze alerts agentic workflow, you must duplicate it and adjust the settings according to your requirements. For more information, see Duplicate an agentic workflow.

Important: When you modify an agentic workflow, AI agent, or tool, make sure that you update all instructions accordingly.

Triage and analyze alerts agentic workflow

Acknowledge, assign, and investigate current and past alerts to determine significance and possible resolutions.

To access the agentic workflow, use the Now Assist panel. For more information about using the agentic workflow in the Now Assist panel, see Now Assist panel.

AI agents used in the triage and analyze alerts agentic workflow

The triage and analyze alerts agentic workflow uses a team of AI agents to perform preliminary tasks and support alert resolution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agents used in the triage and analyze alerts agentic workflow

AI agent	AI agent role
Alert handling AI agent	Assign, acknowledge, and maintain an up-to-date alert record.
Alert analysis AI agent	Perform alert analysis, and update alert description, when applicable.
Alert history analysis AI agent	Analyze past occurrences, assess its significance, and close the alert when applicable.
Related incidents analysis AI agent	Analyze past incidents and provide insights on common assignments and summarized resolution notes.
Alert verification AI agent	Assess data completeness and determine whether the alert is suitable for analysis.

Analyze alert impact agentic workflow

Use the analyze alert impact agentic workflow to investigate an alert and get the context that you need to respond efficiently.

Analyze alert impact agentic workflow overview

The analyze alert impact agentic workflow uses AI agents to interact with observability tools, such as Dynatrace, Kentik, and New Relic. The agents surface information to help you do the following:

- Understand the severity and impact of alerts.
- Find potential root causes using insights, such as recent deployments.
- Identify ownership by surfacing relevant services and responsible teams.
- Support stakeholder communication with clear, actionable information.

Use the information on this page to learn about the agents related to the analyze alert impact agentic workflow. To modify the analyze alert impact agentic workflow, duplicate it and adjust the settings.

Important: When you modify an agentic workflow, AI agent, or tool, make sure that you update all instructions accordingly.

Analyze alert impact agentic workflow

Investigate an alert and get insights into its severity, impact, ownership, and root causes.

To access the agentic workflow in AI Agent Studio:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select **Analyze alert impact**.

The Analyze alert impact page lets you manage the agentic workflow, including defining key requirements, defining security controls, and adding triggers.

Important: This agentic workflow is turned on by default. For more information, see Now Assist skills, agents, and agentic workflows on by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agents used in the analyze alert impact agentic workflow

The analyze alert impact agentic workflow uses observability AI agents to gather information from alerts and request insights. The observability AI agents require additional configuration. For configuration procedures and detailed information about the data returned by these agents, see Configure observability agents for Now Assist.

AI agents and their roles

AI agent	AI agent role
Alert impact summary AI agent	Retrieves the alert impact summary for a specific alert.
Alert information retrieval AI agent	Gathers key observability details for a specific alert.
Observability agents	Retrieves data from the observability vendor associated with the alert. For details, see Configure observability agents for Now Assist

Generating the alert analysis

In the agentic workflow record:

1. Review the information in the Define key requirements, Define security controls, and Add triggers screens, make the necessary updates, and then select **Continue**.
2. In the Select channels and status screen:
   a. Turn on the Now Assist panel display.
   b. Select **Save and test**.
3. Test the agentic workflow by asking a question, for example, `What is the impact of Alert0010056NR?`
4. Select **Continue to Test Chat Response**.

   The page shows the chat responses, visualizes the AI agents involved, and lists the AI agent decision logs.

In *AI Agent Studio*, you get notified when the analysis is generated. You can then act on the information or ask more questions about the alert. For more information about using the agentic workflow in the Now Assist panel, see Analyze alert impact in the Now Assist panel.

Analyze alert impact in the Now Assist panel

Learn how to use the analyze alert impact agentic workflow in the Now Assist panel. The agentic workflow helps you investigate an alert and get the context that you need to respond efficiently.

Before you begin

Make sure Now Assist for ITOM is installed and observability agents are configured for third-party vendors. For more information, see Install Now Assist plugins and Configure observability agents for Now Assist.

Role masking enables users to limit the roles and privileges of agentic workflows during tool execution. Agentic workflows and their AI agents that get installed with Now Assist applications are assigned pre-defined roles. If you select *Users with specific roles* for user access, you must configure the security controls to include these roles. Data access settings

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

must also include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

Role required: evt_mgmt_operator

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation bar, select the Express list icon ( ).
3. Select an alert from a source associated with an observability agent.
4. Open the panel by selecting the Now Assist icon ( ).
5. Ask a tool-specific question about the alert.
   For example, for New Relic alerts, you can ask `Have there been recent deployments for this alert?`. To better understand the type of data you can query, see the **Overview of data returned** row in the corresponding vendor's table in Configure observability agents for Now Assist.

   Now Assist uses the relevant AI agents to analyze your question and respond with a summary or insight. The first response for an alert might take several seconds to appear.

What to do next

Use the information that you received to understand the alert impact and respond accordingly. You can also ask more questions about the alert.

Note: Your conversation in the Now Assist panel is specific to the alert that you selected in Step 3. To ask about a different alert, open that alert and select the Now Assist icon ( ) to start a new conversation.

Agent Client Collector (ACC) diagnostic workflow

Enable and use AI agents to examine agent behavior through the Agent Client Collector (ACC) diagnostic workflow.

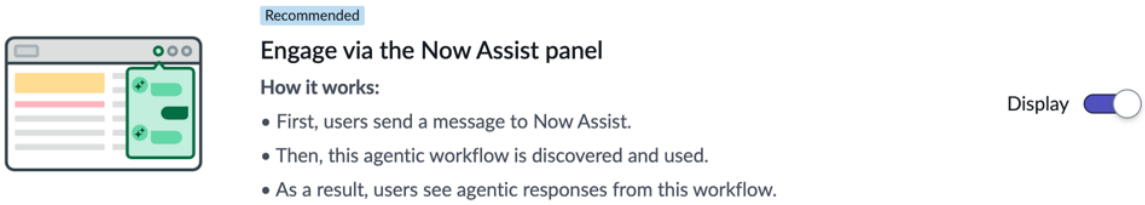
Before you begin

- Ensure that the Now Assist panel is enabled on your instance. For details, see Activate the Now Assist panel standard chat.
- Ensure that Now Assist for IT Operations Management (ITOM) is installed on your instance. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.
- Enable the Agent Client Collector diagnostic workflow in AI Agent Studio.
  1. Select **All** > **AI Agent Studio** > **Create and manage**.
  2. On the **Agentic workflows** tab, select **Agent Client Collector (ACC) Diagnostic**.
  3. Select the **Select channels and status** option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **Engage via the Now Assist** panel, slide the **Display** toggle bar to the right (active).

Display toggle bar



- Role required: agent_client_collector_admin, agent_client_collector_user, or now_assist_panel_user

About this task

Invoke the Agent Client Collector (ACC) diagnostic workflow to:

- Question issues of an ACC agent while on an ACC form.
- Request suggestions to remediate a specific ACC error code.

Procedure

1. In a ServiceNow instance, select the Now Assist icon ( ).
2. In the Now Assist panel, enter prompts to invoke the ACC diagnostic workflow and perform remediation actions on the agent.
   Possible prompts include:
   - Diagnose issues with ACC agent <agent name>
   - Multiple errors on <agent name>, diagnose them
   - Provide suggestions to remediate ACC error code <error code number>

Result

An error report is generated, based on the activity logged by the Agent Client Collector Framework.

Analyze potential impact agentic workflow

The analyze potential impact agentic workflow analyzes how a change request might impact servers and suggested services. This analysis helps you make informed decisions about the next steps regarding the change request.

Analyze potential impact agentic workflow overview

Using the analyze potential impact agentic workflow, the analyze potential impact AI agent produces an analysis of potentially impacted relevant servers and suggested services.

Note: Relevant servers refer to those servers that are currently operational and in use, excluding any non-operational or retired servers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agent used in the analyze potential impact agentic workflow

AI Agent and its role

AI Agent	AI Agent role
Analyze Potential Impact Agent	Analyzes the potential impact of a change on relevant servers and services and generate an impact analysis.

Generating the impact analysis

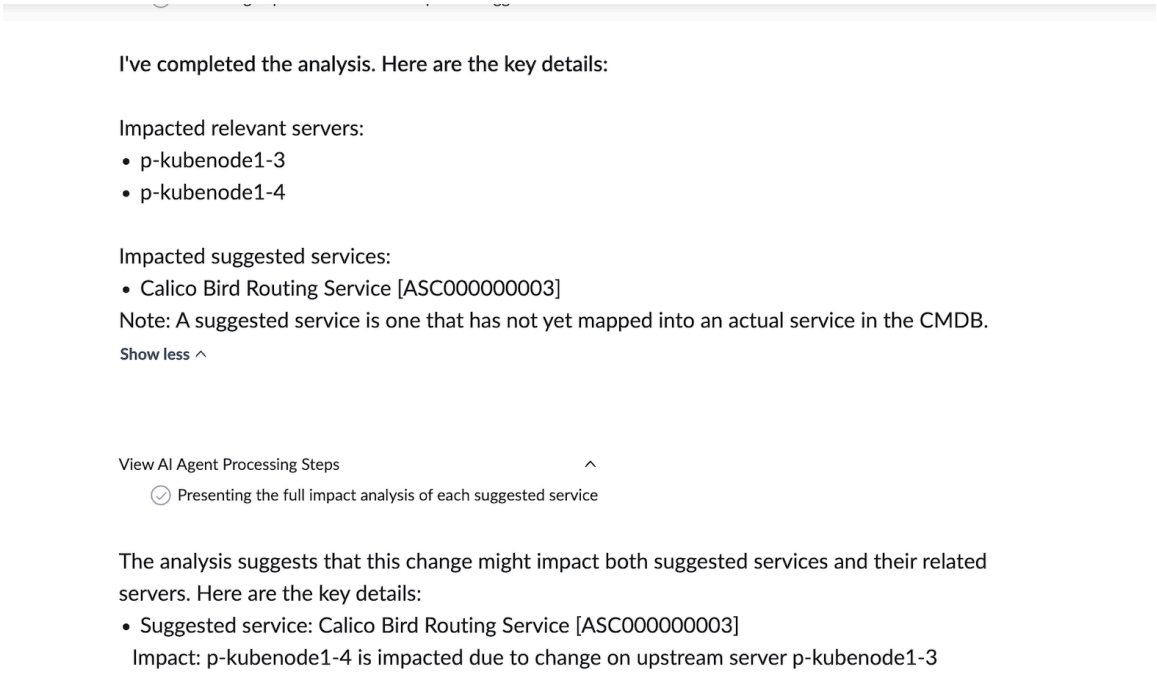
The analyze potential impact agentic workflow in Now Assist uses a single agent to evaluate the potential impact of a change request. When you select the analyze potential impact AI agent in the Now Assist panel, it initiates the workflow as follows:

- **Prerequisite verification** - The agent first verifies that all prerequisites have been met.
- **Change request identification** - If you have a change request open, the agent retrieves the change request number from the current active page. Otherwise, it prompts you to provide the change request number.
- **Server selection**- The agent selects up to 10 affected servers from the affected configuration items (CIs) in the change request.
- **Match identification** - The agent identifies matches between servers and suggested services.
- **Impact analysis** - Eventually, the agent prioritizes and displays up to 10 impacted relevant servers, giving priority to servers that are part of suggested services, and up to 3 impacted suggested services. Additionally, the agent provides you with a summary about each suggested service and how it might be impacted by related servers. This information is displayed in the Now Assist panel.
- **Saving the impact analysis** - The analysis generated by the Analyze potential impact agentic workflow is saved to the change request work notes.

To learn more about using the workflow, see Use the Analyze potential impact agentic workflow to assess a change request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Analyze potential impact agentic workflow sample



report

Domain separation

Currently, the analyze potential impact agentic workflow doesn't support instances with domain separation. For optimal results, conduct all conversations in English.

Service Mapping Now Assist Skills

Service Mapping Now Assist skills are intelligent capabilities that enhance the Analyze potential impact agentic workflow. These skills leverage generative AI to identify, classify, and assess the impact of changes to your IT infrastructure.

Service Mapping provides two primary Gen AI skills:

- Service Mapping Candidate
- Service Mapping Candidates Impact

These Service Mapping Now Assist skills are active by default. For information on activating inactive skills, see:

- Activate the Service Mapping Candidate skill
- Activate the Service Mapping Candidates Impact skill

Service Mapping Candidate skill

This skill automatically identifies and names processes and application service candidates by analyzing process characteristics, commands, and parameters. It provides detailed descriptions and categorization to help you understand which services are running in your environment.

The skill uses a two-stage process:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. In the process classification stage, the agent uses the skill to analyze individual processes within an application service candidate. The agent uses the skill to extract:
   - Publisher: The company or organization that released the product. For example: "Project Calico".
   - Product: The specific product name. For example: "Calico".
   - Description: Detailed explanation of what the process does. For example: "BIRD (BIRD Internet Routing Daemon) process running as part of Calico networking solution for Kubernetes and container orchestration. This process handles BGP routing functionality with remote control socket enabled, running as a daemon with specific Calico configuration for pod-to-pod networking and network policy enforcement."
   - Service Hints: Keywords that help identify the service type. For example: "bird,calico,BGP,routing,daemon,networking,kubernetes,container,policy,socket".
2. In the service information generation stage, the agent combines process details with load balancer information to generate:
   - Service Name: A concise, accurate name for the service candidate. For example: "Calico BGP Routing Service".
   - Service Description: A comprehensive description of the service's purpose. For example: "BIRD Internet Routing Daemon process running as part of Project Calico's networking solution for Kubernetes container orchestration. This service handles BGP routing functionality for pod-to-pod networking and network policy enforcement, operating as a daemon with remote control socket capabilities. The component is connected through Calico's container networking infrastructure to provide routing services in Kubernetes environments".
   - G2 Category: Industry-standard categorization from G2.com. For example: "Container Networking".

Service Mapping Candidates Impact skill

This skill generates comprehensive impact assessments when changes are made to your infrastructure. It analyzes service connections and dependencies to predict how a change to a single component might affect other services and servers, and provides a summary of the impact analysis.

The skill analyzes:

- Connection Topology: How servers within a service candidate are connected.
- Affected Servers: Which servers are directly impacted by a change.

Based on the candidate number, and the analysis, the output summary is provided per a service candidate. For example:

- Service candidate: "bird [ASC000000015]".
- Impact: "Network routing disruption affecting pod-to-pod communication across Kubernetes cluster nodes due to Calico Bird BGP routing daemon failure on p-kubenode1-2, potentially causing connectivity issues for workloads on connected nodes p-kubenode1-3, p-kubenode1-4, and p-kubenode1-5".

Important: This agentic workflow is turned on by default. For more information, see Now Assist skills, agents, and agentic workflows on by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the Analyze potential impact agentic workflow to assess a change request

Use the Analyze potential impact agentic workflow to assess the effects of a change request. This workflow highlights the potential impacted servers and suggested services to help you identify risks, benefits, and make any necessary adjustments.

Before you begin

Using the Analyze potential impact agentic workflow requires the installation of the following:

- Service Mapping Plus version 1.16.3.
- Now Assist for IT Operations Management (ITOM) version 2.3.0.
- Now Assist for IT Service Management (ITSM) version 11.1.3.

Role required: sn_change_write

Role masking

Required role:

Role masking enables users to limit the roles and privileges of agentic workflows during tool execution. Agentic workflows and their AI agents that get installed with Now Assist applications are assigned pre-defined roles. If you select *Users with specific roles* for user access, you must configure the security controls to include these roles. Data access settings must also include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

About this task

The agent verifies the prerequisites at the beginning of the agentic workflow. If any prerequisites aren't met, the workflow stops, and you're informed so that you can acquire the prerequisites. For more information about the agentic workflow, see Analyze potential impact agentic workflow.

Procedure

Either initiate the Analyze potential impact agentic workflow using a change request number or from an open change request.

Situation	Steps
Change request number is known	**a.** From the header menu, select the Now Assist icon to open the Now Assist panel. **b.** Select **Analyze Potential Impact**. **c.** When prompted, enter the change request number.
Open change request	**a.** Navigate to **Workspaces** > **Service Operations Workspace** > **.** **b.** Select the list icon. **c.** Navigate to **Changes** > **All**. **d.** Select the applicable change request from the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Situation	Steps
	e. From the header menu, select the Now Assist icon to open the Now Assist panel. f. Select **Analyze Potential Impact**.

The Analyze potential impact agentic workflow is initiated and the agent starts with the verification of the prerequisites.

Result

In the Now Assist panel, the Analyze potential impact agentic workflow generates an analysis of the potentially impacted relevant servers and suggested services.

Now Assist certificate renewal AI agent

Using the Now Assist certificate renewal AI agent, see which certificates are about to expire and renew them. Choose a specific certificate and renew it on the spot.

Use the Now Assist certificate renewal AI agent to automatically renew certificates before they expire. You can perform the following with the Now Assist certificate renewal AI agent:

- Renew a single certificate
- Find all certificates that are about to expire
- Renew all certificates that are about to expire in a single prompt

You must first configure your system for automatic renewal. Configuring requires the following steps:

1. Configure your MID Server for automatic certificate renewal
2. Add the required applications and capabilities to your MID Server

Role masking enables users to limit the roles and privileges of AI agents during tool execution. AI agents that get installed with Now Assist applications are assigned pre-defined roles. If you select *`Users with specific roles`* for user access, you must configure the security controls to include these roles. Data access settings must also include these roles. For the instructions to change the security controls, see Define security controls for an AI agent.

Discover and renew certificates about to expire using Now Assist

Use Now Assist to find out which certificates expire on a certain date or within a certain date range. Now Assist produces a Unique Certificates list of these certificates and prompts you to renew them in a single click.

Before you begin

Complete the following steps to configure your system for the Now Assist certificate renewal AI agent:

1. Configure your MID Server for automatic certificate renewal
2. Add the required applications and capabilities to your MID Server

Role masking enables users to limit the roles and privileges of AI agents during tool execution. AI agents that get installed with Now Assist applications are assigned pre-defined roles. If you select *`Users with specific roles`* for user access, you must configure the security controls to include these roles. Data access settings must also include these roles. For the instructions to change the security controls, see Define security controls for an AI agent.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: sn_disco_certmgmt.pki_admin

Procedure

1. Navigate to **All** > **Unique Certificates**.
2. Select the Now Assist icon .
3. Enter `Fetch the certificates expiring between 1 May 2026 and 1 August 2026.`

   Note: You can choose any date range that you need.

4. Select the **Certificates** link that Now Assist returns.

Result

Now Assist directs you to a list of certificates that expire between 1 May 2026 and 1 August 2026. Now Assist then asks you if you want to renew these certificates. Renew them all at once by selecting **yes**.

Automatically renew a certificate using the Now Assist certificate renewal AI agent

Automatically renew a single certificate using the Now Assist certificate renewal AI agent.

Before you begin

Complete the following steps to configure your system for the Now Assist certificate renewal AI agent:

1. Configure your MID Server for automatic certificate renewal
2. Add the required applications and capabilities to your MID Server

Role masking enables users to limit the roles and privileges of AI agents during tool execution. AI agents that get installed with Now Assist applications are assigned pre-defined roles. If you select *`Users with specific roles`* for user access, you must configure the security controls to include these roles. Data access settings must also include these roles. For the instructions to change the security controls, see Define security controls for an AI agent.

Role required: sn_disco_certmgmt.pki_admin

About this task

Navigate to the certificate that you want to renew and use the Now Assist certificate renewal AI agent to renew the certificate.

Procedure

1. Navigate to **All** > **Unique Certificates**.
2. Select the certificate that you want to renew.
3. Select the Now Assist icon .

   Warning: Make sure that you are on the unique certificate page of the certificate that you want to renew.

4. Enter the prompt `Renew this certificate`
5. Answer the questions that Now Assist asks you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Now Assist updates you on its progress in renewing your certificate. The certificate renewal AI agent gives you a link to the task record that displays the status of the renewed certificate.

Use Now Assist to renew a certificate set to renew manually

Use the Now Assist certificate renewal AI agent to immediately renew certificates set to renew manually.

Before you begin
Complete the following steps to configure your system for the Now Assist certificate renewal AI agent:

1. Configure your MID Server for automatic certificate renewal
2. Add the required applications and capabilities to your MID Server

Role masking enables users to limit the roles and privileges of AI agents during tool execution. AI agents that get installed with Now Assist applications are assigned pre-defined roles. If you select *`Users with specific roles`* for user access, you must configure the security controls to include these roles. Data access settings must also include these roles. For the instructions to change the security controls, see Define security controls for an AI agent.

Role required: sn_disco_certmgmt.pki_admin

About this task
Find tasks that require you to renew your certificates manually and renew them immediately using the Now Assist AI certificate renewal agent.

Procedure
1. Navigate to **Workspaces** > **Certificate Management**.
2. Select **Tasks**.
3. In the **Renewal Tasks** space, select the number of renewal tasks.
4. Select the number of the renewal task that you want to auto-renew.
5. In the **Unique Certificate** field, select the search icon .

   Note: Selecting the icon opens the certificate record.

6. Select your Now Assist AI tool.
7. In the prompt field of Now Assist, enter `Renew this certificate`.
8. Answer the questions that Now Assist asks you.

Result
The certificate is renewed by the Now Assist AI certificate renewal agent.

Pattern diagnostic agentic workflow

The Pattern diagnostic agentic workflow helps Discovery administrators investigate missing CI attributes. It identifies the gap, parses discovery logs, identifies the root cause, and suggests remediation — without manually navigating log files.

When Discovery runs, it populates CI attributes in the CMDB using both probe-based and pattern-based discovery. The Pattern diagnostic agentic workflow supports investigation into CIs discovered through pattern-based discovery. When an attribute is missing, identifying the cause

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

requires navigating multiple tables and interpreting nested JSON in discovery logs. The Pattern diagnostic agentic workflow automates this investigation and suggests a remediation action, all from the Now Assist panel.

Requirements

Now Assist for IT Operations Management (ITOM) must be installed on your instance. For more information, see Install the Now Assist for IT Operations Management (ITOM) plugin.

Role required: discovery_admin.

Pattern diagnostic agentic workflow overview

A Discovery administrator triggers the workflow by asking a natural-language question in the Now Assist panel. The workflow resolves the CI class and surfaces the attributes that Discovery is responsible for populating. The administrator selects the attribute to investigate. The workflow then identifies affected CI records with the selected attribute missing, parses the relevant discovery logs to identify the root cause, and suggests a remediation.

The workflow uses two agents:

- Pattern diagnostic agent: Receives the administrator's query and runs script tools autonomously to investigate the missing attribute.
- EF Remediation Agent: Receives the identified root cause and suggests a remediation.

Scope

The workflow covers attribute coverage gaps for CI classes discovered through pattern-based Discovery. The following conditions apply:

- Only CIs discovered through patterns are supported for analysis.
- Analysis is based on the pattern metadata table (sn_disco_ai_pattern_metadata). This table contains metadata about the patterns populating a CI and its attributes. Only default pattern information is included; customizations made to patterns aren't considered.
- Log analysis focuses on the first CI in the sample. If issues are found, the workflow reports them and stops. If no issues are found, it checks the next CI in the list, up to the sample limit of five.

Examples

The following scenarios illustrate how the workflow handles different CI and pattern types.

Scenario 1: Direct infrastructure (Linux Server)

The workflow investigates a missing `cpu_manufacturer` attribute on Linux Server CIs. The workflow resolves the CIs IP address and queries the discovery logs directly. It returns a full report with sample CIs investigated, link to CIs, root cause and remediation guidance.

Scenario 2: Applicative pattern (MySQL database)

The workflow investigates a missing attribute on a MySQL database CI. MySQL CIs are discovered through their host servers. The workflow navigates the Runs on relationship to resolve the host server's IP address and queries the discovery logs on the host, not the MySQL instance. It returns a full report with sample CIs investigated, link to CIs, root cause and remediation guidance.

Scenario 3: Cloud pattern (AWS Auto Scaling Group)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The workflow investigates a missing `cluster_connection` attribute on an AWS Auto Scaling Group CI. Cloud CIs use an SA-LDC identifier instead of a traditional IP address. The workflow navigates the Hosted on relationship to resolve the SA-LDC identifier and searches logs using the identifier and process ID. It returns a full report with sample CIs investigated, link to CIs, root cause and remediation guidance.

Manage alerts autonomously agentic workflow

Enhance IT operations with AI-driven, autonomous alert management using the manage alerts autonomously agentic workflow.

Manage alerts autonomously agentic workflow overview

The manage alerts autonomously workflow introduces a unified AI-driven process that significantly streamlines alert management and reduces resolution times. This workflow supports alert management in the following ways:

- Automates the triage
- Impact analysis
- Root cause investigation of IT alerts
- Generates reports, summarizes key insights and possible next steps

For information on how to review key insights and data derived from the workflow in Express List, see Review AI generated alert information and insights in Express List.

For information about configuring this workflow, see Configure the manage alerts autonomously agentic workflow.

Use the information on this page to learn about the actions related to the manage alerts autonomously agentic workflow. To modify the workflow, you must duplicate it and adjust the settings according to your requirements. For more information, see Duplicate an agentic workflow.

Important: When you modify an agentic workflow, AI agent, or tool, make sure that you update all instructions accordingly.

Manage alerts autonomously agentic workflow

The manage alerts autonomously agentic workflow uses the manage alerts AI agent to perform alert management and resolution tasks.

AI agent used in the manage alerts autonomously agentic workflow

AI agent	AI agent role
Manage alerts AI agent	Investigates alerts, summarizes alert-related reports, and stores structured insights with key findings.

The manage alerts autonomously agentic workflow performs several actions in the course of the workflow. These actions may include the following:

- Triages alerts
  - Evaluates and categorizes alert
  - Analyzes alert history to identify noise patterns

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Updates alert group description based on analysis
- Performs related incidents analysis to detect focal points and common closure patterns

- Determines alert impact
  - Evaluates impact on services
  - Determines user impact by finding recent incidents or cases
  - Uses observability skills for deeper service state validation
- Investigates relevant information
  - Retrieves and summarizes similar closed alerts
  - Analyzes recent changes for causal relationships
  - Summarizes related KB articles for relevant information
  - Identifies trends or anomalies in related metrics
  - Uncovers errors, exceptions, or warnings in related logs
  - Analyzes non-primary log analytics alerts in an alert group to support investigation, including the following:
    - Classifies alerts as proactive or reactive, indicating emerging risk or an active issue
    - Assess if triage is required
    - Provides contextual insights, including potential failure scenarios and what may occur if the alert isn't addressed
- Summarizes and stores information
  - Consolidates findings
  - Generates a final summary
  - Saves the summaries in the alert record, such as
    - reasoning, evidence, and confidence level behind AI-driven investigation of alert significance and automatic closure of insignificant alerts
    - summaries of Service Observability dashboards to provide health analysis of each service associated with an alert. For more information see, Analyze service health in Service Observability
  - Provides clear, actionable insights

Important: This agentic workflow is turned on by default. For more information, see Now Assist skills, agents, and agentic workflows on by default.

Review AI generated alert information and insights in Express List

Access alert information in Express List that is consolidated autonomously by AI skills and agents. Use the AI insights badge, column, and filter to monitor alert statuses and review of AI-generated insights.

Before you begin

For this feature, you must have Now Assist for IT Operations Management (ITOM) installed on your instance. For more information about installing Now Assist plugins, see Install Now Assist plugins.

Role masking enables users to limit the roles and privileges of agentic workflows during tool execution. Agentic workflows and their AI agents that get installed with Now Assist applications are assigned pre-defined roles. If you select *Users with specific roles* for user access, you must configure the security controls to include these roles. Data access settings

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

must also include these roles. For the instructions to change the security controls, see Define security controls for an agentic workflow.

[Optional] Additional configuration is required for some skills used in the agentic workflow:

- **Observability skills**: Configure the relevant observability skills to surface data from observability tools integrated with Event Management. See .
- **Log analytics skills**: Install and configure Health Log Analytics to enable analysis of log analytics alerts. See Configuring Health Log Analytics.
- **Service health skill**: Install and configure Service Observability and activate the analyze service health skill to automatically surface insights about service health in an alert. See Install Service Observability and Activate the analyze service health skill for more information.

Role required: evt_mgmt_admin, evt_mgmt_operator

About this task

The manage alerts autonomously workflow investigates alerts, summarizes alert-related reports, and stores structured insights with key findings for use in Express List. For more information about the manage alerts autonomously agentic workflow, see Manage alerts autonomously agentic workflow.

Note: Currently, Now Assist for ITOM only supports tag-based, CMDB, Log Analytics, Mixed, Automated, and Network Traffic-based alert groups. For all other alert group types, it only analyzes the parent alert.

There are several ways to explore AI insights in Express List.

- Quickly review if alerts have been processed by checking for the AI insights badge AI.
- Search for specific information and key words in the Insights column. To add the column, see Add or modify Express List columns for more information.
- Filter for information by using the **Insights** filter attribute in the filter panel.
- Review **AI insights** in the preview panel or the alert record.

These options present differently, depending on whether the workflow is configured for automatic or manual execution.

- When the workflow operates automatically, alerts are addressed as they're created and AI insight information is displayed in Express List.
- When the workflow operates manually, you must manually generate AI insights. For more information, see details in the following procedure.

For information about configuring this workflow, see Configure the manage alerts autonomously agentic workflow.

Procedure

1. Navigate to **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
2. Select the Express List icon.
3. Review the AI insights through the following options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Review AI insights	Procedure
Check for the AI Insights badge for alert status	○ If the AI insights icon AI is visible next to the check box, insights are available for that alert. ○ If insights aren't available for an alert, you can initiate the process manually. Details for generating insights are in the following options.
Search for alerts with AI Insights information and key words	Search for content with the free text search. For more information, see Find alert records in Express List using text search.
Filter using AI Insights filter attribute	Filter using the **Insights** attribute with a minimum string of two characters. For more information, see Filtering the alert display in the Express List pane.
Review AI insights in the preview panel	**a.** In the alerts list, select an alert by selecting the check box or the information icon next to the alert. **b.** ▪ In the **Insights** tab, review **AI insights**. ▪ If data isn't available for this alert, you can initiate the process by selecting **Generate**.
Review AI Insights in the alert record overview	**a.** In the alerts list, select an alert number to open the alert record. The **Overview** tab is selected by default. **b.** ▪ If data is available, you can review the **AI insights** summary in the Summary section. ▪ If data isn't available for this alert, you can initiate the process by selecting **Generate**.

Now Assist for ITOM reference

Reference topics provide additional information for configuring and using the Now Assist for ITOM application.

Applications installed with Now Assist for ITOM

Table that lists applications installed with the Now Assist for IT Operations Management (ITOM) application. When you update your application, any newly required application dependencies are installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Applications installed with Now Assist for ITOM (sn_itom_gen_ai)

Application name	Description
Now Assist for Platform (sn_genai_platform)	Enables Now Assist skills and Features across various BU applications.
AI agents for AIOps (sn_aiops_ai_agents)	Enables IT operations with AI Agents that can help autonomously triage alerts, assess business and technical impact, investigate root causes, and recommend or execute remediation steps. These agents operate within coordinated agentic workflows.
AI Agents for Service Mapping (sn_sm_gen_ai)	Provides autonomous AI Specialists for Service Mapping. It automates the creation of ML-based service maps from Application Service Candidates and the connection of Business Applications to discovered Application Services in the CMDB.
AI agents for Observability (sn_obs_aia)	Helps IT operators assess business and application service impact, and formulate probable cause theories. Helps prioritize investigations by analyzing data from ServiceNow and collaborating with third-party AI agents from leading APM and observability vendors.
AIOps LEAP (sn_itom_leap)	AIOps LEAP (Learning-Enhanced Automation Playbook) leverages AI-driven insights to mine historical incident data, dynamically prioritize tasks, and generate actionable resolution playbooks.

Questions for the analyze alert impact agentic workflow

Questions to ask about alerts in the Now Assist for IT Operations Management (ITOM) analyze alert impact agentic workflow.

Questions organized by alert source

Ask the following questions about alerts from specific observability tools in the Now Assist panel. For more information about using the analyze alert impact agentic workflow, see Analyze alert impact in the Now Assist panel.

Alert source	What to ask
Dynatrace	• What is the impact of this alert? • What is the root cause entity? • What is the root cause theory? • Which entities are impacted by this alert? • Which environments are impacted by this alert?

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert source	What to ask
Kentik	• Are there network anomalies between the impacted services for this alert? • Is there a DDOS attack in progress at the moment on the impacted services for this alert? • Is there connectivity between the impacted services for this alert?
New Relic	• Have there been recent deployments for this alert? • What are the root cause theories for this alert? • What else is impacted by this alert? • What is the user impact for this alert? • Which engineering teams should I pull in to investigate this alert? • Who owns the impacted entity for this alert?

Learning Enhanced Automation Platform (LEAP)

LEAP application uses AI-driven insights and automation to help manage IT operations.

Get started

Explore Learn about LEAP benefits, features, and capabilities.	Configure Install and configure LEAP.
Use Create problem records and playbooks using LEAP.	Reference Get detailed information on important skill configuration during LEAP installation.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported LLMs for Now Assist for ITOM

You can use Now LLM Service, Azure OpenAI, Google Gemini or Anthropic Claude on AWS as the AI model provider for Now Assist skills and AI agents. You can set skill-level preferences in the Now Assist Admin console. For more information, see Large language models on the ServiceNow AI Platform®.

Important:

- Not all model providers are available for customers with in-country SKUs, and some Now Assist products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some Now Assist products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base . Be sure to check for availability updates in future releases.
- Some Now Assist products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

Troubleshoot and get help

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect information about scripts (and associated script records) in which Now Assist for code generation is called. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the Now Assist documentation.

Exploring LEAP

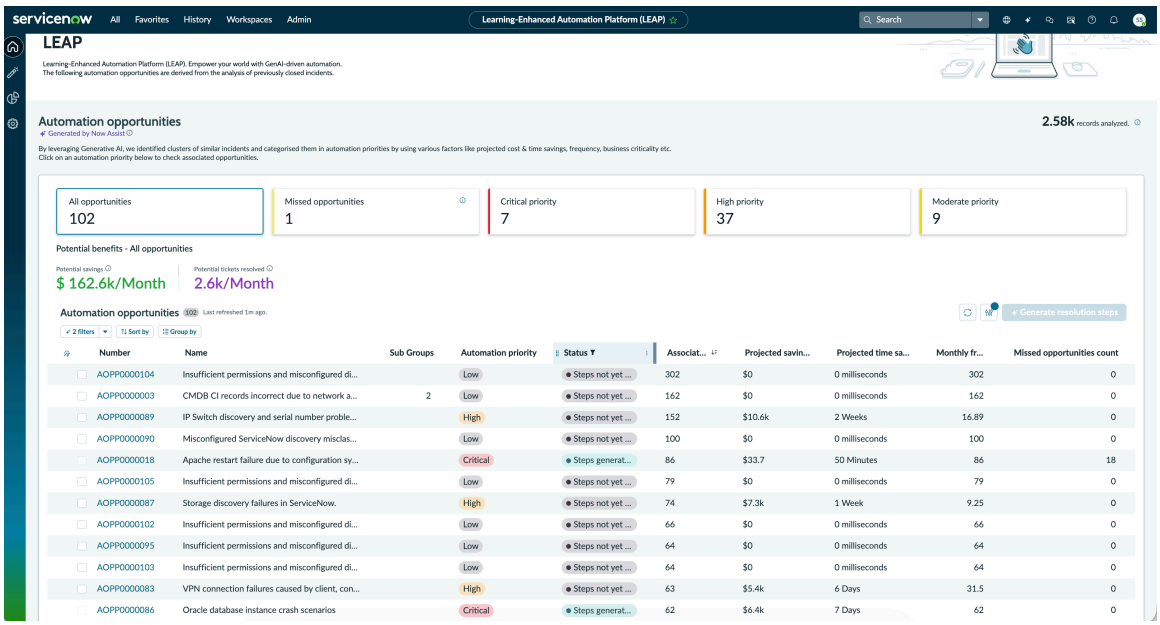
LEAP categorizes similar incidents into groups and uses AI to generate resolution steps, problem records, AI-enhanced knowledge base articles, and playbooks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

LEAP overview

LEAP helps you manage incidents and operational tasks efficiently. It uses AI to gather information from existing incidents and generates resolutions that can be automated. The LEAP automation provides tools to manage incidents early, speed up resolution, use prebuilt automation, and follow clear steps to handle issues. These tools help support smooth operations.

Note: The plugin name has been updated from AIOps Learning Enhanced Automation Playbook to Learning Enhanced Automation Platform (LEAP) to reflect its expanded capabilities and strategic direction.



The landing page displays the number of records analyzed on the right-hand side of Automation opportunities section. The tool tip provides details about the duration considered for record analysis.

Grouping of automation opportunities in LEAP

GAF (Group Action Framework) is the clustering engine that LEAP uses to group incidents into Automation Opportunities (AOs). GAF analyzes incident records using the short description field and applies ML-powered clustering to group incidents that share similar problem patterns. LEAP surfaces recurring issue types as discrete automation opportunities (AOs) rather than treating every incident in isolation.

GAF runs on a scheduled job, by default monthly. The schedule is configured during LEAP skill activation through the installer. On the first run, GAF processes up to six months of historical incident data using the filter set in the installer.

Before clustering begins, GAF selects the top N incidents from the eligible incident pool, where N is configurable and can be set to a maximum of 50. This selection confirms that clustering focuses on the most relevant and recent incidents within the defined scope. You can configure the fields GAF considers during analysis such as tables and columns in the LEAP settings. You can also modify the schedule run frequency in the LEAP settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

LEAP users

User roles

Role	Description
LEAP admin	You have full control over LEAP capabilities, including the following: • Turn features on and off • Execute scheduled jobs • Manage LEAP tables and the LEAP Workspace • Generate and update resolution steps • Generate AI-enhanced knowledge base articles, problem records, and playbooks from automation opportunities (AO)
LEAP viewer	You can access and view data related to LEAP, including tables, the workspace, and problems originating from AOs.
LEAP agent	You can access the LEAP menu from the Service Operations Workspace (SOW) and trigger LEAP executions directly from within SOW.

These roles work together to create a streamlined and secure approach for managing automation, resolving incidents, and sharing knowledge across teams.

Personas in LEAP

LEAP supports different personas who can have different roles assigned to enhance IT Operations Management.

LEAP personas

Persona	Description	Responsibility
Automation architect	An automation architect is a senior technical expert who designs and develops automation solutions, scaling them when required. They're a bridge between IT operations, business needs, and automation strategy. The automation architect streamlines manual, repetitive, and error-prone tasks.	• Identifies high-impact areas for automation • Develops automation scripts, integrate AI-driven insights, and maintain scalable automation frameworks • Extracts patterns from historical ticket data to optimize future resolutions • Refines automation solutions based on feedback and evolving business needs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

LEAP personas (continued)

Persona	Description	Responsibility
		• Collaborates with different business units to align automation with enterprise objectives.
IT operator	An IT operator includes all L1 and L2 incident handlers who support day-to-day IT operations.	• Uses AI-generated playbooks to resolve incidents • Accesses the Knowledge Base
Buyer, Business goal owner	A buyer or a business goal owner gains strategic and operational advantages using LEAP.	• Uses LEAP to improve IT operations • Optimizes resource allocation • Automates recurring issue resolution

An automation architect can use LEAP to gather feedback and refine solutions. In a similar manner, IT operators will use LEAP to detect recurring issues and LEAP displays suggestions for preventive automation. This enables faster resolution and operators can resolve more incidents independently leading to improved efficiency and service quality.

LEAP benefits

LEAP benefits

Benefit	Feature
Promotes automation culture	Interpret data and automate records
Drives incident resolution	Measure and enhance performance
Targets Outcomes for L1 Operators	Interpret data and automate records
Improves MTTR	Measure and enhance performance
Optimize Resource Allocation	Identify and prioritize high impact areas
Provides cost predictability	Fixed pricing model for incident analysis operations

LEAP AI agent

The LEAP AI agent uses automation opportunities created by LEAP analysis to generate artifacts — problem records, knowledge base articles, or playbooks — based on user requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

LEAP AI agent

AI agent	AI agent role
LEAP AI agent	Uses the automation opportunities created by LEAP analysis, and creates artifacts — problem records, AI-enhanced knowledge base articles, or playbooks — based on user requests.

Important: This agent is turned on by default. For more information, see Now Assist skills, agents, and agentic workflows on by default.

What to explore next

To learn more about configuring and using LEAP, see:

- Configuring LEAP
- Using LEAP
- LEAP reference

LEAP features

LEAP includes features such as grouping incidents, creating problem records, and generating playbooks.

Identify and prioritize high impact areas

LEAP uses data-driven analytics to help users identify critical issues and prioritize high-impact automation opportunities. This ensures that resources are prioritized for the areas that deliver the highest operational efficiency and business value.

Measure and enhance performance

LEAP helps improve Mean Time to Repair (MTTR) and operational efficiency by using advanced analytics and AI-driven insights to continuously monitor and optimize IT processes.

Interpret data and automate records

LEAP automatically generates problem records and executes automated playbooks by analyzing historical data patterns, enabling faster root cause identification and reducing manual intervention across complex IT environments.

Generate AI-enhanced knowledge base articles

LEAP uses AI to transform resolution steps into complete, structured knowledge base articles. Generated articles include all required sections and auto-populated metadata. Articles are published to the Knowledge Center through the standard approval workflow.

LEAP savings metrics

LEAP displays two distinct types of savings metrics: projected savings and actual savings. The difference between these metrics helps you correctly interpret the values shown across the platform and make informed decisions about automation opportunities.

LEAP savings metrics overview

When you use LEAP to identify and act on automation opportunities, the platform tracks savings at two stages of the workflow:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Projected savings — displayed on the LEAP home page before you automate, based on historical incident data.
- Actual savings — recorded in resolution reports after playbooks execute during completed incident resolutions.

Both metrics are important. Projected savings help you prioritize which opportunities to pursue. Actual savings help you measure the real return on your automation investment.

Projected savings

Projected savings represent the estimated value that could be realized if an automation opportunity is adopted. These figures appear on the LEAP home page and on individual automation opportunity cards.

LEAP calculates projected savings using the following inputs from your historical incident data:

- Historical incident volume (number of incidents per month)
- Average manual resolution time (mean time to resolve, or MTTR)
- Estimated automation rate
- Cost per hour of IT labor

The formula is:

```
Projected savings = incident volume × Avg. manual resolution
 time × Estimated automation rate × Cost per hour
```

Projected savings update dynamically as new incidents are ingested and clustered. Because they are based on estimates and historical patterns, they represent a potential value, not a guaranteed outcome.

Note: The savings number displayed on the LEAP home page is a projected value. It indicates the potential savings if all identified automation opportunities were fully adopted.

Actual savings

Actual savings represent the realized value recorded when playbooks are executed during completed incident resolutions. These figures reflect real, measured outcomes and accumulate over time.

LEAP calculates actual savings using the following inputs from playbook execution data:

- Number of incidents resolved by the playbook
- Time saved per automated resolution (manual time minus automated time)
- Cost per hour of IT labor

The formula is:

```
Actual savings = Sum of (Time saved per automated resolution ×
 Cost per hour) across all completed playbook executions
```

Actual savings are visible in your resolution reports and savings dashboards. They are recorded per resolution and accumulate as more incidents are handled by playbooks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Projected and actual savings comparison

The following table summarizes the key differences between the two savings metrics.

Projected and actual savings

	Projected savings	Actual savings
Definition	Estimated value based on historical incident data, displayed on the LEAP home page before playbooks are executed.	Realized value recorded when playbooks are executed during completed incident resolutions.
Data source	Historical incident volume, MTTR, and manual effort estimates.	Playbook execution logs, time saved per automated resolution, and resolution outcomes.
Where displayed	LEAP home page and automation opportunity cards.	Resolution reports and savings dashboards.
When calculated	Continuously, as new incidents are ingested and clustered.	Per resolution, upon successful playbook execution.
Formula	Incident volume × Avg. manual resolution time × Estimated automation rate × Cost per hour.	Sum of (Time saved per automated resolution × Cost per hour) across completed executions.

Use case: Password reset automation

This walkthrough follows a realistic scenario to show how projected and actual savings are calculated at each stage of the LEAP workflow.

The scenario: Your IT service desk receives approximately 1,200 password reset requests every month. Each request currently takes an agent about 15 minutes to resolve manually. Your organization values IT labor at $50 per hour.

Stage 1: LEAP analyzes your incident history.

LEAP ingests your historical incident data and identifies a cluster of 1,200 recurring password reset incidents per month. It recognizes this as an automation opportunity and displays it on the home page with a priority level based on the automation priority matrix.

Stage 2: LEAP calculates projected savings.

Using historical data, LEAP estimates how much time and money your team could save if this incident type were automated.

The calculation: 1,200 incidents × 15 minutes each = 18,000 minutes = 300 hours per month. At $50 per hour, that equals **$15,000 per month** or **$180,000 per year** in projected savings.

The LEAP home page displays "Projected savings: $15,000/month" on the automation opportunity card. This is an estimate based on historical patterns.

Stage 3: You create and activate a playbook.

Based on the automation opportunity, LEAP generates resolution steps for password resets. You review them, create a playbook, and activate it. From this point forward, incoming password reset incidents that match the cluster are handled by the playbook automatically.

Stage 4: Playbook runs and LEAP records actual savings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Over the next month, the playbook executes against real incidents. LEAP measures the actual time saved for each automated resolution.

- Coverage: The playbook successfully automates 1,040 of the 1,200 incidents (87%). The remaining 160 incidents require manual handling due to edge cases such as locked accounts, expired tokens, or multi-factor authentication issues.
- Time per automated incident: Each automated resolution takes about 2 minutes (versus 15 minutes manually), saving 13 minutes per incident.
- Actual calculation: 1,040 automated incidents × 13 minutes saved = 13,520 minutes = 225 hours. At $50 per hour = **$11,267 actual savings** for the month.

Stage 5: Compare projected and actual savings.

After one month of operation, you can compare the two numbers side by side to understand the real impact of automation.

Scenario summary: Projected and actual

Metric	Projected (before automation)	Actual (after automation)
Time saved per incident	15 minutes (estimated)	13 minutes (measured)
Monthly time savings	300 hours	225 hours
Monthly cost savings	$15,000	$11,267
Annual cost savings	$180,000	$135,204

Why projected and actual savings differ

A gap between projected and actual savings is normal and expected. The most common reasons include:

- Automation coverage: Not every incident matches the playbook. Edge cases, exceptions, and unusual incident variations still require manual handling.
- Processing overhead: Automated resolutions are fast but not instant. The playbook takes some time per incident rather than zero.
- Ramp-up period: Early in deployment, coverage is typically lower. As playbooks are refined and edge cases are addressed, actual savings trend closer to projected values over time.

Tip: Over time, as playbooks are refined and coverage expands, actual savings typically trend closer to projected values. Regularly review your resolution reports to track this improvement.

Projected savings tell you the potential value of an automation opportunity and help you prioritize which opportunities to pursue. Actual savings tell you the real value being delivered and help you measure return on investment. Both metrics are important, projected savings guide your decisions, and actual savings validate them.

AIOps LEAP prioritization logic and cost savings calculation

AIOps LEAP uses built-in prioritization logic to identify the highest-impact automation opportunities. This logic helps you focus on the most valuable automation tasks. The calculations provide an estimate of potential cost and time savings. It's best to validate these values in a non-production environment before implementing them in production.

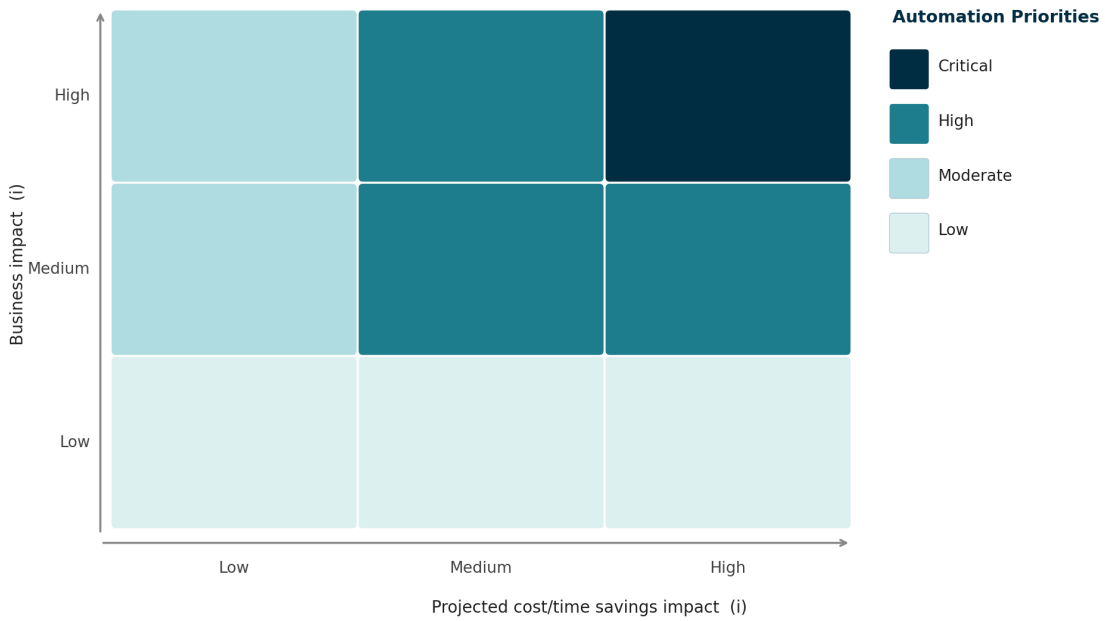
The automation priority is calculated by combining the following key factors:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Business impact
- Projected cost/time savings

The priority for an automation opportunity is determined using the following chart.

Automation opportunity priority



The key factors are evaluated for each group of related incidents, called#automation opportunities, and the results help teams focus on high-value areas.

Business impact

Each automation opportunity is a cluster of tickets. Every ticket is scored based on the following factors:

- Business criticality
- Major incident status
- Impact level

These factors are given values. Example values for#criticality:

- Most Critical = 100%
- Somewhat Critical = 75%
- Less Critical = 50%
- Not Critical = 25%

Properties table

Key	Default value	Description
ohf_p4	0.8	Overhead factor for P4 records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties table (continued)

Key	Default value	Description
ohf_p5	0.4	Overhead factor for P5 records.
ohf_p1	1.8	Overhead factor for P1 records.
ohf_p2	1.4	Overhead factor for P2 records.
cost_per_entry	20	Cost in dollars associated with adding a work note entry to a record.
ohf_p3	1.1	Overhead factor for P3 records.
time_per_entry	0.5	Time in hours associated with adding a work note entry to a record.
first_run_group_limit	0	Total number of groups for which resolution steps are generated in the initial run.
gaf_mapping_min_threshold	0.2	Minimum ratio of incidents pointing to an active group that is considered for remapping after clustering.

Note:

- You can modify the values in the LEAP settings page. However, the calculations will differ when you change the values.
- The values in the LEAP settings page should be modified before activating AIOps LEAP.
- If you modify the values in the LEAP settings page, you need to rerun the calculation. For this, you must deactivate and reactivate the AIOps LEAP installer skill.

Each factor is weighted. For example, say that Criticality = 0.8, Major Incident = 0.2, and Impact = 0.4.

```
Ticket Score = (Criticality × 0.8 + Major Incident × 0.2 +
 Impact × 0.4) ÷ 3
```

The average of all ticket scores in the group becomes the Business Impact Score. Based on this score, automation opportunities are labeled as high impact (the top 33%), medium impact (next 33%), and low impact (remaining 33%).

Projected cost or time savings impact

AIOps LEAP estimates how much time and cost can be saved by automating a group of incidents with historical ticket data.

The key inputs for cost and time savings are the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Frequency of Incidents (FOI)#: Average number of similar incidents per month
- Average Manual Work Notes Count (AWNC)
- Overhead Factor (OHF)#: varies by incident priority based on the priorities table

AIOps LEAP uses the following formulas to calculate the projected cost or time savings:

- `Projected Cost Savings = Σ (FOI × OHF) × AWNC × Cost per Work Note`
- `Projected Time Savings = Σ (FOI × OHF) × AWNC × Agent Time per Entry`

Each ticket's projected savings is calculated. The#average for the group#becomes the#Projected Cost/Time Savings Score, which is also categorized as#High,#Medium, or#Low. The automation opportunities are sorted in descending order based on the projected cost or time savings.

Determining overall priority

After calculating the values for the business impact and the projected cost/time savings, AIOps LEAP assigns a priority level to each automation opportunity using this matrix:

Automation priority matrix

Business impact	Projected cost/time savings	Automation priority
High	High	Very High
Medium	High	High
High	Medium	High
Medium	Medium	Medium
Medium	Low	Low
Low	Medium	Low
Low	Low	Very Low

These prioritized automation opportunities are displayed on the AIOps LEAP home page.

Tracking the actual cost and time savings

After automation is implemented, AIOps LEAP tracks#actual cost and time savings and displays them on the#LEAP Value Dashboard, helping you measure impact and make decisions.

Key metrics:

- Additional Work Notes (AWN)#: Manual entries after playbook execution
- Overhead Factor (OHF) by Priority#: For example, P1 = 1.8x

Formulas:

- `Saved Work Notes (SWNs)# = AWNC – AWN`
- `AWN = SWN × OHF`
- `Actual Cost Savings = AWN × Cost per Work Note`
- `Actual Time Savings = AWN × Agent Time per Entry`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example projected cost and time savings calculations

A cluster has 20 AWNC and is mapped to a P2 incident with 6 AWN. The cost per work note is $20, and the agent time per entry is 0.5 hours.

According to the formulas, the SWN count is `(20 - 6) = 14`. According to the properties tables, the OHF = 1.4.

`SWN x OHF = AWN` so `14 x 1.4 = 19.6`

This value can be rounded off to 20 AWN. Each AWN entry represents $20 of savings.

The actual cost savings post automation = `AWN x Cost per Work Note` = `20 x 20 = $400`.

So, if you use automation, then the projected cost savings can be up to $400. Thus, the calculation provides actionable insights for ongoing process improvement and resource allocation.

Automation opportunities

LEAP groups similar incidents into automation opportunities and uses AI to generate resolution artifacts that help reduce manual effort and repeat incidents.

An automation opportunity is a group of similar incidents that LEAP identifies through AI-driven analysis. For each group, LEAP generates resolution artifacts — such as resolution steps, knowledge base articles, problem records, and playbooks — that operators can use to resolve recurring incidents faster.

Managing automation opportunities

The automation opportunity details page provides tools to review and act on identified opportunities. From this page you can:

- Review the incidents grouped into the opportunity
- Generate or regenerate resolution steps, knowledge base articles, problem records, and playbooks
- Create sub-groups for large opportunities to produce more targeted resolutions
- Track missed opportunities where automation artifacts were available but not used

Automation opportunity sub-groups

Large automation opportunities in LEAP can be broken into smaller, more manageable sub-groups to achieve more granular and accurate incident resolution.

Large automation opportunities with over 150 records tend to generate overly lengthy resolution steps that lack precision and focus. These opportunities often represent a collection of related problems and issues that should be subdivided to produce more targeted and relevant solutions.

Breaking them into smaller sub-groups lets users obtain more refined resolutions for recurring issues. The Action Insights panel on the automation opportunity details page offers recommendations to create these sub-groups for opportunities containing large record volumes.

Sub-grouping example

A large automation opportunity containing 300 password reset incidents might include a mix of VPN password resets, Active Directory account lockouts, and SSO token expiry. While these are all password-related, each requires different resolution steps. LEAP displays suggestions for

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

breaking the automation opportunity into three sub-groups so that each group receives targeted resolution steps — for example, one sub-group with VPN-specific steps, another with AD unlock procedures, and a third with SSO token refresh instructions.

Automatic reorganization

During scheduled LEAP analysis reruns, clusters are automatically reorganized based on newly observed incident patterns. LEAP preserves existing artifacts and links them to updated automation opportunities rather than overwriting them.

The following table describes how each artifact type is handled during reorganization:

Artifact behavior during reorganization

Artifact	Behavior during rerun
Resolution steps	Appended to the new matching automation opportunity. Users can keep the existing steps or select **Regenerate** to create fresh ones.
Playbooks	Remain active and are linked to the new matching automation opportunity. Existing playbook configurations and execution history are preserved.
Knowledge base articles	Remain active and retain their association with the automation opportunity.
Problem records	Remain active and are linked to the new matching automation opportunity.

Automation opportunities that no longer have any associated artifacts after reorganization are marked as deactivated. Opportunities that contain resolution steps, playbooks, or other artifacts remain active and are linked to newly identified matching automation opportunities.

For example: An automation opportunity for "email delivery failures" has resolution steps and a playbook created in the previous analysis run. When LEAP reruns the analysis and reorganizes clusters, this opportunity is matched to a new cluster. The existing resolution steps are appended to the new automation opportunity. The user can review the appended steps and decide whether to keep them or regenerate new ones based on the updated cluster data.

Benefits of sub-grouping

- Provides more focused and contextual resolution steps
- Offers more targeted solutions for similar issues
- Improves incident resolution
- Enables more effective management of large automation opportunities
- Supports operational efficiency by reusing prior resolutions where appropriate

See Create sub-groups for automation opportunities for detailed steps to create sub-groups.

Missed automation opportunities

Track instances where users could have benefited from generated resolution steps, knowledge base articles, or playbooks but didn't have access to them.

Missed automation opportunities occur when users working on incidents that could have benefited from existing LEAP automation artifacts that aren't available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

LEAP automatically logs missed opportunities when there are no artifacts recommended in Service Operations Workspace. These artifacts include resolution steps, knowledge base articles, and playbooks that could have assisted with faster incident resolution. The system helps administrators identify these gaps in automation coverage and prioritize them for future improvements.

How missed opportunities are tracked

When an incident is resolve in SOW, and the Recommendation section does not show any artifacts, the automation opportunity is marked as 'missed automation'.

Missed opportunities are logged in a dedicated table that captures:

- incident details
- Available automation artifacts that could have helped
- User information and timing data

Types of missed opportunities

LEAP tracks several types of missed automation opportunities:

Resolution steps

Generated step-by-step procedures that could have guided incident resolution.

Knowledge base articles

Relevant documentation and solutions that could have provided immediate answers but were not consulted during incident resolution.

Playbooks

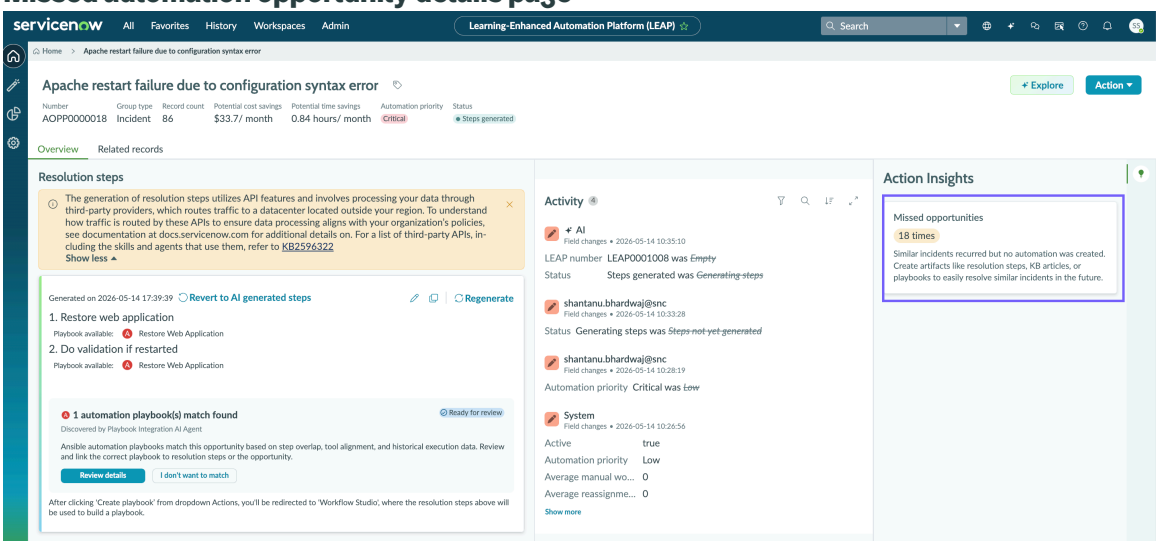
Automated workflows that could have streamlined the resolution process.

Viewing missed opportunities

The LEAP homepage displays the missed automation opportunities card.

Select the number on the missed opportunities card to filter and view only the automation opportunities that missed automation. On the details page for each automation opportunity, you can see how many times an artifact was not available when it could have assisted with incident resolution.

Missed automation opportunity details page



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

LEAP administrators can use missed opportunity data to identify patterns and improve automation coverage. This helps determine where additional automation artifacts might be beneficial.

Regular review of missed opportunities enables administrators to identify gaps in automation coverage for common incident types and prioritize creation of new automation artifacts based on potential impact.

Benefits of tracking missed opportunities

Tracking missed automation opportunities provides valuable insights for continuous improvement of automation strategies:

- Identifies high-impact areas where automation could provide the greatest benefit
- Helps justify investment in additional automation development
- Provides data-driven insights for improving user adoption of existing automation
- Enables measurement of automation program effectiveness and ROI
- Supports strategic planning for future automation initiatives

LEAP AI agent

Enhance IT operations with AI-driven, autonomous artifact creation such as problem record, knowledge base articles, and playbooks using the LEAP AI agent.

Use the information on this page to learn about the actions related to the LEAP AI agent.

Generate LEAP artifacts

AI agent	AI agent role
LEAP AI agent	Uses the automation opportunities created by LEAP analysis, and creates artifacts (problem records, knowledge base articles, or playbooks) requested by user.

Important: This agent is turned on by default. For more information, see Now Assist skills, agents, and agentic workflows on by default.

Ansible automation integration

The Ansible automation integration connects LEAP with Ansible Automation Platform to enable AI-driven discovery of relevant job templates and automated incident remediation from the Service Operations Workspace.

The Ansible automation integration addresses the critical operational gap of lack of automated remediation capabilities during incident resolution.

Key capabilities

The integration provides these core capabilities:

AI-driven automation discovery

LEAP automatically identifies relevant Ansible job templates for automation opportunities using semantic analysis.

Step-to-job mapping

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The integration enables LEAP administrators to map discovered Ansible job templates to specific resolution steps through an intuitive UI.

Automated incident remediation

The integration allows incident responders to execute mapped Ansible automations directly from the Service Operations Workspace during incident resolution.

Manual step handling

The integration supports mixed workflows where some steps require manual intervention while others can be automated.

Integration architecture

The integration uses these key components:

- Ansible discovery agent: Analyzes automation opportunities and identifies candidate job templates
- Ansible execution agent: Executes mapped automation opportunities during incident remediation
- Ansible MCP server: Provides secure API access to Ansible Automation Platform
- Step-to-job mapping store: Maintains the relationship between resolution steps and Ansible job templates

Workflow overview

The integration follows this high-level workflow:

1. The Ansible discovery agent analyzes automation opportunities and discovers relevant job templates
2. LEAP administrators map discovered job templates to specific resolution steps
3. When incidents occur, LEAP predicts the automation opportunity group
4. If mappings exist, automation options are presented to incident responders
5. The Ansible execution agent launches selected automations and reports status

Benefits

The Ansible automation integration provides these benefits:

- Reduces mean time to resolution (MTTR) by automating incident remediation
- Eliminates the requirement to search for relevant job templates or automation playbooks
- Increases automation utilization across the organization
- Provides structured linkage between automation opportunities and Ansible job templates
- Enables consistent, repeatable incident resolution processes

Ansible discovery agent

The Ansible discovery agent analyzes automation opportunities and identifies relevant Ansible job templates using AI-powered semantic matching and historical execution patterns.

The Ansible discovery agent automates the process of finding relevant Ansible job templates for automation opportunities. The agent eliminates the manual effort required by automation engineers to search and identify appropriate automation resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Discovery process

The Ansible discovery agent follows this process to identify relevant job templates:

1. Parses the problem description of the automation opportunity for keywords and context
2. Queries Ansible Automation Platform via the Ansible MCP server to retrieve available job templates
3. Applies AI-powered matching to identify relevant job templates based on problem description similarity using semantic natural language processing
4. Presents discovered job templates to the LEAP administrator for step-to-job mapping

Matching capabilities

The agent uses these techniques to match automation opportunities with job templates:

Semantic analysis

Analyzes the meaning and context of problem descriptions to identify relevant automation patterns.

Keyword extraction

Identifies key terms and technical concepts from automation opportunity descriptions.

Integration points

The Ansible discovery agent integrates with these components:

- AI Teammate Dashboard: Entry point for automation engineers and LEAP administrators.
- Ansible MCP server: Secure API access to Ansible Automation Platform job templates.
- LEAP clustering engine: Source of automation opportunity data and problem descriptions.
- Step-to-job mapping UI: Destination for discovered job template recommendations.

Configuring LEAP

You can download and install LEAP application from the ServiceNow® Store to manage your IT operations efficiently.

Configuration overview

1. Install LEAP

   Install LEAP if you have the admin role.

2. Setup LEAP properties

   View and modify the LEAP LEAP properties as per your requirements.

3. Activate LEAP

   Activate LEAP to enable grouping of incidents, create problem records, and generate resolution playbooks.

4. Change LEAP large language model (LLM)

   Modify the LLM model to suit your requirements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Configure Ansible automation integration

   Configure the integration between LEAP and Ansible Automation Platform to enable automated discovery and execution of Ansible job templates.

Install LEAP

You can install the LEAP application using Now Assist for IT Operations Management (ITOM) (sn_itom_gen_ai) if you have the admin role. The application installs related ServiceNow® Store applications and plug-ins if they aren't already installed.

Before you begin

- Confirm that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the LEAP application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: System admin

About this task

The following items are installed with LEAP:

- Roles
- Scheduled jobs
- Tables

For more information, see Components installed with LEAP.

Procedure

1. Go to the ServiceNow Store website.
2. In the search bar, enter `Now Assist for ITOM` and then select **Search**.
3. Select the Now Assist for ITOM widget and then select **Get** to make this application available for installation on your instances.
4. Install the Now Assist for ITOM application.
   a. Navigate to **All** > **System Definition** > **Plugins**.
   b. Search for Now Assist for IT Operations Management (ITOM).
   c. Select **Install**.

Setup LEAP properties

Configure LEAP properties to estimate cost and time savings calculations for your organization.

Before you begin

Role required: LEAP admin

About this task

If you are a first-time user of LEAP, use the default values to understand how each value is used for estimation. You can modify these values to suit your organization's requirements.

Settings also include a default priority filter that controls which automation opportunities are eligible for resolution step generation. The default priority is Critical. Only automation opportunities at or higher than the configured priority level are processed in each run.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Select **Configure settings**.
2. On the settings page, choose one of the following options:
   - Fresh Install
     a. Select **Configure settings**.
     b. Review the default values for each property.
     c. Select **Save**.

     Note: LEAP recommends using default values initially to view and understand the cost and time savings estimates.

   - Upgrade
     a. Select **Configure settings**.
     b. Review the default values for each property.
     c. Modify values as needed.
     d. Select **Save**.

   You are redirected to the LEAP landing page. For details on each field, see LEAP settings fields
3. Activate LEAP.

Activate LEAP

Activate the LEAP skill after installing the application to assemble and categorize incidents.

Before you begin

Role required: System admin or LEAP admin

and the application scope must be LEAP.

Procedure

1. Activate *LEAP* with one of the following options.

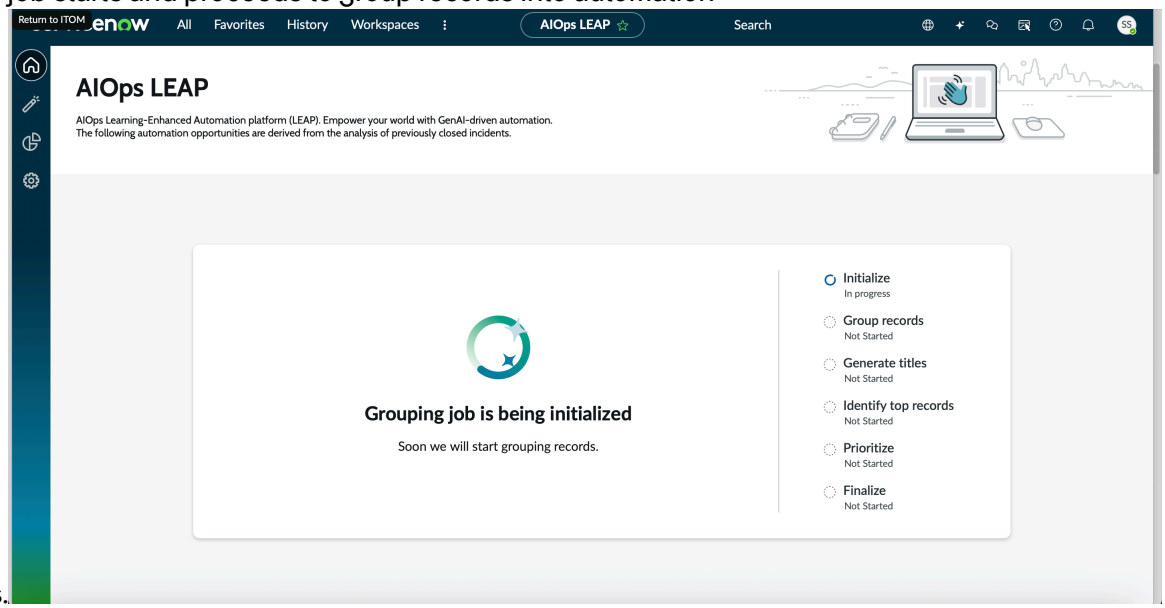
Options	Steps
Workspaces	**a.** Navigate to **Workspaces** > **LEAP**. **b.** Select **Now Assist Admin Workspace**. **c.** On the LEAP installer card, select **Activate skill**.
Now Assist Admin	**a.** Navigate to **All** > **Now Assist Admin** > **Skills**. **b.** In the workflow list under Technology, se lect **ITOM**. **c.** On the LEAP installer card, select **Activate skill**.

2. In the LEAP installer input section, enter the details for LEAP to run scans on existing records, and select **Save and continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on installer fields, see LEAP Installer fields

3. In the Define access section, select the role to whom you want to provide access to LEAP skills.
4. In the Select display section of *LEAP installer*, select the required display and select **Save and continue**.
5. In the Review and activate section of *LEAP installer*,review the selections, and select **Activate**.
6. Select **Return to ITOM** on the success message.
7. The grouping job starts and proceeds to group records into automation opportunities.



If errors are encountered, then LEAP provides links to knowledge base articles to understand the root cause and steps to resolve issues.

Change LEAP large language model (LLM)

LEAP allows you to change the default LLM provider from the Now LLM to your required LLM.

Before you begin

Role required: admin

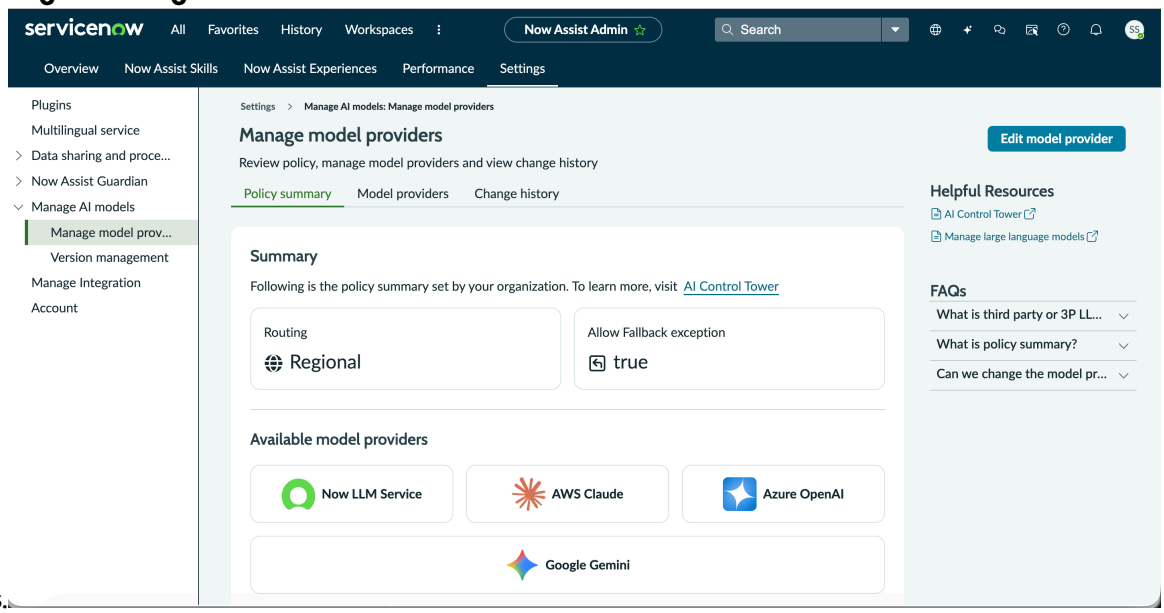
About this task

If you change the LLM model, the LEAP skills should be reapplied to the selected model. The reason is LEAP skills are not applied automatically to an instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

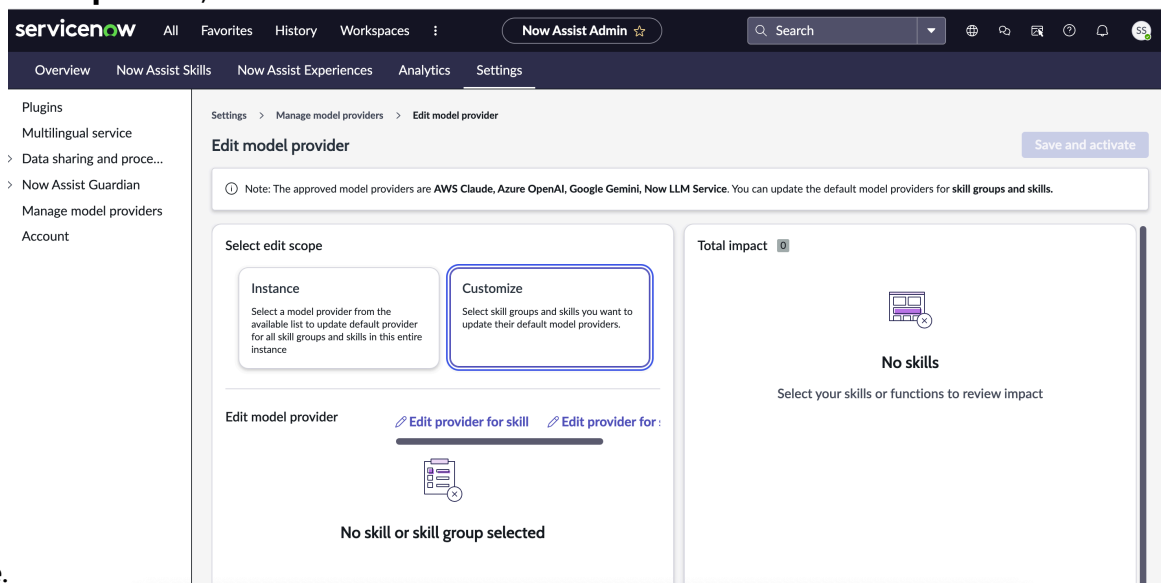
Procedure

1. Access Now Assist Admin in your workspace.
2. Select **Settings** > **Manage model providers**.

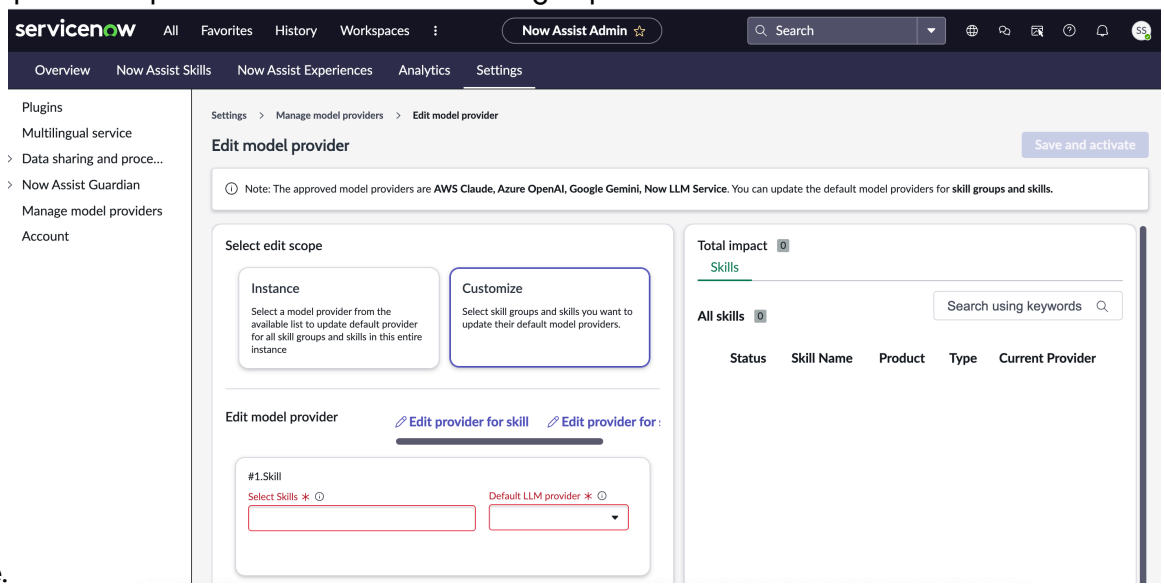


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Edit model provider**, and then select **Customize**.



4. In the *`Edit provider`* section for skill groups, select the required LLM provider and **LEAP** as the Skill group name.



Configure Ansible automation integration

Connect LEAP to Ansible Automation Platform so the Ansible Discovery and Execution Agents can automatically identify job templates and launch them during incident remediation.

Before you begin

Confirm that you have the following components installed and configured:

- LEAP application activated
- Ansible Automation Platform with MCP Server Console configured

  The MCP Server is the middle ware component that helps communication between LEAP and Ansible Automation Platform.

- Network connectivity between ServiceNow and Ansible Automation Platform

Role required: *`sn_itom_leap.leap_admin`*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The Ansible Automation Integration requires configuration of the MCP Server Console connection and agent to enable communication between LEAP and Ansible Automation Platform.

Procedure

1. Navigate to **LEAP Settings** > **Connectors**, and select **Connect**.
2. Configure the Ansible MCP Server Console connection by completing these fields:

Ansible MCP Server Console connection fields

Field	Description
MCP Server URL	The URL of the Ansible MCP Server Console endpoint.
Authentication Method	API key authentication method.

3. In the Token field, enter the API token used for authentication.
4. Assign the required roles to users who will work with Ansible integration:
   - sn_itom_leap.leap_admin = For LEAP administrators who configure step-to-job mappings
   - sn_itom_leap.leap_agent = For incident responders who execute Ansible automations
5. Select **Save** to apply the configuration.

Result

After you configure the Ansible Automation Integration, the Ansible discovery agent analyzes automation opportunities and identifies relevant job templates, and the Ansible execution agent launches mapped automations during incident remediation.

Using LEAP

Use LEAP to analyze automation opportunities (AOs), generate resolution steps and playbooks, create problem records, build knowledge base articles, and execute Ansible automations during incident remediation.

LEAP tasks

AOs are categorized depending on how critical the services are, number of hand offs, and incident information:

- Critical
- High
- Moderate
- Low

LEAP groups incidents into AOs categorized by priority. Use AOs to research incidents, identify root causes, and develop resolutions. You can also map AOs to Ansible job templates and execute automated remediations directly from the SOW.

AOs enable you to create problem records for deeper analysis, knowledge base articles for future reference, and playbooks that give IT operators access to resolution steps.

The Now Assist Explore feature streamlines artifact creation. Select **Explore** to open the Now Assist panel, where a workflow menu guides you through creating the artifacts you need. You can also generate artifacts using the **Actions** button.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Generate and modify resolution steps in LEAP

   Generate resolution steps for automation opportunity and when required get focused solutions by modifying the resolution steps.

2. Create sub-groups for automation opportunities

   Create granular automation opportunities to get targeted resolutions for similar looking issues.

3. Monitor automation opportunities using the LEAP value dashboard

   View and understand how automation helps LEAP to achieve cost and time savings.

4. Create LEAP problem records

   Create a problem record using the resolution steps of an AO. The problem record helps you perform an in-depth analysis to find the root cause of the incident.

5. Generate LEAP knowledge base articles

   Generate AI-enhanced, publication-ready knowledge base articles from resolution steps. Generated articles include structured sections, auto-populated metadata, and a link to the originating incident. Articles are routed through the standard knowledge base approval workflow and published to the Knowledge Center.

6. View LEAP resolution step recommendations in SOW

   View resolution step recommendations in SOW.

7. Generate LEAP playbooks

   Generate automated playbooks that use the resolution steps to resolve similar incidents.

8. Use LEAP playbooks in Service Operations Workspace SOW

   Use LEAP generated playbook to resolve incidents in SOW.

9. Map Ansible jobs to resolution steps

   Create mappings between automation opportunity resolution steps and Ansible job templates to enable automated incident remediation.

10. Execute Ansible automations for incidents

    Use the Ansible Execution Agent to launch mapped Ansible job templates during incident remediation.

Generate and modify resolution steps in LEAP

Learn how to generate, edit, and track AI-generated resolution steps for automation opportunities in LEAP.

About this task

Resolution steps are actions that resolve issues identified by an automation opportunity. During the initial run, GAF generates these steps by analyzing work notes and historical resolutions.

The **Generate resolution steps** button creates resolution steps as required. As your system processes new incidents and records, regenerate these steps to maintain solution accuracy. LEAP provides three search capabilities: AI search, KB search, and web search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- AI search: Scans records within your existing instance to identify relevant resolutions.
- KB search: Searches knowledge base resources external to your organization to suggest more effective resolution steps.
- Web search: Queries web resources beyond your organization's systems to find comprehensive solutions, broadening the scope of potential resolutions.

Note:

- Regenerating resolution steps incurs chargeable transactions. Exercise caution and careful planning before using the regenerate button to avoid unexpected costs.
- Only a system administrator or a LEAP admin with system administrator access can enable these additional sources of searches. Users with agent or viewer access must contact their administrator to activate these features. Once enabled, LEAP expands its search capabilities to deliver more comprehensive and effective resolution steps.

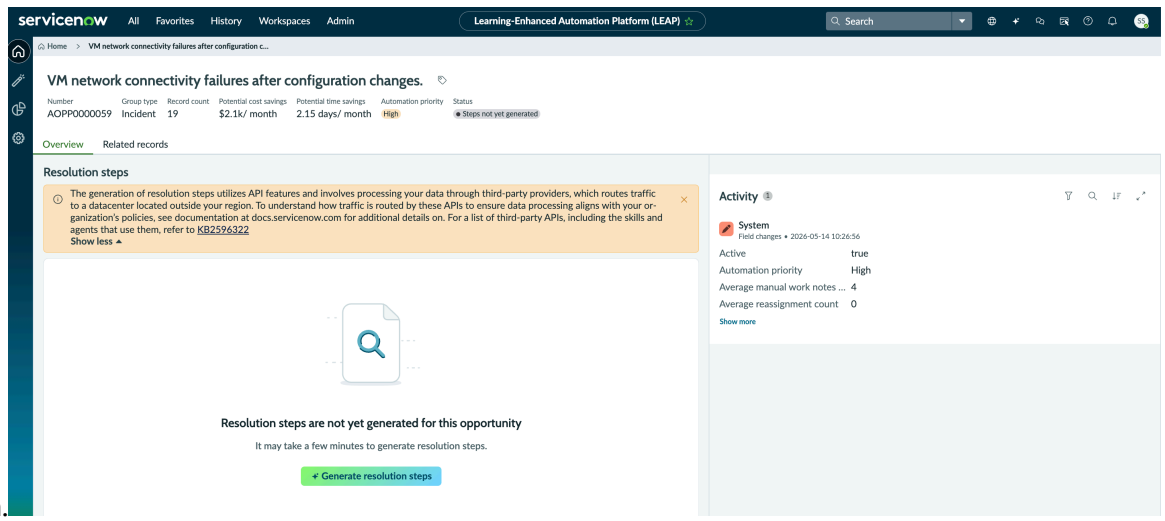
Resolution steps are generated only for automation opportunities that match the **Default resolution steps filter** configured in LEAP settings. The default filter is set to Critical priority (`automation_priority=40`). Items are processed in batches in the background, so performance is not affected during generation. To change the priority filter, update the condition builder in LEAP settings fields.

Before you begin

Role required: LEAP admin

Procedure

1. Select **Workspaces** > **LEAP**.
2. On the LEAP landing page, select the required automation opportunity.
3. If resolution steps are unavailable in the Overview section, select **Generate resolution steps**.
4. If resolution steps are available, and you want to get alternative resolution steps, then use the **Regenerate** button.



Note:

- The Regenerate button is turned off while manual editing is in progress.
- Resolution steps are generated based on the capability enabled either using AI search or Knowledge Base or Web search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. To manually modify resolution steps, select the edit icon.
   Each update to the resolution steps is recorded in the LEAP Outcome Snapshots table for traceability.
6. To revert to the last generated resolution steps, use the **Revert to AI generated steps** button.

Result

Create sub-groups for automation opportunities

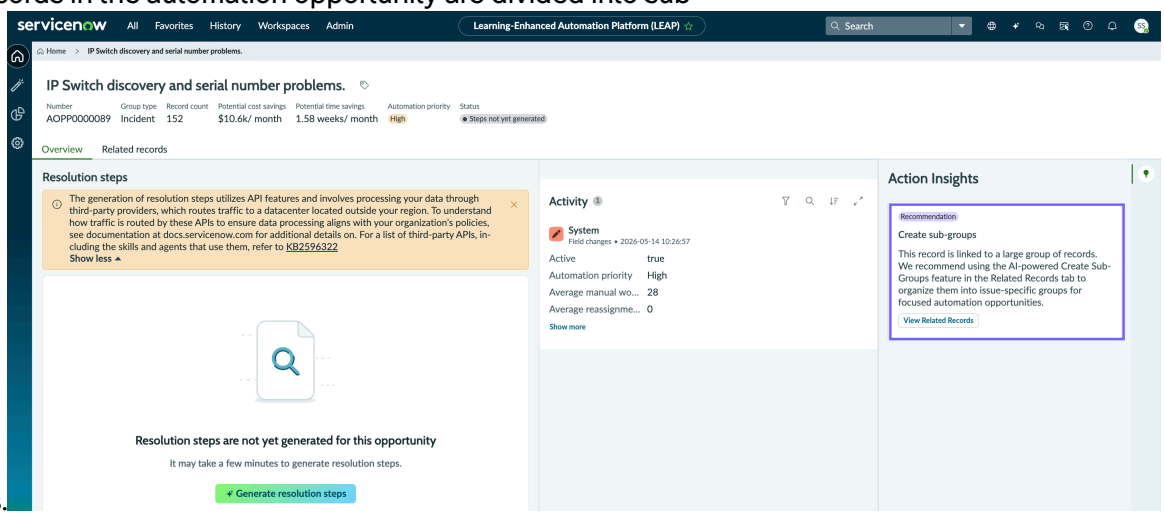
Large automation opportunities in LEAP are broken into smaller, more manageable sub-groups to support focused and contextual incident resolution steps.

Before you begin

Role required: LEAP admin

Procedure

1. Navigate to LEAP landing page, and select the automation opportunity that you want to refine.
2. Select **Related records** tab.
3. Select **Create Sub Groups**.
   The records in the automation opportunity are divided into sub-groups.



4. Select the **Sub Groups** tab to view the child sub-groups created.
   Each child sub-group has it own ID and you can generate focused resolution steps with only the records in the sub-group. On the LEAP landing page, the parent automation opportunity shows child automation opportunity in the *`Sub Groups`* column.

Monitor automation opportunities using the LEAP value dashboard

Use the dashboard to track automation opportunities, cost savings, and operational efficiency metrics.

Before you begin

Role required: admin

About this task

The LEAP value dashboard provides real-time insights into automation opportunities within your IT operations. Use this dashboard to justify automation investments and track the return on automation initiatives.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the LEAP dashboard by selecting the dashboard icon .

   The dashboard displays records analyzed and grouped into automation opportunities.

   The dashboard opens, displaying automation metrics and grouping statistics.

2. Review the Grouping statistics section.

   a. Review the total number of records analyzed.
   This metric shows the volume of data processed by LEAP.

   b. Check the number of groups created and average group size.
   Groups represent similar incidents that can be automated together.

   c. Identify large groups that exceed the automation threshold.
   Large groups indicate high-value automation opportunities.

   d. Note the record duration and last GAF run timestamp.
   This information shows the data freshness and analysis scope.

3. Review the Automation Value section.

   a. Review the predicted cost and time savings from automation.
   These projections help justify automation investments.

   b. Check the number of playbooks created and tickets resolved.
   These metrics demonstrate actual automation implementation and success.

   You can see the quantified benefits of your automation initiatives.

4. Contact your LEAP administrator to customize settings when dashboard metrics don't align with organizational requirements.
   LEAP administrators can adjust calculation parameters, thresholds, and time ranges to match your business context.

Result

The dashboard displays current automation metrics including potential cost savings, time savings, and automation opportunities. Use these metrics to prioritize automation initiatives and demonstrate ROI to stakeholders. If the dashboard shows no data, verify that LEAP settings are configured correctly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create LEAP problem records

Create problem records for LEAP from available incident clusters, also known as automation opportunities, for further analysis.

Before you begin

Role required: LEAP admin

About this task

The problem record creation process automatically transfers critical information from incidents to problem records. When a problem record is created, LEAP includes all relevant information. This information includes:

- incident group description
- incident group link
- resolution steps

The automated data transfer is characterized with:

Root cause documentation

LEAP populates the cause notes section of the problem record with the same details as available in existing incident records.

Incident attachment

All incidents associated with the group are automatically linked to the problem record for comprehensive tracking.

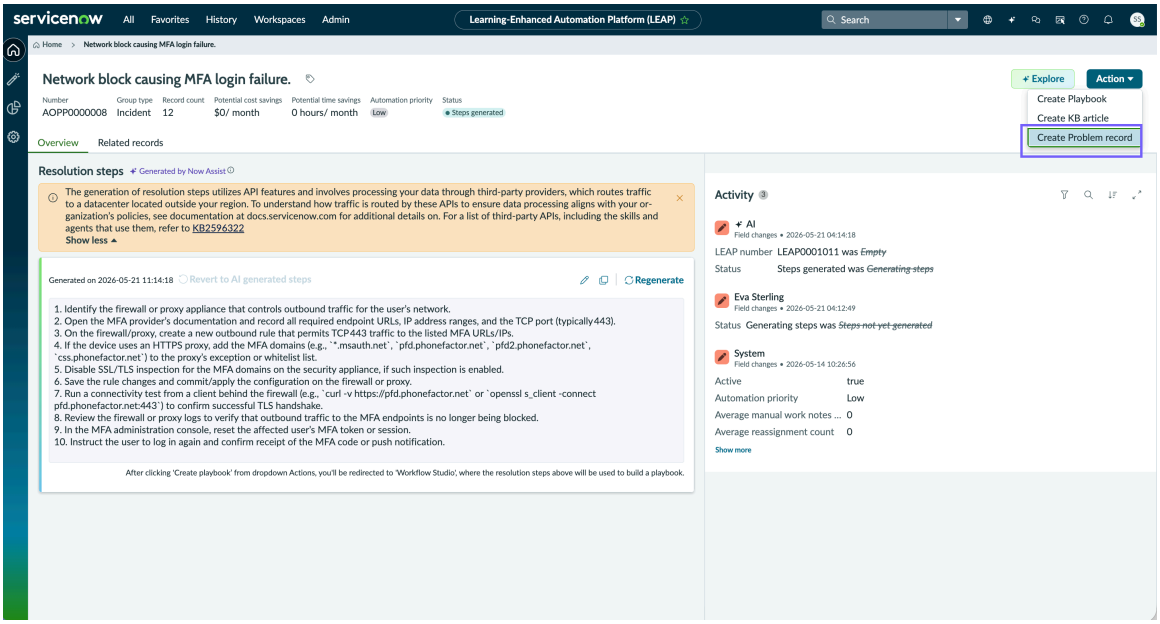
Async processing

Problem records are generated efficiently without manual intervention even during high-volume scenarios.

Procedure

1. Select **Workspaces** > **LEAP**.
2. On the LEAP landing page, select an automation opportunity.
3. If resolution steps don't appear in the Overview section, select **Generate resolution steps**.
4. Select **Actions** > **Create problem record** button to create a record for further in-depth analysis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Another option is to invoke the LEAP AI agent by selecting the Explore button

and creating problem record.

Generate LEAP knowledge base articles

Generate AI-enhanced knowledge base articles from automation opportunity resolution steps to share structured, publication-ready knowledge across your organization.

Before you begin

Resolution steps must exist for the automation opportunity before you can generate a knowledge base article.

Role required: admin

About this task

LEAP uses AI to transform resolution steps into a complete, structured knowledge base article. The generated article includes the following sections:

- Summary
- Symptoms — inferred from incident data and resolution context
- Resolution steps — expanded with sub-steps and code or command formatting
- Related resources
- Metadata — including Article Number, Product, Category, Visibility, and Valid To date

The article is created in draft state and routed through the standard knowledge base approval workflow before publication. Each generated article maintains a link to the originating automation opportunity and is suggested when similar incidents occur.

Note: AI-generated content may be inaccurate. Review the generated article before submitting it for approval to confirm it reflects the correct resolution information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **LEAP**.
2. On the LEAP landing page, select the automation opportunity for which you want to generate a knowledge base article.
3. If resolution steps are unavailable in the Overview section, select **Generate resolution steps** and wait for the steps to be generated.
4. Select **Actions** > **Create KB**.
   LEAP generates a complete knowledge base article from the resolution steps. The article opens in the Knowledge Center in draft state.

   Tip: You can also generate a knowledge base article by selecting the

   button Explore to open the Now Assist panel and selecting the knowledge base option from the workflow menu.

5. Review the generated article, including all sections and auto-populated metadata, and make any corrections.
   Technical commands and code snippets are formatted with monospace font and include platform-specific context where applicable.
6. Submit the article through the knowledge base approval workflow.
   The article moves through the approval workflow and is published to the Knowledge Center. It is linked to the originating incident record and suggested when similar incidents occur.

View LEAP resolution step recommendations in SOW

Use LEAP to view AI-generated resolution step recommendations that match the incident description in SOW to resolve incidents more efficiently.

Before you begin

Role required: LEAP agent

About this task

When you work on an incident in SOW, LEAP compares the incident short description against existing resolution steps. Only the steps relevant to the incident description appear in the **Recommendations** tab under LEAP Resolution Steps. Steps that don't match the incident description are filtered out. If fewer steps appear than expected, this indicates successful filtering of irrelevant steps.

Note: AI-generated content may contain inaccuracies. Review all recommended resolution steps before applying them to verify their accuracy and suitability for your environment.

Procedure

1. Open an incident in SOW.
2. In the insights panel, select the **Recommendations** tab.
   LEAP displays resolution steps that match the incident's short description.
3. Review the recommended resolution steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If fewer steps appear than expected, LEAP filters out steps that don't match the incident description.

4. Apply the resolution steps to resolve the incident.

Generate LEAP playbooks

Create standard, dynamic, and automated playbooks using LEAP to promote fast incident resolution and response time.

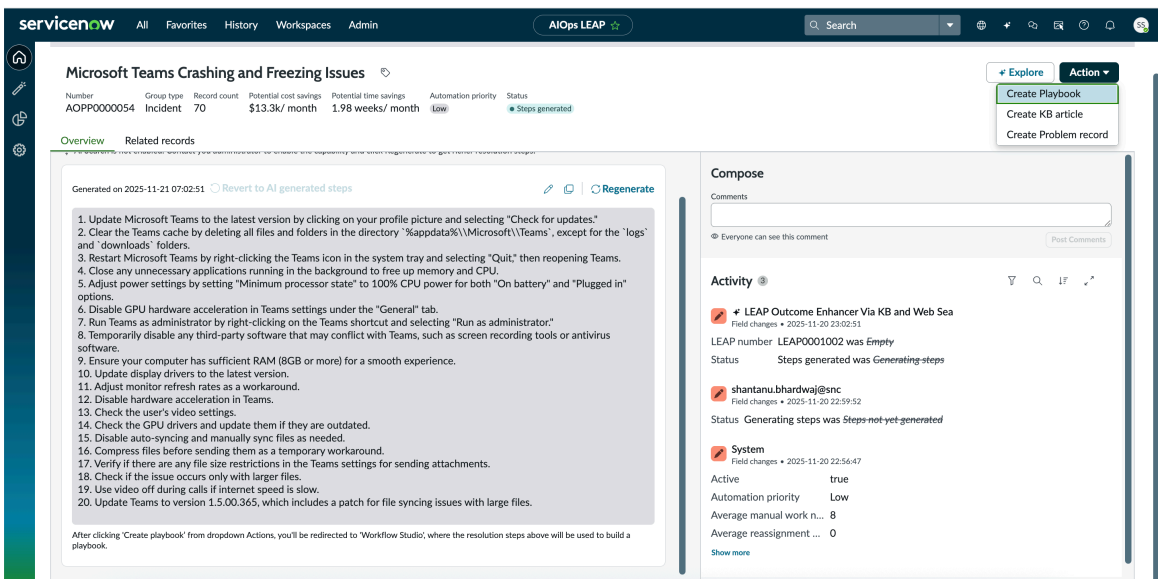
Before you begin

Role required: LEAP admin

Procedure

1. Select **Workspaces** > **LEAP**.
2. On the LEAP landing page, select the required automation opportunity to create a playbook.
3. If resolution steps are unavailable in the Overview section, select **Generate resolution steps**.
4. Select one of the following options to create playbook.

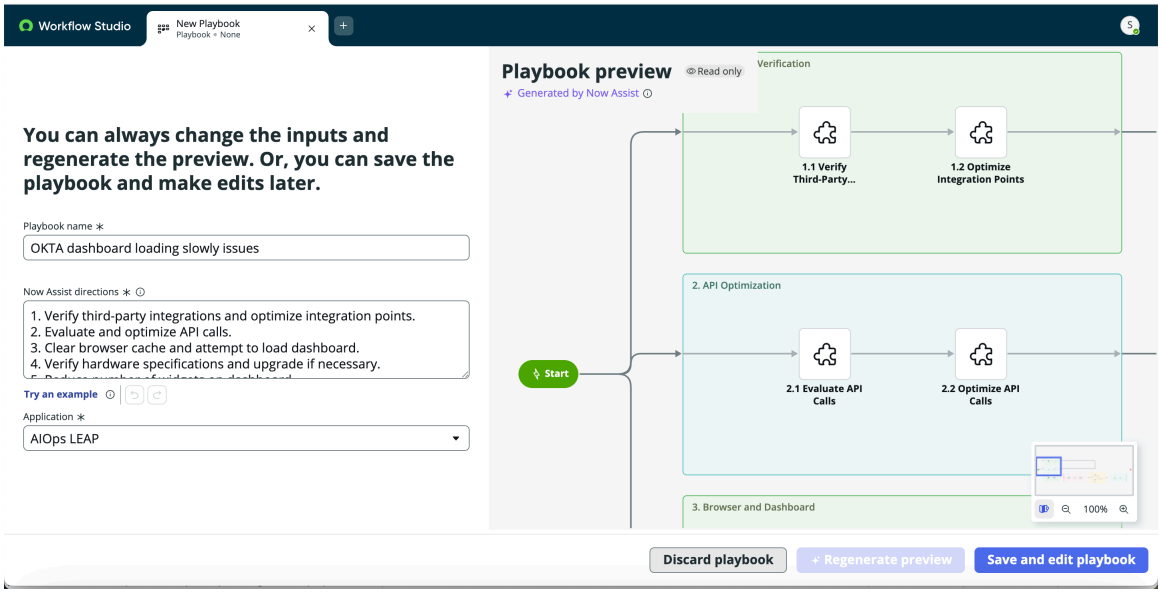
UI option	Steps
Actions	Select Actions button , and select **Create Playbook**.
Explore	**a.** Select Explore button . **b.** In the Now Assist panel, select **Create play book**.



Workflow Studio opens and the playbook generation process starts. The **Playbook name** and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Now Assist directions fields are pre-filled with the problem record title and the generated resolution steps.



Use LEAP playbooks in Service Operations Workspace SOW

Use LEAP playbooks in the SOW.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **LEAP**.
2. Select the required automation opportunity.
3. Generate LEAP playbooks.
4. Open the SOW interface using the Workspaces menu.
5. Select the required incident, and access the insights' panel.
6. Select the playbook icon

.
7. If a LEAP playbook is available for the selected incident, review the AI-filtered resolution steps and use them to resolve the issue.

Map Ansible jobs to resolution steps

Create mappings between automation opportunity resolution steps and Ansible job templates to enable automated incident remediation.

Before you begin

Before mapping Ansible jobs to resolution steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The Ansible discovery agent must have analyzed the automation opportunity
- Job templates related to the resolution steps must exist and be available in your connected Ansible Automation Platform instance.
- The automation opportunity must have generated resolution steps

Role required: *sn_itom_leap.leap_admin*

About this task

Step-to-job mapping creates the relationship between specific resolution steps and Ansible job templates. This mapping enables the Ansible execution agent to automatically launch the appropriate automations during incident remediation. At remediation time, the Ansible execution agent reads this mapping to determine which job template to launch for each step, in sequence.

Procedure

1. Navigate to **LEAP** > **AI Teammate Dashboard**.
2. Locate the automation opportunity that you want to configure for Ansible integration.
3. Select **Map Ansible Jobs** to open the mapping modal.
   This button appears only after the Ansible discovery agent has analyzed the automation opportunity and identified candidate job templates.

   If the button does not appear, confirm that the Ansible discovery agent has completed analysis.
4. Review the resolution steps displayed in the mapping modal.
   The modal parses the resolution steps and displays each step with a numbered index.
5. For each resolution step, select the appropriate Ansible job templates from the drop-down list:
   - Select one or more job templates if the step can be automated.

     A step can be automated if a matching job template exists.
   - Leave the drop-down empty if the step requires manual intervention.

   The drop-down is populated with job templates discovered by the Ansible discovery agent. Each job template shows:

   - Job template name
   - Description
   - Confidence score from the discovery analysis
6. Review your mappings to verify that:
   - Automated steps have appropriate job templates selected.
   - Manual steps are left unmapped (empty drop-down).
   - The sequence of steps makes logical sense for incident remediation.
7. Select **Save** to create the step-to-job mapping.
   The mapping is saved to the `sn_itom_leap_ansible_mapping` table in an active state.

Result

The step-to-job mapping is created and activated. The automation opportunity detail page now displays each resolution step with its mapped job templates. Manual steps are indicated with **(manual)**. The mapping is available for incident remediation in the Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Step-to-job mapping

After saving a mapping, the automation opportunity displays resolution steps like this:

```
Step 1: Restart the nginx service
  ▶ nginx-restart-playbook
  ▶ service-restart-generic

Step 2: Flush DNS cache
  (manual)

Step 3: Verify service health
  ▶ health-check-playbook
```

What to do next

After creating the mapping:

Note: If resolution steps are regenerated after saving, this mapping is deleted and must be recreated.

Editing replaces the existing mapping. Don't edit a mapping while it is in use during an active incident remediation.

Execute Ansible automations for incidents

Use the Ansible Execution Agent to automatically launch mapped Ansible job templates during incident remediation in the Service Operations Workspace, reducing manual effort and accelerating mean time to resolution..

Before you begin

Before executing Ansible automations:

- Step-to-job mappings must exist for the predicted automation opportunity group

  For more information, refer to Map Ansible jobs to resolution steps.

- The mappings must be in **active** state
- The Ansible Execution Agent must be configured and enabled

Role required: *sn_itom_leap.leap_agent*

About this task

When an incident arrives in the SOW, LEAP predicts the automation opportunity group using existing clustering. If step-to-job mappings exist for that group, automation options are presented to incident responders for execution.

Procedure

1. In SOW, select the incident.
2. In the **Ansible Automations** section, review the available automation options.
   This section appears only if LEAP has predicted an automation opportunity group with active step-to-job mappings.
3. Select **Execute Ansible Playbook**.
   Complete the workflow by appropriately providing approvals to the tasks,
4. For each automated step, provide the required inputs when prompted:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Review the job template details presented by the agent.
The agent displays the template name, description, playbook, and current status.

b. Complete the input form with required survey questions and launch parameters.
The agent consolidates all required inputs into a single form, including survey questions and any ask_on_launch parameters.

c. Approve the launch job to execute the automation.

5. For manual steps, complete the required actions and confirm completion:
   a. Review the manual step description provided by the agent.
   b. Perform the required manual actions outside of ServiceNow.
   c. Select **Step Completed** to confirm that the manual step is finished.
6. Monitor job execution status and respond to agent prompts:
   - The agent provides real-time status updates while a job is running.
   - You can request job status at any time.
   - After completing a step, the agent waits for your confirmation before proceeding to the next step.
7. Review the execution summary when all steps are completed.
   The agent provides a summary including total steps processed, jobs launched with their Ansible Job IDs, manual steps completed, and any failures or errors.
8. Update the incident record with the remediation results and close the incident if resolution is successful.

Result
The mapped Ansible automations are executed in sequence, with manual steps completed as needed. The incident is remediated using the automated workflow defined in the step-to-job mapping.

Example: Example execution flow

For a database connectivity incident, the execution might proceed as follows:

1. Agent: "Step 1: 'Restart the nginx service' — launching nginx-restart-playbook"
2. Agent: "Launched successfully. Ansible Job ID: 12345. Status: Running"
3. Agent: "Job completed successfully. Proceeding to next step."
4. Agent: "Step 2: 'Flush DNS cache' — this step has no playbook mapped. Please complete this step manually."
5. User: "Step completed" (after manually flushing DNS cache)
6. Agent: "Step 3: 'Verify service health' — launching health-check-playbook"
7. Agent: "All steps completed. Summary: 2 jobs launched, 1 manual step completed."

What to do next
After execution:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Review the Ansible job logs in Ansible Automation Platform for detailed execution information.
- Document any issues or improvements for future automation opportunity mappings.
- Consider updating step-to-job mappings based on execution results and feedback.

LEAP reference

These topics provide detailed field description information required during LEAP installation.

LEAP Installer fields

Field values that you configure when installing LEAP using the LEAP Installer.

LEAP Installer skill activation form

Field	Description
Run frequency	Frequency at which LEAP runs on the configured table. This field is automatically set to Run every month.
Group records from this table	Table from which LEAP queries and filters records for grouping. This field is automatically set to Incident.
Use this column for grouping	Column from the selected table used to read records for grouping. This field is automatically set to Short description.
Use this filter	Condition filter used to select records for grouping. The default filter is `active=false^ORactive=true`. Modify this filter to change the scope of records that LEAP processes. **Note:** By default, incidents are grouped and filtered for the last 6 months.
Use this column for topic generation	Column from the selected table used to generate titles for the created groups. This field is automatically set to Short description.

Define access

Field	Description
Roles	Roles assigned to the ACL entry that determine who can access the skill. This field is automatically set to `sn_itom_leap.leap_genai_worker`. Roles selected here are available in the Select display step.

Components installed with LEAP

Several types of components are installed with activation of the plugin, including tables, user roles, and scheduled jobs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed

Role title [name]	Description
LEAP admin [sn_itom_leap.leap_admin]	You have full control over LEAP capabilities, including the following: • Turn features on and off • Execute scheduled jobs • Manage LEAP tables and the LEAP Workspace • Generate and update resolution steps • Create and view problems and generate LEAP playbooks from automation opportunities (AO)
LEAP viewer [sn_itom_leap.leap_viewer]	You can access and view data related to LEAP, including tables, the workspace, and problems originating from AOs.
LEAP agent [sn_itom_leap.leap_agent]	You can access the LEAP menu from the Service Operations Workspace (SOW) and trigger LEAP executions directly from within SOW.

Scheduled jobs installed

Scheduled job	Description
Populate Record Metrics Aggregate Records	Runs once per day to populate the LEAP aggregate metrics table by time periods.
Update Record Metrics Table with Calculated Metrics	Runs daily to calculate and update the records in the LEAP Record Metrics table for all the records where the metrics haven't been calculated yet.
GAF- Run Offline Flow	Runs monthly to group the tasks using the task data provided in the skill configuration while activating the LEAP skill.

Tables installed

Table	Description
LEAP aggregate metrics	Contains metrics, like cost savings, time savings, and record count, for each time period. This data is used in the LEAP report page in the workspace.
LEAP feedback	Stores the feedback given by the agent to the playbooks that are run to fix the tasks.
LEAP GAF mapping	Maintains a map between the GAF groups and the published LEAP instances to retain information in the subsequent GAF clustering runs.
LEAP group	Stores the LEAP group details, like group description, resolution steps, and whether the LEAP is automated or not.
LEAP group ranking	Maintains data, like business impact, projected cost savings, problem record, and status, that is used in the Automation Opportunities page of the workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
LEAP properties	Sets custom values to the properties that are used in LEAP.
LEAP job tracker	Maintains the status of background jobs init, grouping, processing, and completion phases.
LEAP outcome snapshot	Maintains snapshots of automation outcomes generated by AI or edited by users.
LEAP Integration Project	Maintains record of integration projects that organize LEAP functionality and properties.
LEAP record metrics	Maintains data that's used in the Published LEAP page in the workspace. It contains calculated data, like time saved, tickets resolved, and rating trend.
LEAP missed opportunity	Maintains record of missed automation opportunity artifact creation of type; resolution steps, kb article, or playbook.
LEAP group strategy	Maintains the strategic data for automation opportunities, including the association of records and GAF group.
LEAP Hierarchical job	Records hierarchical job execution status with GAF group associations.
LEAP Ansible Agent status	Records Ansible agent execution and conversation status for playbook runs.
LEAP Ansible Step Mapping	Maintains record of the step to job mapping performed by LEAP.
Discovered Job Catalog	Maintains record of discovered Ansible jobs and their associations with automation opportunities.

LEAP settings fields

LEAP settings page field values help estimate cost and time savings when automation is used. These settings support cost predictability with the fixed pricing model.

LEAP settings fields

Field name	Description
Cost per work note ($)	This value represents the cost for each work note that also includes labor and operational expenses for every incident. **Example:** If your organization spends an average of $50 per work note entry including analyst time and overhead, enter 50. This value is used to calculate total cost savings when automation reduces the number of work notes.
Time per work note (hrs)	This value is the average time spent on each work note entry used to estimate the total time impact across incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field name	Description
	Example: If analysts spend an average of 30 minutes on each work note, enter 0.5. For a cluster of 100 incidents with 4 work notes each, LEAP estimates 200 hours of time savings when automation is applied.
P1 - Critical priority incidents	Overhead factors are multipliers that are used for high-priority incidents and represent hidden costs. Priority 1 incidents often require more coordination, communication, and escalation — beyond just the direct work notes. For P1 incidents, the base cost is multiplied by 1.8 to reflect the additional impact. **Example:** If the base cost per work note is $50 and a P1 incident has 4 work notes, the adjusted cost is $50 × 4 × 1.8 = $360.
P2 - High priority incidents	Overhead factors are multipliers that are used for high-priority incidents and represent hidden costs. For priority 2 incidents, the base cost is multiplied by 1.4 to reflect the additional impact. **Example:** If the base cost per work note is $50 and a P2 incident has 4 work notes, the adjusted cost is $50 × 4 × 1.4 = $280.
P3 - Moderate priority incidents	Overhead factors are multipliers that are used for moderate-priority incidents and represent hidden costs. For priority 3 incidents, the base cost is multiplied by 1.1 to reflect the additional impact. **Example:** If the base cost per work note is $50 and a P3 incident has 4 work notes, the adjusted cost is $50 × 4 × 1.1 = $220.
P4 - Low priority incidents	Overhead factors are multipliers that are used for low-priority incidents and represent hidden costs. For priority 4, the base cost is multiplied by 0.8 to reflect the additional impact. **Example:** If the base cost per work note is $50 and a P4 incident has 4 work notes, the adjusted cost is $50 × 4 × 0.8 = $160.
P5 - Planning incidents	Overhead factors are multipliers that are used for low-priority incidents and represent hidden costs. For priority 5, the base cost is multiplied by 0.4 to reflect the additional impact. **Example:** If the base cost per work note is $50 and a P5 incident has 4 work notes, the adjusted cost is $50 × 4 × 0.4 = $80.
Grouping configuration	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field name	Description
Large group threshold	Groups that have incidents more than the threshold set are marked as large groups. The default value set is 100 incidents. **Example:** If set to 200, any group containing more than 200 incidents is flagged as a large group, helping LEAP prioritize high-volume clusters for automation analysis.
Initial run: Groups with resolution steps	The maximum number of groups for which resolution steps are generated in the first run of LEAP. The default is 500. **Example:** If set to 500, LEAP generates resolution steps for up to 500 groups in the first run. Increasing this value generates broader coverage but may extend processing time.
Remapping eligibility threshold	The minimum ratio of incidents to group size required for a group to be eligible for remapping. The default is 0.2, which represents 20% of the group size. Higher values result in more selective remapping. **Example:** If set to 0.2, a group must contain at least 20% of the expected group size before it is eligible for remapping. Increasing this value limits remapping to only well-populated groups, reducing noise from small or transient clusters.
Default resolution steps filter	A condition builder filter that determines which automation opportunities are eligible for resolution step generation. The default filter is `automation_priority=40`, which corresponds to Critical priority. Update the filter using the condition builder to change the priority scope. **Example:** The default value `automation_priority=40` limits resolution step generation to critical priority automation opportunities. Modify the condition to include additional priority levels as needed.

Access to cloud environments for ITOM products

If your organization deploys IT assets on the cloud, ITOM products must access your cloud environment to collect information about the IT infrastructure.

Related topics

- Discovery for cloud environment
- Cloud resource discovery references

Install and configure MID Servers to access cloud environments

Install and configure the MID Servers correctly to enable ITOM products to access to the cloud resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: discovery_admin or sn_cmp.cloud_admin (for Cloud Provisioning and Governance)

About this task

Procedure

1. For IP-based discovery, Installing the MID Server on a server inside the cloud environment, inside a Virtual Private Cloud (VPC).

   Example
   For example, if you are configuring access to AWS service accounts using IAM roles, install the MID Server at the Amazon EC2 instance.

   Important: If you configure AWS credentials at ServiceNow AI Platform, the location of the MID Server doesn't matter.

   If your organization has multiple VPC segments, deploy the MID Servers in a manage-mentor transit VPC.

2. Activate IP-based discovery jobs to access the compute layer using agentless credentials.
3. Configure the MID Server with the capabilities necessary for the cloud environment you are planning to discover.

   You can select the `ALL` capability or configure specific capabilities for tighter security.

   Add Cloud Management in **supported application** in MID Server for Cloud Provisioning and Governance requests to be processed.

Cloud environment	MID Server capability required by Cloud Discovery	MID Server capability required by Cloud Provisioning and Governance
Amazon AWS Cloud	`AWS` or `Cloud Management` or `ALL`	`AWS` or `Cloud Management`
Microsoft Azure Cloud	`Azure` or `Cloud Management` or `ALL`	`Azure` or `Cloud Management`
Google Cloud	`Google` or `Cloud Management` or `ALL`	`Google` or `Cloud Management`
IBM Cloud Platform	`IBM` or `Cloud Management` or `ALL`	N/A
Oracle Cloud Infrastructure (OCI)	`OCI` or `Cloud Management` or `ALL`	N/A
OpenStack	`OpenStack` or `Cloud Management` or `ALL`	N/A
Red Hat Virtualization (RHV)	`RHV` or `Cloud Management` or `ALL`	N/A

4. If the MID Servers must go through an unauthenticated proxy server to access cloud resources, modify the `agent\conf\wrapper-override.conf` file, as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
wrapper.java.additional.1=-Dhttp.proxySet=true
        wrapper.java.additional.2=-Dhttp.proxyHost=<proxyHost>
        wrapper.java.additional.3=-Dhttp.proxyPort=<proxyPort>
        wrapper.java.additional.4=-DuseProxy=true
```

5. If you're using an authenticated proxy server, configure the MID Server parameters in the `config.xml` file.

   For a description of the parameter values, see the **Proxy server parameters** section in MID Server parameters.

Related topics

Proxy server configuration for MID Servers used for Cloud Discovery and Cloud Provisioning and Governance

Proxy server configuration for MID Servers used for Cloud Discovery and Cloud Provisioning and Governance

You can configure the MID Server for Cloud Provisioning and Governance to use a proxy server. Using a proxy server supports all cloud-based activities such as running Discovery, billing downloads, provisioning virtual machines, and running life-cycle operations on virtual machines.

Proxy server limitations

- VMware Cloud is not supported.
- Windows or Linux platforms only are supported.
- The Google Cloud Console integration does not support downloading billing data.
- Remote PowerShell scripts cannot be executed.
- Custom APIs may not work.

Note:

SSH calls should not be routed through a proxy server, when using a private cloud environment that is on the same side of the proxy as the MID Server.

Set *mid.capi.skip_proxy_for_ssh* to true to skip it. See MID Server properties used by Service Mapping for more information.

mid.capi.skip_proxy_for_ssh:

- Determines whether the MID Server skips the proxy server when routing SSH calls.
- Type: true | false
- Default value: false

Supported proxy server authentication for Cloud Provisioning and Governance

Proxy Server type	Authentication type
HTTP/HTTPS	No authentication
SOCKS5	No authentication
HTTP/HTTPS	Basic authentication

Cloud Request Retry Configuration

If a request is throttled by a cloud provider during Discovery, Cloud Request Retry Configuration provides a customizable method to retry requests. Discovery and Service Mapping Patterns includes a retry configuration for AWS and Azure. You can customize the included configuration or create your own.

Discovery admins and Cloud admins can access the request retry configuration at **All** > **Discovery** > **Cloud Request Retry Configuration**. You can create one configuration for each provider.

When a request is throttled, the retry framework uses retry configuration defined for the provider to handle retries before returning the final response to the ApiCommand classes:

- AwsApiCommand
- AzureApiCommand

The retry configurations are synced with the MID Servers through the MID Server property, *`mid.cloud.discovery.retry.configuration`*.

There are the following retry strategies:

- Exponential backoff
- Response header backoff
- Custom backoff

Exponential backoff

For the following example configuration:

Setting	Value
Max retries	3
Response codes	429
Base delay in ms	1000
Max delay in ms	10000

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting	Value
Additional delay window in ms	1500

The Exponential backoff retry strategy works as follows:

- 1st retry—the backoff multiplier is randomly selected between 0 and 1. The max delay value is 400 ms (400 * 1).
- 2nd retry—the backoff multiplier is randomly selected between 0 and 3. The max delay value is 1200 ms (400 * 3).
- 3rd retry—the backoff multiplier is randomly selected between 0 and 7. The max delay value is 2800 ms (400 * 7).

On subsequent retries, if the delay exceeds 10000 (the max delay), 10000 will be used as initial delay.

Once the initial delay is generated, jitter is added to the delay. The jitter window is defined by the **Additional delay window in ms** field. The system selects a random value between 0 and 1500 and adds it to the initial delay.

If the initial delay is 500, the final delay (with jitter) can be a value between 500 and 2000 ms.

Response header backoff

For the following example configuration:

Setting	Value
Max retries	3
Response codes	429
Response header	Retry-After
Response header delay unit	Seconds
Additional delay window in ms	1500

The Response header backoff strategy works as follows:

- Fetch the value of header `Retry-After` from the server response.
- Convert the `Retry-After` to milliseconds by multiplying by 1000.

Once the initial delay is generated, jitter is added to the delay. The jitter window is defined by the **Additional delay window in ms** field. The system selects a random value between 0 and 1500 and adds it to the initial delay.

If the initial delay is 2000, the final delay (with jitter) can be a value between 2000 and 3500 ms.

Custom backoff

With a custom backoff retry strategy, you define the **Max retries** and **Response codes** and create your own **Mid script include** that defines how requests are retried using the `getDelay()` function. For more information, see Script includes.

Set up a cloud service account

Create and configure ServiceNow cloud accounts at ServiceNow AI Platform for the corresponding Cloud vendor service accounts.

Related topics

Cloud Discovery service account form reference

Set up Oracle Cloud infrastructure (OCI) service accounts

Create and configure cloud service accounts at ServiceNow AI Platform for the corresponding Oracle Cloud Infrastructure (OCI) service accounts.

OCI service account is a type of identity used to authenticate and authorize access to OCI resources and services. It provides a way for applications, services, and users to securely interact with OCI resources. Service accounts are often used for automated processes, applications, or services running within OCI, allowing them to access resources according to the defined permissions and policies.

Verify the REST API Permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

OCI access and permission using policies

Oracle Cloud Infrastructure (OCI) access and permission using policies provide privileges for secure cloud resource utilization and management in OCI.

For information on OCI permissions, go to the Oracle Help Center and search for the "Managing Access to Resources" article.

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Create Oracle API credentials

Create Oracle API credentials on the ServiceNow AI Platform to enable access to your Oracle resources during Oracle discovery.

Before you begin

Verify that your OCI user has at least read-only access to all Oracle services. For information on access permissions, consult your system administrator.

Retrieve the following properties from the Oracle Cloud Console:

- Tenancy Oracle Cloud Identifier (Tenancy OCID)
- User OCID
- Key fingerprint
- Private key

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For instructions on retrieving these properties, go to the Oracle Help Center and search for the "Required Keys and OCIDs" article.

Role required: discovery_admin

Procedure

1. Navigate to **All** > **Discovery** > **Credentials**.
2. Select **New**.
3. Select **Oracle API Credentials**.
4. On the form, fill in the fields with the property values you retrieved.

Oracle API Credentials form

Field	Value
Name	Unique and descriptive name for the Oracle credentials.
Active	Option to select to use the credential.
Tenancy Id	Oracle Cloud Identifier (OCID) for your tenancy.
User Id	OCID of the OCI user.
Key Fingerprint	Fingerprint of the public key.
Private Key	RSA private key that is used for API signing authentication.

5. Select **Submit**.

What to do next
Create OCI service accounts. For more information, see Create OCI service accounts.

Create OCI service accounts

Create Oracle Cloud Infrastructure (OCI) service accounts on the ServiceNow AI Platform to access your Oracle account during Oracle discovery.

Before you begin
Verify that Oracle API credentials have been created. For more information, see Create Oracle API credentials.

Retrieve the Compartment ID, which can be found under **Identity & Security** > **Compartments** in the Oracle Cloud Console.

For GovCloud accounts, confirm that Discovery and Service Mapping Patterns is using at least version 1.29.0.

Role required: discovery_admin

Procedure

1. In the navigation filter, enter `cmdb_ci_cloud_service_account.list`.
2. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Discovery Credentials field**, begin to enter the credential name and select it from the list.
4. On the form, fill in the remaining fields.

Cloud Service Account form

Field	Description
Name	A unique name for the OCI service account.
Account ID	Compartment ID, which is the Oracle Cloud Identifier (OCID) of the compartment associated with this service account.
Datacenter URL	URL of the datacenter. Example URLs: ○ For commercial cloud: `https://{service}.ap-mumbai-1.oraclecloud.com` ○ For GovCloud: `https://{service}.us-gov-ashburn-1.oraclegovcloud.com`
Datacenter Type	Type of the datacenter where the account is hosted, which should be OCI Datacenter [cmdb_ci_oci_datacenter].

5. Select **Submit**.

What to do next

Schedule an OCI cloud discovery. For more information, see Create a discovery schedule in Cloud Discovery Workspace.

Setting up AWS service accounts

Create and configure cloud service accounts at ServiceNow AI Platform for the corresponding Amazon Web Services (AWS) service accounts.

Verify the REST API Permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Ensure that you are familiar with the hierarchy of AWS service accounts in your environment. For example, if there are AWS Organizations, set up the management and member accounts at ServiceNow AI Platform to reflect that hierarchy. You can set up the AWS service accounts of the following types:

- **Discrete account**: Standalone account, with no management account.
- **Management account**: Management account that may or may not contain member accounts (subaccounts).

  Note: Some ServiceNow UI screens may refer to management accounts as master accounts.

- **Member account**: Subaccount that belongs with the (management) account.

Access setup for AWS service accounts

Cloud Discovery and Cloud Provisioning and Governance need access to resources in the Amazon Web Services (AWS) service accounts. Learn about different methods of configuring such access.

Cloud Discovery and Cloud Provisioning and Governance access resources in AWS service accounts through MID Servers. You must authorize inbound traffic to Amazon EC2 instances from the MID Server for setting up initial communication. For more information, see Configure security group inbound rules using the AWS Management Console.

Types of AWS credentials

There are permanent and temporary AWS credentials that you can use for configuring access to AWS service accounts.

Permanent

The permanent credentials are the actual AWS credentials for the service account that you add to the Connections and Credentials module of ServiceNow AI Platform. While it might be time consuming to manage credentials on ServiceNow AI Platform, you avoid the complex configurations involved in using temporary credentials.

Temporary

The temporary credentials are generated by the AWS Security Token Service (AWS STS) for IAM roles. After you configure IAM roles for AWS accounts, the MID Server accesses AWS resources with these temporary credentials. You can use the default IAM role, *`OrganizationAccountAccessRole`*, or create custom IAM roles.

Assuming IAM roles in a large AWS organization is more convenient and offers better security than using large numbers of permanent credentials for all AWS accounts. Temporary credentials are only acquired on behalf of a service account when there's no permanent credential specified for that service account in the Service Accounts [cmdb_ci_cloud_service_account] table.

The MID Server uses the AssumeRole action in the AWS Security Token Service API to assume a member account role. Parameters passed to this API determine which additional security restrictions are applied to the role when it accesses the AWS resources.

By default, the MID Server is configured to assume the *`OrganizationAccountAccessRole`*, which grants temporary credentials to all the members of a primary account. This action occurs automatically if no permanent credentials exist for the member accounts. This configuration doesn't apply any additional security or restrict access to any resources in member accounts.

By default, the ServiceNow instance caches temporary credentials for member accounts for 60 minutes. This interval enables the horizontal discovery process to run multiple times without generating new credentials during each discovery. You can avoid credential caching or modify the caching period using MID Server properties.

IAM roles and permissions

To enhance security provided by the default AWS `OrganizationAccountAccessRole` role, you can customize the AWS roles that MID Servers can assume to receive temporary credentials for member accounts. You can configure additional permissions to improve security

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

and customize the way that the member account's role is assumed when discovering cloud resources.

Methods of granting access

For the purposes of configuring access for AWS accounts, the following terms are used:

Trusting accounts

The trusting accounts don't have permanent AWS credentials. You configure the trust relationship for IAM roles in these accounts to rely on other accounts for access.

Trusted accounts

The trusted accounts are used by the trusting accounts for access. The ServiceNow UI refers to the trusted accounts as accessor accounts.

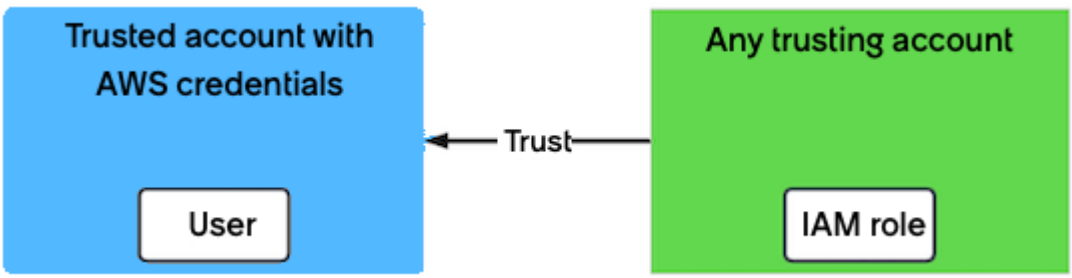
Typically, you set up access to the AWS accounts in your organization using the following methods:

Configuring access for a single account

- Configure AWS credentials on the ServiceNow AI Platform to avoid the complexity of creating and setting up IAM roles. For more information, see Configure access to the AWS accounts using permanent AWS credentials.
- Create an AWS service account on the ServiceNow AI Platform. For more information, see Create AWS service accounts.

Configuring access for an account that trusts an accessor account with AWS credentials

Setting up any AWS account to rely on a trusted account with AWS credentials



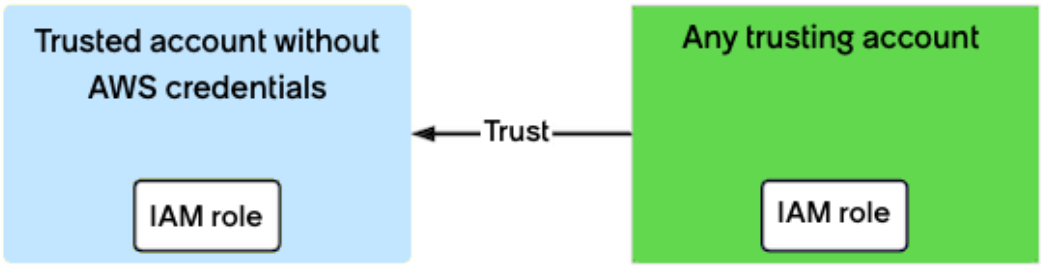
- Configure any type of account—discrete (independent), management, or member—to rely on a trusted account with AWS credentials for access.
- Configuring an IAM role belonging to the trusting accounts to trust the user of the trusted account enables using only one set of AWS credentials for providing access to multiple AWS accounts.

For more information, see Configure temporary credential access for trusted AWS accounts.

Configuring access for an account that trusts an accessor account without AWS credentials

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting up any AWS account to rely on a trusted account without AWS credentials

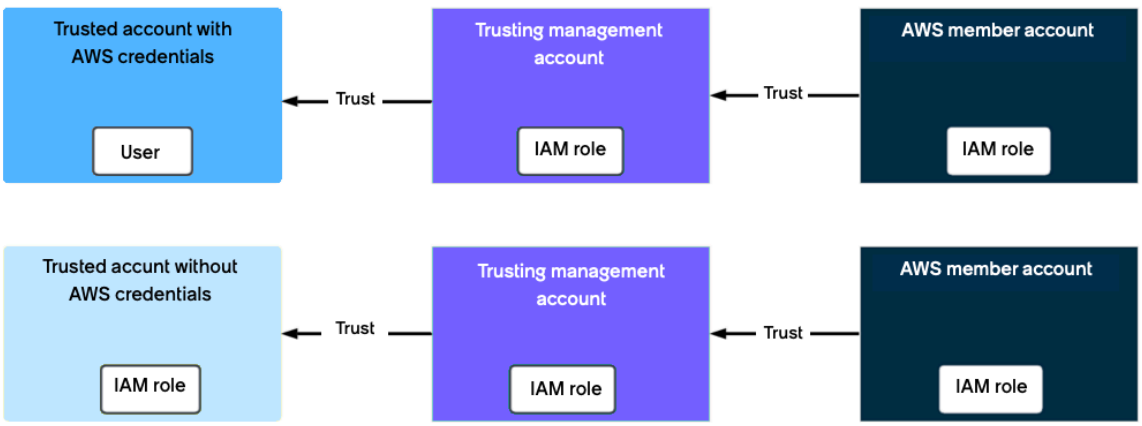


- Configure any type of account—discrete (independent), management, or member—to rely on a trusted account without AWS credentials for access.
- Configure an account without AWS credentials using an IAM role and permissions to access the trusting service account.
- Set up the IAM role of the trusting account to grant access to the IAM role of the trusted account.

For more information, see Configure credential-less access using trusted AWS accounts.

Configuring access for AWS member accounts by using a trust chain from the accessor through the management account.

Configuring member accounts to use their management account for access



- Configure the IAM roles of the member accounts to trust the IAM role of their management account. For more information, see Configure access for trusting AWS member accounts in trust chain.
- Configure the management accounts to trust the accessor accounts with or without AWS credentials. For more information, see:
  - Configure temporary credential access for trusted AWS accounts.
  - Configure credential-less access using trusted AWS accounts.

How Cloud Discovery determines which credentials to use

Member account trusts management account

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Discovery uses the following logic to determine which credentials to use to discover AWS cloud resources in member accounts:

1. If permanent credentials are defined for the member account in the Cloud Service Account [cmdb_ci_cloud_service_account] table, Discovery uses those credentials. The Cloud Service Accounts [cmdb_ci_cloud_service_account] table contains the information on the service account types, like management or member, and their credentials.
2. If no permanent credentials are defined for the member account, Discovery checks the Cloud Service Account AWS Org Assume Role Params [cloud_service_account_aws_org_assume_role_params] table for any special parameters associated with the member account. If parameters exist in that table, Discovery uses the temporary credentials acquired from specifying a role and its parameters in the AWS Security Token Service API AssumeRole action.
3. If no special parameters are associated with the member account in the [cloud_service_account_aws_org_assume_role_params] table, Discovery checks that table for parameters associated with the management account. If parameters exist that define a role for the management account, Discovery uses the temporary credentials provided by that role.
4. If no special parameters are present in the [cloud_service_account_aws_org_assume_role_params] table for either management or member accounts, Discovery uses the defaults defined for the `OrganizationAccountAccessRole` role.

Member or management account trusts accessor account

1. If permanent credentials are defined for the member or management account in the Cloud Service Account [cmdb_ci_cloud_service_account] table, Discovery uses those credentials. The Cloud Service Accounts [cmdb_ci_cloud_service_account] table contains the information on the service account types, like management or member, and their credentials.
2. If no permanent credentials are defined for the account, Discovery checks the Cloud Service Account AWS Cross Assume Role Params [cloud_service_account_aws_cross_assume_role_params] table for any special parameters associated with the account. If parameters exist in that table, Discovery uses the temporary credentials acquired from specifying a role and its parameters in the AWS Security Token Service API AssumeRole action.

AWS Cloud Discovery Setup – Use Case Guide with CloudFormation Templates [KB2221157]

Configure access to the AWS accounts using permanent AWS credentials

To securely access data on your provider account, the Discovery process must present appropriate credentials. To make the credentials available to Discovery and Cloud Provisioning and Governance, you first create a user with programmatic access in the AWS Management Console. You then securely store the credentials in a service account at ServiceNow AI Platform.

Before you begin

Roles required:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- AWS Management Console administrator
- For Cloud Discovery: discovery_admin
- For Cloud Provisioning and Governance: admin or sn_cmp.cloud_admin

About this task

Cloud providers often use different names for accounts, regions, and credential settings. Because the ServiceNow application supports several cloud providers, the app uses general-purpose names for the settings.

Procedure

1. **Optional:** To create a user for Cloud Provisioning and Governance (for programmatic access to your AWS resource and billing data), perform the following steps.

   a. On the AWS Management Console, navigate to **Identity and Access Managements (IAM)** > **Access Management** > **Users**.

   b. On the IAM Resources portal, select **Users**.

   c. Select **Add user**.

   d. On the Details page, configure the user settings, and then select **Next**.

   Details page

Field	Description
User name	Name for the programmatic user. For example, `servicenowcloud`.
Access type	Select **Programmatic access**.

   e. On the Permissions page, attach the user to a policy.
   Configure the following settings and then select **Next**.

Field	Description
Set permissions for <user name>	Select **Attach existing policies directly**.
Attach one or more policies …	Select the appropriate policy. **Note:** The **AdministratorAccess** policy has the most powerful permission level, including permission to provision cloud resources. The policy enables the same access that would be granted to the instance if you were not using IAM and used your AWS account Access Key ID and Secret Access Key. You might instead prefer to create a policy or combine multiple policies to grant the appropriate permission level. See Control AWS access and permissions using policies for details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. On the Review page, verify your selections and then select **Create user**.

g. On the Security Credentials page, copy the secret access key and the access key ID.

> **Important:** Do not leave the page until you have completed both steps. The **Secret access key** value does not appear again. You need to paste the values that you generate in these steps into a Cloud Provisioning and Governance form.

i. Select **Show** to display the Secret access key. Copy the value.

ii. Select **Download .csv** to save the CSV-format file that contains the user name, Access key ID, and the Secret access key value. You create the file as a backup in the case that you lose the values. Verify that the file was created and then store the file securely.

2. On the ServiceNow AI Platform, configure AWS credentials.

a. In the ServiceNow instance, navigate to **Discovery** > **Credentials**.

b. Select **New**, select **AWS Credentials**, enter a unique and meaningful **Name** (for example, `Cloud Provisioning Account`), and then fill in the form.

AWS Credentials form fields

Field	Input value
Name	Unique and descriptive name for the AWS credentials.
Active	Option to use the credential.
Access Key ID	The **Access key ID** that you generated on the AWS Management Console, such as: APIAIOSFODNN7EXAMPLE.
Secret access key	The **Secret access key** that you generated on the AWS Management Console, such as: wPalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY.

c. Select **Update** or **Submit**.

What to do next

Create an AWS service account on the ServiceNow AI Platform. For more information, see Create AWS service accounts.

Create AWS service accounts

Create AWS service accounts on the ServiceNow AI Platform to access your AWS account during AWS discovery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Retrieve the user account number, which can be found in the AWS Management Console by expanding the list under the AWS account name.
- Confirm that Discovery Admin Workspace is using at least version 1.10.0. The **Discovery** > **Cloud Service Accounts** navigation module isn't available with earlier versions. To access **Cloud Service Accounts** with an earlier version, enter in the navigation filter: `cmdb_ci_cloud_service_account.list`.

Role required: discovery_admin

About this task

A service account is a secure record on your instance that stores the credential and access information for your provider account. Discovery uses the information to access your provider account to get data on each resource in each specified datacenter. A cloud account is the logical representation in cloud management of all or part of your managed cloud infrastructure. A cloud account can include multiple service accounts—even service accounts from different providers. For each service account, you specify which datacenter to include in the cloud account.

Procedure

1. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.
2. Select **New**.
3. On the form, fill in the fields.

Cloud Service Account form

Field	Description
Name	The unique and meaningful name for this service account.
Account ID	12-digit user account number. Expand the list under the AWS account name on the AWS Management Console to view the number. **Important:** In the **Account ID** field, remove the hyphen characters (-) from the number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	IAM user account number Discovery credentials	The credentials needed for ServiceNow applications to access this account. You may configure this field at a later stage, while configuring access to AWS accounts. ○ If you configured AWS credentials at ServiceNow AI Platform , select the magnifying glass icon, and then select the name of the relevant AWS credential. ○ To use other AWS accounts to access this account, leave the field blank. For example, you don't need to specify the AWS credentials for accounts assuming IAM roles or member accounts using their management account for access.
Datacenter URL	URL of the datacenter. This field is required for AWS China region and AWS GovCloud (US) accounts. For example: ○ AWS China region: `https://organizations.cn-northwest-1.amazonaws.com.cn` ○ AWS GovCloud (US): `https://ec2.us-gov-west-1.amazonaws.com`
Datacenter type	Type of the datacenter where the account is hosted. Select **AWS datacenter**.
Datacenter discovery status	Auto-generated value: Status and timestamp of the last execution of Discovery on the datacenter.
Parent account	Name of the management account that represents the organization in AWS that this member account belongs to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	It appears when you select **AWS datacenter**. Leave the field empty if this account is not part of an AWS organization.
Is master account	Management account flag. It appears when you select **AWS datacenter** from the Datacenter Type drop-down. Select the check box to associate the AWS service account with the management account. Select this check box only for accounts that you previously configured in the AWS Management Console as management accounts with some member accounts belonging to them. See the AWS documentation for information on AWS Organizations. **Note:** You will need to setup the correct permission in AWS or the Organization role for a standard credential. For more information, see Control AWS access and permissions using policies.
Accessor account	Name of the trusted account. Configure this field only for accounts that don't use permanent AWS credentials and rely on IAM roles for access.

4. Select **Submit**.

Configure temporary credential access for trusted AWS accounts

Configure the trusting account whose resources need to be accessed, to rely on the trusted account using the Identity and Access Management (IAM) role.

Before you begin

- Familiarize yourself with the Amazon documentation on Creating a role to delegate permissions to an IAM user.
- Decide which AWS account is going to be the trusted account. You use the trusted account to configure temporary credentials for Cloud Discovery using IAM roles. The trusted account that you use to access other accounts using IAM roles is referred to as an accessor account.
- For trust chain setups, confirm that the member account trusts the management account before the management account trusts an accessor account. For more information, see Configure access for trusting AWS member accounts in trust chain.
- Confirm that Discovery Admin Workspace is using at least version 1.10.0. The **Discovery** > **Cloud Service Accounts** navigation module isn't available with earlier versions. To access **Cloud Service Accounts** with an earlier version, enter in the navigation filter: `cmdb_ci_cloud_service_account.list`.

Role required:

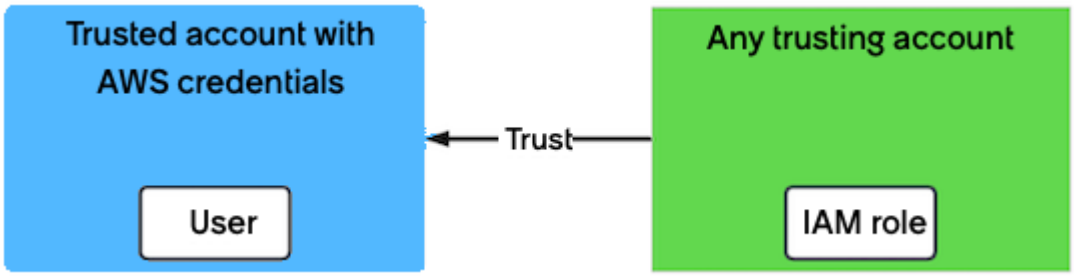
- For Cloud Discovery: discovery_admin
- For Cloud Provisioning and Governance: admin or sn_cmp.cloud_admin

About this task

During this configuration, you create an IAM role for the trusting account, and then configure the trusted service account for the trusting account at ServiceNow AI Platform. Finally, you associate the IAM role you created for the trusting account with the trusting account itself.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting up any AWS account to rely on a trusted account with AWS credentials



Procedure

1. Create an IAM role for the trusting account and configure the trust relationship between the user assuming this role and the trusted (accessor) account.

   a. Log in to the trusting account on the AWS Management Console.

   b. Create and configure the IAM role specifying the trusted (accessor) account ID in the **Account ID** field.
   For information on creating AWS roles, see the Amazon documentation.

   c. On the Summary page for the IAM role, select the **Trust Relationships** tab.

   d. Select **Edit trust relationship**.
   The Edit Trust Relationship page opens showing the policy document.

   e. Set the *AWS* parameter to the full user ARN of the trusted (accessor) account.

   f. Verify that the `Action` value is set to `sts:AssumeRole`.

   g. Select **Update Trust Policy**.

2. On the ServiceNow AI Platform, configure the trusted service account.
   a. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.
   b. Selelct **New**.
   c. On the form, fill in the fields.
   d. Select **Submit**.
3. On the ServiceNow AI Platform, configure the trusting service account.
   a. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.
   b. Select **New**.
   c. In the **Accessor account** field, enter the name of the trusted account.
   d. On the form, fill in the remaining fields.
   e. Select **Submit**.
4. On the ServiceNow AI Platform, assign the AWS IAM role to the trusting account, using the relevant form, based on the relationship to the trusted account.

Trusted account type	Steps
Management account	a. Navigate to **All** > **Cloud Provisioning and Governance** > **Organization Access Parameters** > **AWS Org Assume Role Parameters**. b. Select **New**. c. On the form, configure only the following fields for the trusting member account: **Cloud Service Account AWS Org Assume Role Params form** **Field** / **Definition** Access role name: Name of the IAM role created for the trusting account. ▪ If IAM roles are the same across all member accounts: Enter the full ARN using an asterisk (*) as a wildcard for the account ID in the format: `arn:aws:iam::*:role/MemberRoleName`. For example: `arn:aws:iam::*:role/SN_MEMBER_ACCOUNT_ROLE`.

Trusted account type	Steps
	<table><tr><th>Field</th><th>Description</th></tr><tr><td>Cloud service account</td><td>Name of the trusting account for which you are providing access using the IAM role.</td></tr></table> **d.** Select **Submit**.

What to do next

Verify that ServiceNow applications can access the trusting service account using the IAM role:

1. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.
2. Select the trusting AWS service account.
3. Under **Related Links**, select **Create Discovery Schedule**.
4. In the Discovery Manager Cloud Discovery page, select **Test Account**.
   - If the connection is successful, a message displays indicating the account validation is successful.
   - If the connection isn't successful, an error message displays indicating the cause of failure.

Configure credential-less access using trusted AWS accounts

Set up a trusted credential-less account that other AWS accounts can rely on for access.

Before you begin

- Familiarize yourself with the Amazon documentation on Creating a role to delegate permissions to an IAM user.
- Decide which AWS account is going to be the trusted account. You use the trusted account to configure temporary credentials for Cloud Discovery using IAM roles. The trusted account that you use to access other accounts using IAM roles is referred to as an accessor account.
- If you're setting up a trust chain, confirm that the member account trusts the management account. The management account must also trust the accessor account. For more information, see Configure access for trusting AWS member accounts in trust chain.
- Confirm that Discovery Admin Workspace is using at least version 1.10.0. The **Discovery** > **Cloud Service Accounts** navigation module isn't available with earlier versions. To access **Cloud Service Accounts** with an earlier version, enter in the navigation filter: `cmdb_ci_cloud_service_account.list`.

Role required:

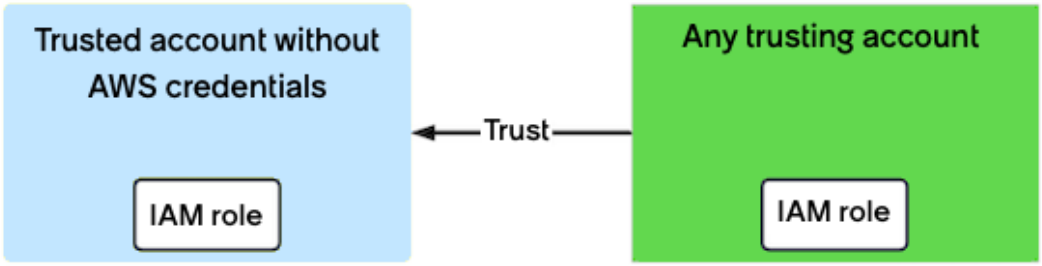
- For Cloud Discovery: discovery_admin
- For Cloud Provisioning and Governance: admin or sn_cmp.cloud_admin

About this task

To use an account without AWS credentials, you must first configure that account with an IAM role and permissions to access the trusting service account. Then, you set up the IAM role of the trusting account to grant access to the IAM role of the trusted account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting up any AWS account to rely on a trusted account without AWS credentials



Procedure

1. Configure an IAM role for the trusting account.

   a. Log into the trusting account on the AWS Management Console.

   b. Create an IAM role for this account.
   Use the account ID of the trusted account while creating this IAM role. For operational information about working with AWS roles, refer to the Amazon documentation.

   c. Create a ReadOnlyAccess policy and attach it to the newly created IAM role.

2. Configure the IAM role for the trusted account.

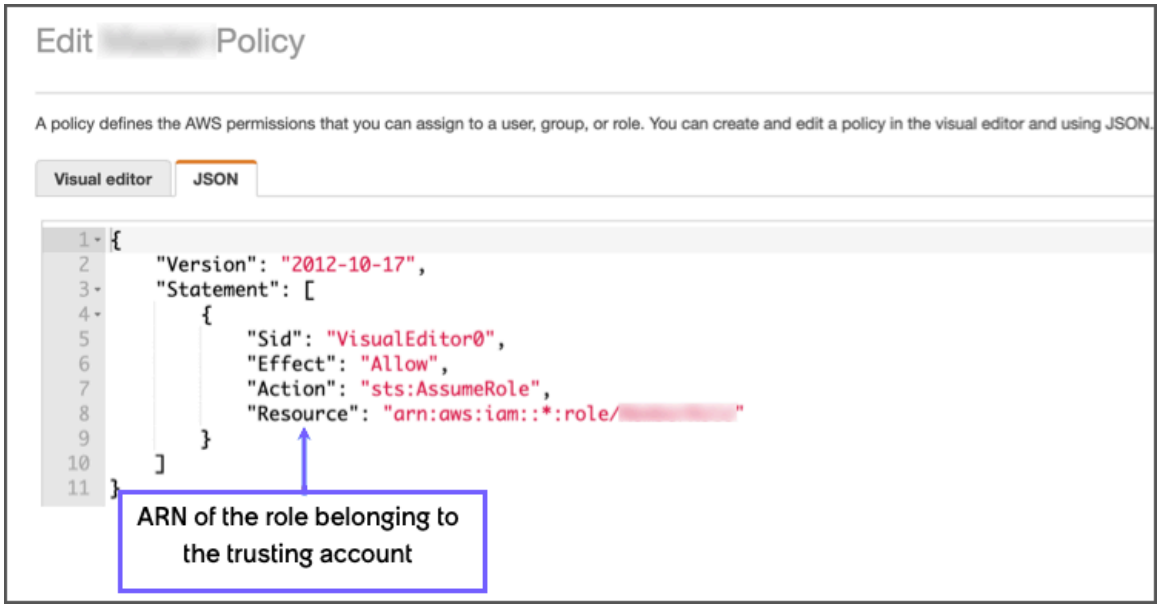
   a. Log into the AWS Management Console using the credentials of the account that you want to set up as a trusted account.

   b. Create an IAM role by choosing the **AWS service** option.

   c. Create a read-only access policy for the trusted account IAM role.
   For more information, see Control AWS access and permissions using policies.

   d. Create an additional policy to grant this IAM role access to resources in trusting accounts:
   - Set the *`Action`* parameter to `sts:AssumeRole`
   - Set the *`Resource`* parameter to the ARN of the trusting account role that you created in 1.b.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



e. Attach the newly created role to the relevant Amazon EC2 instance.
By default, when you attach an IAM role to an EC2 instance, it creates a trust relationship between this role and the EC2 instance.

3. Configure the trusting service account to grant access to the IAM role belonging to the trusted account.

a. Log into the trusting account on the AWS Management Console.

b. Navigate to the IAM role you created for this account as described in 1.b.

c. Edit the Trust Relationship for this IAM role as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Set the *Action* parameter to `sts:AssumeRole`.
- Set the *AWS* parameter to the ARN of the trusted account role that you created in 2.b.

4. Configure the MID Server for AWS IAM roles.
   For more information, see Configure the MID Server for AWS IAM roles.
5. On the ServiceNow AI Platform, configure the trusted service account.
   a. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.
   b. Selelct **New**.
   c. On the form, fill in the fields.
   d. Select **Submit**.
6. On the ServiceNow AI Platform, configure the trusting service account.
   a. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.
   b. Select **New**.
   c. In the **Accessor account** field, enter the name of the trusted account.
   d. On the form, fill in the remaining fields.
   e. Select **Submit**.
7. On the ServiceNow AI Platform, assign the AWS IAM role to the trusting account, using the relevant form, based on the relationship to the trusted account.

Trusted account type	Steps
Management account	a. Navigate to **All** > **Cloud Provisioning and Governance** > **Organization Access Parameters** > **AWS Org Assume Role Parameters**. b. Select **New**. c. On the form, configure only the following fields for the trusting member account:

d. Select Submit.
</td></tr>
</table>

What to do next

Verify that ServiceNow applications can access the trusting service account using the IAM role:

1. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.
2. Select the trusting AWS service account.
3. Under **Related Links**, select **Create Discovery Schedule**.
4. In the Discovery Manager Cloud Discovery page, select **Test Account**.
   - If the connection is successful, a message displays indicating the account validation is successful.
   - If the connection isn't successful, an error message displays indicating the cause of failure.

Configure access for trusting AWS member accounts in trust chain

Configure access for AWS member accounts by using a trust chain from the accessor through the management account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Familiarize yourself with the Amazon documentation on Creating a role to delegate permissions to an IAM user.
- Ensure that you know which AWS member accounts are assigned to the same management account. You use the management account for configuring temporary credentials for cloud discovery using IAM roles.
- Confirm that Discovery Admin Workspace is using at least version 1.10.0. The **Discovery > Cloud Service Accounts** navigation module isn't available with earlier versions. To access **Cloud Service Accounts** with an earlier version, enter in the navigation filter: `cmdb_ci_cloud_service_account.list`.

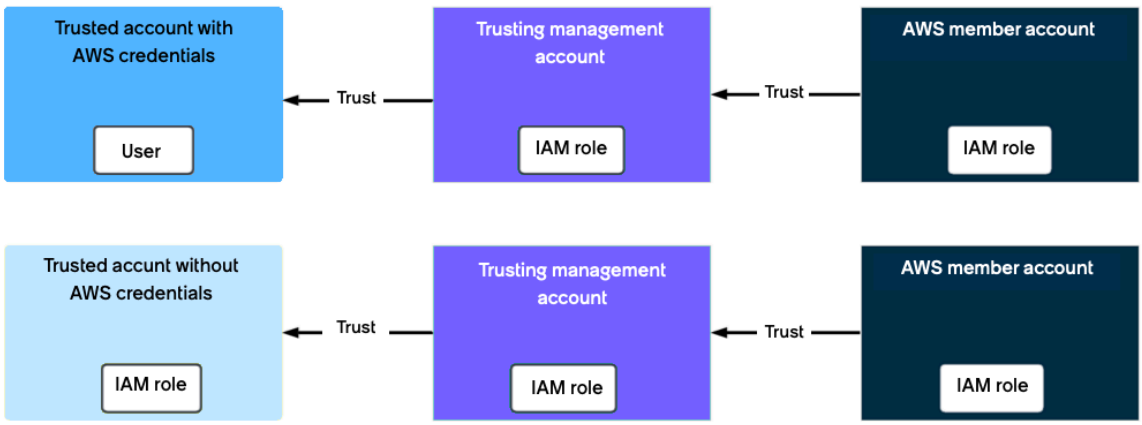
Role required:

- For Cloud Discovery: discovery_admin
- For Cloud Provisioning and Governance: admin or sn_cmp.cloud_admin

About this task

You can configure access for AWS member accounts by using a trust chain from the accessor through the management account. The accessor account either has AWS credentials or uses a credential-free method.

Configuring member accounts to use their management account for access



Procedure

1. Create an IAM role for the member account and configure the trust relationship between the user assuming this role and the trusted management account.

   a. Log into the AWS Management Console using the credentials of the member account for which you are configuring access.

   b. Create and configure the IAM role specifying the management account ID in the **Account ID** field.
   For operational information about creating AWS roles, refer to the Amazon documentation.

   c. On the **Summary** page for the IAM role, click the **Trust Relationships** tab.

   d. Click **Edit trust relationship**.
   The Edit Trust Relationship page opens showing the policy document.

   e. Edit the trust relationship as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Set the *Action* parameter to `sts:AssumeRole`
- Set the `AWS` parameter to the full role ARN of the management account.

f. Click **Update Trust Policy**.

2. On the ServiceNow AI Platform, configure the trusting member's service account.

a. Navigate to **All** > **Discovery** > **Cloud Service Accounts**.

b. Select **New**.

c. In the **Parent account** field, enter the name of the management account.

d. On the form, fill in the remaining fields.
For a description of the field values, see Create AWS service accounts.

e. Select **Submit**.

3. On the ServiceNow AI Platform, assign the AWS IAM role to the member account.

> **Important:** Perform this step only if you created custom IAM roles. By default, the OrganizationAccountAccessRole role is assigned to the member's trusting management account and you don't need to assign the OrganizationAccountAccessRole role to a service account.

a. Navigate to **All** > **Cloud Provisioning and Governance** > **Organization Access Parameters** > **AWS Org Assume Role Parameters**.

b. Select **New**.

c. On the form, configure only the following fields for the trusting member account:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Service Account AWS Org Assume Role Params form

Field	Definition
Access role name	Name of the IAM role created for the trusting account. ▪ If IAM roles are the same across all member accounts: Enter the full ARN using an asterisk (*) as a wildcard for the account ID in the format: `arn:aws:iam::*:role/MemberRoleName`. For example: `arn:aws:iam::*:role/SN_MEMBER_ACCOUNT_ROLE`. ▪ If IAM roles are different across member accounts: Enter the full ARN of the specific IAM role for each member account in a separate entry.
Cloud service account	Name of the trusting account for which you are providing access using the IAM role. ▪ If IAM roles are the same across all member accounts: Enter the management account name. ▪ If IAM roles are different across member accounts: Enter each member account in a separate entry.

d. Select **Submit**.

What to do next

Configure the trusting management account and the trusted accessor account.

- For information on configuring accessor accounts with AWS credentials, see Configure temporary credential access for trusted AWS accounts.
- For information on configuring accessor accounts without AWS credentials, see Configure credential-less access using trusted AWS accounts.

Configure the MID Server for AWS IAM roles

Configure the MID Server to retrieve the temporary security credentials associated with an IAM role.

Before you begin

Role required: discovery_admin or sn_cmp.cloud_admin (for Cloud Provisioning and Governance)

Procedure

1. Navigate to **All** > **Discovery** > **MID Servers**.
2. Select a MID Server installed on an Amazon EC2 instance within the relevant AWS service account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Open the **Configuration Parameters** related list.
4. Click **New**.
5. In the configuration parameter form, select *mid.aws.instance_profile_name* in the **Parameter name** field.
6. Enter the name of the IAM role attached to the EC2 Instance in the **Value** field.

   Note: AWS Cloud Discovery for "mid.aws.instance_profile_name" accepts both "role name" and "full ARN" as valid parameter values. For example, both of the following values are acceptable:

   - arn:partition:service:region:account-id:resource-type/resource-id
   - resource-id

   The MID Server uses the same IAM role that is set up for the corresponding AWS service account. For more information, see Configure temporary credential access for trusted AWS accounts.

   For operational information about creating AWS roles, refer to the Amazon documentation on Creating a role to delegate permissions to an IAM user.

7. Click **Submit**.
   The new parameter is listed in the MID Server record.

Control AWS access and permissions using policies

Configure policies with the necessary level of permissions to provide access to the AWS resources for Cloud Discovery and Cloud Provisioning and Governance.

Before you begin

Familiarize yourself with creating IAM users and user policies. Refer to the AWS documentation.

Identify the level of permissions required for discovering the resources using Cloud Discovery and managing the resources with Cloud Provisioning and Governance. For example:

- Additional S3 permissions are needed as AWS uses an S3 bucket to store and run the cloud formation templates to deploy stacks using CloudFormation. These permissions are needed even if you run the same CloudFormation template from the AWS console.

  Note: `s3:ListAllMyBuckets` must be scoped account-wide, not to a specific bucket ARN.

- Read-only access is required to do pattern discovery with the custom policy.

AWS CloudFormation provisions and configures resources by making calls to the AWS services that are described in your template. For more information, see How does CloudFormation work?

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Roles required:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- AWS Management Console administrator
- For Cloud Discovery: discovery_admin
- For Cloud Provisioning and Governance: admin or sn_cmp.cloud_admin

About this task

The policy you configure defines the AWS permissions that you can assign to a user, group, or a role. Depending on the AWS services you use, specify actions for the service to perform discovery and provisioning and life-cycle actions using Cloud Provisioning and Governance.

Procedure

1. Log in to the AWS Management Console using the credentials of the relevant service account. If you used an IAM user or an IAM role to provide access using temporary credentials, log in using the same IAM user or IAM role.
2. Open the user record in the instance for the relevant user.
3. Define a user policy in AWS Management Console using either of the following methods:
   - Grant administrator access to the instance. This method gives the same level of access as using the Access Key ID and Secret Access Key gives. Attach the `AdministratorAccess` policy to the user profile.

     Note: To create a user policy that supports only Cloud Discovery rather than the provisioning of cloud resources, attach the `ReadOnlyAccess` policy instead.

   - Create a custom policy with a descriptive name. In the Policy Document field, write the code that includes the APIs that this policy allows running.

     Note: The following JSON sample is a partial example showing permissions for Cloud Discovery. It isn't a complete list of all required permissions.

```
{
   "Version":"2012-10-17",
   "Statement":[
      {
         "Sid":"PermissionsNeededForDiscovery",
         "Effect":"Allow",
         "Action":[
            "account:ListRegions",
            "apigateway:GET",
            "application-autoscaling:Describe*",

Set up Azure service accounts

Create and configure cloud service accounts at ServiceNow AI Platform for the corresponding Microsoft Azure accounts.

Verify the REST API Permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Before you begin

Ensure the configuration of Azure credentials

For more information, see Create Azure cloud credentials and Configuration steps for Azure Service Principal User and Credentials (KB2202765)

Ensure that you are familiar with the hierarchy of the Azure service accounts in your environment.

Set up the service accounts at ServiceNow AI Platform to reflect the hierarchy of your environment. You can set up the Azure service accounts for the following Azure account types:

- Management group.
- Subscription.

Role required: discovery_admin

About this task

A service account is a secure record on your instance that stores the credentials and access information for your provider account. Discovery uses the information to access your provider account to get data on each resource in each specified datacenter. A cloud account is the logical representation in cloud management of all or part of your managed cloud infrastructure. A cloud account can include multiple service accounts—even service accounts from different providers. For each service account, you specify which datacenter to include in the cloud account.

Procedure

1. In the navigation filter, enter `cmdb_ci_cloud_service_account.list`.
2. Select **New**.
3. Fill in the fields by the following order:
   a. Select the datacenter.
   b. Select the check box of the **Is management account** if your are creating a service account for a management group.
   c. Select **Should pull events** to preform event-based discovery. For more information, see Microsoft Azure Alert driven discovery

Cloud Service Account form

Field	Description
Name	The unique and meaningful name for this service account.
Account ID	If you are creating a service account for a management group, fill in the Azure management group ID that belongs to the management group. If you are creating a service account for a subscription, fill in the Azure subscription ID.
Discovery credentials	The credentials needed for ServiceNow applications to access this account.
Datacenter URL	URL of the datacenter. Configuring this field is required for Azure Gov Cloud (US) accounts. For example, https://management.usgovcloudapi.net/.
Datacenter type	Type of the datacenter where the account is hosted. Select **Azure datacenter**.
Datacenter discovery status	Auto-generated value: Status and timestamp of the last execution of discovery on the datacenter.
Parent account	When setting up a service account for an Azure subscription, fill in the management group ID. When the **Is management account** check box is selected, the **Parent account** field is not applicable

Field	Description
Accessor account	Not applicable for Azure service accounts.

4. Select **Submit**.

Discovery for Microsoft Azure Cloud

Set up Google Cloud Platform service accounts

Create and configure cloud service accounts at ServiceNow AI Platform for the corresponding Google Cloud Platform (GCP) service accounts.

GCP service account is a unique account typically used by an application or compute workload, such as a Compute Engine instance, rather than a user. A service account is identified by its email address, which is unique to the account. It's used to authenticate and authorize interactions between your application and various GCP services.

Verify the REST API Permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Configure the Google API credentials for Cloud Discovery

Create Google API credentials to allow Cloud Discovery to access the data on your Google account securely.

Before you begin

Ensure that the latest versions of the following applications are installed:

- Discovery and Service Mapping Patterns
- Visibility Content
- CMDB CI Class Models

Role required: discovery_admin

Procedure

Configure the GCP credentials either by importing a JSON file or by filing in the record manually.

Option	Actions
Import the JSON file	**a.** When receiving the email from GCP, down load the JSON file. **b.** Navigate to **Discovery** > **Credentials**. **c.** Select **New** and then select **Google API Cre dentials**. **d.** Select **Import JSON File**

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Actions
	e. Select **Choose File** and choose the JSON file you downloaded. **f.** Select **Upload Credential Data**.
Configure the credentials manually	**a.** Navigate to **Discovery** > **Credentials**. **b.** Select **New** and then select **Google API Credentials**. **c.** Select **New**. **d.** In the form, fill in the fields according to the form description. For description of the form fields, see Google API Credentials Form. **e.** Select **Submit**.

Google API Credentials Form

Fill in the Google API Credentials form to configure the credentials.

Field	Description
Name	Set a unique name for the Google Cloud API credentials.
Active	Option for enabling this credential for discovery. Select this check box to enable discovery.
Applies to	MID Server to which you apply the credentials. Select **All MID servers**.
Order	Order in which the platform runs this credential as it attempts to log in to devices. A smaller number indicates that the credential appears higher in the list. Establish the credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number, or none, the instance tries the credentials in a random order. The default value is 100.
Email	Your GCP email address.
Secret Key	Secret key that you generated on the Google Cloud Console.
Credential alias	A credential alias that is used by the credentials to authorize actions.

Create GCP service accounts

Create Google Cloud Platform (GCP) service accounts on the ServiceNow AI Platform to access your GCP account during GCP discovery.

Before you begin

Verify that Google API credentials have been created. For more information, see Configure the Google API credentials for Cloud Discovery.

Retrieve the **project_id** value from the JSON key file that is associated with the service account.

Role required: discovery_admin

Procedure

1. In the navigation filter, enter `cmdb_ci_cloud_service_account.list`.
2. Select **New**.
3. In the **Discovery Credentials field**, begin to enter the credential name and select it from the list.
4. On the form, fill in the remaining fields.

Cloud Service Account form

Field	Description
Name	A unique name for the GCP service account.
Account Id	GCP project ID.
Datacenter URL	URL of the datacenter, which should remain empty.
Datacenter Type	Type of the datacenter where the account is hosted, which should be Google Datacenter [cmdb_ci_google_datacenter].

5. Select **Submit**.

What to do next

Schedule a GCP cloud discovery. For more information, see Create a discovery schedule in Cloud Discovery Workspace.

GCP access and permission using policies

Google Cloud Platform (GCP) access and permission using policies provide privileges for secure cloud resource utilization and management in GCP.

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.
