Platform Analytics

Optimize processes and increase productivity with the Platform Analytics applications. These applications include Reporting, Performance Analytics, Usage Insights, and Process Mining. Present data through either the Core UI or the Platform Analytics experience.

Get started

Select one of these tiles to learn more about these applications, which help provide many different kinds of data to many different kinds of users.

Platform Analytics experience

Explore analytics with data visualization tools, dashboards, and KPIs, all accessible by natural language queries.

Now Assist in Platform Analytics

Ask questions about data in plain language and receive AI-powered responses, including Platform Analytics data visualizations.

Performance Analytics

Improve service delivery times and reduce costs using this set of business-analysis tools.

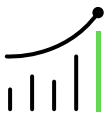
Usage Insights

Get a dashboard view of how your users work with multiple ServiceNow applications, with full visuals of metrics, interactions, and more.

Process Mining

Analyze your data in automated process flows with this application and find ways to improve your enterprise's workflow efficiency.

Task Mining



Identify task inefficiencies in work tasks by collecting and processing workstation data to provide insights into activities and interactions.

Platform Analytics experience

Explore the many options for showing data in data visualizations. Create, modify, and share dashboards. Filter the data that is shown on a dashboard. Receive insights on your dashboards about potentially significant events in the data. Explore indicators of process behavior with KPI Details, and be alerted to significant changes in these indicators through KPI Signals.

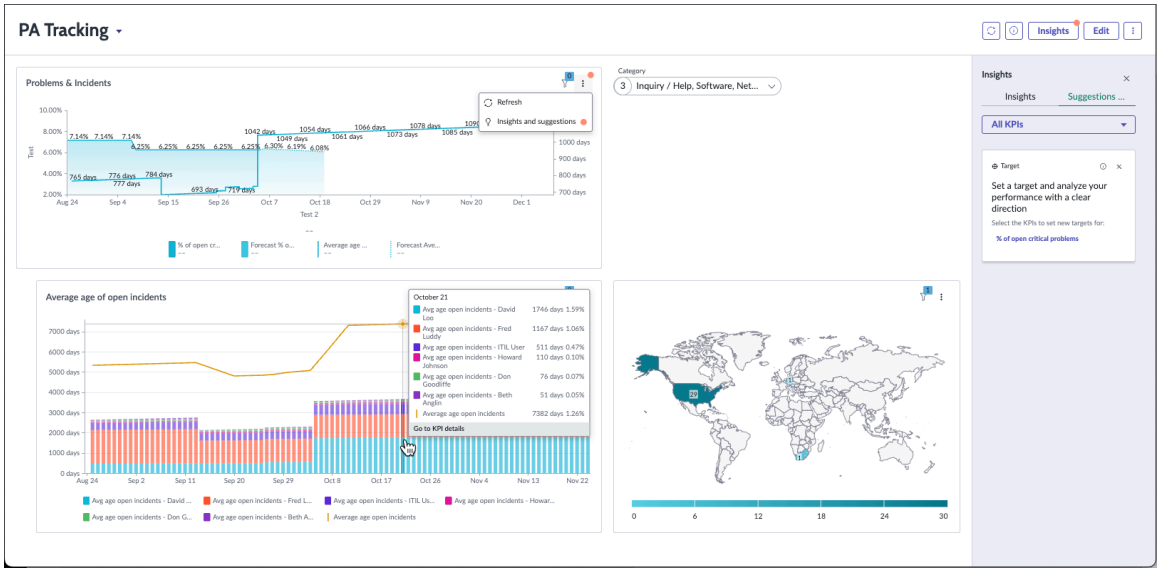
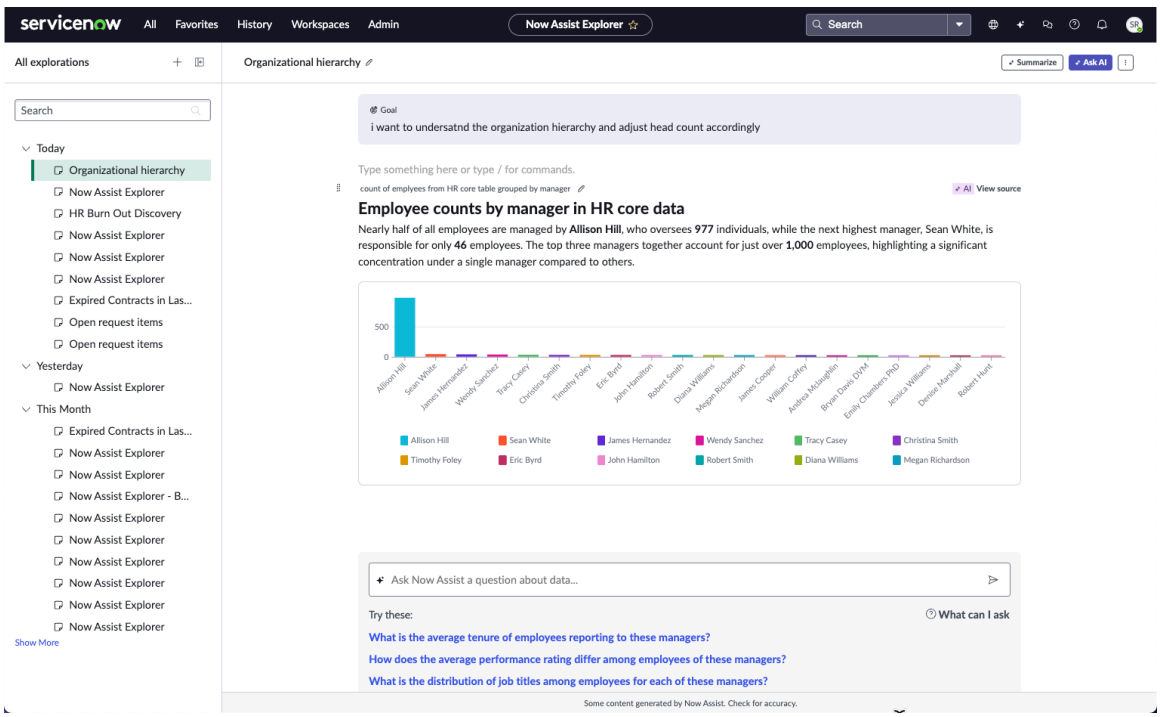
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Now Assist in Platform Analytics

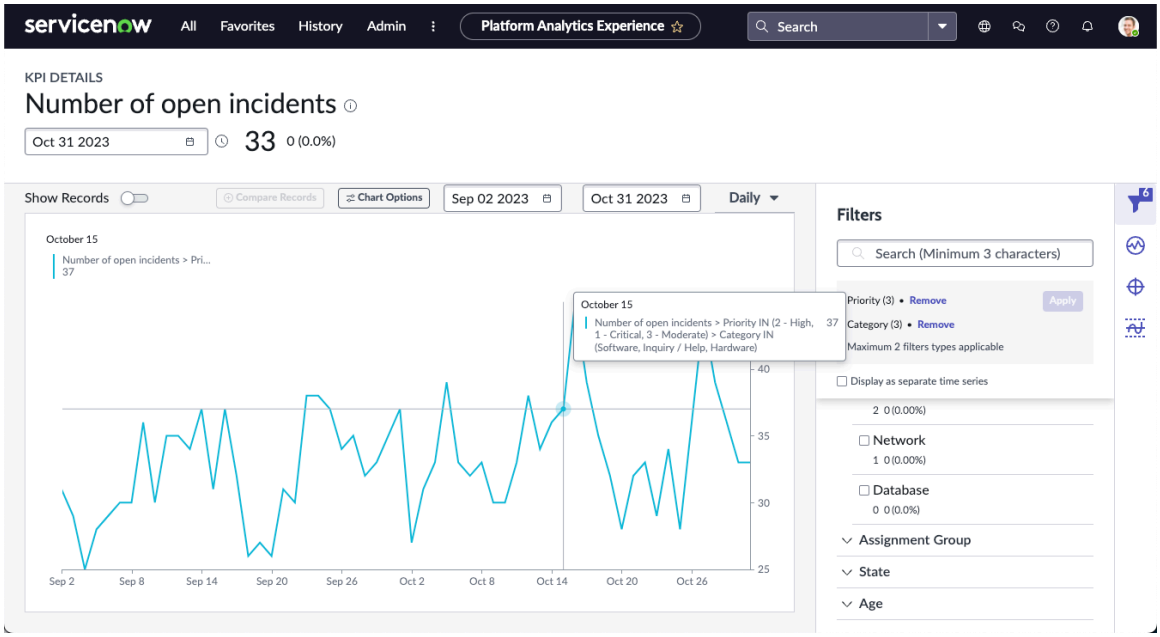
Leverage AI to generate insights into data. Ask for data visualizations in the Now Assist panel. Explore data on your own or with a collaborative group in AI Data Explorer, where you can have not only data visualizations but summaries and conversations.



Performance Analytics indicators

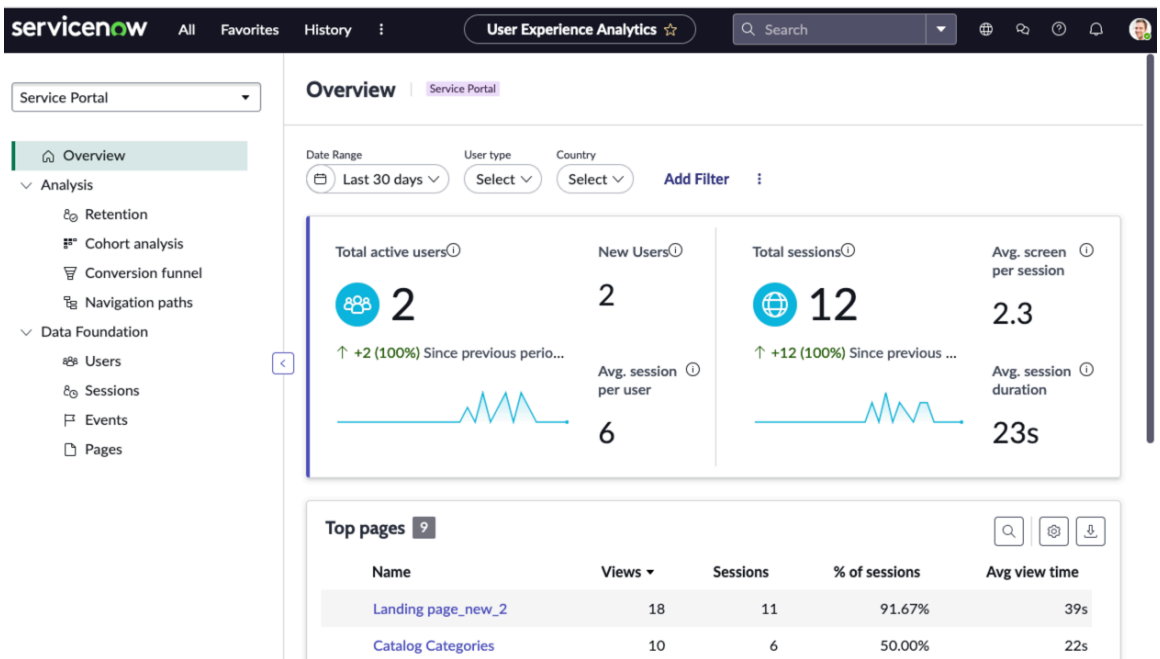
Learn how to help your business constantly improve. Plan and implement key performance indicators using Performance Analytics fundamentals. Go further by configuring advanced features, to work directly with data structures as an administrator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Usage Insights

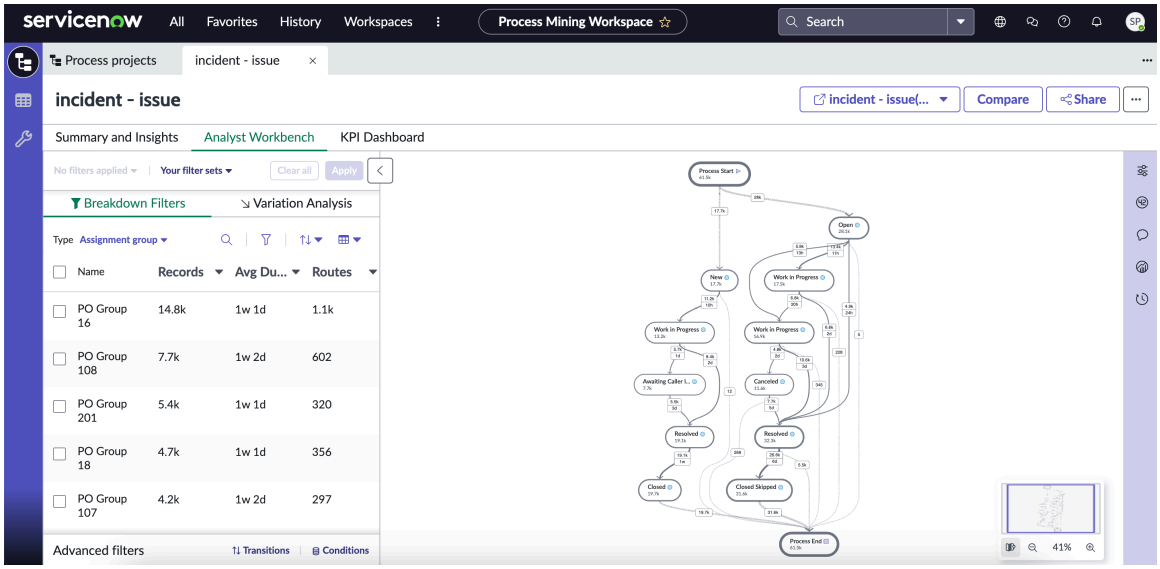
Learn about dashboard-based analytics on the usage of several ServiceNow applications. Administrators can get information on user engagement with both mobile and web applications, including user population, retention, and behavior.



Process Mining

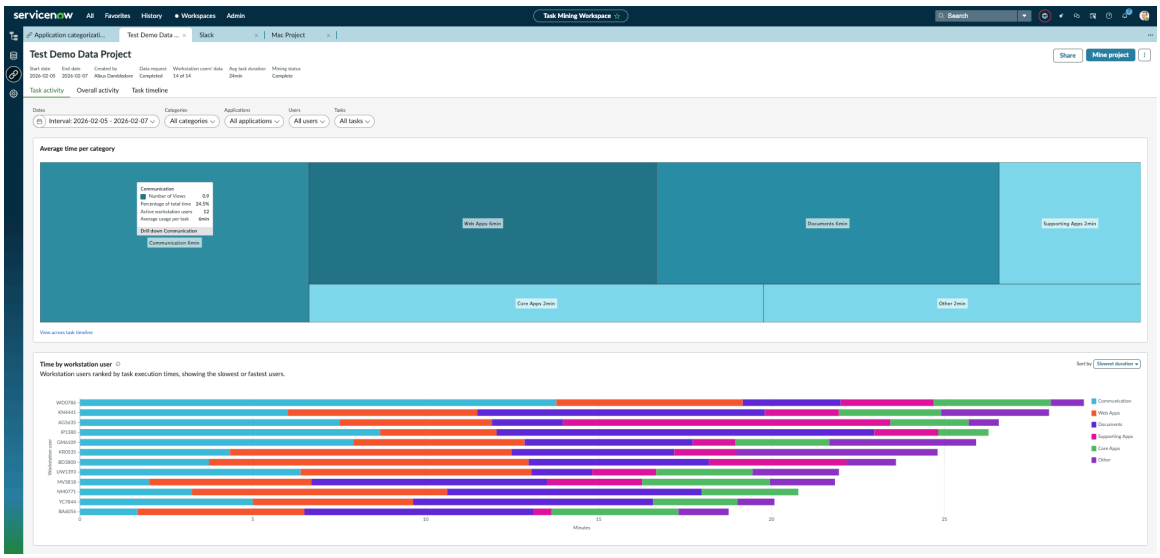
Discover ways to streamline your business, find bottlenecks and deviations in workflows, filter and compare processes, and more. A comprehensive listing of Process Mining key terms provides all the notable terminology and their definitions, to assist you in getting the most effective performance from your enterprise.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Analysis in Task Mining

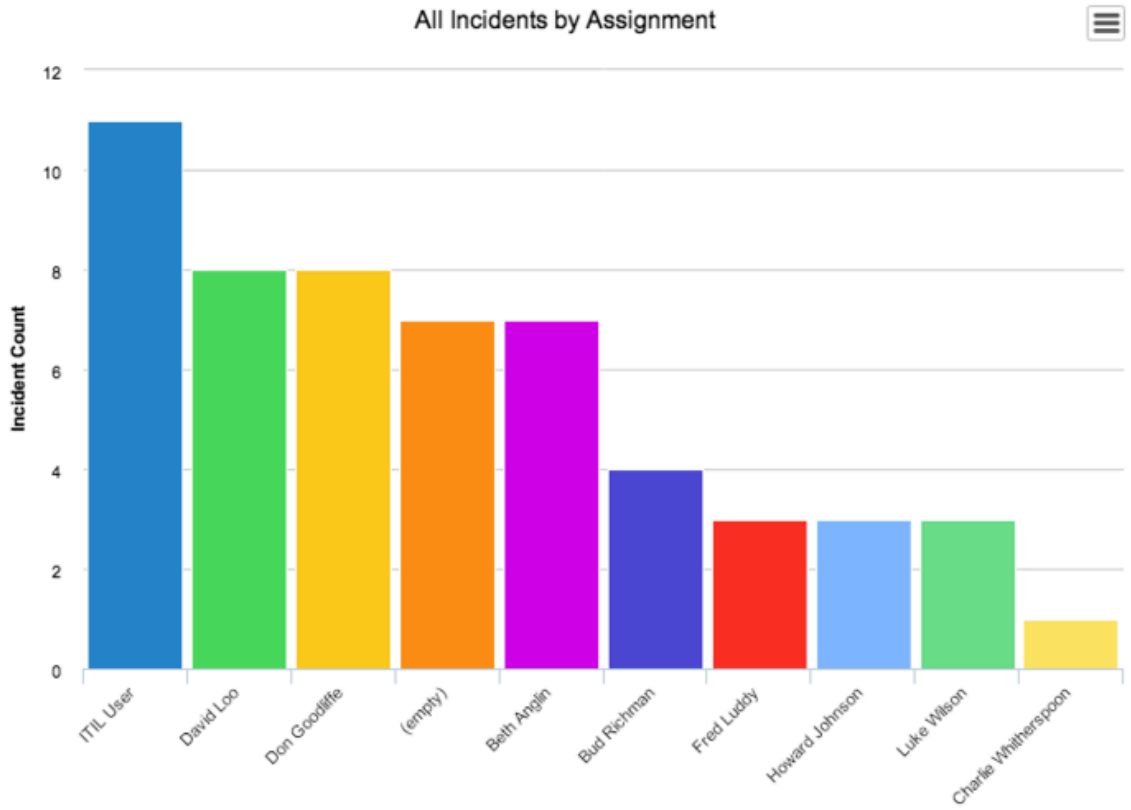
Learn how Task Mining helps process owners collect and analyze workstation activities to understand how tasks are performed, identify inefficiencies, and make data-driven decisions.



Reports and dashboards in the Core UI

Give administrators and other stakeholders the ability to work with real-time data reports and analyze trends, using Core UI dashboards. Create and define Performance Analytics widgets, and configure the quick-view dashboards that use those visualizations, to suit your data and your business goals. Use the Analytics Hub to perform in-depth data exploration, examine activity over time, compare scores versus benchmarks, and analyze other various targets and trends as optional add-ons.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Applications and features

- Platform Analytics Migration Center
- Dashboards in Platform Analytics
- Data visualizations in Platform Analytics
- Use AI to explore data with AI Data Explorer
- Create visualizations conversationally in the Now Assist panel
- Performance Analytics indicators
- Indicator breakdowns
- Design your Performance Analytics solution with KPI Composer
- Explore your indicators with KPI Details
- Usage Insights
- Process Mining
- Task Mining
- Reporting, dashboards, and Performance Analytics in the Core UI
- Identify workflow automation opportunities with Automation Discovery

Platform Analytics experience

Distribute and consume Platform Analytics through data visualizations and dashboards with optional filters. Explore KPIs and receive insights into significant events in the data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Platform Analytics experience is a unified interface for visualizing data from multiple data sources. Access it in Unified Navigation at **All** > **Platform Analytics**.

Note: To learn more about Platform Analytics and the Migration Center, see the Platform Analytics enablement toolkit on the ServiceNow Community.

The Platform Analytics experience has two main sections:

Analytics Center

This page displays all your bookmarked and company-certified dashboards and data visualizations. It also contains Analytics Q&A, a field where you can ask a question using natural language and be shown the relevant analytics in a visualization.

Library

The library is a set of pages listing all the Platform Analytics visual components that you can access, along with utilities that apply to these components. You can also create your own dashboards, data visualizations, and filters. With the appropriate roles, you can add the components you create to the shared library.

Note: You can add an Analytics Center with tabs for library content to your own configurable workspace. For more information, see Creating Platform Analytics pages in your own workspace.

Platform Analytics Dashboards	Data visualizations	Platform Analytics filters
View all the dashboards you have rights to access, and filter them by those you've created, those you've bookmarked, and those that are certified. Create your own dashboards and potentially share them with others.	Create, update, certify, and share visualizations based on tables, indicators, or other data to share with others.	Filter lists and data visualizations on a dashboard by data value, by whether the value is true or false, or by date.

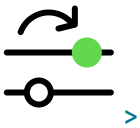
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

KPI Details	KPI Signals	Reference
		


Delve into the information behind your Key Performance Indicator (KPI) scores. See trends, forecasts, and associated records. Experiment with different breakdowns and time aggregations.	Learn when a business process behaves in an unexpected way. Notify responsible users when a KPI score changes significantly.	Data caching, roles, and tables across the Platform Analytics experience

Platform Analytics Migration Center

When you migrate your Core UI data, your existing dashboards, reports, interactive filters, and Performance Analytics widgets are moved to Platform Analytics. When you activate the migration, the result is a single set of visualizations and unified filters for all data sources.

Note:

To learn more about Platform Analytics and the Migration Center, see the Platform Analytics enablement toolkit on the ServiceNow Community.

From the Zurich release, however both Core UI and Platform Analytics experience dashboards and visualizations sit side by side in the Platform Analytics library.

Once migration is complete, you won't be able to add Core UI reports, PA widgets and filters to Platform Analytics experience dashboards. It is possible to add only migrated content and content created within Platform Analytics experience to these dashboards.

You cannot use update sets to move the migrated material from a non-production instance to a production instance. Test the migration on the non-production instance and then use Migration Center functionality to migrate the production instance.

What is migrated

The migration process takes your dashboard content and migrates it from Core UI (Dashboards and visualizations in the classic environment) to the Platform Analytics library. You then access all of your analytics through a unified navigation menu. If you use indicators, you get tools to alert you of significant changes.

Note: When you upgrade releases, the Migration Center automatically migrates any previously incompatible content that is now compatible.

What isn't migrated

The short answer is that almost everything is migrated. Most Core UI dashboard content is supported in Platform Analytics experience. Some content doesn't have an analogous Platform Analytics feature. Any dashboard with content that isn't migrated and is migrated into a container, also called an iframe. This is called Compatibility mode. For detailed information about content that isn't migrated, see Content not migrated or migrated in compatibility mode.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What is the migration process

The migration process has the following steps.

Remove unused dashboards

Remove any unused dashboards and reports to promote a streamlined process.

- Navigate to pa_dashboards.list, select the dashboards you want to delete, and then select **Actions on selected rows** > **Delete**.
- Navigate to **All** > **Reports** > **Administration** > **All**, select the reports you want to delete, and then select **Actions on selected rows** > **Delete**.

Run the migration procedure

The procedure identifies what can be migrated directly into Platform Analytics and what is migrated in Compatibility Mode.

Review the migration results

You may identify dashboards or other content that you don't want to migrate, for example, unused dashboards, out-of-date visualizations, or filters that don't work as expected.

Activate the migration

Activation might be time-consuming, depending on how much content you are migrating.

Create custom content

You can use tools such as UI Builder to create custom content that meets the needs of content that doesn't migrate.

What happens to my menus

Before migration, users navigated to **Self Service** > **Dashboards** to view the dashboard overview and to **Reports** > **View / Run** to view the list of reports. After you activate the migration, all analytics content, including dashboards, data visualizations, filters, and KPIs are under **Platform Analytics** > **Library**.

Block Migration Options

You can disable the **Start Moving** and **Activate** Platform Analytics experience options. Create the system property `com.glide.par.coreui.migration.enabled` and set it to `False`. If you set the property to `False` before you migrate any content, both options are disabled. If you set the property to false after you migrate your content, only the **Activate** button is disabled.

If you want to start the migration and view what artifacts are in compatibility mode, and resolve any issues, set the property to `False` after you run the migration to prevent activation of Platform Analytics experience. If you want to prevent the migration process, set the property to `False` first.

For more information, see Add a system property.

Perform full data migration

Migrate your existing dashboards, reports, interactive filters, and Performance Analytics widgets to the Platform Analytics experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: To perform the full migration and activate Platform Analytics experience: admin. Users with other admin roles (pa_admin, report_admin, and dashboard_admin) have access to the Migration Center to evaluate the migration.

About this task

This topic assumes that your instance is not a net new Xanadu, Yokohama, or Zurich instance. The Migration Center is only available on upgrading instances.

Run and test the migration on a single, non-production instance. After you're satisfied with the results of a full test migration, launch the migration on the production instance. Select **Try your content** to test the output on a limited number of dashboards.

Note:

If you change a Core UI dashboard after migration and migrate it again, the changed dashboard overwrites the originally migrated dashboard.

If you change a report, and perform full data migration again, the changed Core UI report overwrites the originally migrated content, and any changes you have made to the associated Platform Analytics experience visualization. Changed Core UI reports do not overwrite changes when you perform a partial migration of Core UI dashboards.

You cannot move the migrated material from a non-production instance to a production instance.

Dashboards migrated in compatibility mode may experience performance issues.

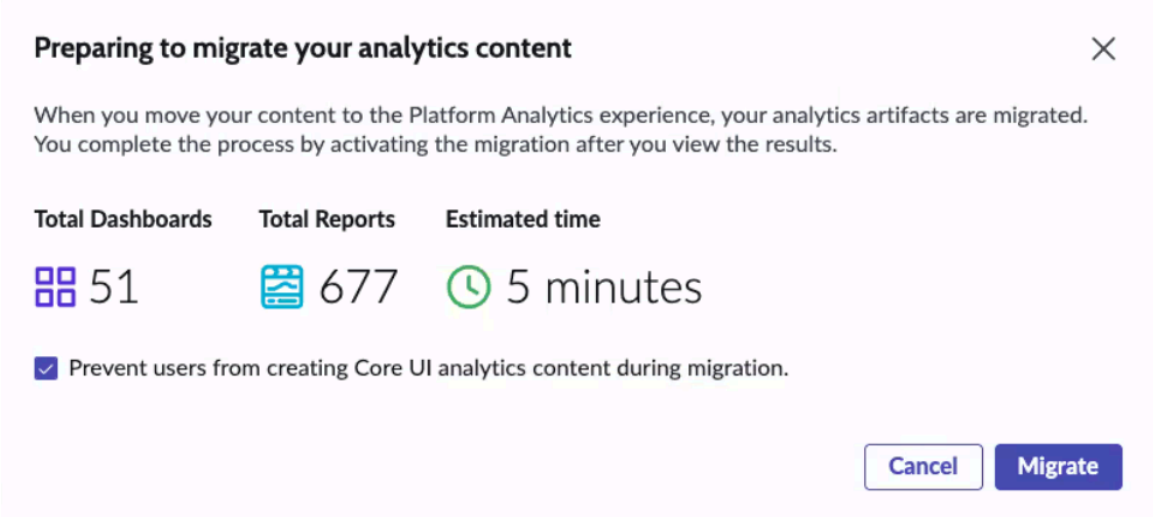
Migrated dashboards appear in the Platform Analytics library. Links to the original Core UI dashboards redirect to the library as well.

Reports associated with chart to chart drilldown are saved to the Visualization Library.

Procedure

1. Navigate to **All** > **Performance Analytics** > **Migration Center**.
2. Review the information about the migration process under Learn about Platform Analytics experience.
   The tabs provide more information about the migration process and what you can expect from Platform Analytics.
3. Select **Start moving** to migrate all of your content.
   The length of the migration process depends on the number of dashboards, reports, filters, and Performance Analytics widgets you have on your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

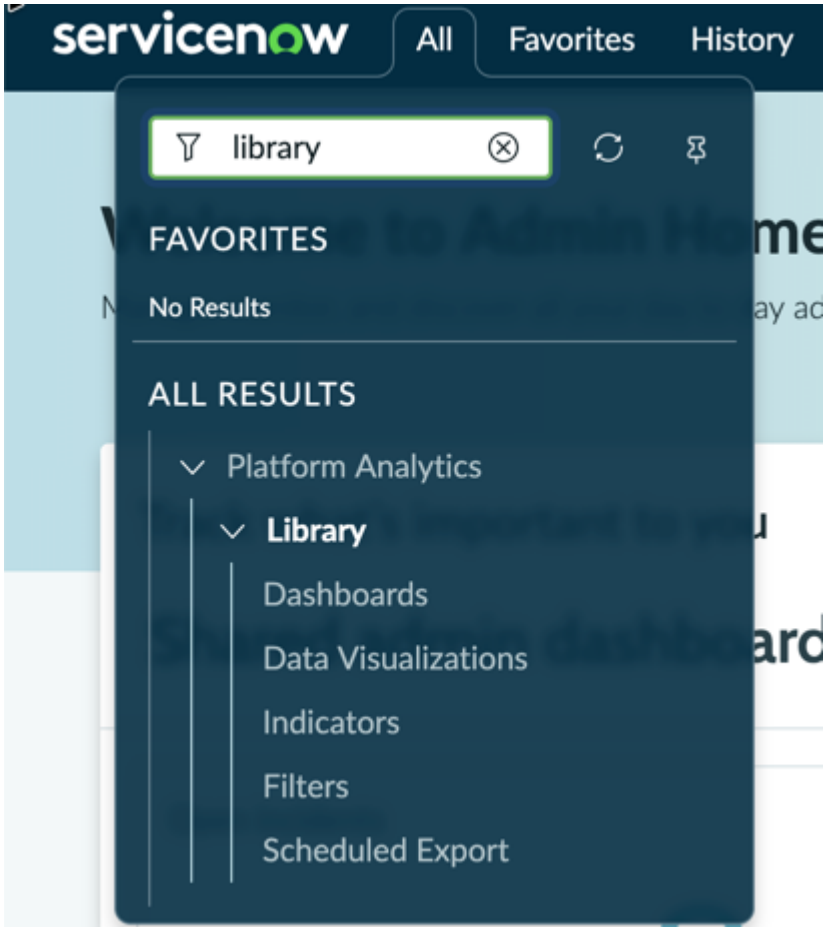


4. **Optional:** Select **Prevent users from creating Core UI analytics during migration**.
   New Core UI analytics content may need to be migrated at a later time.
5. Select **Migrate** to start the migration process.
6. Evaluate the results.
7. Select **Activate** to complete the migration process.
   The newly migrated content is not available in the Platform Analytics experience until you select **Activate**. Any menu item previously connected to Core UI dashboards and reports automatically redirects to the new migrated version.

Result

Your dashboards and other migrated content are now found under the library. Navigate to **All** > **Platform Analytics** > **Library**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



What to do next
Evaluate full data migration

Evaluate full data migration

When you have completed the migration process, review the results.

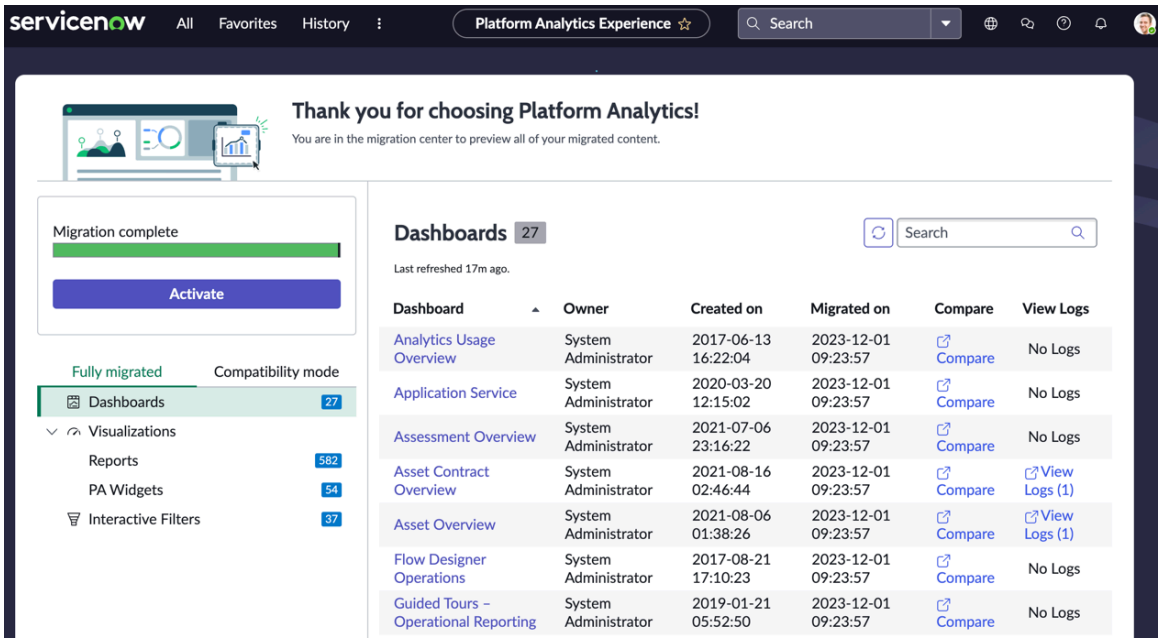
Before you begin
Role required: To perform the full migration and activate Platform Analytics experience: admin. Users with other admin roles (pa_admin, report_admin, and dashboard_admin) have access to the Migration Center to evaluate the migration.

About this task
As soon as your data has been migrated, you see the results of the migration. Review the fully migrated content and the content migrated in compatibility mode. You can compare all migrated content with the original Core UI versions.

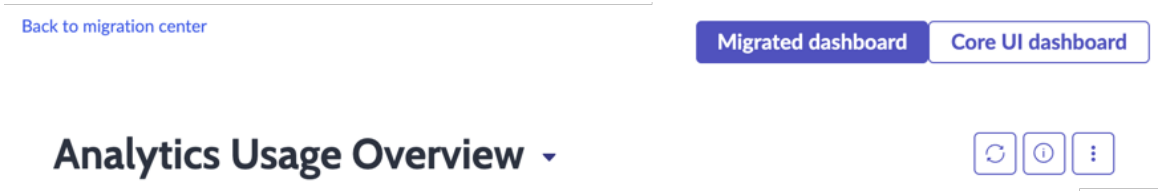
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Migration Center, select an item from the Fully migrated column, Dashboards, Visualizations, Reports, PA Widgets, or Interactive Filters to review a list of all of the migrated items.



2. Choose the **Compare** link for any dashboard to see the Core UI and migrated content back to back.



3. Select the **Compatibility mode** tab to compare content in the Core UI dashboard and the content migrated in compatibility mode.
4. Select View Logs links to review issues associated with each migrated element.
5. Select **Activate** to complete the migration process.
   Any menu item previously connected to Core UI dashboards and reports automatically redirects to the new migrated version.

   Both Core UI and Platform Analytics experience dashboards and visualizations sit side by side in the Platform Analytics library.

Relaunch data migration

Relaunch migration when Core UI content is changed after full data migration and when earlier unsupported functionality becomes supported in the Platform Analytics experience.

About this task

When there are modified artifacts, new content, or newly supported content to migrate, a banner is shown in the Migration Center with a button labeled **Migrate again**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

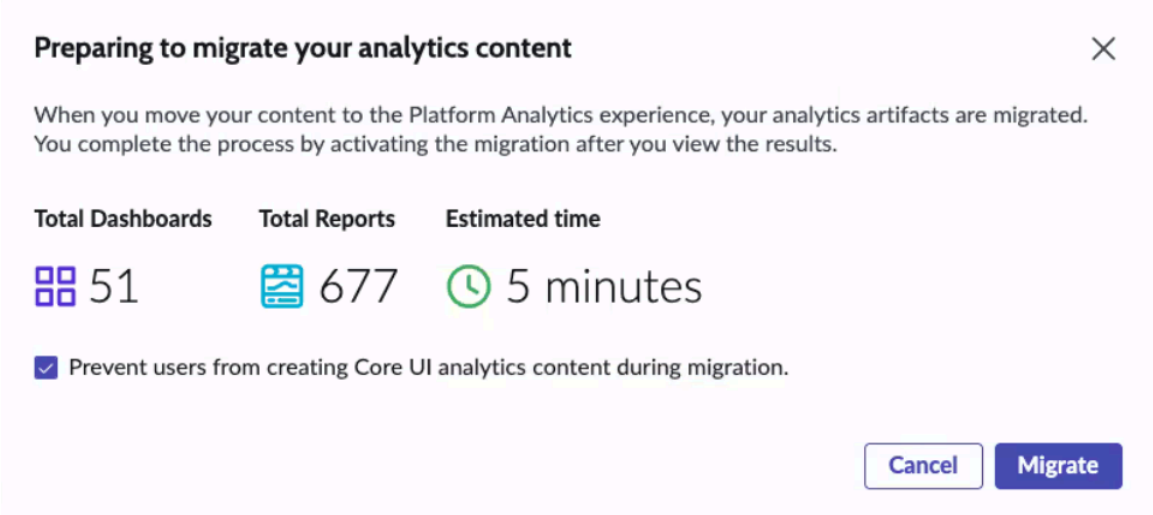
Note: When you upgrade releases, the Migration Center automatically migrates any previously incompatible content that is now compatible.

You cannot use update sets to move the migrated material from a non-production instance to a production instance. Test the migration on the non-production instance and then use Migration Center functionality to migrate the production instance.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **Platform Analytics Administration** > **Migration Center**.
2. Select **Migrate again**.
   The length of the migration process depends on the number of new artifacts that you have on your instance.



3. **Optional:** Select **Prevent users from creating Core UI analytics during migration**.

Result
The changed and new content is migrated to Platform Analytics experience.

What to do next
Evaluate the newly migrated content. For more information, see Evaluate full data migration.

Set redirection for admins

Migrated responsive dashboards automatically redirect to the Platform Analytics experience library. However, you can set a system property to specify redirection for admins.

Before you begin
Role required: admin

Procedure

1. Navigate to `sys_properties.list`.
2. Create the boolean property *`com.glide.par.coreui.migration.admin_redirection.enabled`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Set the value to true to redirect users with the admin or dashboard_admin role from the responsive dashboard to the migrated dashboard.
- Set the value to false to enable users with the admin or dashboard_admin role to open responsive dashboards in the Core UI experience.

  If Active Experience=Next for dashboards in the bridging tables, redirection is to the migrated version of the dashboard.

Migrated artifact locations

After data migration, your artifacts such as dashboards, visualizations, and filters, reside in different tables in your instance.

Users with the admin, pa_admin, report_admin, or dashboard_admin roles have access to the migrated artefact tables.

In addition to these tables, snpar_sched_export_v_scheduled_export_visualization is a virtual table for the scheduled export UI form.

Functionality	Core UI table	Platform Analytics experience table
Dashboards	pa_dashboards	par_dashboard
Dashboard groups	pa_dashboards_group	analytics_category
Reports	sys_report	par_visualization
PA widgets	pa_widgets	par_visualization
Interactive filters	sys_ui_hp_publisher	par_component_filter
Scheduled reports	sysauto_report	sysauto_par, par_export_visualization, par_notification_email

Migration log locations

A set of logs is stored for each dashboard, report, filter, and dashboard element (widget) in the bridging tables.

Users with the admin, pa_admin, report_admin, or dashboard_admin roles have access to the Migration logs. You can view the logs from within the Migration Center or navigate to the associated list to review them.

Log	Type
par_coreui_migration_bridge_dashboard.list	Dashboard logs
par_coreui_migration_bridge_sysauto.list	Scheduled export logs
par_coreui_migration_bridge_widget.list	Migrated dashboard element logs
par_coreui_migration_bridge_component.list	Logs associated with reports, PA widgets, and filters when migrated outside of a dashboard

Note: Logs may be empty as only negative events such as incompatibilities are logged.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Perform a partial migration of dashboards

Migrate a selection of your existing dashboards, reports, interactive filters, and Performance Analytics widgets to Platform Analytics. Migration works the same whether you choose to migrate some or all of your content. However, you can move some of your content to evaluate the process or when you have many dashboards and want to migrate in segments.

Before you begin

Role required: You can migrate any dashboard you own. Users with admin or dashboard_admin roles can migrate any dashboard.

About this task

Run and test the migration first on a single, non-production instance. After you're satisfied with the results, launch the migration on the production instance.

Note: You cannot use update sets to move the migrated material from a non-production instance to a production instance. Test the migration on the non-production instance and then use Migration Center functionality to migrate the production instance.

If content on a dashboard is used in only one dashboard, it will be available only on that dashboard after migration. If it is used in more than one dashboard, that content is migrated to the Platform Analytics experience library.

If you change a Core UI dashboard after migration and migrate it again, the changed dashboard overwrites the originally migrated dashboard.

You cannot move the migrated artifacts from a non-production instance to a production instance.

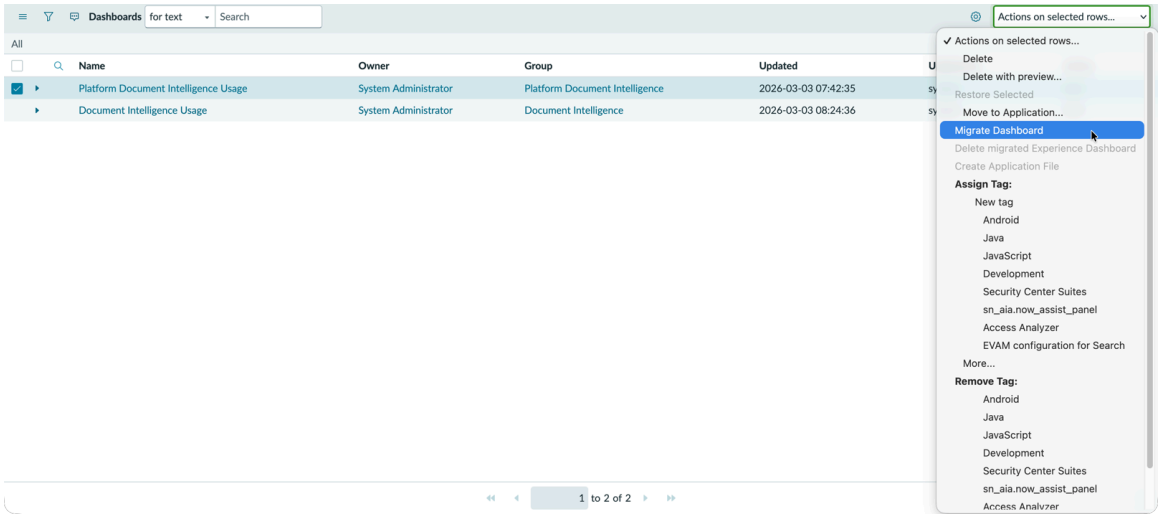
If you delete a migrated dashboard, that dashboard isn't migrated if full migration is performed on your instance. You can migrate it again using the steps in this topic. If you want to remigrate a Core UI dashboard, be sure to delete the existing migrated dashboard to avoid duplicating dashboard content.

The migrated dashboard appears in the Platform Analytics library. Links to the original Core UI dashboard redirect to the library as well.

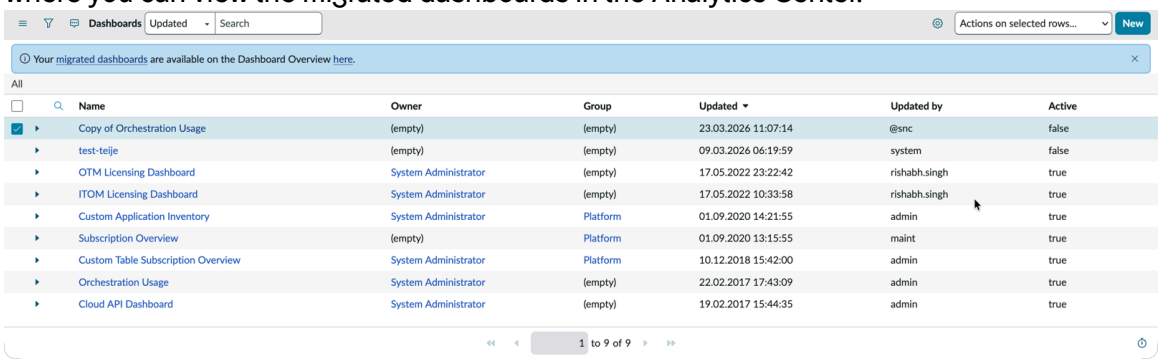
Procedure

1. Navigate to **All** > **Performance Analytics** > **Migration Center**.
   If you're already familiar with the migration process, navigate to `pa_dashboards.list` and follow the instructions from step 4.
2. Review the information about the migration process under Learn about Platform Analytics.
3. Select **Try your content** to choose a subset of your data to Platform Analytics.
4. On the Dashboards list, select the dashboards you want to migrate.
5. From the **Action on selected rows** menu, choose **Migrate Dashboard**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. When the migration is complete, select the banner link to view the migrated dashboards on the dashboard overview.
   The first link takes you to the PAR Dashboards list. You can review the dashboards' forms there. The second takes you to the Dashboard Overview where you can view the migrated dashboards in the Analytics Center.



What to do next

Verify that the migrated dashboards have all the features of the Core UI dashboards, either as fully migrated content or as iframed content. For more information, see Content not migrated or migrated in compatibility mode.

Migrate dashboards that you own

Migrate dashboards that you own, including reports, interactive filters, and Performance Analytics widgets to Platform Analytics experience.

Before you begin

Role required: You can migrate any dashboard you own. Users with admin or dashboard_admin roles can migrate any dashboard.

About this task

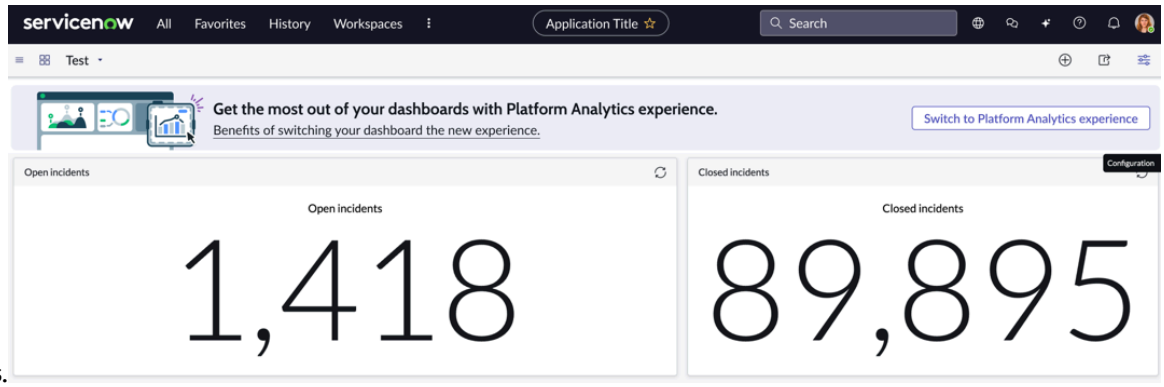
To learn about migration and its benefits, see Platform Analytics Migration Center.

Note: You cannot use update sets to move the migrated material from a non-production instance to a production instance. Test the migration on the non-production instance and then use Migration Center functionality to migrate the production instance.If content on a dashboard is used in only one dashboard, it will be available only on that dashboard after migration. If it is used in more than one dashboard, that content is migrated to the Platform Analytics experience library.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Self-Service** > **Dashboards**.



2. Select the dashboard that you want to migrate.
3. Select **Switch to Platform Analytics experience**.
   This converts the dashboard from Core UI to the new experience, marks the old version Inactive, and opens the converted dashboard.

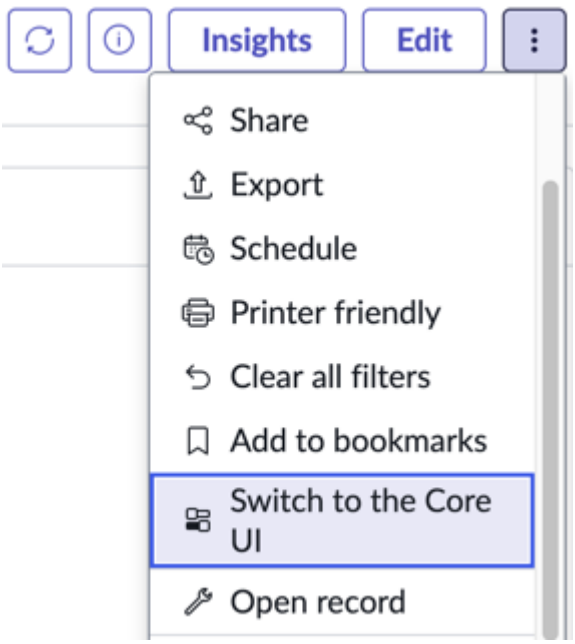
Result

The migrated dashboard appears in the Platform Analytics library. Links to the original Core UI dashboard redirect to the library as well.

What to do next

Verify that the migrated dashboard has all the features of the Core UI dashboard, either as fully migrated content or as iframed content. For more information, see Content not migrated or migrated in compatibility mode.

To roll back a migrated dashboard, select the More actions menu (⋮) and choose **Switch to the Core UI**.



Disable migration of single dashboards

Hide the banner on individual dashboards that enables owners to migrate dashboards that they own.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin.

About this task
Add a system property to prevent users from migrating their own dashboards.

Procedure
1. Navigate to **sys_properties.list**.
2. Add the system property *com.glide.par.coreui_single_migration.enabled* if it does not already exist.
   For more information, see Available system properties.
3. Set *com.glide.par.coreui_single_migration.enabled* to `false`.

Result
The banner with the button to convert individual dashboards from Core UI to Next Experience is hidden.

Migrate a selection of Core UI reports

Migrate a selection of your Core UI reports to Platform Analytics experience.

Before you begin
Role required: admin, report_admin, or dashboard_admin.

About this task
Users can find these migrated reports in the Platform Analytics library. The original report is labeled Active=False.

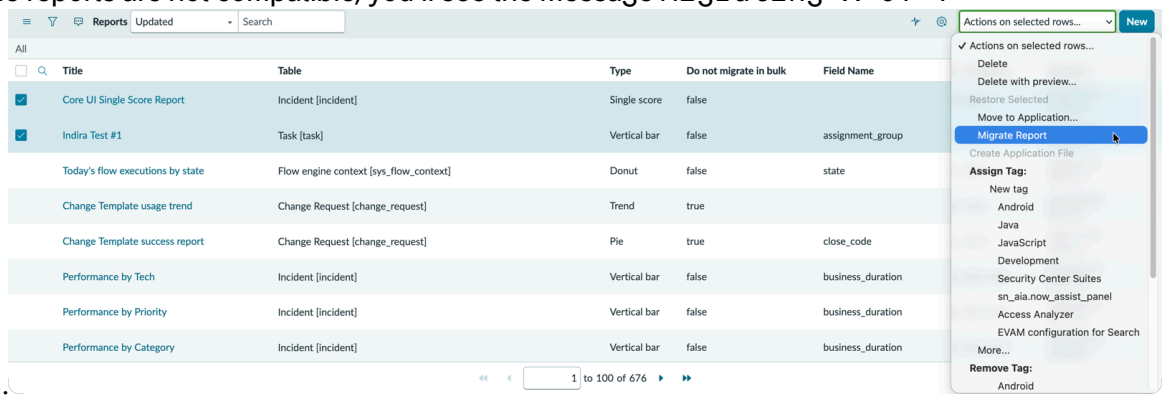
Note: You cannot use update sets to move the migrated material from a non-production instance to a production instance. Test the migration on the non-production instance and then use Migration Center functionality to migrate the production instance.There is no automatic redirection from Core UI reports to the migrated data visualization because dashboards that use the Core UI report still require access to it for editing purposes.

If you change a Core UI report and migrate it again from `sys_report.list`, these changes overwrite any changes made to the associated Platform Analytics experience data visualization.

Procedure
1. Navigate to `sys_report.list`.
2. On the Reports list, select the reports you want to migrate.
3. From the **Action on selected rows** menu, choose **Migrate Report**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If any of the reports are not compatible, you'll see the message `Migrating X of Y reports.`



4. When the migration is complete, select the banner link to view the migrated reports in the Platform Analytics Data Visualization library.

What to do next

Verify that the migrated visualizations have all the features of the Core UI reports. For more information, see Content not migrated or migrated in compatibility mode.

Block migration of specific artifacts

Before you perform full migration, you can flag artifacts to be excluded from the migration process.

Before you begin

Role required: admin.

Procedure

1. Navigate to one of the following tables to select artifacts.

Table	Content
sys_report.list	Core UI data visualizations (reports)
pa_widgets.list	Performance analytics widgets
sys_ui_hp_publisher.list	Interactive filters
pa_dashboards.list	Responsive dashboards

2. Select the **Personalize List** icon ( ) to add columns to the list.
3. Move **Do not migrate in bulk** to the **Selected** column.
4. In the column **Do not migrate in bulk**, change the flag from false to true for the artifacts you want to exclude.
   You can select multiple consecutive or non-consecutive fields. For more information, see Edit multiple records in a list using the list editor .
5. **Optional:** If you can't change the flag, edit the list control for the column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Hover over the **Do not migrate in bulk** column title and expand the **Column options** (
).

b. Select **Configure** > **List Control**.

c. Change the List edit type field from `Disable list editing` to `Save data by rows`.

d. Select **Update**.
You can now change the flag in the **Do not migrate in bulk** column.

Result
When you perform a full data migration, the selected artifacts are excluded. You won't see the excluded content in the associated lists when you trigger the full migration.

What to do next
Navigate to **All** > **Performance Analytics** > **Migration Center** to proceed with migrating the other artifacts on your instance. For more information, see Perform full data migration.

Hide the Platform Analytics library banner

On instances that will not be migrated to Platform Analytics experience, set a system property to hide the banner that links to the Platform Analytics experience library.

Before you begin
Role required: admin

Procedure
1. Navigate to `sys_properties.list`.
2. Create the system property *`com.glide.par.unified_analytics.enabled`*.
For more information, see Add a system property.
3. Set the value of the property to `false`.

Result
Users will not see the banner that directs them to the Platform Analytics experience library.

Content not migrated or migrated in compatibility mode

Most dashboard content is migrated to the new Platform Analytics experience. However, some visualizations, aspects of visualizations, filters, and configurations cannot be migrated. Dashboards with this content are migrated as embedded content (iframes), also known as compatibility mode.

Note: If you have already migrated to Platform Analytics experience, the Migration Center automatically migrates any previously incompatible content that is now compatible when you upgrade releases.

Not migrated

The only generic dashboard configurations that is not migrated is widget title alignment.

Filters that are not migrated

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Group filter
- Debug filter
- Filter user preferences from dashboards
- Cascading filters that support the Choice > Choice configuration
- Filtered list content. For more information on List filters, see Create a filter in List.

Visualization configurations that are not migrated:

- Restriction of dashboard access to specific roles.
- Group edit rights.

  Reports that are shared to groups with edit rights only retain view rights when migrated. Open the migrated visualization in the library and share it with the group again. For more information, see Share a data visualization in the Visualization Designer.

- In the context of bulk migration, visualizations that are used in one or more dashboards lose their header and color configurations. (In Core UI, these are configured at the dashboard level; in Platform Analytics experience, they are configured at the visualization level.)

  In the context of partial migration, visualizations that are used in a single dashboard are migrated with their header and color configurations. Visualizations that are used in multiple dashboards lose their header and color configurations.

Indicators/Breakdown Scorecard elements that are not migrated:

- Show Distribution
- Show Bullet chart

Calendar component elements that are not migrated:

- Year view
- Highlighting based on

Compatibility mode migrations

Migration in compatibility mode means that all of the dashboard's original artifacts are inserted into the migrated dashboard in iframes. The original content is not changed or moved.

Dashboards with any content that is not a Performance Analytics widget, report, or interactive filter, including all custom interactive filters, custom content blocks, gauges, and gadgets, are migrated in compatibility mode, as iframes.

Note: Dashboards migrated in compatibility mode may experience performance issues.

Generic configurations

Generic visualization configurations migrated in compatibility mode:

- Sort by dot-walked fields
- Reporting on variables/questions
- List default drilldown view configured in Report Designer
- Breakdown element = empty for breakdowns based on choice field
- Sort by Performance Analytics breakdown based on choice field order

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Single score with compare X period back
- Pivot scorecard support for element filter
- Group by based on duration fields
- Different follow filters for related indicators on the Indicator scorecard and visualizations
- Hierarchy breakdown support on filters/data visualizations

List scorecard configurations

List scorecard configurations migrated in compatibility mode:

- Show Key indicators
- Filter based on: Best Performing, Worst Performing, Improved, Deteriorated
- Different follow filters on additional indicators

Other scorecard configurations

Scorecard widgets with multiple widget indicators that have different time series aggregations are migrated in compatibility mode.

Reports

Reports migrated in compatibility mode:

- Control
- Trendbox
- Histogram
- Funnel
- Pyramid

Performance Analytics widgets

Performance Analytics widgets migrated in compatibility mode:

- Workbench
- Text Analytics
- Treemap
- Previous period charts
- Spider
- Funnel
- Pyramid
- Relative compare

Roll back migrated dashboards

Convert a migrated Platform Analytics dashboard back to a Core UI dashboard.

About this task

You can return unchanged Platform Analytics dashboards to the Core UI format, but the content is iframed. This is useful when a dashboard has custom charts, custom content blocks, or custom interactive filters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: It is not possible to roll back dashboards created in UI Builder (also known as technical or advanced dashboards).

Before you begin
Role required: dashboard_admin

Procedure
1. Navigate to `par_dashboard.list`.
2. Check one or more boxes next to the names of dashboards on the list.
   Technical dashboards are identified with the phrase Advanced Dashboards in the Experience column. You cannot roll these back to Core UI dashboards.
3. Select Rollback from the **Action on selected rows** menu.

Result
The version of the rolled back dashboard that is shown as **Active** in the Dashboard library is the Core UI version, not the version of the dashboard migrated to Platform Analytics experience version.

Migrate non-responsive dashboards

Non-responsive dashboards that no one has opened migrate to the Platform Analytics experience with empty tabs. Open these dashboards in the Core UI before migration to populate them.

Before you begin
Role required: admin

Unopened non-responsive dashboards have empty canvas pages. This issue affects solutions dashboards as well as dashboards that users create. Opening the dashboard creates the canvas page that the Migration Center looks for. Once the canvas pages are created, re-trigger the migration to create the Platform Analytics experience version of the dashboard.

Procedure
1. Navigate to `pa_dashboards.list`.
2. Open each of the problematic non-responsive dashboards.
3. Perform full data migration to migrate these dashboards to Platform Analytics experience.

Platform Analytics migration tables

The following tables are used in the process of migrating to Platform Analytics. Each row of the bridging tables states the migration type: bulk, owner, list, or upgrade.

Table	Description
par_coreui_migration_bridge_component	Lists reports, PA widgets, and filters that have been migrated outside of a dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
	• Bulk indicates a migration from the Migration Center. • List and Owner indicate partial migrations. • Upgrade indicates a dashboard supported in a bulk migration in the context of an upgrade.
par_coreui_migration_bridge_dashboard	Lists the dashboard migration logs.
par_coreui_migration_bridge_sysauto	Lists the scheduled export logs.
par_coreui_migration_bridge_widget	Lists the elements of a dashboard that have been migrated.

Dashboards in Platform Analytics

Dashboards are canvasses for organizing and sharing data visually. They contain data visualizations, filters, and other visual elements.

Overview of creating and populating Platform Analytics experience dashboards including library content, new visualizations, and filters.

Get started

Explore Guide to the layouts and content of a dashboard and how to find a dashboard in the library	Create, edit, share Procedures for performing the most common dashboard tasks	Configure Set refresh periods and other one-time settings as an owner or administrator
Proactive analytics Insights Automate the extraction of insights from your indicator data sources	Technical dashboards Create dashboards as UI Builder pages, with all of UI Builder's customizability and complexity. Developers only.	Reference Roles and translatable fields

Troubleshoot and get help

- Ask questions and explore other resources for dashboards and Platform Analytics in general in the ServiceNow Community
- Search the Known Error Portal for known error articles
- Contact Customer Service and Support

Exploring Platform Analytics dashboards

Use Platform Analytics dashboards to access, organize, and share data in a visual format.

Dashboard overview

You can find all the dashboards that you have permission to access, dashboards that you own, dashboards that you've bookmarked, and dashboards that have been shared with you by navigating to **All** > **Platform Analytics** > **Library** > **Dashboards**.

For more information, see Dashboards in the library.

Dashboards for users with the admin roles

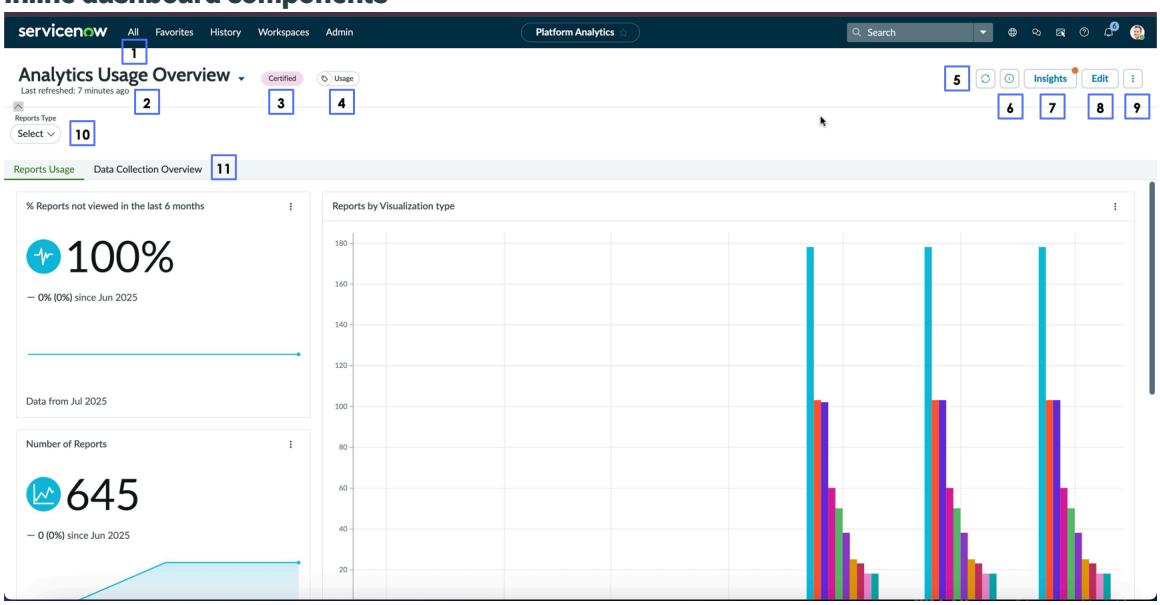
The configuration of the Dashboards page and the data access depends on the user roles. Users without admin roles have limited capabilities, as compared to users with the admin roles. Users with the admin roles can perform such actions as deactivating, activating, deleting, or creating categories.

For more information, see Dashboards for users with admin roles. For more information on the types of admin roles in Platform Analytics, see Platform Analytics roles.

Dashboard components

When you open a dashboard, you can view the components.

Inline dashboard components



1. Dashboard title

Displays the dashboard title. Select the arrow to choose a different dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Refresh information

   Displays the time or duration when the dashboard was last refreshed. Users with admin roles can configure the refresh intervals. For more information, see Configure Platform Analytics dashboard settings.

3. Certification badge

   Whether the dashboard is company-approved and recommended for use.

4. Category badge

   Terms or phrases that describe one or more dashboard categories. This information is provided by the dashboard creator or the analytics_categories_admin.

5. Refresh button

   Button for refreshing all the visualizations on the dashboard.

6. Details button

   Button for displaying the ownership and sharing information about the dashboard. You can view the user, groups, roles, and access permissions. For more information, see Configure Platform Analytics dashboard details.

7. Insights button

   Button for viewing the insights cards. For more information, see Proactive analytics insights on dashboards.

8. Edit button

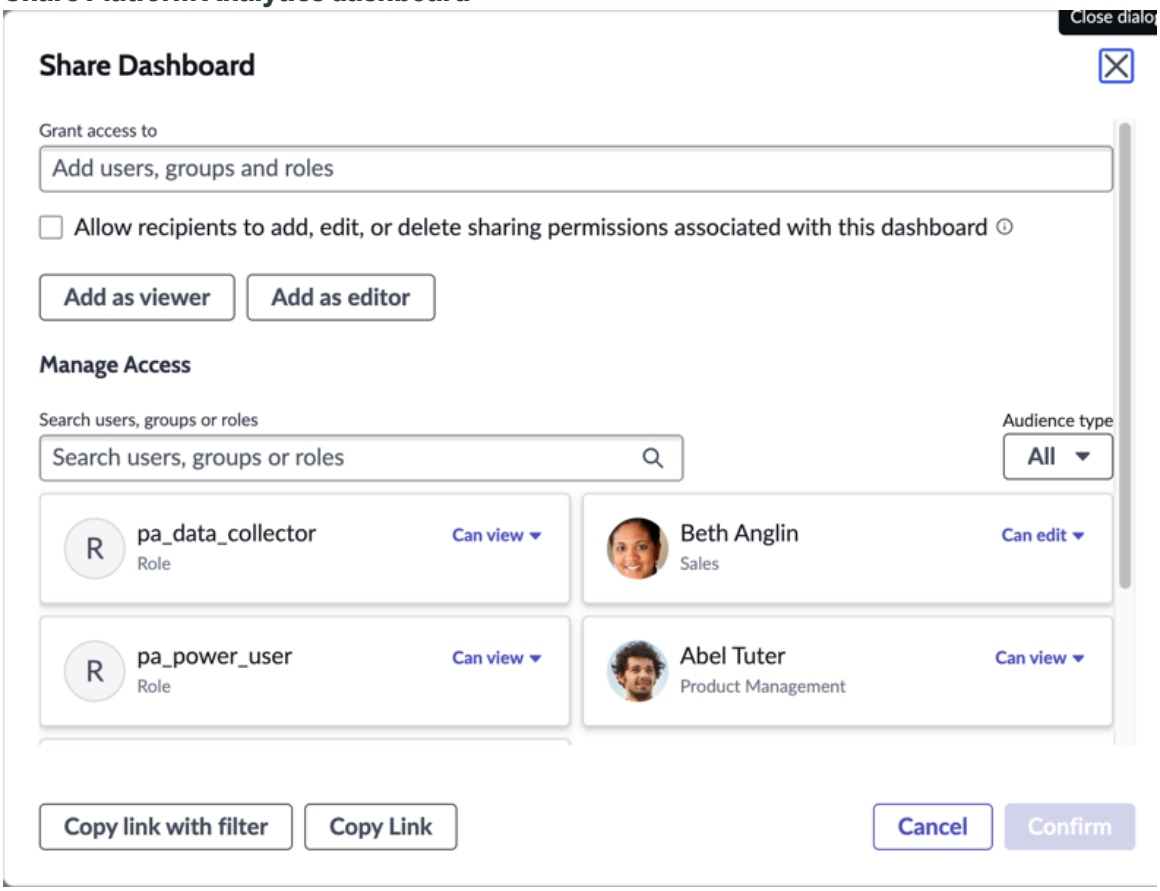
   Button for editing the dashboard. Only users with admin roles, edit permissions, and ownership of the dashboard can edit the contents of the dashboard.

9. More actions button

   Button for creating, duplicating, sharing, printing, bookmarking, clearing the filters for, or deleting the dashboard. For more information on sharing the dashboard information, see Share a Platform Analytics dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Share Platform Analytics dashboard



10. Top stage

    Elements that are visible no matter which tab has the focus. Filters in this section apply to visualizations on all of the tabs.

11. Tabs

    Tabs for managing information on your dashboard and keeping related information in the same place.

Dashboards in the library

Use Platform Analytics dashboards to access, organize, and share data in a visual format. Dashboards contain data visualizations, filters, and other visual elements.

Dashboards overview

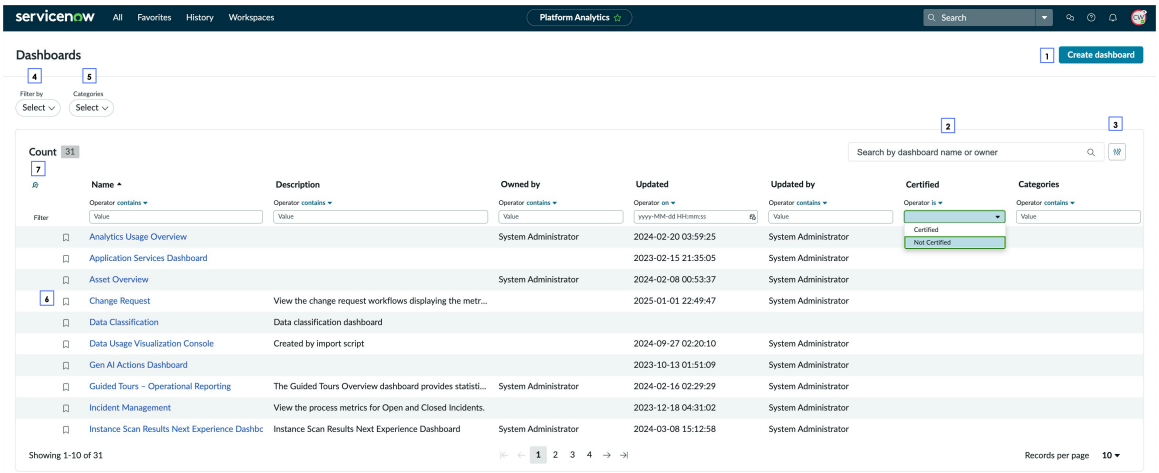
To find dashboards in Platform Analytics, navigate to the library at **All** > **Platform Analytics** > **Library** > **Dashboards**. By installing and enabling Unified Analytics on your instance, you can find both Core UI and Platform Analytics experience dashboards in the Platform Analytics Dashboards library.

The configuration of the Dashboards page and the data access depends on the user roles. Users without an admin role have limited capabilities, as compared to the users with an admin role. For more information on the types of admin roles in Platform Analytics, see Platform Analytics roles. To know more about the dashboards for users with the admin roles, see Dashboards for users with admin roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows what a user can see in the Platform Analytics Dashboards library for users without an admin role.

Platform Analytics Dashboards library for users without a platform analytics admin role



The following table shows the common elements that users with and without the admin roles can view in the Dashboards page. Refer to the numbered call-outs in the image and their descriptions in the table.

Common dashboard elements for users with and without admin roles

No.	Field (or) Element Name	Description
1	**Create Dashboard**	Option for creating dashboards. For more information on creating dashboards, see Create a dashboard with the in-line editor.
2	**Search**	Option for searching dashboards by name or owner.
3	**Personalize list**	Option for adding or removing columns in the Dashboards list.
4	**Filter by**	Option for filtering the Dashboards list to display the data based on the following conditions: • **Bookmarked**. Your bookmarked dashboards. By bookmarking your dashboards, you can find them. For more information about bookmarking dashboards, see Bookmark a Platform Analytics dashboard. • **Certified**. Dashboards that an administrator has certified (company approved and recommended for use). For more information, see Certify a Platform Analytics dashboard. • **Owned by me**. Dashboards that you own. • **Recently opened by me**. Dashboards that you recently opened. • **Shared with me**. Dashboards that other users have shared with you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common dashboard elements for users with and without admin roles (continued)

No.	Field (or) Element Name	Description
5	**Categories**	Option to view and select the available and applied categories for dashboards. If you're a user with the platform_analytics_admin privileges, you can create and customize the categories for the dashboards. For more information on creating dashboard categories, see Create dashboard categories.

6	**Dashboards list**	List of all dashboards. You can personalize and also sort the list by Name, Description, Views, and Certified.
		
		All Users (with and without an admin role) can view the following columns:
		• Name: Name of the dashboard.
		• Description: Description of the dashboard.
		• Owned by: Name of the creator/owner of the dashboard.
		• Updated: Date and timestamp when the dashboard was last updated.
		• Updated by: Name of the user who last updated the dashboard.
		• Certified: Certification status of the dashboard:
		  ○ Certified: Selected if the dashboard is company approved and recommended for use.
		  ○ Not Certified: Selected if the dashboard isn't company approved and not recommended for use.
		• Categories: Categories that are associated with the dashboard.

7	**Column Filter**	Option for displaying the column filters in the dashboards to filter the data in the columns based on the specified condition. By default, the **Column Filter** is turned off.

Dashboards for users with admin roles

Use Platform Analytics dashboards to access, organize, and share data in a visual format. Dashboards contain data visualizations, filters, and other visual elements.

Dashboard overview

To find dashboards in Platform Analytics, navigate to **All** > **Platform Analytics** > **Library** > **Dashboards**. For users with admin roles, the dashboards page includes tools that are designed to help administrators efficiently manage the dashboards. Administrators can monitor the usage, perform dashboard-specific tasks, such as deleting or deactivating dashboards, and also identify the key insights with filters.

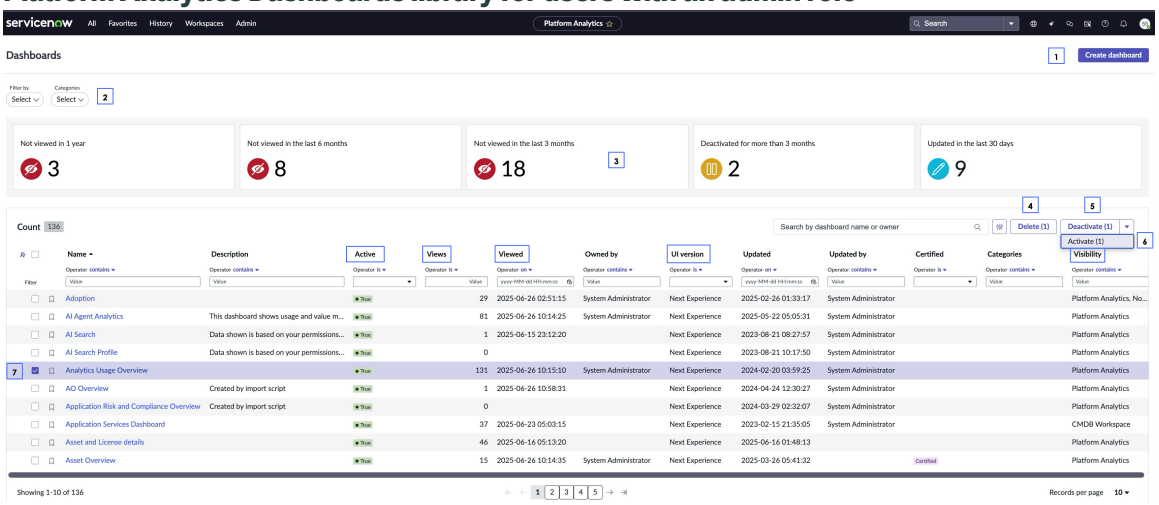
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dashboards for users with admin roles

The following example shows the Dashboards library that includes all the common and additional elements that are visible to the users with admin and dashboard_admin roles only. See Additional dashboard elements for users with admin roles table for descriptions.

Platform Analytics Dashboards library for users with an admin role



The following table shows the features that the Platform Analytics Dashboards page offers to users with the admin roles. Refer to the numbered call-outs in the image and their descriptions in the table.

Additional dashboard elements for users with admin roles

No.	Field (or) Element name	Description
1	**Create Dashboard**	Option to create dashboards. As a user with the admin role, you can create Core UI dashboards on the instances with Platform Analytics experience enabled.
2	**Categories**	Available and applied categories for dashboards. As a user with an admin role, you can create and customize the categories for the dashboards. For more information on creating dashboard categories, see Create dashboard categories.
3	**Dashboard Single Scores**	Dashboard scores. These scores highlight the key dashboard statistics that are based on the following filter conditions: • Not viewed in 1 year • Not viewed in the last 6 months • Not viewed in the last 3 months • Deactivated for more than 3 months • Updated in the last 30 days

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Additional dashboard elements for users with admin roles (continued)

No.	Field (or) Element name	Description
		Select a score to filter and display the dashboards that match the condition.
4	**Delete**	Option to delete the selected dashboards.
5	**Deactivate**	Option to deactivate the selected dashboards.
6	**Activate**	Option to activate the selected dashboards.

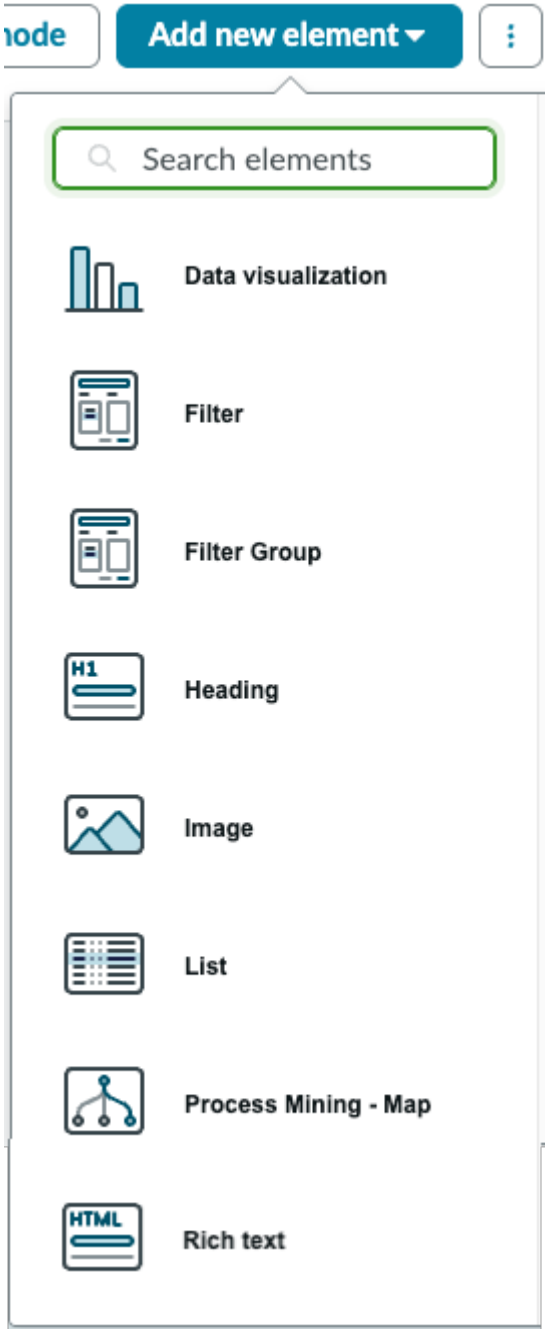
7	Dashboard columns	Additional columns that you can see if you're a user with the admin role:
		• Active dashboards: Status of the dashboard:
		  ○ Active
		  ○ Inactive
		• Views: The number of views for the dashboards in the library.
		• Viewed: The date and time when the dashboard was last viewed.
		• UI version: The UI version of the dashboard:
		  ○ Next Experience
		  ○ Core UI
		• Visibility: The workspaces to which the dashboard can be added. For more information about adding a dashboard to a workspace, see Add a dashboard to a Dashboards page.

Dashboard elements

Elements refer to the visual objects you can place on a dashboard, including filters.

Dashboards contain a combination of visual elements to show data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Data visualization

Data visualizations enable you to present a visual representation of current instance data or temporary data that you've imported. Data visualizations include visualizations that you create in the dashboard designer and data visualizations from the library.

Important: You cannot place reports or Performance Analytics widgets on a Platform Analytics dashboard. You must create data visualizations instead.

Filter

Filters enable users to filter the visualizations on a dashboard based on specified criteria. You can put filters either on the individual tabs or above the tabs so that the filter applies to elements every tab. Filters include both data filters and domain filters. You can create filters in the dashboard designer or select them from the library.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filter group

A filter group is a set of filters that you can apply simultaneously. Use when you have multiple filters that can apply to multiple visualizations.

Heading

Headings provide a place for text at the top of a dashboard or section of a dashboard. Formatting for headings is limited to six heading levels.

Image

Image elements hold static or animated images on the dashboard.

Process Mining - Map

Map the different states that are part of your process and the transitions between those states. See which states the objects of the process are in and the speed with which they change state. Requires an existing Process Mining project.

List

Lists show table records. They support Platform Analytics filters and drilling down from data visualizations by default.

Rich text

Rich text elements hold text that you can format either as text or as html, including font selection, text size, highlighting, and hyperlinks. Note that to edit in HTML markup, you open the HTML editor in the Configuration panel, and select the code tag icon < >.

Default element dimensions

Each element has a default height and width when you place it on the stage to configure. Select and drag an element's handlebar to resize it.

Filter

Six columns by three rows

List, Multipivot, and Indicator Scorecard visualizations

48 columns by 18 rows

All other components

11 columns by 11 rows

Add visual elements to an in-line dashboard

Differences between Core UI and Platform Analytics dashboards

When the unified analytics property is enabled, Core UI dashboards and dashboards in Platform Analytics can coexist in your instance. Use this reference to distinguish between them.

Both Core UI and Platform Analytics dashboards enable you to show visual components in a shareable canvas. When the *com.glide.par.unified_analytics.enabled* property is enabled, all dashboards are available.

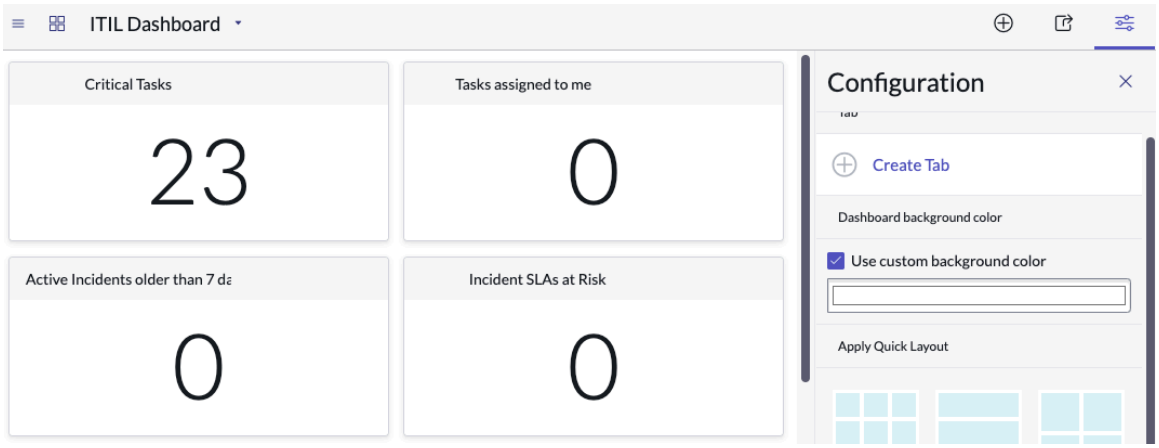
On migrated instances, your Core UI data, existing dashboards, reports, interactive filters, and Performance Analytics widgets are moved to Platform Analytics. The result is a single set of visualizations and unified filters for all data sources. For more information, see Platform Analytics Migration Center.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Core UI dashboards

Core UI dashboards are those created in the classic UI featuring visualizations created in Report Designer and Performance Analytics content created using PA widget forms.

Dashboard example



Menu path

- When Platform Analytics is not enabled, navigate to **All** > **Self-Service** > **Dashboards**.
- When Platform Analytics is enabled, navigate to **Platform Analytics** > **Library** > **Dashboards**.

When you edit Core UI dashboards and their content, you do so in the Core UI tools including Report Designer. For more information, see Reporting, dashboards, and Performance Analytics in the Core UI.

Platform Analytics dashboards

Platform Analytics dashboards are created using either UI Builder or the inline dashboard editor. These dashboards support all objects in the element library, such as data visualizations, filters, and rich text. In a tabbed dashboard, these contents can be placed in a tab or above the tabs. Filters placed above the tabs apply to content on all the tabs.

When you create Platform Analytics dashboards, you can add any existing element that you have rights to, or create a new element from within the dashboard. These elements include data-agnostic visualizations based on indicators, table data, MetricBase data, and Usage Insights.

Platform Analytics dashboards also provide Proactive Insights that support more informed decision making. Insights explore correlations and highlight potential changes and issues before they turn into problems. For more information, see Proactive analytics insights on dashboards.

Dashboard example

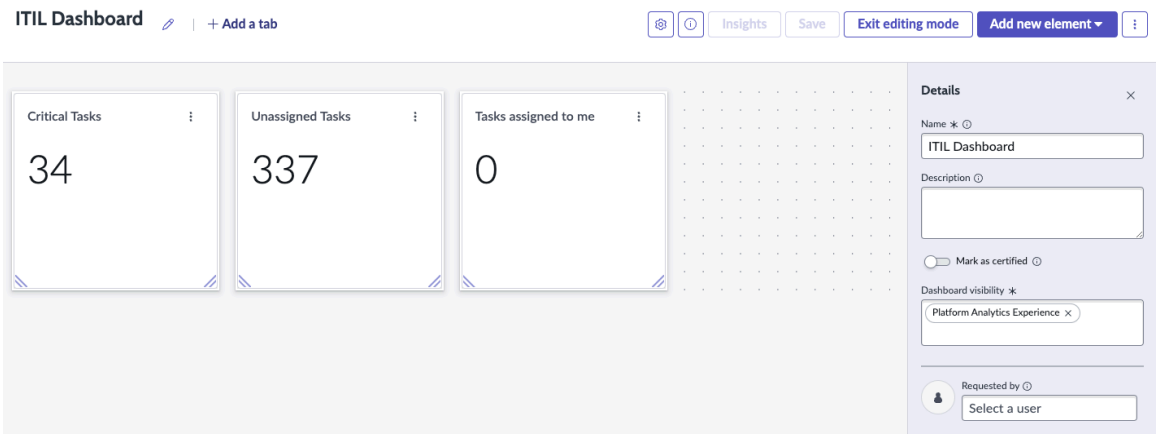
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Menu path

All > **Platform Analytics** > **Library** > **Dashboards**

Different approaches to dashboards

Depending on your needs, you have four different ways to present a collection of data visualizations and filters.

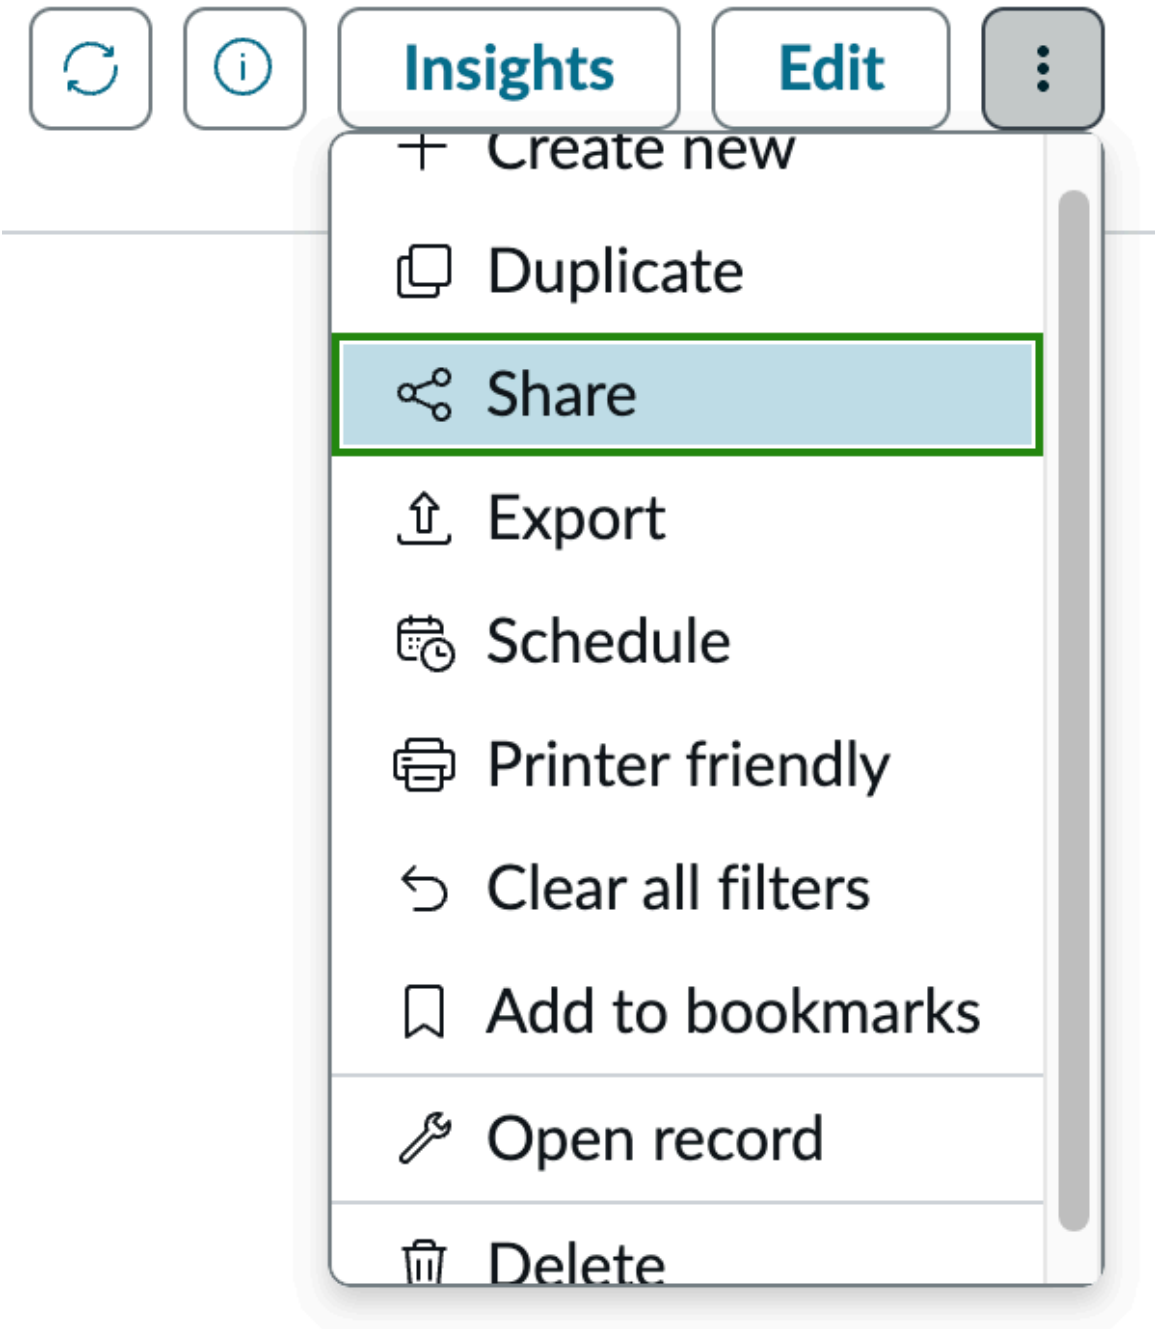
- Create the data visualizations and the dashboards entirely inside the Platform Analytics experience. This approach does not require a developer role or special technical knowledge, and probably should be explored before you try a more complex solution.
- Create data visualization components in a generic UI Builder page, along with filters and other components. This approach gives you the most freedom as a developer, but also requires the most configuration.
- Create the data visualizations and the dashboards inside the Platform Analytics experience, but then place the dashboards inside UI Builder pages using the Dashboard page template. This approach lets you use the convenience and special features of the Platform Analytics experience to create dashboards, data visualizations, and filters in your own experiences/ workspaces. This approach also gives you the freedom to customize the page configuration partially. For more information, see Creating Platform Analytics pages in your own workspace.
- Create a technical dashboard and populate it inside UI Builder. This approach is almost the same as creating your own UI Builder page from scratch, but the dashboard is available in the dashboard library, has dashboard details, and can be shared like other dashboards. For more information, see Technical dashboards.

Common dashboard tasks in the in-line editor

See how to create, edit, share, and delete Platform Analytics dashboards, along with other common tasks. Most tasks are launched from the same menu.

The majority of tasks you need to perform on a dashboard are available in the dashboard's **More actions** menu, including the creation of another dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Anyone can duplicate, print, or bookmark any dashboard to which they have access. If you have filters on the dashboard, you can clear all their values in one action. If you own a dashboard, you can also share or delete it. When you share a dashboard, you can let the user with whom you share the dashboard edit it or share it with more users. Dashboard administrators (dashboard_admin role) and ServiceNow AI Platform admins can perform any of these actions on any dashboard, or open the underlying PAR Dashboard [par_dashboard] record.

Create a dashboard with the in-line editor

In the Platform Analytics experience, you can create shareable dashboards with data visualizations, filters, and other elements. You can create elements and add existing elements from the inline editor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

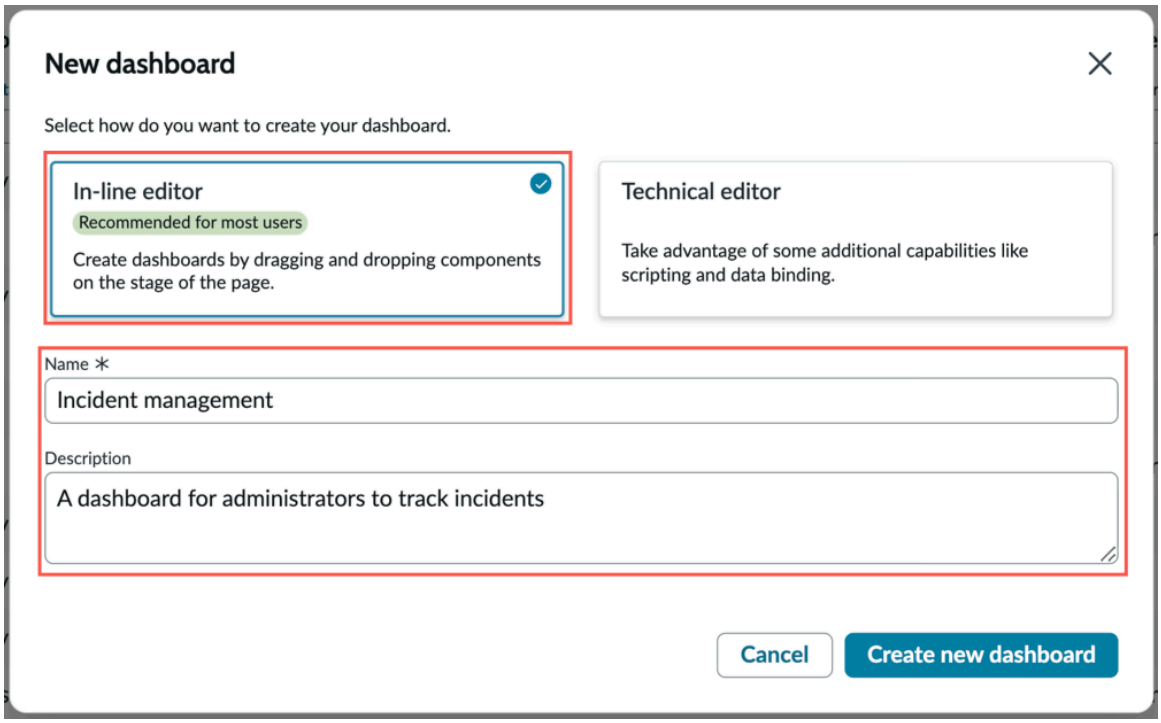
Save your work regularly.

Role required: Any user with an internal role can create dashboards with the inline editor.

Note: Data visualizations based on table data are automatically shared with users that you share a dashboard with.

Procedure

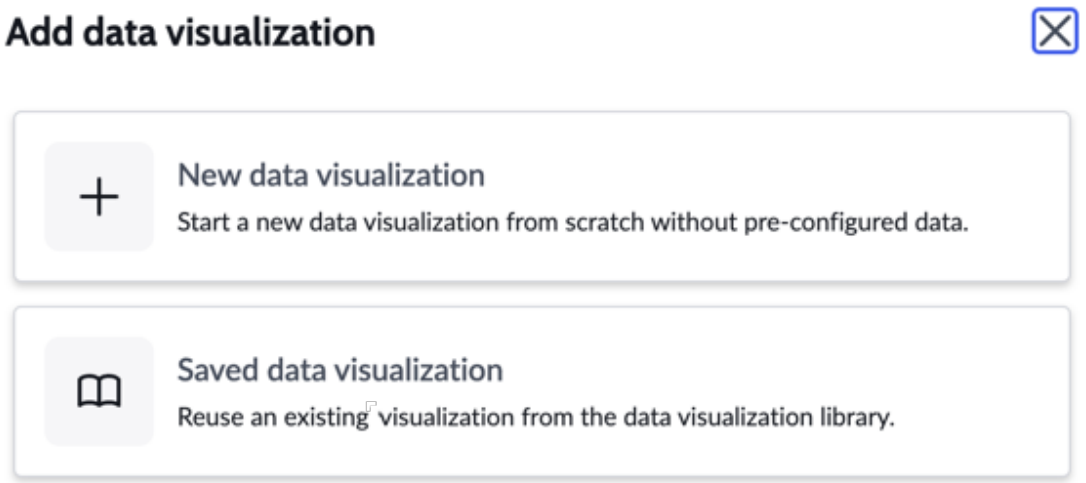
1. Navigate to **All** > **Platform Analytics** > **Library** > **Dashboards**.
2. Select **Create new dashboard**.
3. Select the **inline editor** tile and give the dashboard a name and a description.
   If you want to use scripting, data binding, and other advanced capabilities, select the **Technical editor** tile to continue in UI Builder. This editor is available only to users who can access UI Builder (ui_builder_admin role). If you do not have this role, go to step 6. For more information about the technical editor, see Technical dashboards.
4. Select **Create new dashboard**.



5. Choose **inline editor**.
   The Technical editor option opens a page in UI Builder that is treated as a dashboard, with a list of available components. Creating dashboards in UI Builder is recommended for developers. For more information, see UI Builder and Create a technical dashboard in UI Builder.
6. Give the dashboard a meaningful name and description.
7. Select **Add new element** to add content to the dashboard.
   See Exploring Platform Analytics dashboards for information about what you can add to a dashboard.

   When you add a data visualization, select **New data visualization** to create a visualization from scratch or **Saved data visualization** to choose one from the library. When you add a filter, select **New filter** to create the filter without preconfigured data or **Saved filter** to reuse an existing filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. Select the information icon (ⓘ) to open the Details panel and provide a name and description for your dashboard.
9. Arrange the data on the canvas to make it useful.
   You can click and drag from the corners of the elements to resize them on the canvas.
10. Select **Add a tab** to create room for more information on additional tabs.
11. Select **Save** early and often.
    The dashboard inline editor doesn't automatically save your dashboard when you're creating it. Be sure to save your work regularly.

What to do next

- Edit in-line Platform Analytics dashboard elements
- Configure Platform Analytics dashboard details

Edit Platform Analytics dashboards

You can edit dashboard and dashboard tab information in the inline editor. If the dashboard has been shared, any changes you make are applied globally.

Before you begin

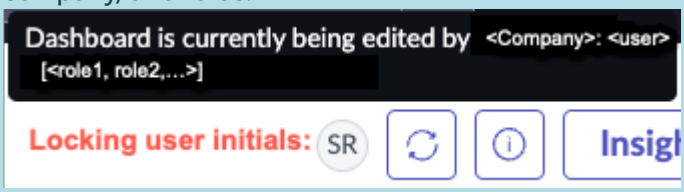
You can edit the details of dashboards created in the inline editor and in the technical editor in the Platform Analytics experience. When you edit elements in dashboards created in the technical editor, you're redirected to UI Builder.

Role required: dashboard_admin for all dashboards, or any role for dashboards that you own or ones that you have been given the right to edit. See Platform Analytics dashboard roles for more information about viewing and editing rights on dashboards.

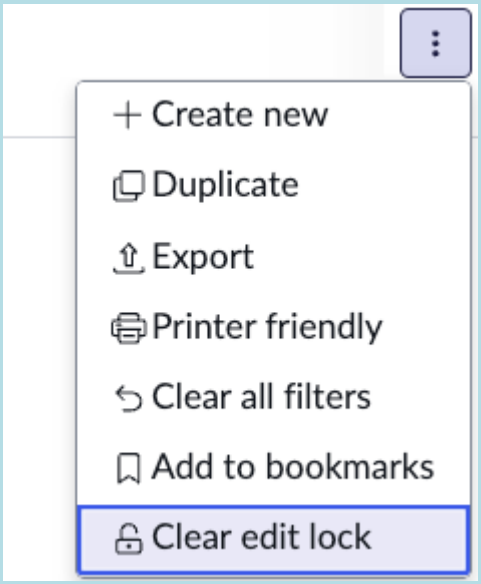
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Important: By default, dashboards are subject to edit lock. Only one person at a time can have the same dashboard in edit mode. If you are viewing a locked dashboard, you will not have an **Edit** button even with edit rights. You will see the locking user's initials next to the **Refresh** and **View dashboard details** icons. Hover on the initials to see the user's name, company, and roles.

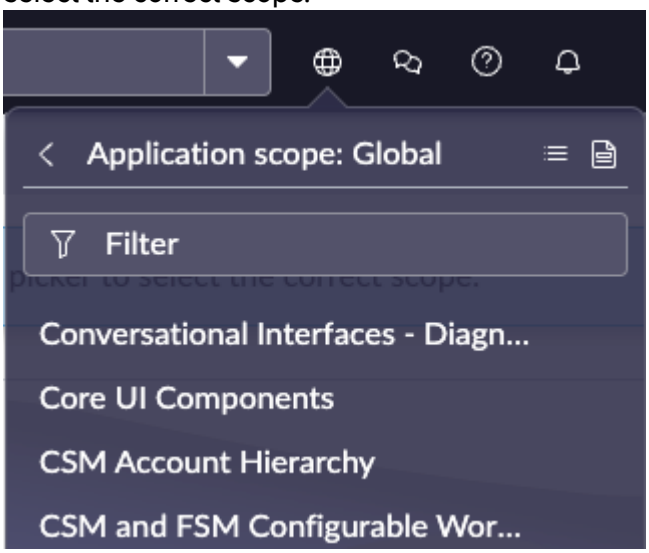


The **More actions** menu includes the option to clear the edit lock. Use this option with caution.



Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Dashboards**.
2. Select the dashboard that you want to edit.
   If you are in a different application scope than the dashboard, use the application picker to select the correct scope.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Perform any of the following actions.

Action	Steps
Edit dashboard details	To edit the details of a dashboard created in the inline edi tor: **a.** Select the information button ( ). **b.** Select the **Edit** button ( ) to put the dashboard into ed it mode. **Note:** If you don't see the **Edit** button, either you don't have the right to edit the dashboard or it is in edit lock. **c.** Edit the details of the dashboard and then select **Exit editing mode**. To edit the details of a technical dashboard: **a.** Select the information button . **b.** Select the arrow next to the **Edit in UI builder** button and then select **Edit dashboard details** to put the dashboard into edit mode. **Note:** If you don't see this option, you don't have the right to edit the dashboard.  **c.** Edit the details of the dashboard and then select **Exit editing mode**. For more information, see Configure Platform Analytics dashboard details.
Configure the dashboard lay out	Select and drag an element's handlebars to resize it. Select and drag an entire element to move it around the dashboard layout. Elements include data visualizations, fil ters, and other dashboard content.
Add a tab to a dashboard	Select **Add a tab**. A tab labeled `Untitled` is added next to any existing tabs. When you add your first tab to a dash board, there's a new part of the layout below the title and above the tabs. Add elements above the tabs that are visi ble no matter which tab has focus. Select the pencil icon ( ) to rename the tab.
Reorder a dashboard tab	You can reorder tabs by dragging and dropping them. You can also reorder dashboard tabs using keyboard actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Steps
	a. Select the **Edit** button (Edit) to put the dashboard into ed it mode. **Note:** If you don't see the **Edit** button, you don't have the right to edit the dashboard. **b.** Use the TAB key to move the focus to a dashboard tab. **c.** Use the LEFT and RIGHT arrow keys to select a tab to move. **d.** Use the SHIFT+LEFT arrow or SHIFT+RIGHT arrow com mand to move the selected tab left or right. **e.** Select **Save**.
Duplicate a dashboard tab	You can duplicate a tab on the current dashboard. **a.** Select the **Edit** button (Edit) to put the dashboard into ed it mode. **Note:** If you don't see the **Edit** button, you don't have the right to edit the dashboard. **b.** Select the More actions menu icon ( ) next to the tab's name and choose **Duplicate**. A new tab with the same content as the duplicated tab opens with the name Untitled. Choose the pencil icon to re name the tab.
Delete a dashboard tab	**a.** Select the **Edit** button (Edit) to put the dashboard into ed it mode. **Note:** If you don't see the **Edit** button, you don't have the right to edit the dashboard. **b.** Select the More actions menu icon ( ) next to the tab's name and choose **Delete**. **Note:** There's no confirmation message. The tab dis appears from the dashboard.
Rename a tab	**a.** Select the tab to make it active. **b.** Point to the tab name and select the pencil icon ( ). **c.** Type the new name then press Enter.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Steps
	Note: If you rename a tab on a dashboard that has been translated, the translations are replaced with the new English tab name. To translate the new name: **a.** Navigate to **User Menu** > **Preferences**. **b.** On the **Display** tab, select the target language. **c.** On the translated dashboard, rename the tab with the translation of its new name.
Configure the refresh settings	Role required: admin. **a.** Select the **Edit** button (Edit) to put the dashboard into ed it mode. **Note:** If you don't see the **Edit** button, you don't have the right to edit the dashboard. **b.** Select the Dashboard Settings button ( ) to open the Settings panel. **c.** Select **Show refresh information** to show the time of the last refresh under the dashboard's title. **d.** Select **Scheduled repetition** to configure the number of minutes that the dashboard is automatically refreshed. The minimum refresh interval is 10 minutes.
Configure background colors	**a.** Open the Background Color menu to show the preconfig ured colors. **b.** Choose an existing color or select the Color Palette icon ( ) to open the palette. Specify Hex or RGBA values, or choose from the color picker.
Configure Insights	Choose whether and which analytics to show in the **In sights** section. When you select **Show insights panel**, an Insights button is added to the dashboard and the selected analytics op tions are shown. For more information, see Proactive analyt ics insights on dashboards.

Add visual elements to an in-line dashboard

Populate your dashboard with a selection of widgets, including data visualizations and filters.

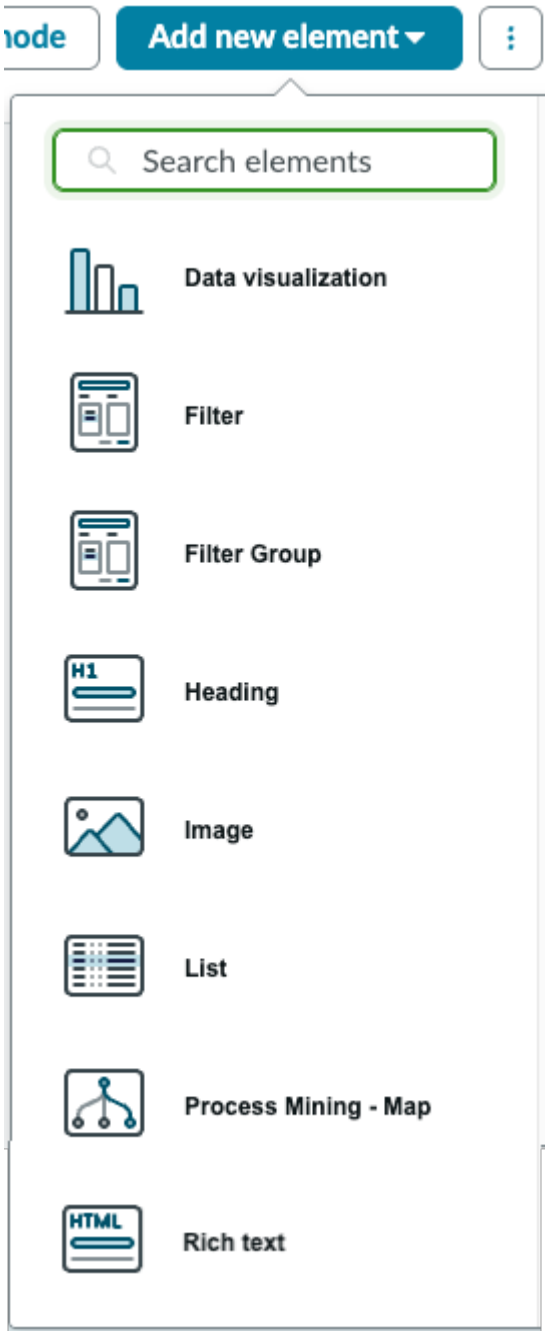
Before you begin

Role required: dashboard_admin for all dashboards, or any role for dashboards that you own or ones that you have been given the right to edit. See Platform Analytics dashboard roles for more information about viewing and editing rights on dashboards.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Dashboards**.
2. Either create a dashboard or open the dashboard you want to edit.
3. If the dashboard has an **Edit** button, press it.
   A new dashboard is automatically in editing mode. A technical dashboard has an **Open in UI Builder** button instead of an **Edit** button. For more information about technical dashboards, see Technical dashboards.
4. Expand **Add New Element**.



5. Select an element to add.
   For a brief overview of dashboard elements, see Dashboard elements.
6. If you are adding a data visualization or a filter, select whether to create a new element or use one saved in the relevant library.
7. If you are creating a new element, configure it, following one of these tasks:

- Creating data visualizations
- Create or add a filter on an inline dashboard
- Create a filter group
- Configure a Process Mining map on a dashboard

Edit in-line Platform Analytics dashboard elements

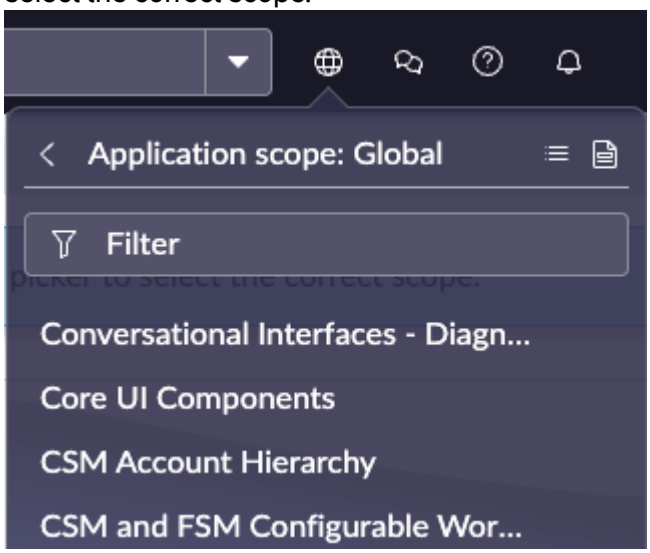
You can edit the contents of a dashboard or dashboard tab, including data visualizations and filters. Because dashboards are shared, any changes you make are applied globally.

Before you begin

Role required: dashboard_admin for all dashboards, or any role for dashboards that you own or ones that you have been given the right to edit. See Platform Analytics dashboard roles for more information about viewing and editing rights on dashboards.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Dashboards**.
2. Open the dashboard you want to edit.
3. Select **Edit** to put the dashboard into edit mode.
4. If you are in a different application scope than the dashboard, use the application picker to select the correct scope.



5. Focus on the element you want to edit.
   A menu appears in the element header. The selection of actions to take depends upon your roles.

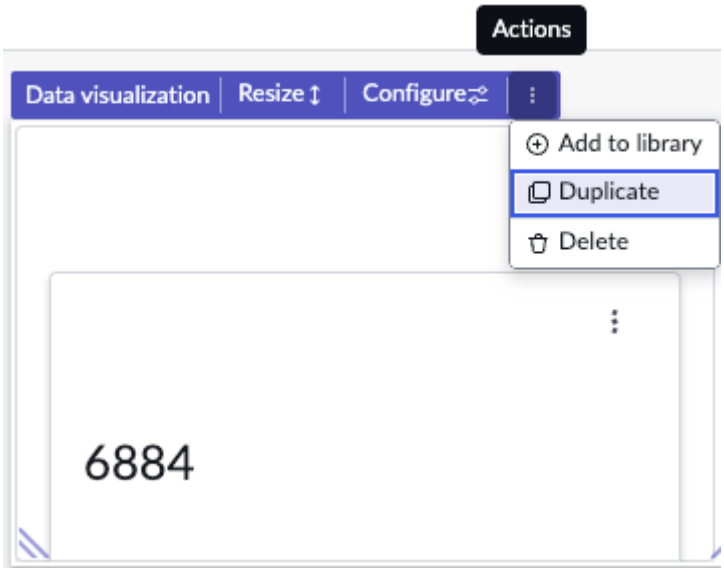
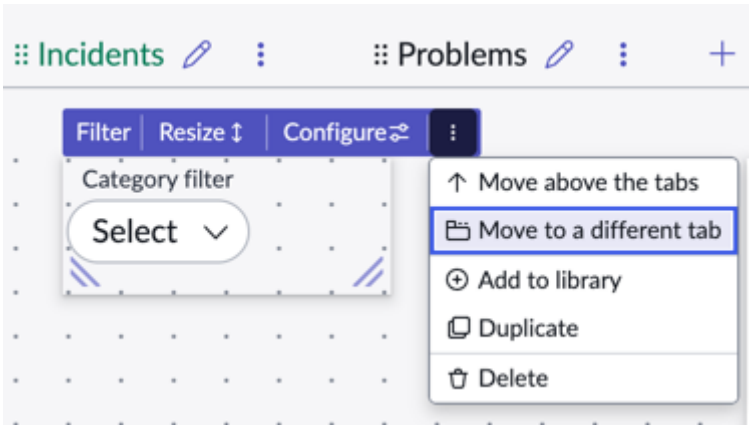
Actions menu of data visualization for itil user



Actions menu of filter for admin user, multi-tab dashboard



6. Perform any of the following actions on the element.

Action	Steps
Configure an element	Focus on the element and select **Configure**. The configura tion panel opens. Configuration options depend on the element type. For da ta visualizations and filters, they also depend on the visual ization or filter type, respectively. For more information, see Creating data visualizations or Filters in Platform Analytics. **Note:** There are role and ownership requirements for editing a component that is shared from a library. If you see a message in the configuration panel that you are not allowed to edit an element, you might be able to create a local version that is not linked to the library and edit it. For more information, see Edit a copy of a shared dashboard element.
Resize the element	Focus on the element. To increase its height, press **Resize**. To decrease its height, press Shift-**Resize**. To change its

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Steps
	 **c.** When you choose **Move to a different tab**, choose the tab and select **Move**.
Configure a data visualization to follow or not follow filters	Data visualizations follow filters by default. A data visual ization follows filters in the same tab as itself or above the tabs. Data visualizations either follow all such tabs that tar get their data sources, or none. For configuration instructions, see Configure a data visual ization to follow filters or not.
Set drilldown options	Choose what happens when a user selects a visualization or one of its segments. The procedure depends on the type of dashboard. The default drilldown from a dashboard opened in Platform Analytics experience or any other work space/experience is to Core UI artifacts. ○ For a dashboard created in the inline editor and viewed in Platform Analytics experience, choose a preconfig ured Chart Interaction. For more information, see Chart interactions in a data visualization. ○ For a dashboard created in the inline editor and viewed in a workspace/experience other than the Platform Ana lytics experience, see Configure custom redirection from a dashboard component. The inline dashboard first has to be enabled to be viewed in the workspace, and then has to be referenced from a page built from the Dash boards page template, as described in Add a dashboard to a Dashboards page. ○ For a technical dashboard, see Add a drilldown event to a data visualization on a technical dashboard.

Related topics

Share a Platform Analytics dashboard

Edit a copy of a shared dashboard element

To configure a shared element that you added to a dashboard from a library, make a local copy that is not linked to a library. You only have to do this if you do not have permission to edit the version in the library.

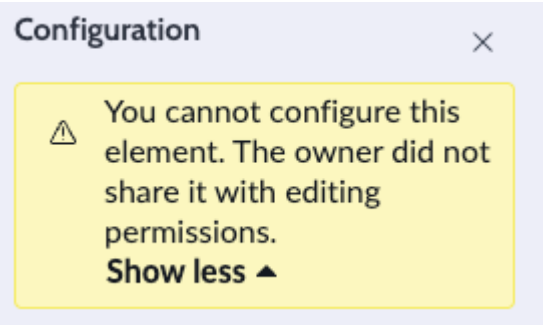
Before you begin

Role required: Any

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You may find yourself needing to reconfigure a data visualization or a filter on a dashboard to which you have editing rights. However, if it is a visualization or filter that is shared from the library, you would be editing the library copy that other people use. You might not have the permissions to do so. In this case, you see a notification that the owner has not shared the element with editing permissions.

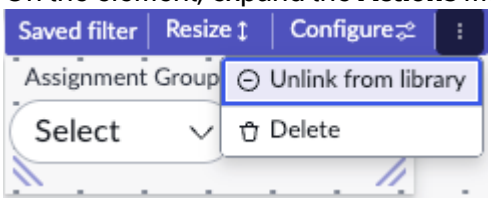


However, as long as you can edit the dashboard, you can unlink a visualization on the dashboard from the library. Then you have a local version that you can edit freely.

Note: If you have the right to edit a shared element, you are given the choice to change the configuration in the library, which affects all dashboards that contain it, or to create a local copy. You do not need to unlink the element.

Procedure

1. Navigate to **Platform Analytics** > **Library** > **Dashboards** and open your dashboard.
2. Select **Edit** to put the dashboard in edit mode.
3. Focus on the element you want to edit.
4. On the element, expand the **Actions** menu.



5. Select **Unlink from library**.

Note: You can unlink a filter or visualization from the library even if you do not have the right to duplicate it.

6. Select **Configure**.
7. Proceed as described in one of the following topics:
   - Creating data visualizations
   - Create or add a filter on an inline dashboard

Add images to Platform Analytics dashboard cards

Distinguish the cards in the dashboard overview with uploaded images.

Before you begin

Role required: ui_builder_admin to enable the image preview; dashboard_admin to add the image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Add an image to the cards in the Platform Analytics dashboard overview.

Procedure

1. Enable the image preview in the Dashboard overview component.

   a. Navigate to **Now Experience Framework** > **UI Builder**.

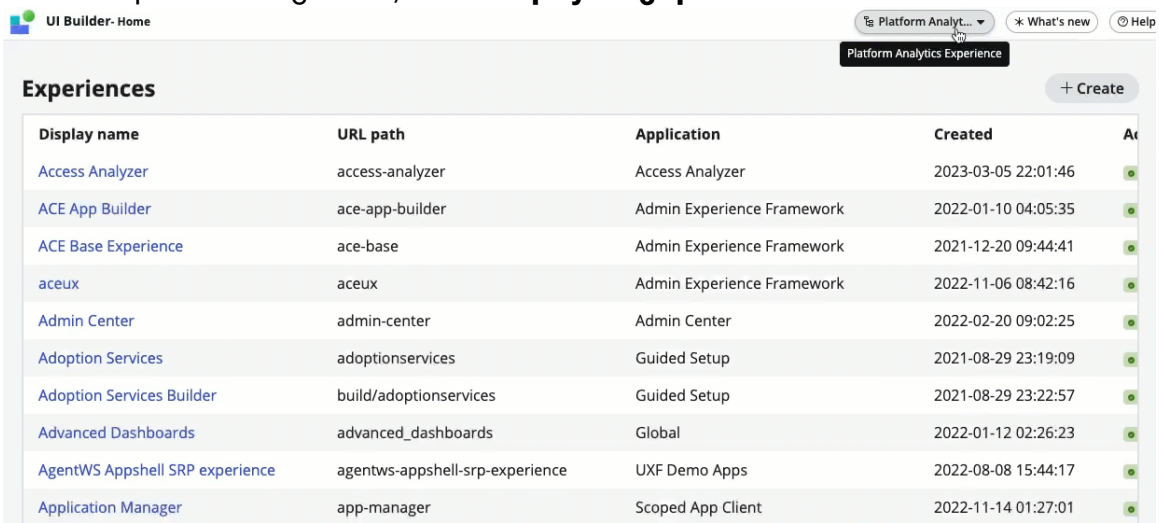
   b. Change the application scope to Platform Analytics.

   c. Select the Platform Analytics experience.

   d. Open the Dashboard Library (Default) item.

   e. In the outline, select **Dashboard overview 1**.

   f. In the component configuration, select **Display image preview**.



2. Navigate to `par_dashboard_user_metadata.list`.

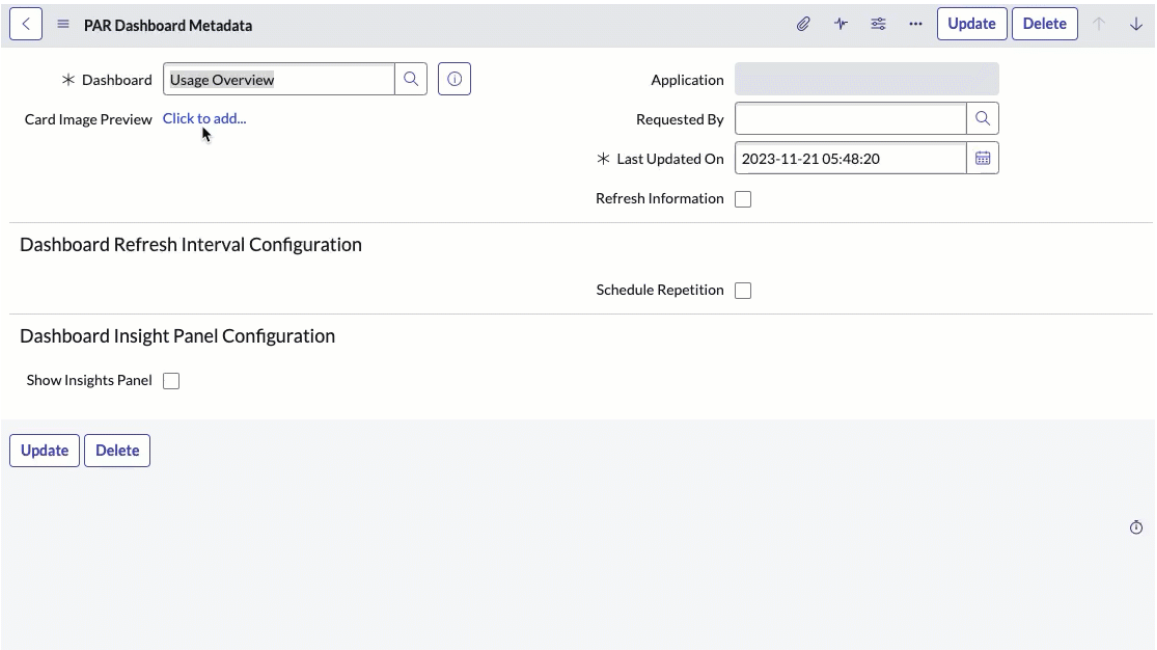
3. Select the **Preview record** icon (ⓘ) next to the dashboard that you want to add an image to.

4. Select **Open Record**.

5. Next to Card Image Preview, select **Click to add** to choose a card background image.
   There's no limit on the size of the image that you can upload, but the card thumbnail area is 260 pixels wide by 110 pixels high.

6. Choose an image file and select **OK**.
   The image appears on the form for the dashboard.

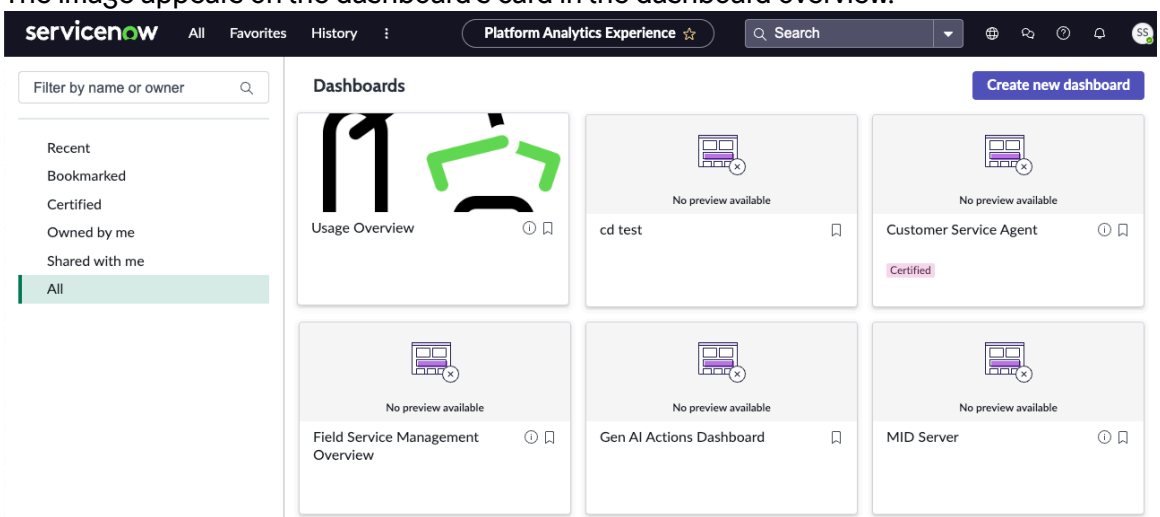
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Select **Update**.

Result

The image appears on the dashboard's card in the dashboard overview.



Share a Platform Analytics dashboard

Share a dashboard with other users, groups, or roles to create a shared view of data that you can use to collaborate. You can grant viewing rights or both viewing and editing rights.

Before you begin

https://player.vimeo.com/video/1062163149?h=25296c447d&badge=0&autopause=0&player_id=0&app_id=58479

Role required: You can share any dashboard that you created. You can share dashboards that have been shared with you, if sharing is allowed. If you have the right to edit a dashboard that has been shared with you, you can pass that right along to whomever you share it with. Users with the admin or dashboard_admin role can share all dashboards.

A role with read access to the Roles [sys_user_role] table is required to share a dashboard with roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Data visualizations based on table data are automatically shared with users that you share a dashboard with.

Edit rights granted by sharing a dashboard do not apply to the underlying data visualizations on the dashboard. View rights granted do not apply to that dashboard's visualizations outside of the dashboard itself.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Dashboards**
2. Select the dashboard you want to share.
3. Select the **More actions** button ( ) and choose **Share**.
   The Share Dashboard dialog opens.
4. In the **Grant access to** field, enter the names of one or more users, groups, or roles you want to share the dashboard with.
   To share the dashboard with roles, you need read access to the Roles [sys_user_role] table.
5. To allow the people you share the dashboard with to share the dashboard as well, select **Allow recipients to add, edit, or delete sharing permissions associated with this dashboard**.
   When you add a user, group, or role as a viewer, they can only share the dashboard as a viewer. When you add a user, group, or role as an editor, they can share the dashboard as a viewer or as an editor.

   Important: The right to share a dashboard or data visualization includes the right to add, edit, and delete sharing rights for any user, group, or role on that dashboard or data visualization. A user cannot use this ability to give themselves or others edit rights if they were not originally given edit rights.

6. Select one of the following options.

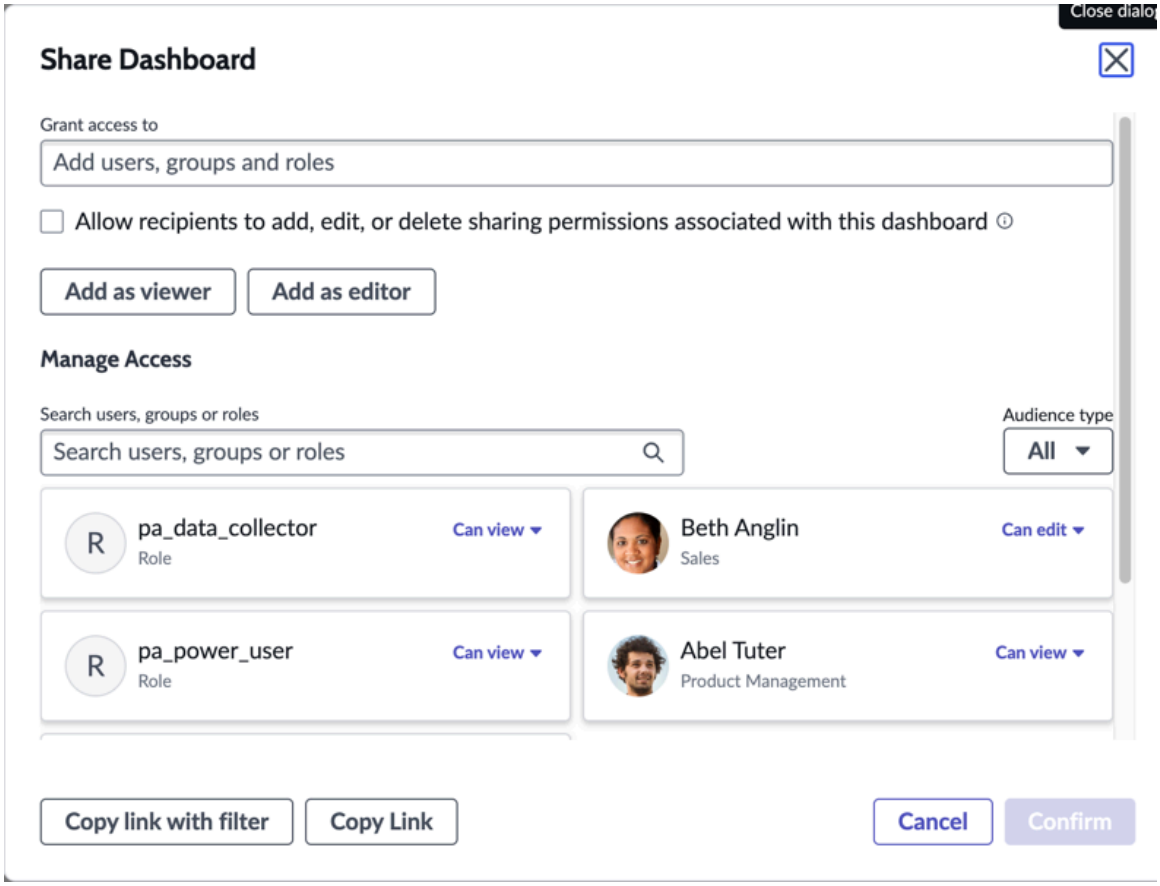
Option	Description
Add as viewer	Grant only viewing rights to the users, groups, or roles you are sharing the dashboard with. They cannot edit it.
Add as editor	Grant editing rights to the users, groups, or roles you are sharing the dashboard with. You must be in the same application scope as the dashboard to add a user as an editor.

7. **Optional:** Select **Copy link with filter** or **Copy link** to copy the dashboard's URL to the clipboard.
   The URL points to the tab that was open when you opened the **Share dashboard** dialogue. **Copy link with filter** also applies the filters as they're configured on the dashboard or dashboard tab.
8. Select **Confirm**.

Result

The roles, groups, and users you have shared the dashboard with appear when you reopen the dialog, along with the rights you have given them.

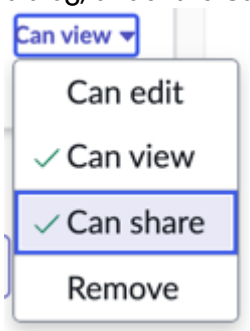
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Tip: The users, groups, and roles with which a dashboard is shared are also visible in the dashboard details. For more information, see Configure Platform Analytics dashboard details.

What to do next

You can change the rights of whom you have shared the dashboard with in the Share Dashboard dialog, under the Can view/Can edit list for each user, group, or role.



Duplicate a Platform Analytics dashboard

Duplicate a dashboard created in the in-line editor so that you can share a modified version with different users.

Before you begin

Role required: At least one role, as well as access to the dashboard.

Note: This task only applies to dashboards created in the in-line editor. To work with dashboards created in UI Builder, see UI Builder.

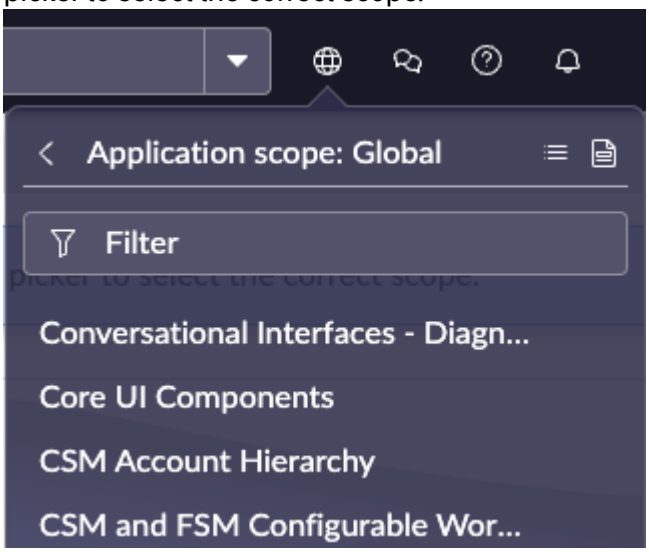
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

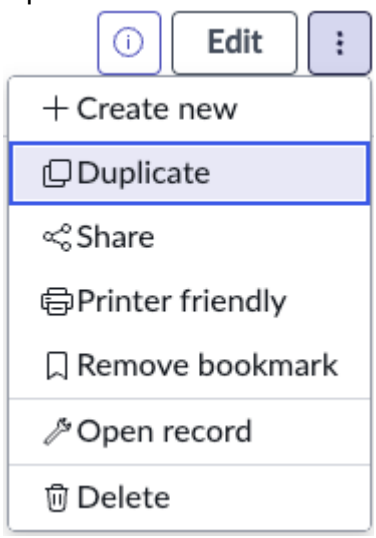
When you duplicate a dashboard, you copy all settings and details of the original. Content that exists locally on the original dashboard is duplicated onto the new dashboard. If the original dashboard contains references to content in a library, such as a shared visualization, the references are duplicated. The role requirements for editing an element in a library apply to the latter.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Dashboards**.
2. Select the dashboard that you want to duplicate.
3. **Optional:** If you are in a different application scope than the dashboard, use the application picker to select the correct scope.



4. Open the More actions menu ( ) and select **Duplicate**.



5. Give the duplicate a unique name and select **Duplicate**.

Result

The dashboard is copied with the new name. The appearance of the dashboard is identical to the original.

Important: The new duplicate is automatically saved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Duplicate a dashboard tab

Duplicate a dashboard tab created in the in-line editor so that you can add related important content. When you add your first tab to a dashboard, there's a new part of the layout below the title and above the tabs. Add elements above the tabs that are visible no matter which tab has focus.

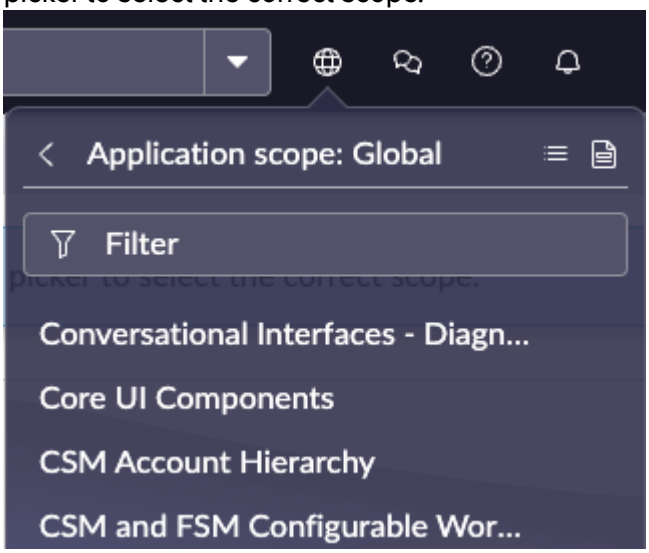
Before you begin

Role required: At least one role, as well as edit rights to the dashboard.

Note: This task only applies to dashboards created in the in-line editor. To work with dashboards created in UI Builder, see UI Builder.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Dashboards**.
2. Select the dashboard with a tab that you want to duplicate.
3. **Optional:** If you are in a different application scope than the dashboard, use the application picker to select the correct scope.



4. Select the **Edit** button (Edit) to put the dashboard into edit mode.
   If you don't see the **Edit** button, either you don't have permission to edit the dashboard, or it is in edit lock.
5. Select **Add a tab**.
   This link is next to the dashboard's title.
6. Open the More actions menu ( ) on the original tab and select **Duplicate**.
   The copy of the tab has the default name **New Tab**. Select the pencil icon ( ) to rename the tab.
7. Give the duplicate a unique name.
8. Select **Save** to save the dashboard with the new tab.

Result

The dashboard tab is copied with the new name. All other aspects of the dashboard remain the same.

Important: The new duplicate tab is saved automatically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Print a Platform Analytics dashboard

To print a dashboard, create a printer-friendly copy and print that copy from your browser.

Before you begin

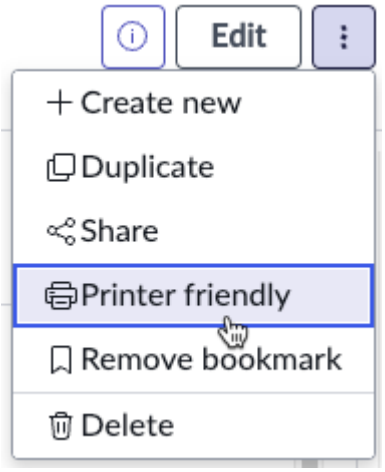
Role required: Any

About this task

Note: For security reasons, List visualizations in the printer-friendly version of a dashboard include only the first several lines of the visualization.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Dashboards**
2. Open the dashboard that you want to print.
3. From the More actions menu ( ), select **Printer friendly**.



A printer-friendly copy of the dashboard opens in a new browser tab.

4. Use your browser functionality to export or print the printer-friendly dashboard copy.

Export a Platform Analytics dashboard

Export a Platform Analytics experience dashboard to PDF or Microsoft PowerPoint.

Before you begin

Role required: Any, if the user has access to the dashboard.

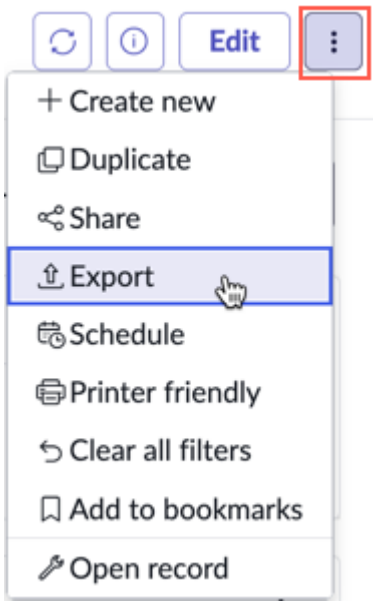
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- This task only applies to dashboards created in the inline editor. Technical dashboards do not have the **Export** option in the **More actions** menu. For more information, see Technical dashboards compared to inline dashboards.
- Calendar report, geomap, and indicator scorecard visualizations are not supported for export. Lists are not supported for export to PowerPoint. These visualization types will not appear in the exported file.
- Only the supported data visualizations and Lists (PDF) are exported, not Headings or Rich Text or any other element.
- Content is not necessarily exported in the order it appears on the dashboard.
- Depending on your entitlements, you may be able export a dashboard conversationally through the Now Assist panel. See Export dashboards and data visualizations from the Now Assist panel.
- Dashboards exported to PowerPoint include the title above and the description below each visualization in an editable format if this information is provided in the source visualization.
- You can also export individual data visualizations from a dashboard to a PNG or JPEG file. For more information, see Download a data visualization from a dashboard.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Dashboards**.
2. Select the dashboard that you want to export.
3. Select the dashboard's **More actions** menu and choose **Export**.



4. In **File type**, select PDF or PowerPoint.
   a. If you are exporting to PDF, specify the page format and orientation.
   Any filter values set on the dashboard at the time of export apply to the export.
   b. If you are exporting to PowerPoint, you can set the following options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Export all tabs	If the dashboard has more than one tab, you can select whether to export them all or only a subset. Default: On
Export all visualizations in the top layout	If the dashboard has more than one tab and you are not exporting them all, you can set whether to export any visualizations that are in the layout outside the tabs. Select tabs:	If you are not exporting all tabs, select each tab to export.
Export with applied filters	You can select whether to apply to the export any values that have been set in filters on the dashboard. For example, say your dashboard has an Incident Category filter and a single-score visualization showing the number of incidents. With nothing chosen in the filter, the visualization shows 6884 incidents. With the Software category chosen in the filter, it shows only 5278 incidents. Now you export the dashboard with Software chosen in the filter. If **Export with applied filters** is on, the slide for that visualization shows 5278 incidents; with it turned off, it shows 6884. Default: On

Note: For PowerPoint, the export creates a separate slide for each visualization in the dashboard, not one slide for each tab on the dashboard.

5. Choose the delivery method, **Download file** or **Send via email**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Delivery method	Result
Download file	When the export is complete, you are prompted to download the export.
Send via email	Choose the users to send it to. You can select only users on your instance. Security constraints may restrict who you can email. You must specify a subject, and you can add a message.

6. Select **Export**.

Result

The dashboard with selected tabs and filters is exported to a PDF or PowerPoint file and delivered by the chosen method.

Schedule the export of dashboards and data visualizations

Automate the export and mailing of dashboards and data visualizations. Help colleagues build presentations, share information with external users, or track data over time.

Before you begin

Role required:

- par_scheduler, or any role that contains it, to create or edit the scheduled export of any dashboard or visualization that you can access.
- sn_par_sche_export.par_scheduler_admin to delete the scheduled export of a dashboard or data visualization.
- viz_admin to create, update, or delete the scheduled export of any data visualization on the instance
- dashboard_admin to create, update, or delete the scheduled export of any dashboard on the instance.

To view the list of scheduled exports, navigate to **All** > **Platform Analytics** > **Library** > **Scheduled Export**. This list contains all scheduled exports including Core UI dashboards and reports and Platform Analytics experience dashboards and data visualizations.

About this task

You can export multiple dashboards and data visualizations together in one scheduled email. Supported export formats depend on what you are exporting and whether you are exporting it as part of a dashboard or as a standalone data visualization.

Supported export formats

Data visualization or dashboard element	Supported dashboard export formats	Supported data visualization export formats
Calendar reports, Indicator scorecards, Pivot tables, Geomap	None	None
Lists	PDF	PDF, Microsoft Excel (.xls or .xlsx), Embedded LIST, CSV

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported export formats (continued)

Data visualization or dashboard element	Supported dashboard export formats	Supported data visualization export formats
Other data visualizations	PowerPoint, PDF	PowerPoint, PDF, PNG, JPEG, Embedded PNG
Non-data visualization dashboard elements, like Headings	None	Not applicable

Note: This topic is available in both the Dashboard and the Data Visualization documentation.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** and select **Data Visualizations** or **Dashboards**.
2. Select an item that you want to export on a regular schedule.
   Check the list of supported export formats under **About this task**.
3. From the More actions menu ( ), select **Schedule**.
   You cannot be in Edit mode.

   All the options appear for exporting the dashboard or data visualization. If you do not want to export this object, select **Change**.
4. Select the file type.
5. If you are exporting a dashboard or data visualization to PDF, or a data visualization to a graphic file, select the page format and orientation.
   Scheduled exports of List data visualizations to PDF do not have options for page format or orientation. If you need a PDF with a particular format or orientation, consider putting the List on a dashboard and scheduling the export of that dashboard, instead.
6. If you are exporting a dashboard to Power Point, do the following steps:

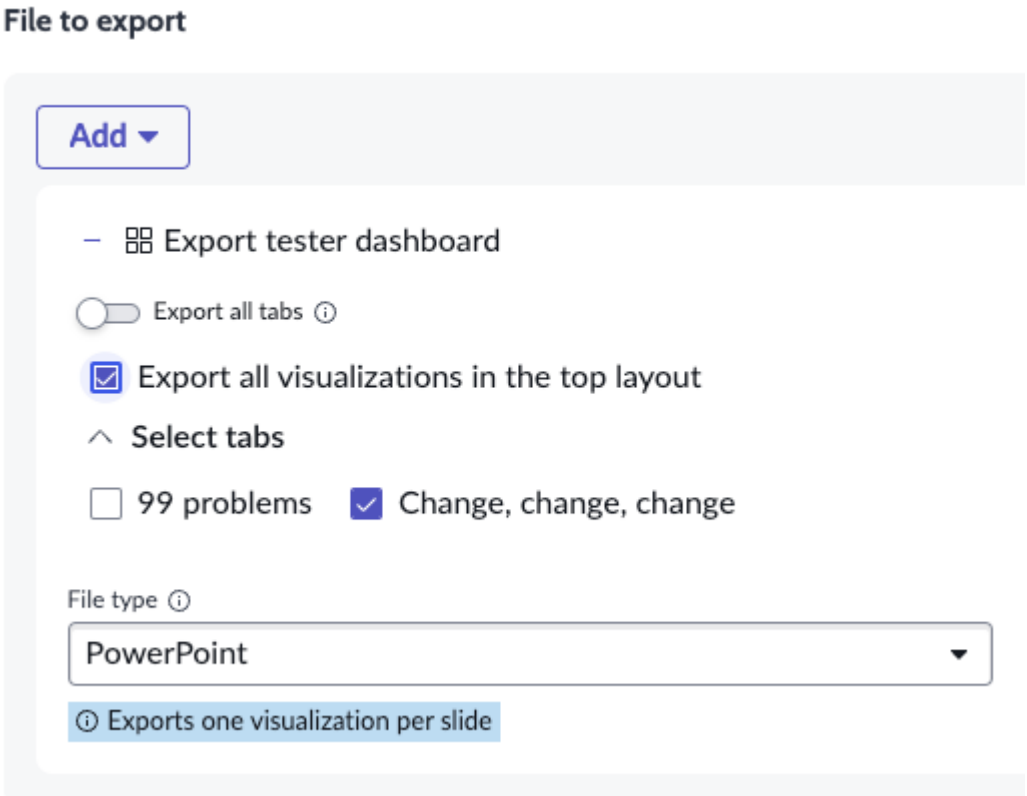
   a. Select whether to export all tabs or only specific tabs.

   b. If you select to export only specific tabs, select which tabs to export and whether to include the top layout contents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example

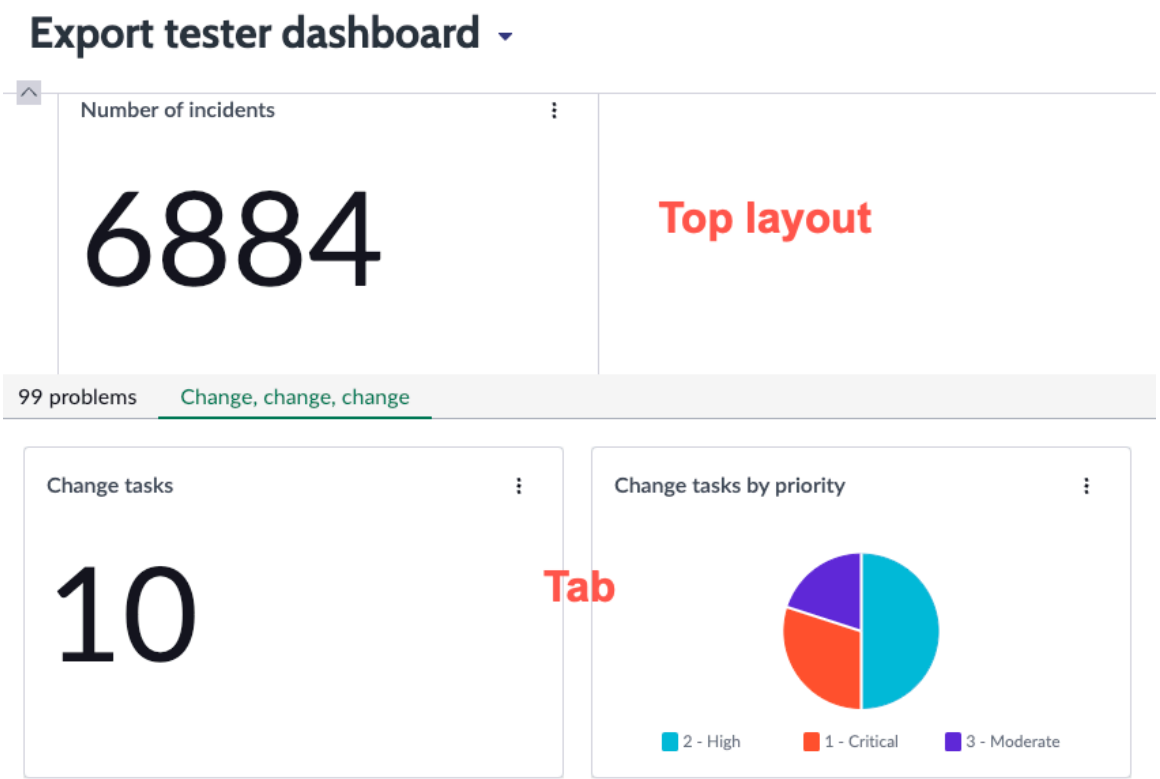
Configuring the export of dashboard tabs



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, if you do not turn on **Export all tabs**, you have to select the tabs to export. If you select a tab and turn on **Export all visualizations in the top layout**, you export that tab and any visualizations placed above the tabs.

The visualizations that are exported



7. To add more dashboards or data visualizations to the export, do the following steps:
   a. Expand the **Add** menu.
   b. Select **Dashboard** or **Data visualization**.
   c. Choose one or more dashboards or visualizations to export.
   d. Configure the export criteria for each added dashboard or visualization as in Steps 4-6. You can add both dashboards and data visualizations to a single export.
8. To send non-embedded exports as ZIP files, turn on **Send as ZIP files**.
9. In the Email schedule section, specify when and how often to send the email.

Field	Description
Active	Turn on to enable delivery of scheduled export emails.
Reoccurrence	Select how often to send the export email.
Day, Time, other calendar fields	Specify when to send the email. Your options depend on how often you chose to send the email in **Reoccurrence**. Time fields are in HH:MM:SS format.
Omit if no records	Turn on to prevent the distribution of empty emails.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Use conditions	Turn on to specify a scripted condition for generating the report.
Condition	A conditional script that determines if a scheduled job should run. The last expression of the script should evaluate to a Boolean (true/false) value. This text box appears only if you select **Use conditions**. For more information about scripts on the ServiceNow AI Platform®, see Scripts. **Warning:** Conditional scripts for scheduled emails are executed in the sandbox. Therefore, function definitions are not allowed. Some API calls and keywords are also not allowed. For more information, see Script sandbox property.

10. In the Email details section, specify the recipients and the email subject.
    You can enter users and groups on your instance or any permitted internal or external email addresses. Security constraints may restrict who you can send the report to. You can also add a message. To send email to persons who are not on your instance, you need to have outbound email configured. See Outbound Email Configuration.
11. Select **Save** to save the schedule.

Bookmark a Platform Analytics dashboard

Bookmark a dashboard so that you can find it easily in the Analytics Center.

Before you begin
Role required: Any, if the user has access to the dashboard

Procedure
1. Navigate to **All** > **Platform Analytics** > **Dashboards**.
2. Select the dashboard that you want to bookmark.
3. From the More actions menu (⋮), select **Add to bookmarks**.

Result
In the **Dashboards** overview, the selected dashboard appears in the Bookmarked list.

What to do next
To remove a bookmark, choose the bookmarked dashboard and select **Remove bookmark** from the More actions menu (⋮).

Delete a Platform Analytics dashboard

You can delete a dashboard that is no longer useful. The Analytics Center invokes the Workflow Studio to remove the dashboard from your instance.

Before you begin
Inform any users who can view the dashboard that you're deleting it. Users who have bookmarked a deleted dashboard see an error when they try to access it.

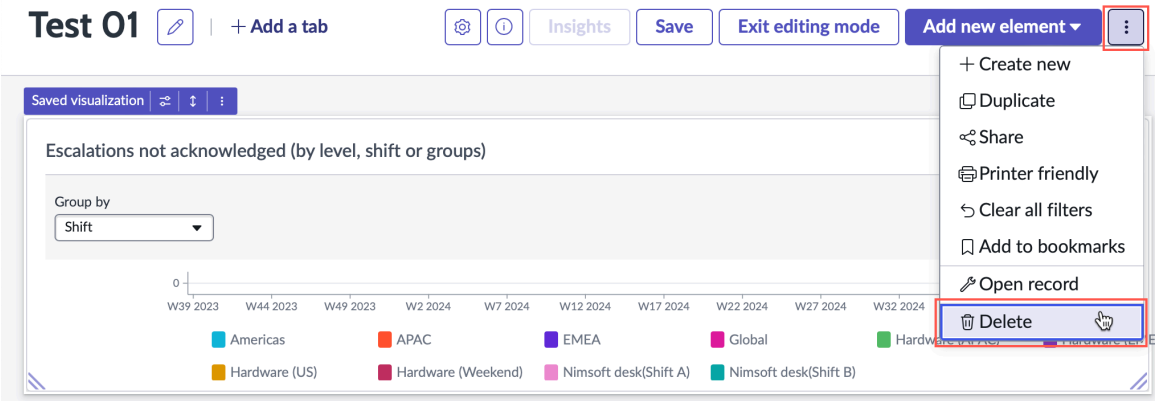
Role required: You can delete any dashboard that you created. Users with the admin or dashboard_admin role can delete any dashboard.

Note: The steps to delete a Core UI responsive dashboard are different. For more information, see Manage responsive dashboards.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Dashboards**.
2. Open the dashboard that you want to delete.
3. From the More actions menu ( ), select **Delete**.



4. Confirm the deletion.
   You can't undo this action. If you accidentally delete a dashboard associated with a plugin, a system administrator can restore the original version of the dashboard.
   a. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
   b. Find the plugin using the filter criteria and search bar.
   c. Select the More actions menu button and choose **Repair**.
   d. Select **Repair** in the Activate Plugin window.

Configure dashboard deletion actions in the Workflow Studio

Using the Workflow Studio, you can add actions to the dashboard deletion process. Actions may include sending an email to the dashboard's users or generating an approval request.

Before you begin

Prior to invoking the flow, the instance checks that the dashboard exists and that the initiating user has the correct role.

Role required: You can delete any dashboard that you created. Users with the admin role can delete all dashboards. Administrators can grant and deny access to the Workflow Studio based on user roles. For more information, see User access to Flow Designer.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**
2. Select **Subflows**.
3. Select the **Delete Dashboard** subflow.
4. Select **Add an Action, Flow Logic, or Subflow**.
   For more information about the available possibilities, see Flow Designer.
5. **Optional:**
   Use the handle next to the action number to reorder the action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Test the flow with the actions that you added.
   For more information, see Test a flow.
7. Save the flow.

Result
There are three possible outputs:

Successful deletion

Output code 1. Indicates that the deletion process was successful.

Failed to delete

Output code 2. Indicates that the deletion failed.

Deletion has been initiated

Output code 3. Indicates that the deletion process has started, but that intermediate steps such as an approval are not complete.

For more information, see Action error evaluation.

Configuring dashboards

Configure your dashboard and perform admin tasks. Most tasks are performed in either the dashboard details or the dashboard settings UI.

Common configuration tasks

The following tasks do not require a special role, though they may be limited to the dashboard owner or a user with editing rights.

- Change dashboard name or description

  Provide an informative description of your dashboard for other users.

- Specify dashboard requester

  Specify the user who requested that this dashboard be created. Specifying the user automatically gives them editing rights to the dashboard.

- Transfer ownership of a dashboard

  By default, the creator of the dashboard is the dashboard owner. If you are the owner of a dashboard, you can transfer this ownership to another user or to a user group.

- Set background colors

  Select the background colors for one or more tabs on the dashboard.

- See who created a dashboard
- See who the dashboard is shared with

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Admin configuration tasks

The following tasks require at least the dashboard_admin if not the admin role.

- Set data refresh options

  Set whether the dashboard is refreshed on a schedule and whether data caching is used. Requires the dashboard_admin or admin role. For more information, see Data caching in Platform Analytics.

- Certify a dashboard

  Certify that a dashboard has been officially approved for use by your organization. Requires the admin role.

- Configure Platform Analytics dashboard tab cache timeout

  Set the number of minutes that dashboard tab content is retained before being refreshed. Applies to all dashboard tabs on the instance. Requires the admin role.

- Manage which workspaces are allowed to contain the dashboard

  Specify the workspaces on the instance other than the Platform Analytics experience that this dashboard can be added to. Requires the admin or dashboard admin role. For more information about dashboards in workspaces, see Add a dashboard to a Dashboards page.

- Move a Platform Analytics dashboard with an update set

  Moves the dashboard structure to an update set, so it can be put on another instance. Does not include dashboard contents. Requires the admin role.

Process Mining integration tasks

- Configure a Process Mining map on a dashboard

  Map the different states that are part of your process and the transitions between those states. See which states the objects of the process are in and the speed with which they change state. Requires the sn_process_optimization_analyst role.

- Creating Process Mining projects from Proactive Analytics suggestions

  The Insights panel can include suggestions for Process Mining projects to create. Creating the projects requires the sn_process_optimization_analyst role.

Configure Platform Analytics dashboard details

You can change a dashboard name, add a description, certify it, configure visibility, and specify the requester, the owner, the owner group.

Before you begin

You can edit **Dashboard Details** for both dashboards created in UI Builder and dashboards created with the inline editor.

Role required: dashboard_admin for all dashboards, or any role for dashboards that you own or ones that you have been given the right to edit. See Platform Analytics dashboard roles for more information about viewing and editing rights on dashboards.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Dashboards**.
2. On the **Dashboards** overview, choose the dashboard you want to configure.
3. Select the info button (ⓘ) to open the **Details** panel.
   On the **Details** panel, you can edit several aspects of the dashboard.

   a. Edit the **Name** field to change how the dashboard appears in the Analytics Center and the Dashboard Overview.

   b. Fill in the **Description** to provide further context about what the dashboard is for.

   c. Mark the dashboard as **Certified** to inform the user that the dashboard is recommended for use across your organization.

   > **Note:** You must have an admin role to mark a dashboard as **Certified**. For more information, see Certify a Platform Analytics dashboard.

   d. In **Dashboard Visibility**, view, add, or remove workspaces the dashboard can be added to.

   > **Important:** Specifying a workspace here does not make the dashboard visible in that workspace. It only enables you to add the dashboard to that workspace. For more information about adding a dashboard to a workspace, see Add a dashboard to a Dashboards page.

   e. Specify one or more dashboard categories.
   For more information, see Platform Analytics experience dashboard categories.

   f. Specify who requested the dashboard.
   This user is considered a responsible user. The data visualization is shared with them, with editing rights.

   g. Specify the owner of the dashboard.
   By default, the owner is the creator of the dashboard, but the creator or owner can assign ownership to another user.

   h. Specify an owner group.
   The owner of a dashboard can be an entire group rather than a single person.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure Platform Analytics dashboard settings

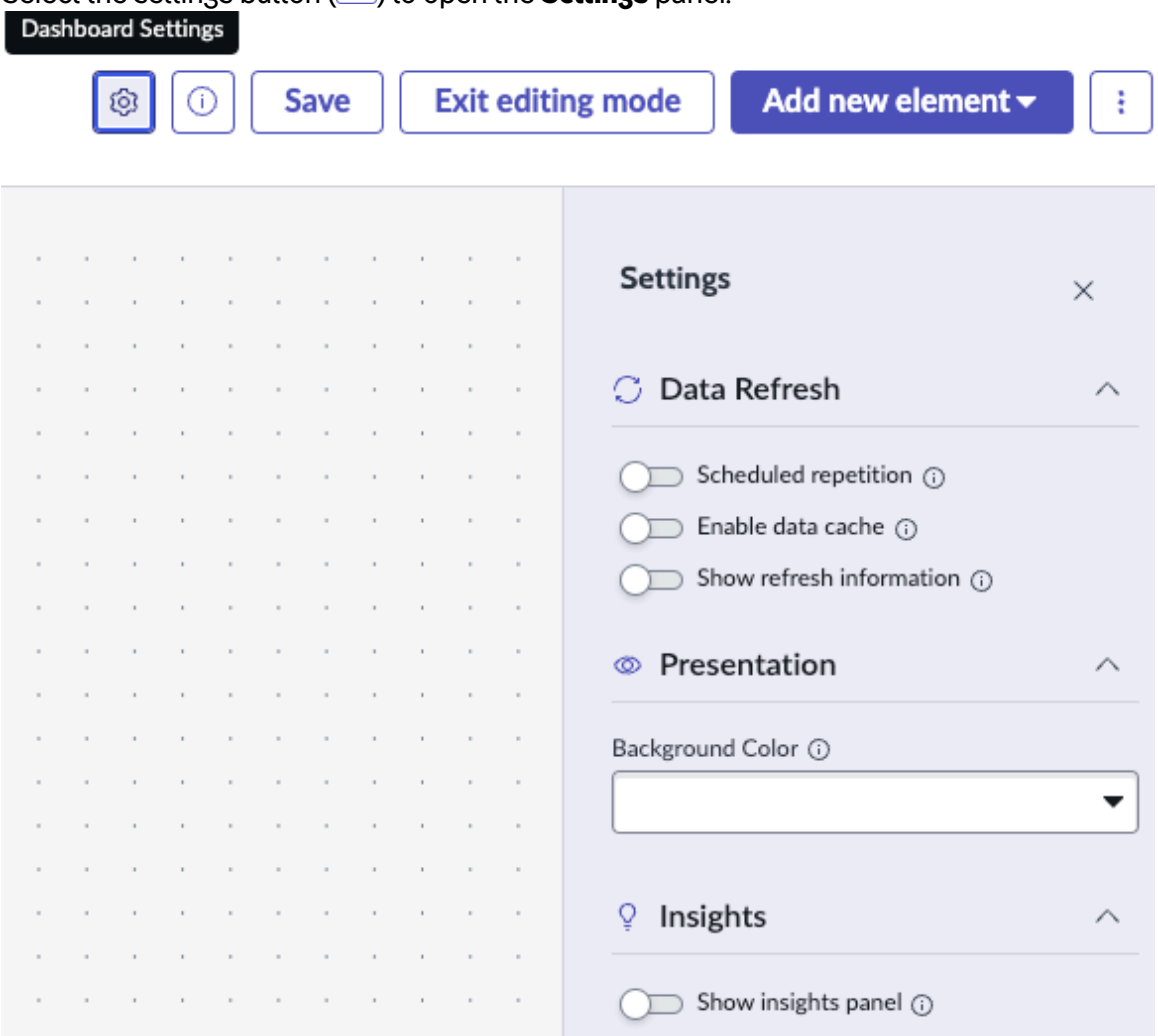
You can set refresh interval details and background colors, enable data caching to speed page refreshes, and choose which Insights cards to show.

Before you begin

Role required: dashboard_admin for all dashboards, or any role for dashboards that you own or ones that you have been given the right to edit. See Platform Analytics dashboard roles for more information about viewing and editing rights on dashboards. Additionally, dashboard_admin is required to schedule automated refreshes even of dashboards that you own.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Dashboards**.
2. In the **Dashboards** library, choose the dashboard you want to configure.
3. Select **Edit** to enter editing mode.
4. Select the settings button ( ) to open the **Settings** panel.



5. Change any of the following settings.
   - Edit the **Refresh** options.

     Users with the dashboard_admin role or higher can configure automatic refreshes of the dashboard.

     Show refresh information

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Displays the last time the dashboard was refreshed under the dashboard title. This information updates when the dashboard is automatically refreshed and when a user selects the refresh button .

Scheduled repetition

Specify in minutes or hours how often the dashboard is reloaded. Applies only while the dashboard is open. When you navigate away from the dashboard, including opening a new browser or browser tab, the interval is paused until you return to the dashboard. Requires the dashboard_admin or higher.

Note:

Do not confuse this setting with the **Refresh after being away for X minutes** option on data visualizations. This latter option takes effect when you navigate away from a dashboard containing the data visualization to another page in the same workspace or experience. If you navigate back to the dashboard after the specified number of minutes, the data visualization automatically refreshes.

Enable data cache

shorten the load time on page refreshes for data visualizations based on table or indicator data. Data caching also applies to indicator scorecards. The dashboard uses the cached data instead of querying the database when the page is refreshed.

Note:

- Enabling **Scheduled repetition** turns off data caching and vice versa.
- Enabling **Real time update** or **Refresh after being away for X min** on a data visualization overrides caching for that visualization. If this option is subsequently turned off, the currently cached value is shown, if it hasn't expired.

Data caches have an expiration time. When the page is refreshed and the cached data has expired, fresh data is queried and cached. When data caching is enabled, you can set the length of time for cached data to be valid in **Cached expiration time**. Options are 1, 2, 4, 8, 12, or 24 hours.

You can manually refresh the cached data for either the whole dashboard or a data visualization by refreshing either the dashboard or the visualization, respectively.

- In the **Presentation** section, edit the background color of one or more tabs on the dashboard.

  Select a color from a list of preconfigured colors, or use the color palette to specify a color.

- Choose whether and which analytics to show in the **Insights** section.

  When you select **Show insights panel**, an **Insights** button is added to the dashboard. When a viewer presses this button, insights cards corresponding to the selected analytics options are shown. For more information, see Proactive analytics insights on dashboards.

Configure Platform Analytics dashboard tab cache timeout

Dashboard content isn't refreshed every time a user navigates between tabs. You can configure the number of minutes that dashboard tab content is cached before it's refreshed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Navigate to `sys_properties.list`.
2. Open the property *`next_experience.dashboard.tab.timeout`*.
   This property is enabled by default.
3. Edit the value.
   The default number of minutes after which tab content is refreshed is 20.
4. Select `Update`.

Platform Analytics experience dashboard categories

Dashboard categories enable searching and filtering dashboards using general terms assigned to multiple dashboards.

Note: Core UI dashboard groups are migrated into categories.

Users with the platform_analytics_admin or analytics_categories_admin can create, edit, and remove dashboard categories. Users can then apply one or more categories to dashboards they create and can filter the dashboards in the Dashboards library by category.

When there are enough categories, you can search for categories in the dashboard overview. Otherwise, all categories that have been assigned to dashboards are visible under **Filter by categories**. Categories that have not been assigned in the dashboard's Information panel do not appear in the overview.

Navigate to analytics_category.list to view all categories.

Create dashboard categories

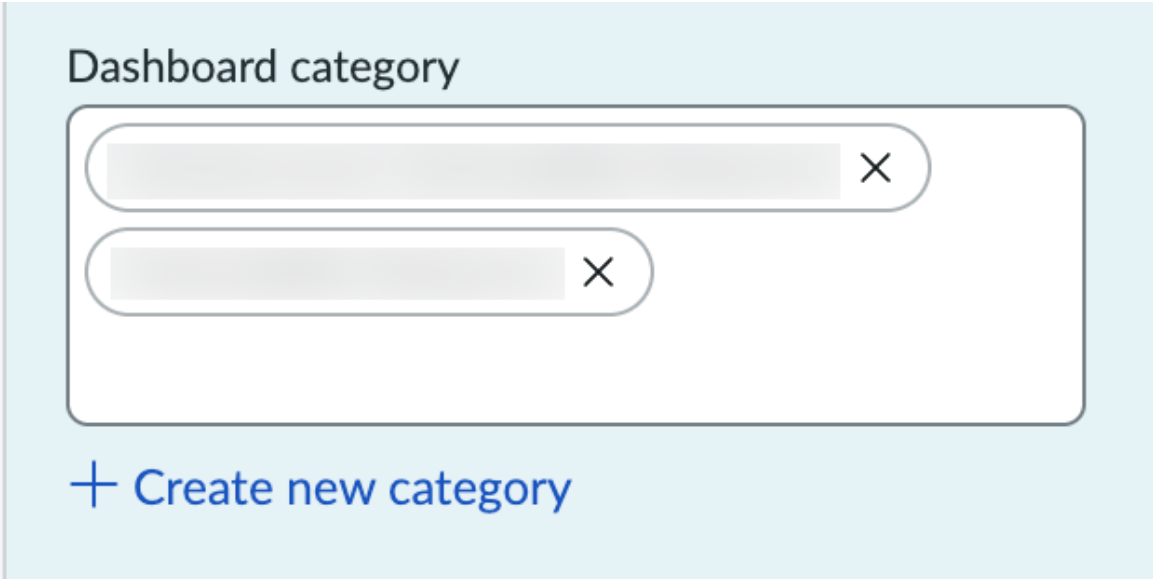
Dashboard categories users to filter the dashboards in the dashboard overview on terms or phrases describing the dashboard as provided by its creator or the analytics_categories_admin.

Before you begin
Role required: analytics_categories_admin

Procedure

1. **Optional:** Select the Application scope icon ( ) and choose the scope the category should apply to.
   The default application scope is Global.
2. Navigate to **All** > **Usage and Governance** > **Analytics Categories**.
   You can also select **Create new category** in the Details window of a dashboard in Edit mode to open the Category New record form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select **New**.
4. Provide a name for the category.
5. Select **Submit**.

Result
The category is available to apply to dashboards in the Info panel, and to search on in the Dashboards library.

Assign dashboard categories

Categories enable users to filter dashboards in the Dashboard library. You can assign one or more categories to each dashboard

Before you begin
Role required: Any user who can create a dashboard can assign an existing category to it. Only users with the analytics_categories_admin role can create categories. Only the owner of the dashboard or users with the analytics_categories_admin and dashboard_admin roles can assign categories to an existing dashboard.

Assign dashboard categories on the dashboard's info panel.

Procedure
1. Navigate to **All** > **Platform Analytics** > **Library** > **Dashboards**.
2. Select the dashboard you want to apply a category to.
3. Select the Edit button (Edit) to put the dashboard into Edit mode.
4. Select the Info button (ⓘ) to open the dashboard's Information panel and choose the categories you want to apply.
   Users with the analytics_categories_admin role also have the option to create a new category.
5. Select **Exit editing mode** to apply the categories to the dashboard.

Result
- Dashboard cards in the library indicate which categories are applied.
- Users can find the dashboard by filtering on the assigned categories.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Certify a Platform Analytics dashboard

Certify a dashboard to indicate that it is company-approved and recommended for use.

Before you begin

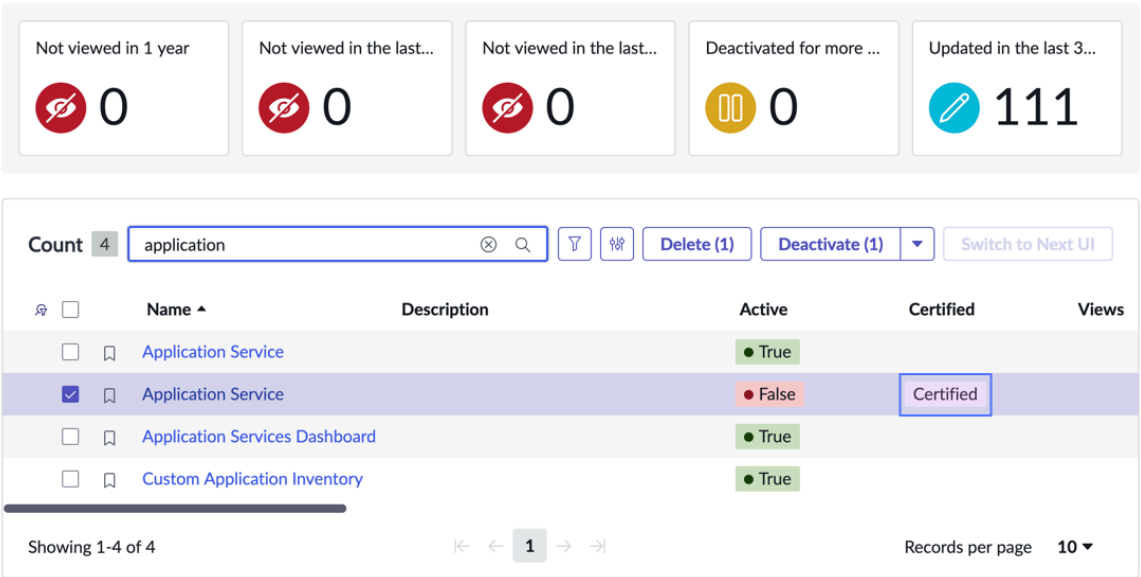
Role required: admin or dashboard_admin

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Dashboards**
2. Select the dashboard you want to certify.
3. Select the information button (ⓘ) to open the Details panel.
4. Select **Edit**.
5. Select the toggle labeled **Mark as certified**.
6. Select **Save**.

Result

In the Dashboards library, the dashboard's entry is marked **Certified** in the Certified column.



Set Platform Analytics dashboards as home for all users

You can set dashboards as home for all users. By default, the most recent dashboard a user has visited is the dashboard they see when they log in to ServiceNow.

Before you begin

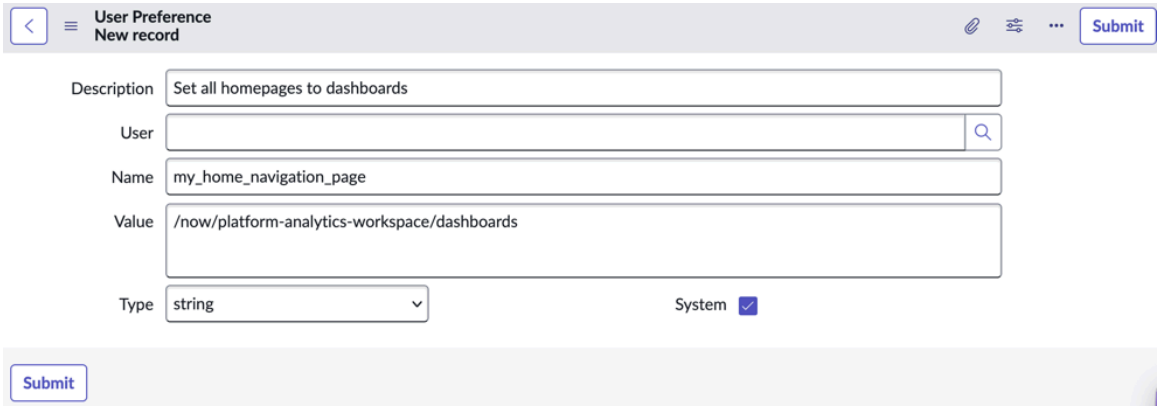
Role required: admin

Procedure

1. Navigate to **All** > **User Administration** > **User Preferences**.
2. Create a user preference with the name `my_home_navigation_page`.
3. Give the preference the description `Set all homepages to dashboards`.
4. Select the **System** check box to create an instance-wide default.
5. Leave the **User** field empty.
   Steps 4 and 5 make the preference universal.
6. Set the **Type** to `string`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Set the value to `$pa_dashboard.do`.
8. Select **Submit**.



Result
All users see the last dashboard that they visited when they log in to ServiceNow.

What to do next
Set a specific dashboard as home for all users

Set a specific Platform Analytics dashboard as home for all users

Configure ServiceNow so that all users see the same dashboard when they log in.

Before you begin
Role required: admin

Note: Navigate to the dashboard you want to set as home, and copy the sys_id from the URL. The sys_id is the last element after the last forward slash. For example, in this URL, the sys_id is 456CBA: `https://my-instance.service-now.com/now/platform-analytics-workspace/dashboards/params/edit/false/sys-id/456CBA`. Paste the sys_id into a text file so that you can copy it into the system preference you create.

About this task
The dashboard that you configure should be available to all users.

Procedure
1. Create a user preference with the name `my_home_navigation_page`.
2. Give the preference the description `Set all homepages to dashboards`.
3. Select the **System** check box to create an instance-wide default.
4. Leave the **User** field empty.
   Steps 3 and 4 make the preference universal.
5. Give the preference a meaningful description that you can search for.
6. Set the **Type** to `string`.
7. In the **Value** field, enter the following: `$pa_dashboard.do?sysparm_dashboard=dashboard_sys_id`, but replace `dashboard_sys_id` with the sys_id you copied before you began.
8. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
All users see the same dashboard when they open ServiceNow.

Set a specific Platform Analytics dashboard as home for specific users

Configure ServiceNow so that specified users see the same dashboard when they log in.

Before you begin
Role required: admin

Note: Navigate to the dashboard you want to set as home, and copy the sys_id from the URL. The sys_id is the last element after the last forward slash. For example, in this URL, the sys_id is 456CBA: `https://my-instance.service-now.com/now/platform-analytics-workspace/dashboards/params/edit/false/sys-id/456CBA`. Paste the sys_id into a text file so that you can copy it into the system preference you create.

About this task
The dashboard that you configure should be available to all users.

Procedure
1. Navigate to **All** > **User Administration** > **User Preferences**.
2. Create a user preference with the name `my_home_navigation_page`.
3. Give the preference a meaningful description such as `Set home dashboard for ITIL users` that users can search for.
4. In the **User** field, specify one user this dashboard will be the home for.
5. Set the **Type** to `string`.
6. In the **Value** field, enter the following: `$pa_dashboard.do?sysparm_dashboard=dashboard_sys_id`, but replace `dashboard_sys_id` with the sys_id you copied before you began.
7. Select **Submit**.
8. **Optional:** Select the context menu (☰) and choose **Insert and Stay**.
   This action duplicates the user preference so that you can specify another user this dashboard will be home for. You can also specify a different sys_ID on the duplicated record.

Result
The specified users see the specified dashboards when they open ServiceNow or select the company logo.

Move a Platform Analytics dashboard with an update set

Dashboard tabs aren't automatically transferred in update sets. You can add a dashboard's components to update sets from a dashboard record using the **Unload Dashboard** function. The **Unload Dashboard** function unloads the entire dashboard with related content.

Before you begin
Role required: admin

About this task
This procedure describes moving the structure of an in-line dashboard to an update set. The dashboard structure includes the dashboard itself, tabs, the related security configuration, and dashboard-specific settings such as header color and borders. Moving technical dashboards with update sets is not supported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This procedure adds saved data visualizations and filters to the update set. Other content is not moved. You can add dashboard content to the update set using default platform functionality.

Important: Make sure that the dashboard content is either in the same update set as the dashboard record or is already present in the target instance. Errors result if the moved dashboard points to content that doesn't exist on the target instance.

Additional steps may be necessary if you are moving a dashboard in a scoped application. For more information, see Update set id 'global' is different than update set scope id.

Tip: If you have difficulty with this procedure, contact Customer Service and Support.

Procedure

1. Create a new update set and activate it.
2. In the source instance, navigate to `par_dashboard_list.do`.
3. Select the dashboard that you want to unload to an update set.
4. Select the Additional actions icon ( ) and select **Unload Dashboard**.
   Only perform this step after the dashboard is ready to unload, meaning that you've added all content to the tabs.
   The record for a dashboard in the par_dashboard table is always updated. This update to par_dashboard should always be included in the update set when transferring it to another instance. This also updates the sys_updated_on field even if no other fields are modified, such as when only widgets are changed.
5. When you're ready to move the update set, mark the update set as complete.
6. On the target instance, move the update using standard update set functionality.
   For more information, see Retrieve an update set.
   On the Remote Instance page, the **Retrieved Update Sets** related list shows all retrieved update sets. Select the update set to see if there are errors. Errors are shown on the **Retrieved Update Set** form in a related list called **Update Set Preview Problems**.

Result

The dashboard and its tabs are moved to the target instance.

Platform Analytics dashboard cache

Changes to the layouts of Platform Analytics dashboards are stored in the par_dashboard_cache table. Whenever a dashboard is called, a new entry is made in this table. Delete entries in this table to regenerate the cache for troubleshooting.

In the context of troubleshooting a dashboard's layout, navigate to `par_dashboard_cache_list.do` to open the PAR Dashboard Metadata Caches table. Delete a dashboard's record on this table to regenerate the cache.

These access control lists (ACLs) apply to the PAR Dashboard Metadata Caches *`par_dashboard_cache`* table:

- Admin only role: report_on, report_view, create, write, delete
- Any logged-in user: read

For a full guide to roles connected to Platform Analytics dashboards, see Platform Analytics roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Domain separation for Platform Analytics dashboards

Domain separation is supported throughout Platform Analytics. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An Admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Overview of domain separation

To activate the domain separation plugin, see Request domain separation.

Important: For users in child domains to view dashboards in parent domains, both domain separation and delegated administration must be enabled.

Users in child domains cannot overwrite dashboards. Child domain users only have read access to dashboards.

How domain separation works in Dashboards

Assumptions:

- Only dashboards that have been shared are visible to other users. See Share a responsive dashboard.
- Users granted edit permissions on a dashboard can only edit that dashboard if they are in the same domain as the dashboard. For example, a user who is in the HR domain cannot edit a dashboard created in the parent of the HR domain.

Dashboard data that is domain separated includes dashboard records, dashboard tabs, and widget containers. Widget content is governed by the domain separation that applies to the content itself. For example, an admin adds a report created in the HR domain to a dashboard in the IT domain. This report is not visible to users in the IT domain, although they can see the widget container.

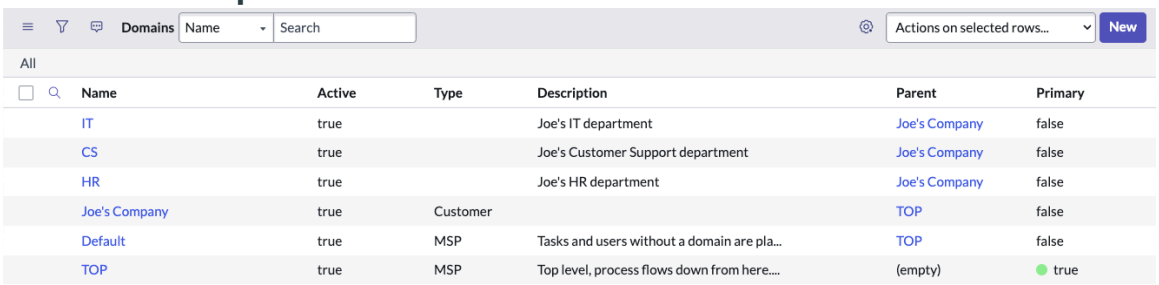
A dashboard defined at the global level is visible to all users with whom it has been shared. A shared dashboard created in a parent domain is visible to users in the parent and all its child domains. For example, a dashboard created in the TOP company is visible to users in:

- Joe's company
- Other companies in the TOP company
- All HR, CS, and IT child domains in those companies if it is shared with those users.

In the following figure, dashboards created in the IT, CS, and HR domains are not visible to users in the other child domains or in the parent domain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Domains list example



Name	Active	Type	Description	Parent	Primary
IT	true		Joe's IT department	Joe's Company	false
CS	true		Joe's Customer Support department	Joe's Company	false
HR	true		Joe's HR department	Joe's Company	false
Joe's Company	true	Customer		TOP	false
Default	true	MSP	Tasks and users without a domain are pla...	TOP	false
TOP	true	MSP	Top level, process flows down from here....	(empty)	true

Important: Administrators should not edit a domain-separated dashboard from the global domain, because additions made to the dashboard are not visible to users within the separated domain. When editing dashboards, make sure that you are logged in to the correct domain.

Domain separation recommended practices for service providers

Configure a Process Mining map on a dashboard

Map the different states that are part of your process and the transitions between those states. See which states the objects of the process are in and the speed with which they change state.

Before you begin

You should be familiar with Process Mining and Process projects. For more information, see Process Mining.

The relevant Process project must already exist.

Role required: sn_process_optimization_analyst

About this task

The Process Mining Map component enables users to visualize how a process is being executed for a particular data set that is being analyzed. For example, you can show users the number of records for a specific date range, business area, and region.

This component offers similar content on any dashboard that you get from process maps in the Process Mining Workspace. For more information about process maps, see Process details page.

Procedure

1. Create a dashboard, or navigate to a dashboard that you are allowed to edit.
   For more information, see Create a dashboard with the in-line editor.
2. Select **Edit** to enter editing mode.
3. Expand **Add new element** and scroll down to Process Mining - Map.
   When you select this element, it is added to the dashboard, and its configuration panel opens.
4. Under **Header and border**, set whether the map shows a header or a border, along with the chart title in the header and a description.
5. Under **Data** in the Process Mining - Map configuration panel, select a Process Mining project.
   You can only select a Process Mining project that you can access.
6. For the map to follow filters on the dashboard, select **Follow filters**.
   For more information, see Applying filters to Process Mining maps.
7. Set the percentage of connections to show.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connections are lines that show how the subjects of the mapped process change states. These lines end in arrows to show the direction of the change. They also have boxes that show the number of records that followed that path and the average time they spent in the earlier state before moving. For example, if a box in the middle of a connection says 505/5d,

505 records have followed this change in state, and the average time in the earlier state was 5 days.

The most frequent changes are shown first. So if you accept the default 20%, only the 20% most frequent changes between states are shown. Too low a number results in too little data being shown on the map. Too high a number turns the map into a mass of spaghetti, with many rare changes between states that you might not care about.

8. Set the percentage of activities to show.
   Activities, or nodes, are the possible states of the subject of the process. For example, if you are looking at Incidents, an incident can be in the Assigned state or the Work in progress state. Too many activities can clutter the map, but generally show as many as you can.
9. **Optional:** Animate the map by turning on **Case follow simulation**.
   When **Case follow simulation** is active, the solid lines of the connections are replaced by moving dashed lines. The speed at which the dashes move represents the speed at which objects move from one state to the next. The thickness of the dashes shows the relative amounts of traffic.

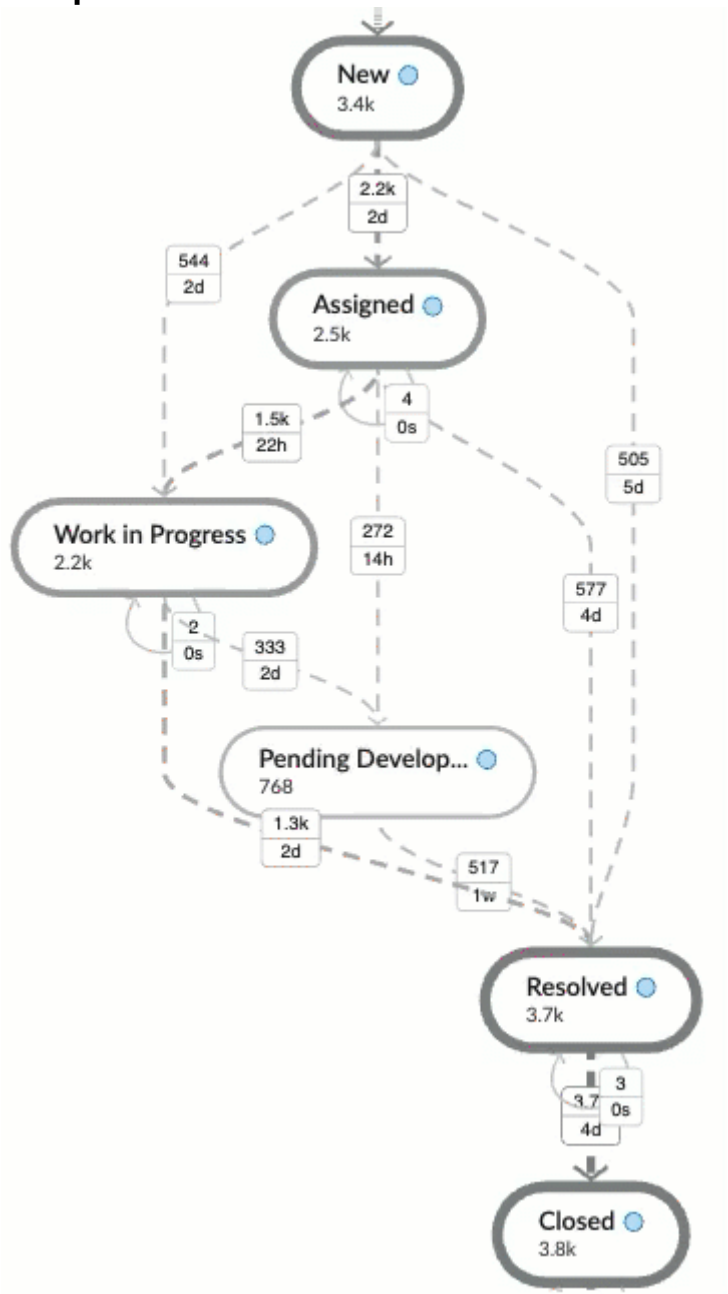
Example



10. **Optional:** Specify the header and border settings, such as the title and description.

What to do next

Outside of editing mode, a user can expand the settings on the map. In these settings, they can adjust the connection and activities percentages and turn animation on and off.

Applying filters to Process Mining maps

If a dashboard filter is on the same table as the breakdown of a process project, that filter can apply to a Process Mining map of that project.

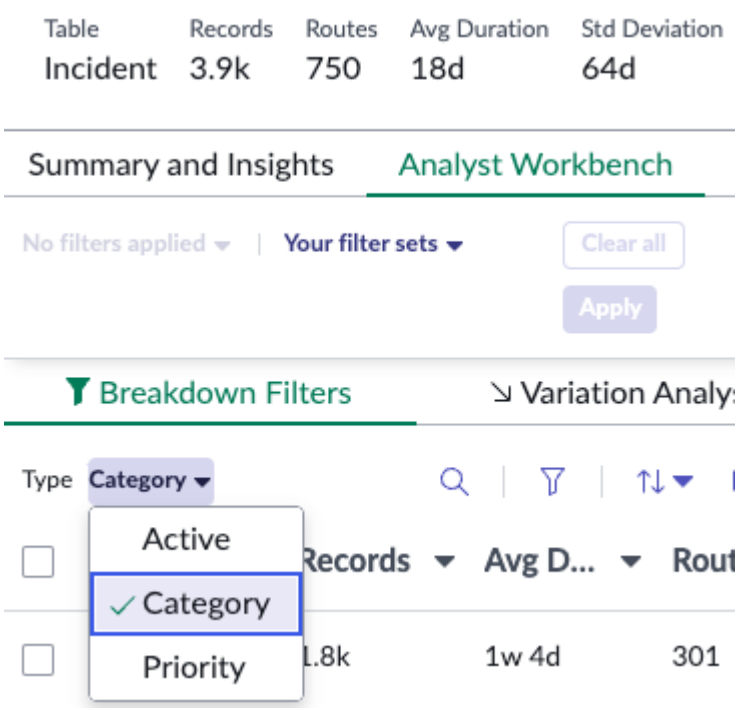
You can apply a single-select or true/false filter to a Process Mining map.

Single-select filter on Process Mining maps

For a single-select filter to apply to a Process Mining map, the filter source and the data to filter must both be on the same table as the table of the process project. Furthermore, they must be on a field of that table that is also a breakdown of the process project.

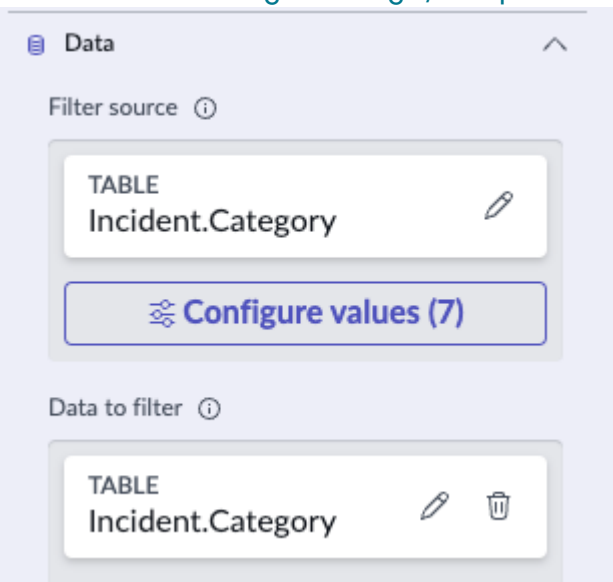
For example, consider a process project on the Incident [incident] table. The breakdown filters for this project include the Category field. In the Process Mining Workspace, you can see the breakdowns in the Breakdown Filters column of the Analyst Workbench for the project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You can also see and change the breakdowns in the table configuration record for the project. For more information, see Configure a breakdown definition.

In the dashboard where you have added your Process Mining map for this project, you want users to be able to filter the map by Category. Category is a breakdown of the process project, so it is simple to add such a filter. When you create the filter, select the Incident table, then the Category field. This selection automatically applies to both the filter source and the date to filter, as described in Configure a Single/Multiple select or cascading filter.



The filter applies to the Process Mining map the same as it does to a bar visualization of the Incident table.

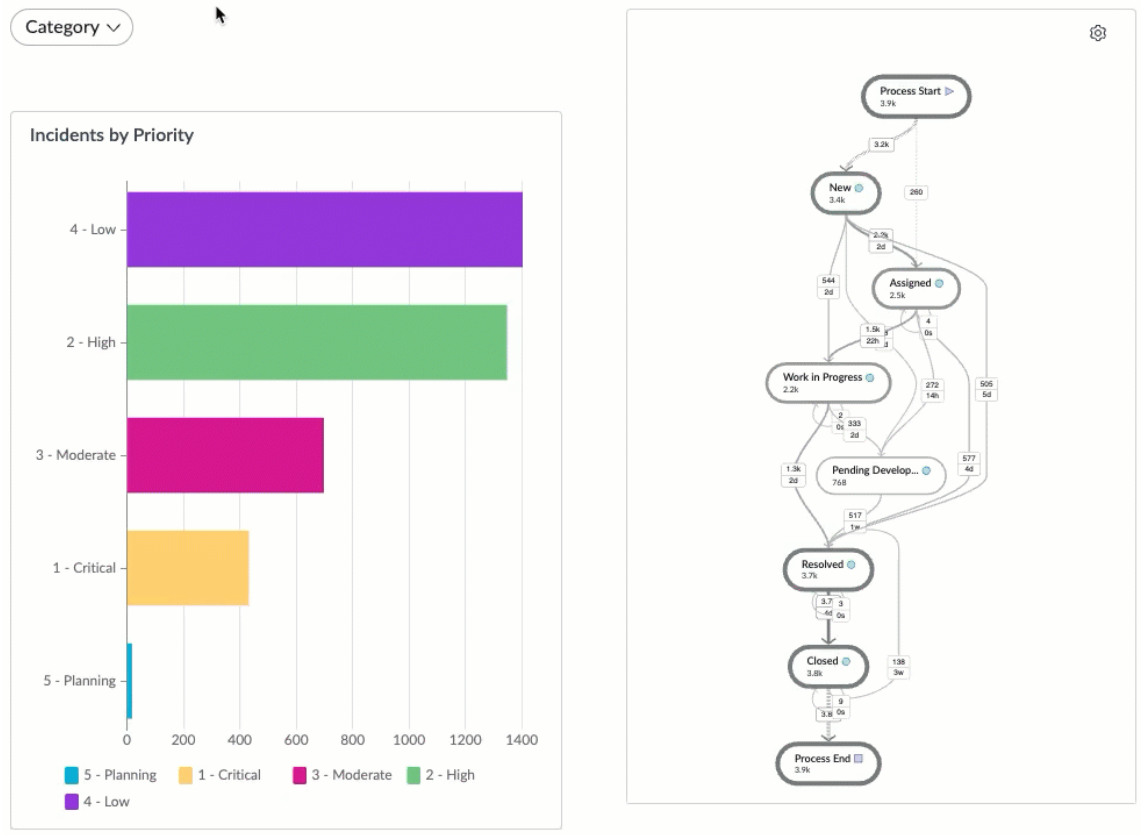
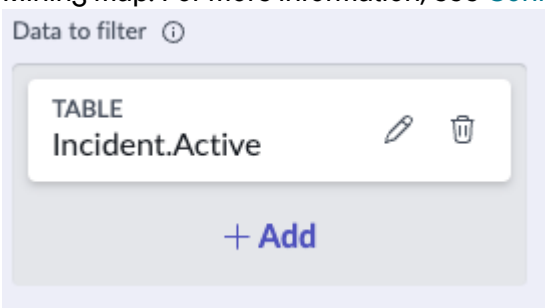
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



True/false filter on Process Mining maps

For a true/false filter, you only select the data to filter. Again, select the table of the process project and a field that is used as a breakdown. Continuing with the project from the Single Select filter example, Active is a true/false, or Boolean, field that is used as a breakdown. Therefore, you can set a true/false filter to filter Incident.Active, and it will filter the Process Mining map. For more information, see Configure a True/False filter.



Again, the filter affects both a data visualization and a Process Mining map on the Incident table.

Executive dashboard overview

Executive dashboards provide top-level overviews of your operations from the C-Suite perspective.

Chief Information Officer (CIO) Dashboard

The CIO Dashboard provides a decision-making framework with key decisions, critical questions, and the insights needed to stay on course and scale your business.

Chief Information Security Officer (CISO) Dashboard

The Chief Information Security Officer Dashboard provides a single pane glass view of end-to-end security operations.

Chief Procurement Officer (CPRO) Dashboard

The Chief Procurement Officer Dashboard provides key insights around the procurement process of any organization.

Chief Risk Officer (CRO) Dashboard

The Chief Risk Officer Dashboard provides a single pane glass view of end-to-end Governance, Risk, and Compliance.

General Counsel (GC) Dashboard

The General Counsel Dashboard provides transparency into legal service delivery and operations. The insights include visibility into contracts, legal requests, compliance issues, and digital forensics.

Chief Human Resources Officer (CHRO) Dashboard

The Chief Human Resources Officer Dashboard helps People leadership to run its business, to deliver value quickly, and to improve productivity and optimize risks.

Chief Financial Officer (CFO) Dashboard

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Chief Financial Officer Dashboard provides a single pane glass view of end-to-end financial operations.

Chief Digital Officer (CDO) Dashboard

The Chief Digital Officer Dashboard provides visibility into the health and productivity of your company's digital properties.

Chief Customer Operations Officer (CCO) Dashboard

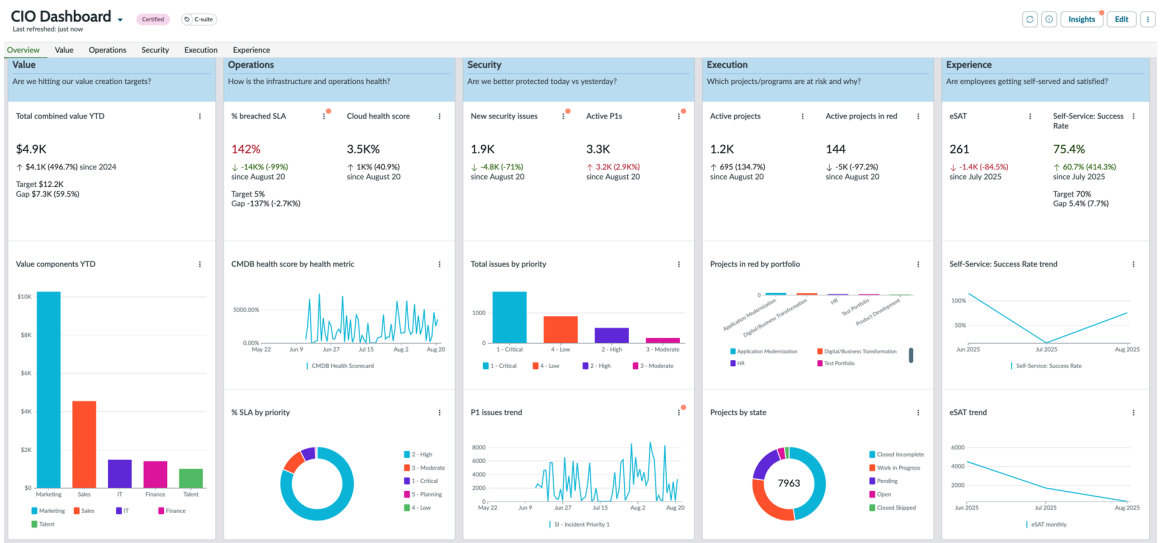
The Chief Customer Operations Officer Dashboard provides the visibility into customer support and operations that helps leadership to tune operations for greater effectiveness.

Chief Information Officer (CIO) Dashboard

The CIO Dashboard provides a decision-making framework with key decisions, critical questions, and the insights needed to stay on course and scale your business.

The CIO Dashboard is critical for organizations on both day-to-day and strategic levels. It provides a bird's-eye view of what's happening across the IT organization and provides the information needed to make better decisions.

At its core, the CIO Dashboard provides a shared view of IT performance against the business's top priorities, empowering CIOs to run IT like a business. By aligning technology operations with strategic outcomes, it helps leaders make data-driven decisions, identify risks and opportunities, and demonstrate IT's contribution to organizational growth. the CIO Dashboard provides IT leaders with real-time insights across five core areas: value, operations, security, execution, and experience.



Install the CIO Dashboard

The Chief Information Officer (CIO) Dashboard provides a decision-making framework for key decisions, critical questions, and the insights to stay on course and scale your business.

Before you begin

Roles required: sn_ciodashboard.ciodashboard_admin, sn_ciodashboard.ciodashboard_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The CIO Dashboard application is free from the ServiceNow Store. However, the contents of the dashboard require professional entitlements to the following applications:

- IT Service Management
- IT Operations Management
- IT Asset Management
- Security Operations (SecOps)
- Strategic Portfolio Management (SPM)

These professional entitlements include a license for Platform Analytics.

These solutions consist of Platform Analytics indicators and associated data collection jobs, used by the metrics on the CIO Dashboard. If you don't have the prerequisite licenses, the installation proceeds. However, without the required plugins (found in the application manager) and applications (found in the ServiceNow store) and the underlying data, the dashboard won't show any relevant metrics. If you have any questions about your licensing and entitlements, consult your account executive.

Plugins:

- com.snc.pa.cmdb
- com.snc.pa.slacom.snc.pa
- com.snc.pa.itsm_dashboards
- com.snc.pa.sla
- com.snc.pa.request
- com.snc.pa.change
- com.snc.pa.premium.sam
- com.snc.pa.pmo_dashboards
- com.snc.pa.self_service_analytics
- com.sn_communities

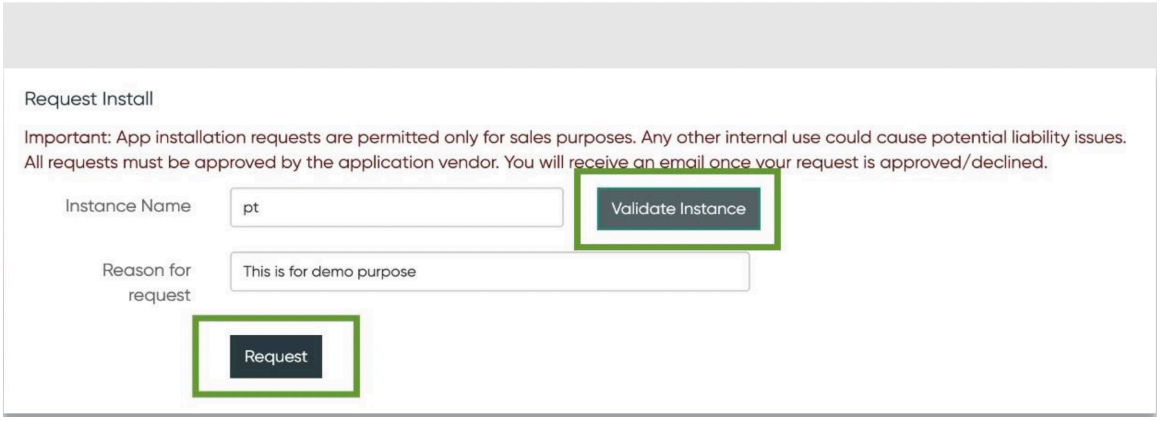
Applications:

- sn_sir_analytics
- sn_vul_analytics
- sn_compliance
- sn_ppm_imd

Procedure

1. Log in to `https://store.servicenow.com`.
2. Search for the CIO Dashboard application.
3. Select the **Request Install** button to create the app installation request.
   Select **Request** to request the CIO Dashboard application plugin for the specified instance and provide the instance details with your reason for request and validate the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Navigate to **System applications** > **All available applications**.
5. Search for and install the CIO Dashboard plugin (sn_ciodashboard).
6. Assign roles to configure and view the CIO Dashboard.

   CIO Dashboard admin

   Assign the role sn_ciodashboard.ciodashboard_admin to users or groups who require configuration privileges on the dashboard.

   Note: Only users with this role are able to configure the CIO Dashboard.

   CIO Dashboard end users

   Assign the user role sn_ciodashboard.ciodashboard_user to users or groups who must view the dashboard.

   Users must log out and log back in to enable their new roles after the admin assigns them. For more information on user roles, see Exploring user administration.

Chief Information Officer Dashboard tabs

Organizing insights into these five pillars promotes CIO focus on both operational stability and long-term innovation.

Strategic pillars

Tab	Focus Area	Description
Overview	Core IT metrics	The Overview tab delivers a high-level, real-time snapshot of core IT metrics: value, operations, security, execution, and experience.
Value	Business Growth	Displays real-time revenue and cost insights to steer operations and drive organizational growth.
Operations	Infrastructure & Service Delivery	Offers visibility into incident trends, request management, cloud governance, and asset health
Security	Risk & Compliance	Tracks vulnerabilities, incident response metrics, and compliance status
Execution	Strategic Programs	Provides project progress, resource allocation, and portfolio management insights

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tab	Focus Area	Description
Experience	User & Customer Satisfaction	Measures user sentiment and service quality to optimize experiences

Overview tab

Purpose

The Overview tab functions as a strategic command center, giving CIOs a concise, real-time snapshot of the health and performance of IT services across the enterprise. It aggregates critical indicators into a single view. This single view enables leaders to gauge whether IT is aligned with business goals and pinpoint where action is needed.

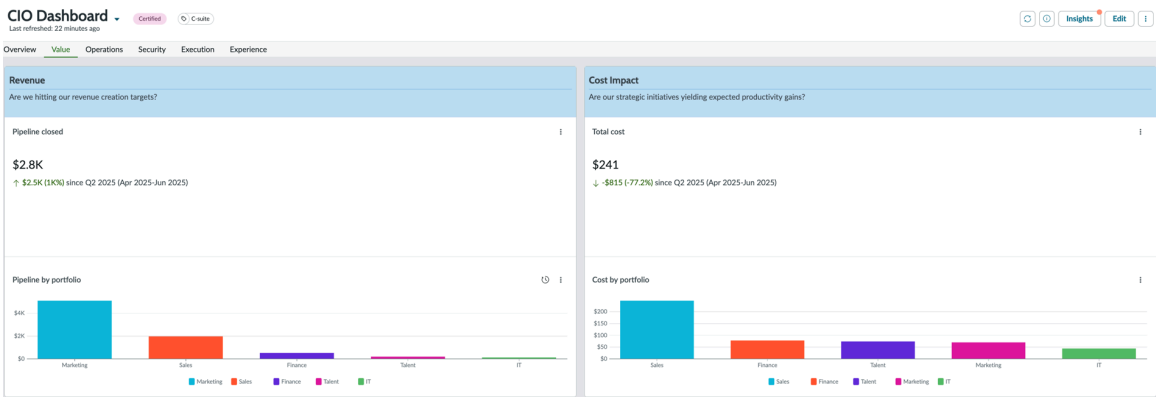
Target audience

The Overview tab is crafted for senior IT leadership — most notably CIOs — to deliver an at-a-glance, real-time view of enterprise IT health and performance, aligning daily operations with strategic business goals.

Primary Stakeholders

- Chief Information Officer (CIO)
- Chief IT executives
- IT leadership team
- Strategic business stakeholders
- ServiceNow admins and analytics leads
- Executive reviewers and board members

Value tab



Purpose

The Value Tab centers on demonstrating how IT investments drive measurable business outcomes. It surfaces real-time revenue and cost insights that help CIOs understand return on investment, optimize spending, and align technology initiatives with growth objectives.

Target audience

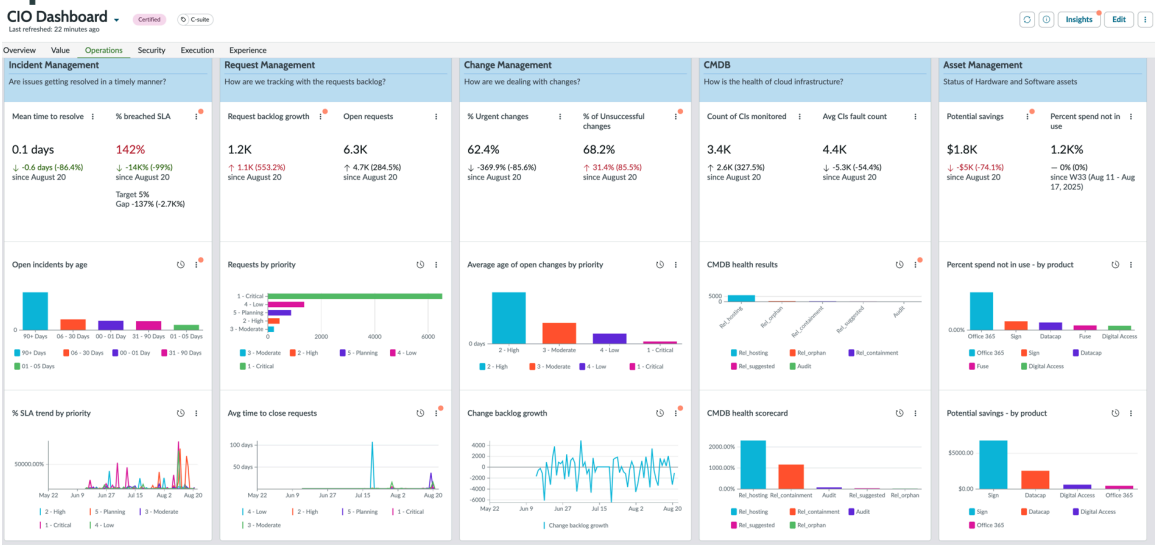
The Value Tab is designed for leaders who need clear, quantifiable insights into how IT investments drive business growth and cost efficiency. It surfaces metrics like ROI, TCO, and cost per service that enable strategic financial decision-making.

Primary Stakeholders

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Chief Information Officer (CIO)
- Chief Financial Officer (CFO)
- IT Finance and Budgeting Managers
- Strategic Portfolio Managers
- Business unit leaders and Line-of-Business owners
- Financial analysts supporting IT investments
- Enterprise architects focused on cost optimization

Operations tab



Purpose

The Operations Tab focuses on ensuring stability, reliability, and efficiency of IT services and infrastructure. It provides CIOs with real-time visibility into incident management, request fulfillment, change processes, and asset health to maintain uptime and optimize resource utilization.

Target audience

The Operations Pillar delivers real-time insights into IT service performance, infrastructure health, and process efficiency. It aggregates key metrics from IT Service Management, IT Operations Management, and asset data to help teams spot bottlenecks, drive automation, and maintain service reliability.

Primary Stakeholders

- Chief Information Officer (CIO)
- IT Operations Managers and Directors
- Service Delivery Managers
- Incident and Problem Managers
- Change and Release Managers
- Service Desk and Support Managers
- Infrastructure and Cloud Operations Teams
- IT Service Management (ITSM) Process Owners

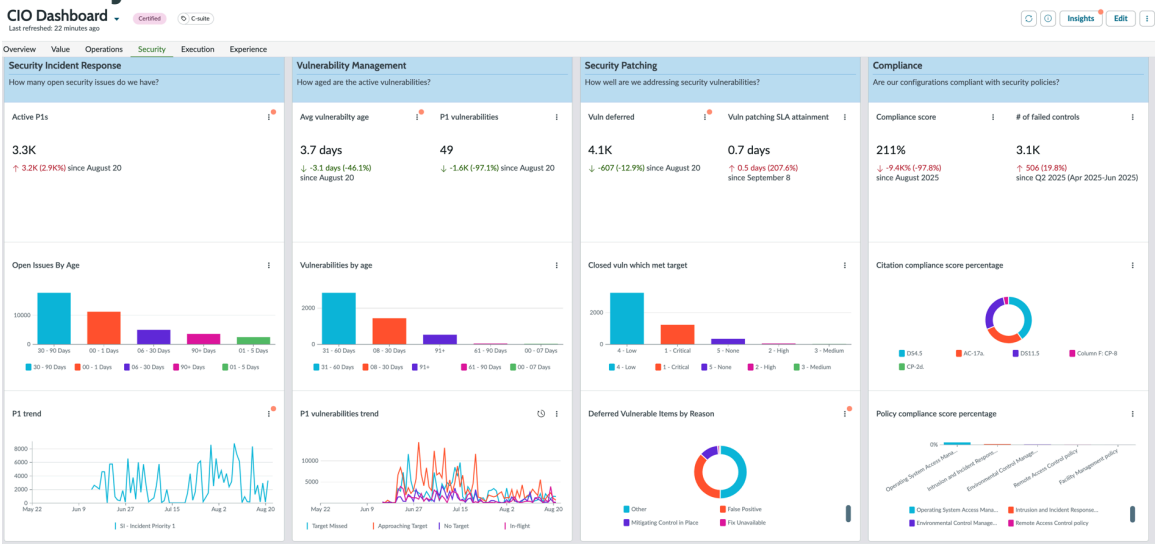
- Service Level and Availability Managers
- Operations Analysts and Continuous Improvement Leads

Security tab



Purpose

The Security Tab provides CIOs with a centralized view into security operations, consolidating vulnerability intelligence, incident response metrics, and compliance indicators to help protect the organization from cyber threats and ensure adherence to regulatory standards.

Target audience

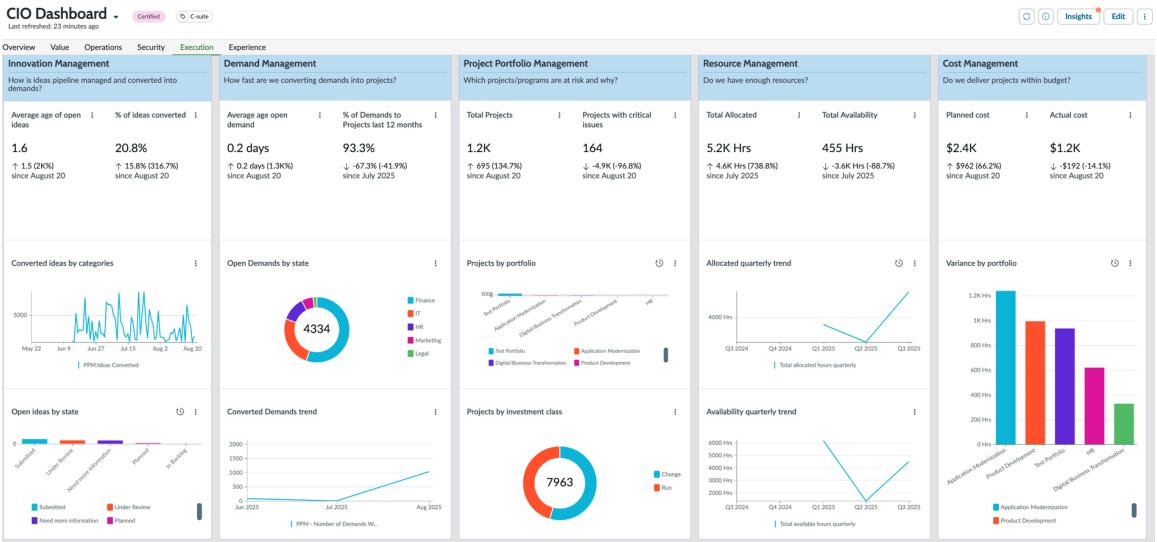
The Security Tab of the ServiceNow CIO Dashboard is crafted for senior security and risk-management stakeholders who need a real-time overview of the organization's security posture, incident response, and compliance status.

Primary Stakeholders

- Chief Information Security Officer (CISO) and Chief Security Officer (CSO)
- Security Operations Center (SOC) managers and analysts
- IT risk and compliance leads
- IT audit and governance teams
- Enterprise architects overseeing security controls

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Execution tab



Purpose

The Execution Pillar focuses on tracking strategic initiatives, ensuring projects stay on course and delivering intended outcomes. It provides visibility into project progress, resource allocation, and more, powered by ServiceNow Strategic Portfolio Management.

Target audience

The Execution Tab provides visibility into project and program metrics—progress against milestones, resource utilization, budget adherence, and risk indicators—empowering IT leaders to steer strategic initiatives, optimize delivery, and align investments with business outcomes.

Primary Stakeholders

- Chief Information Officer (CIO)
- Strategic portfolio managers and PMO directors
- Program managers and project managers
- Resource and capacity planning managers
- Business unit leaders and program sponsors
- Finance business partners and budget owners
- Enterprise and solution architects
- Risk and governance officers

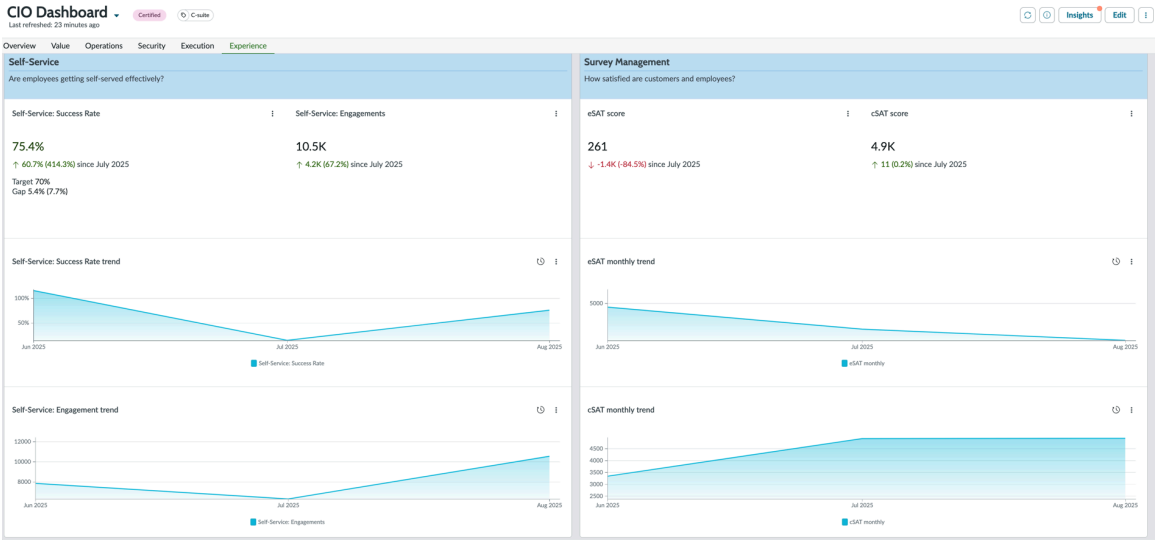
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Experience tab



Purpose

The Experience Tab provides CIOs with a holistic view of end-user satisfaction and adoption across IT services, capturing feedback, engagement, and sentiment data to guide enhancements in digital experiences.

Target audience

The Experience Tab focuses on capturing user sentiment, satisfaction, and engagement across digital channels. It surfaces metrics like CSAT scores, survey response rates, self-service adoption, and digital employee experience dashboards. These insights help teams continuously refine the end-user experience and drive service adoption.

Primary Stakeholders

- Chief Information Officer
- Chief Experience Officers or Chief Customer Officers
- Service delivery and support managers
- UX and digital employee experience leads
- Knowledge Management and self-service owners
- Human Resources and employee engagement teams
- Virtual agent and chatbot designers
- Change and adoption managers
- IT Service Management process owners
- Service Desk and operations managers

Chief Information Officer Dashboard data visualizations

Use these data visualizations to get high-level and detailed views of how information is used in your organization.

Chief Information Officer Dashboard indicators

Indicators provide the data used in most of the dashboard's visualizations. The indicators are used across the dashboard.

This dashboard employs all three kinds of indicators, Automated, Formula, and Manual. For more information about configuring indicators, see

- Automated indicators
- Formula indicators
- Manual indicators

Chief Information Officer Dashboard roles

Two roles are associated with this dashboard

Platform Analytics administrator

The dashboard administrator (sn_ciodashboard.ciodashboard_admin) is responsible for installing, configuring, and maintaining the CIO Dashboard and its underlying content.

Key duties include:

- Installing plugins and assigning the admin roles to configuration owners
- Defining verticals and business questions (for example, Value, Operations, Security)
- Selecting and tuning KPIs/KRIs, setting thresholds, and mapping data sources
- Creating and validating Platform Analytics indicators, breakdowns, and data-collection jobs
- Managing translations, plugin upgrades, and best-practice templates to ensure consistency

Business user

The user (sn_ciodashboard.ciodashboard_user) role is required to access the dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Typical activities:

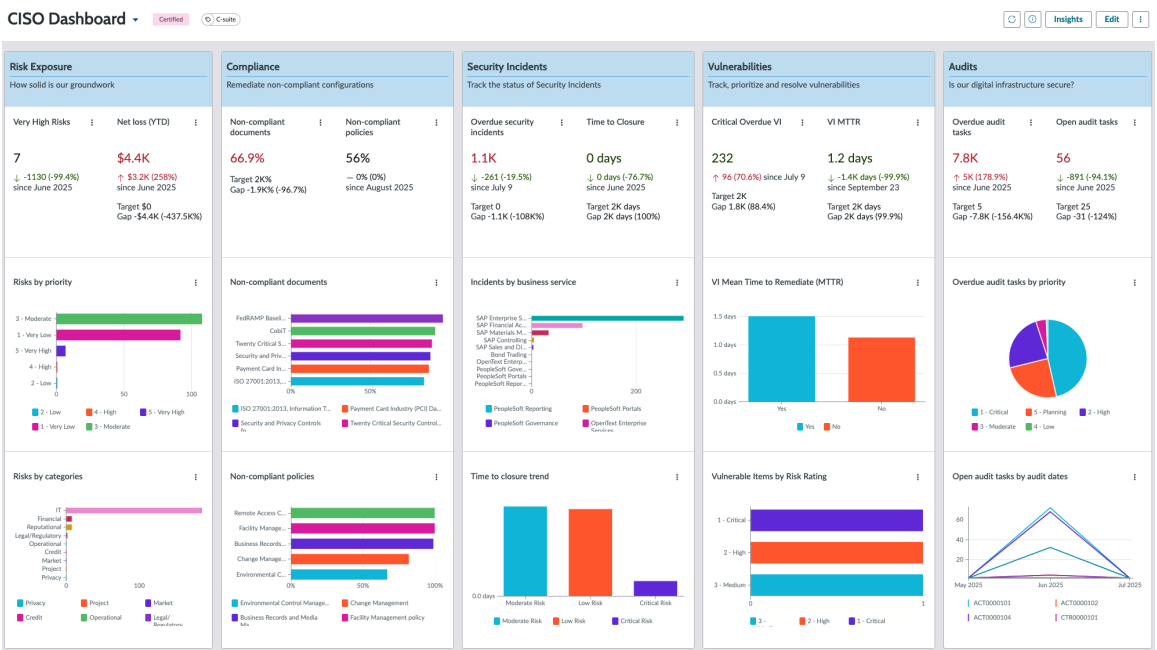
- Viewing real-time scorecards and visualizations aligned to strategic goals
- Applying filters, switching time frames, and drilling into underlying records (incidents, projects, security events)
- Exporting charts and reports for executive briefs or stakeholder presentations
- Subscribing to alerts and notifications when metrics cross defined thresholds
- Providing feedback on dashboard usability and data relevance to the admin team

Chief Information Security Officer (CISO) Dashboard

The Chief Information Security Officer (CISO) dashboard provides a single pane glass view of end-to-end information security operations by capturing real-time insights on organizational security posture across risk exposure, compliance health, security incidents, vulnerabilities, and audit performance.

The CISO dashboard serves as a central security command interface, bringing together key data that helps leadership proactively manage threats, reduce risk, and maintain enterprise-wide compliance. It consolidates essential metrics such as incident volume, time to closure, non-compliant configurations, critical vulnerabilities, overdue audits, and risk categories—providing a comprehensive picture of the organization's cyber resilience.

This dashboard visualizes insights on security incident trends, MTTR, risk severity distribution, compliance violations, outstanding audit tasks, and vulnerability remediation progress. These indicators help CISOs to identify emerging threats, track operational security maturity, minimize exposure, and strengthen the organization's overall security posture through timely interventions and informed decision-making.



Install the Chief Information Security Officer (CISO) Dashboard

The Chief Information Security Officer (CISO) Dashboard provides a single pane glass view of end-to-end security operations.

Before you begin

Role required: sn_ciso_dashboard.admin, sn_ciso_dashboard.user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The CISO Dashboard application is free from the ServiceNow Store. However, the contents of the dashboard require professional entitlements to the following applications:

- Security Operations (SecOps)
- Governance, Risk, and Compliance (GRC)

These professional entitlements include a license for Platform Analytics.

These solutions consist of Platform Analytics indicators and associated data collection jobs, used by the metrics on the CISO Dashboard. If you don't have the prerequisite licenses, the installation proceeds. However, without the required plugins (found in the application manager) and applications (found in the ServiceNow store) and the underlying data, the dashboard won't show any relevant metrics. If you have any questions about your licensing and entitlements, consult your account executive.

Plugin: com.snc.vulnerability.analytics.

Applications:

- sn_sir_analytics
- sn_vul_analytics
- sn_grc_pa_advanced
- sn_vulc_analytics

Procedure

1. Log in to `https://store.servicenow.com`.
2. Search for the CISO Dashboard application.
3. Select the **Request Install** button to create the app installation request.
   Select **Request** to request the CISO Dashboard application plugin for the specified instance and provide the instance details with your reason for request and validate the instance.
4. Navigate to **System applications** > **All available applications**.
5. Search for and install the CISO Dashboard plugin (sn_ciso_dashboard).
6. Assign roles to configure and view the CISO Dashboard.

   CISO Dashboard admin

   Assign the role sn_ciso_dashboard.admin to users or groups who require configuration privileges on the dashboard.

   Note: Only users with this role are able to configure the CISO dashboard.

   CISO Dashboard end users

   Assign the user role sn_ciso_dashboard.user to users or groups who must view the dashboard.

   Viewer

   Assign the pa_viewer role to those who need to view Performance Analytics scores.

   Users must log out and log back in to enable their new roles after the admin assigns them. For more information on user roles, see Exploring user administration.

Chief Information Security Officer (CISO) Dashboard pillars

Organizing insights across these pillars empowers CISOs to proactively reduce risk, improve compliance, strengthen incident responses, accelerate vulnerability remediation, and maintain audit readiness.

Strategic pillars

The strategic pillars of the dashboard show metrics related to Risk Exposure, Compliance, Security Incidents, Vulnerability, and Audits.

Pillar	Focus Area	Key Metrics	Description
Risk Exposure	Risk identification & severity distribution	• Very High Risks • Net Loss • Risks by Priority • Risks by Category	Highlights risk severity and categorical distribution to help leaders understand where critical exposures exist and prioritize mitigation.
Compliance	Configuration, policy & document adherence	• Non-compliant Documents • Non-compliant Policies • Compliance Trends	Tracks compliance gaps across policy, configuration, and documentation layers to ensure adherence to frameworks and regulatory requirements.
Security Incidents	Incident response & containment	• Overdue Incidents • Time to Closure • Incidents by Business Service	Monitors incident volume, closure speed, and business-service impact to strengthen detection and response effectiveness.
Vulnerability	Remediation & risk reduction	• Critical Overdue Vulnerabilities • VI MTTR • Vulnerable Items by Rating	Evaluates vulnerability remediation progress, MTTR, and severity to manage exposure and accelerate risk reduction efforts.
Audits	Oversight, readiness & control validation	• Overdue Audit Tasks • Open Audit Items • Audit Trends by Priority	Provides visibility into audit backlog, control testing readiness, and remediation timelines to maintain governance and reduce compliance failures.

CISO Dashboard overview

This dashboard is for the Chief Information Security Officer and others who require real-time insights into information security operations.

Purpose

The CISO Dashboard provides a unified, real-time snapshot of an organization's security posture across risk exposure, compliance health, security incidents, vulnerability management, and audit readiness. It consolidates key KPIs and KRIs to help security leaders quickly identify where the organization is most exposed, evaluate operational response effectiveness, and prioritize remediation efforts that reduce enterprise risk.

Designed as both a strategic and operational command center, the dashboard supports informed decision-making by offering visibility into incident trends, MTTR, non-compliant configurations, overdue vulnerabilities, and audit gaps. By centralizing security insights into one view, it enables CISOs and security teams to proactively mitigate threats, strengthen compliance, and uphold governance across the security life-cycle.

Target audience

The CISO Dashboard is intended for cybersecurity, governance, and risk leaders who require data-driven visibility into the health and performance of enterprise security operations. It supports users responsible for monitoring risk levels, managing compliance frameworks, responding to security incidents, and preparing for audits or regulatory reviews.

This dashboard is also used by operational teams and business partners who rely on accurate, timely indicators to support remediation planning, ensure policy adherence, and maintain business continuity.

Primary Stakeholders

- Chief Information Security Officer
- Chief Information Officer

Chief Information Security Officer Dashboard roles

Two roles are associated with this dashboard.

Platform Analytics administrator

The dashboard administrator (sn_ciso_dashboard.admin) is responsible for installing, configuring, and maintaining the CISO Dashboard and its underlying content.

Key duties include:

- Installing plugins and assigning the admin roles to configuration owners
- Defining verticals and business questions (for example, Value, Operations, Security)
- Selecting and tuning KPIs/KRIs, setting thresholds, and mapping data sources
- Creating and validating Platform Analytics indicators, breakdowns, and data-collection jobs
- Managing translations, plugin upgrades, and best-practice templates to ensure consistency

Business user

The user (sn_ciso_dashboard.user) role is required to access the dashboard.

Typical activities:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

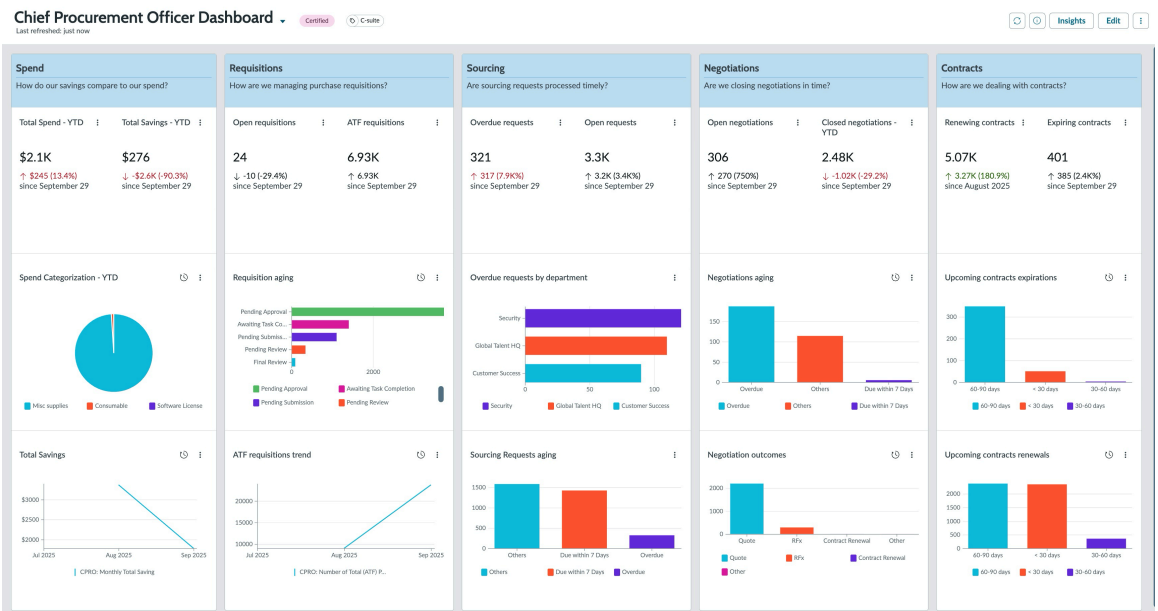
- Viewing real-time scorecards and visualizations aligned to strategic goals
- Applying filters, switching time frames, and drilling into underlying records (incidents, projects, security events)
- Exporting charts and reports for executive briefs or stakeholder presentations
- Subscribing to alerts and notifications when metrics cross defined thresholds
- Providing feedback on dashboard usability and data relevance to the admin team

Chief Procurement Officer (CPRO) Dashboard

The Chief Procurement Officer Dashboard provides a consolidated view of the enterprise procurement performance across spending, requisitions, sourcing operations, negotiations, and contract life cycle management.

The CPRO dashboard serves as a centralized workspace for tracking end-to-end procurement health, enabling leaders to optimize spend, manage requisition flow, ensure timely sourcing execution, and maintain contract discipline. It brings together critical indicators such as year-to-date spend, savings achieved, open requisitions, sourcing backlog, negotiation outcomes, and contract renewals or expiration.

This dashboard visualizes essential procurement insights including requisition aging, sourcing request trends, negotiation timeliness, department-level sourcing delays, contract renewal pipelines, and spend categorization. These metrics help procurement executives identify bottlenecks, improve cycle time, enhance spend governance, and maximize value from procurement operations.



Install the Chief Procurement Officer Dashboard

The Chief Procurement Officer Dashboard provides key insights around the procurement process of your organization.

Before you begin

Role required: sn_cpro_dashboard.admin, sn_cpro_dashboard.user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The CPRO Dashboard application is free from the ServiceNow Store. However, the contents of the dashboard require professional entitlements to the following applications:

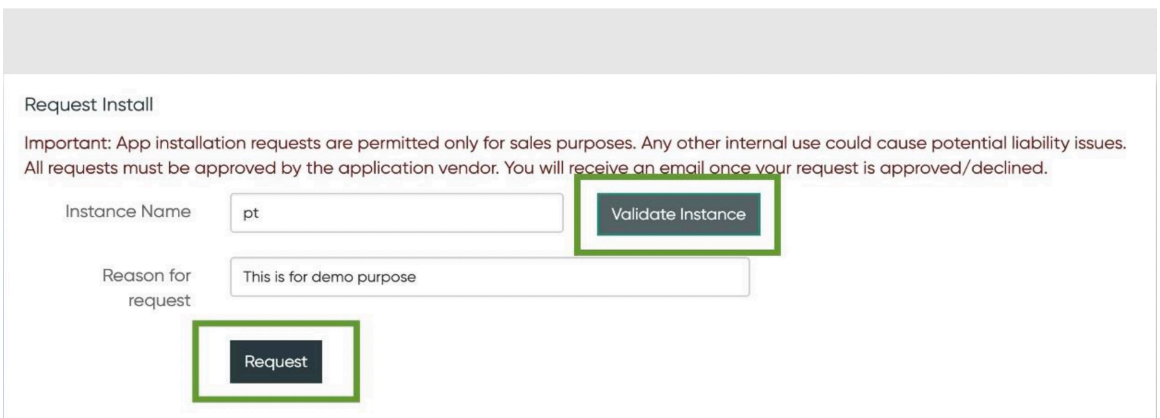
- Performance Analytics Content Pack for Procurement Service Management
- Purchase Automation Integration with Risk Assessment
- Procurement Case Management
- Procurement Specialist Workspace
- Procurement Integration Framework
- Finance Common Architecture
- Service Delivery Common
- Purchase Modification Experience Pack for Procurement Case Management
- Sourcing and Purchasing Automation
- Virtual Agent Experience Pack for Procurement Service Management
- Procurement Common Architecture
- Procurement with Project Management
- ShoppingHub Mobile
- Finance - ERP Integration
- Procurement File Transfer Framework
- Procurement Service Management NLU Model

These professional entitlements include a license for Platform Analytics.

These solutions consist of Platform Analytics indicators and associated data collection jobs, used by the metrics on the CPRO Dashboard. If you don't have the prerequisite licenses, the installation proceeds. However, without the required plugins (found in the application manager) and applications (found in the ServiceNow store) and the underlying data, the dashboard won't show any relevant metrics. If you have any questions about your licensing and entitlements, consult your account executive.

Procedure

1. Log in to `https://store.servicenow.com`.
2. Search for the CPRO Dashboard application.
3. Select the **Request Install** button to create the app installation request.
   Select **Request** to request the CPRO Dashboard application plugin for the specified instance and provide the instance details with your reason for request and validate the instance.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Navigate to **System applications** > **All available applications**.
5. Search for and install the CPRO Dashboard plugin (sn_cpro_dashboard).
6. Assign roles to configure and view the CPRO Dashboard.

   CPRO Dashboard admin

   Assign the role sn_cpro_dashboard.admin to users or groups who require configuration privileges on the dashboard.

   Note: Only users with this role are able to configure the CPRO dashboard.

   CPRO Dashboard end users

   Assign the user role sn_cpro_dashboard.user to users or groups who must view the dashboard.

Users must log out and log back in to enable their new roles after the admin assigns them. For more information on user roles, see Exploring user administration.

Chief Procurement Officer Dashboard pillars

Organizing insights across these pillars enables procurement leaders to drive cost efficiency, improve operational throughput, strengthen supplier engagements, and maintain contract compliance across the enterprise.

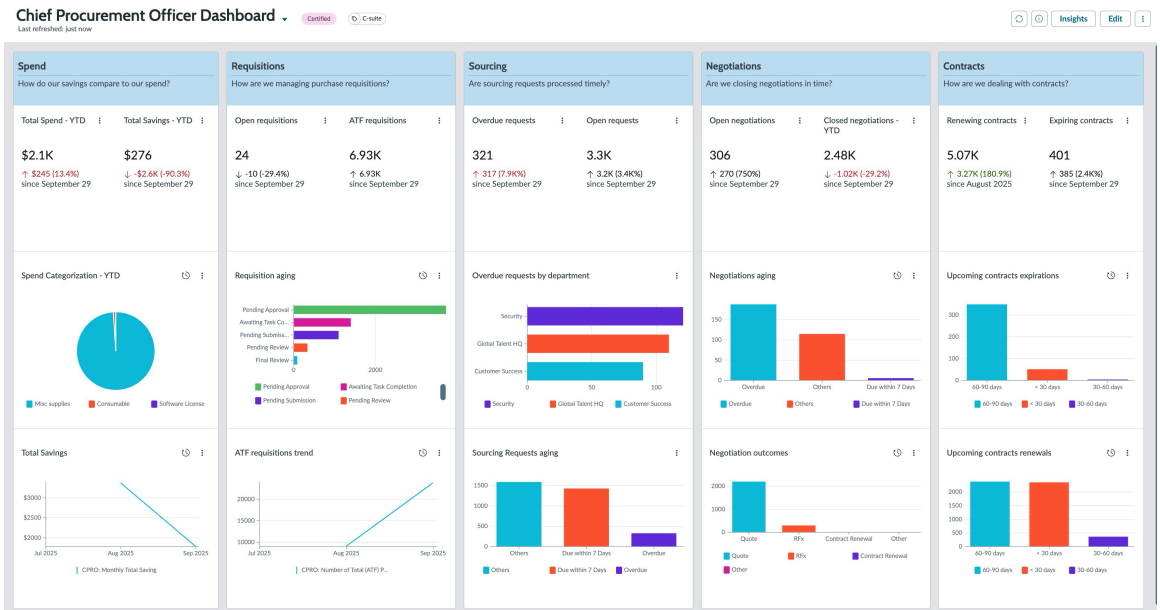
Strategic pillars

The strategic pillars of the dashboard show metrics related to Spend, Requisitions, Sourcing, Negotiations and Contracts.

Pillar	Focus Area	Key Metrics	Description
Spend	Financial efficiency & cost control	• Total Spend YTD • Total Savings YTD • Spend Categorization	Provides visibility into how enterprise spend compares to realized savings, helping leaders monitor cost performance and track optimization outcomes.
Requisitions	Intake management & request lifecycle	• Open Requisitions • ATF Requisitions • Requisition Aging	Tracks requisition volume and aging to ensure timely processing and improve turnaround times across procurement functions.
Sourcing	Supplier & sourcing workflow timeliness	• Overdue Requests • Open Requests • Sourcing Aging • Overdue by Department	Monitors sourcing backlog and departmental delays, enabling better prioritization and more efficient supplier engagement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pillar	Focus Area	Key Metrics	Description
Negotiations	Commercial outcomes & cycle time	• Open Negotiations • Closed Negotiations YTD • Negotiation Aging • Negotiation Outcomes	Evaluates negotiation workload, aging, success distribution, and closed outcomes to strengthen supplier negotiations and commercial performance.
Contracts	Contract lifecycle management & renewals	• Renewing Contracts • Expiring Contracts • Renewal & Expiration Aging	Provides insight into upcoming renewals and expirations to ensure timely contract actions, mitigate risk, and maintain business continuity.



CPRO Dashboard overview

This dashboard is for the Chief Procurement Officer and others who require real-time insights into procurement processes.

Purpose

The CPRO Dashboard provides a comprehensive, real-time view of enterprise procurement performance, consolidating insights across spending, requisition handling, sourcing efficiency, negotiation progress, and contract lifecycle management. It enables procurement leaders to assess operational workload, identify bottlenecks, monitor cost savings, and ensure that procurement processes are delivering timely, compliant, and cost-effective outcomes.

By visualizing indicators such as total spend, savings achieved, aging requisitions, overdue sourcing requests, open negotiations, and upcoming contract renewals or expirations, the dashboard helps procurement teams make informed decisions. This centralized view supports improved vendor management, stronger sourcing governance, and greater financial discipline across purchasing activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Target audience

The CPRO Dashboard is intended for procurement, sourcing, and supply chain professionals who need ongoing visibility into the performance and efficiency of procurement workflows. It serves both operational teams responsible for processing requisitions, managing negotiations, and handling contracts, as well as strategic leaders who monitor spend trends, savings opportunities, and supplier performance.

This dashboard also supports finance and business unit leaders who rely on accurate procurement insights to plan budgets, coordinate purchasing needs, and align procurement performance to business goals.

Primary Stakeholders

- Chief Procurement Officer
- Chief Financial Officer
- Chief Risk Officer
- Sourcing and Supplier Management Teams
- Negotiation and Commercial Managers
- Contract Management Teams
- Finance and Budget Owners
- Audit and Governance Officers

Chief Procurement Officer Dashboard roles

Two roles are associated with this dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Platform Analytics administrator

The dashboard administrator (sn_cpro_dashboard_admin) is responsible for installing, configuring, and maintaining the CPRO Dashboard and its underlying content.

Key duties include:

- Installing plugins and assigning the admin roles to configuration owners
- Defining verticals and business questions
- Selecting and tuning KPIs/KRIs, setting thresholds, and mapping data sources
- Creating and validating Platform Analytics indicators, breakdowns, and data-collection jobs
- Managing translations, plugin upgrades, and best-practice templates to ensure consistency

Business user

The user (sn_cpro_dashboard.user) role is required to access the dashboard.

Typical activities:

- Viewing real-time scorecards and visualizations aligned to strategic goals
- Applying filters, switching time frames, and drilling into underlying records (incidents, projects, security events)
- Exporting charts and reports for executive briefs or stakeholder presentations
- Subscribing to alerts and notifications when metrics cross defined thresholds
- Providing feedback on dashboard usability and data relevance to the admin team

Chief Risk Officer (CRO) Dashboard

The Chief Risk Officer (CRO) uses this dashboard to get a single pane glass view of end-to-end Governance, Risk, and Compliance.

The CRO dashboard is a critical tool for day-to-day risk governance as it provides a comprehensive view of the organization's risk posture and compliance health. This dashboard assists CROs in making key risk-informed decisions by consolidating enterprise-wide metrics across risks, issues, audits, compliance, and business continuity governance.

This dashboard presents a collection of data visualizations for key risk indicators such as high-risk entities, net loss, open and aging issues, audit findings and failed controls, document and policy compliance rates, crisis and emergency events, and continuity plan status. These insights reflect trends over time, highlight areas of concern, and enable proactive risk mitigation and organizational resilience.

Install the Chief Risk Officer Dashboard

The CRO Dashboard provides a single pane glass view of end-to-end Governance, Risk and Compliance.

Before you begin

Role required: sn_cro_dashboard.admin, sn_cro_dashboard.user

Note: The CRO Dashboard application is free from the ServiceNow Store. However, the contents of the dashboard require professional entitlements to the following applications:

- GRC
- GRC: Profiles
- GRC: Policy and Compliance
- Audit Management

These professional entitlements include a license for Platform Analytics.

These solutions consist of Platform Analytics indicators and associated data collection jobs, used by the metrics on the CRO Dashboard. If you don't have the prerequisite licenses, the installation proceeds. However, without the required plugins (found in the application manager) and applications (found in the ServiceNow store) and the underlying data, the dashboard won't show any relevant metrics. If you have any questions about your licensing and entitlements, consult your account executive.

Application plugins:

- sn_grc
- sn_audit
- sn_compliance
- sn_risk

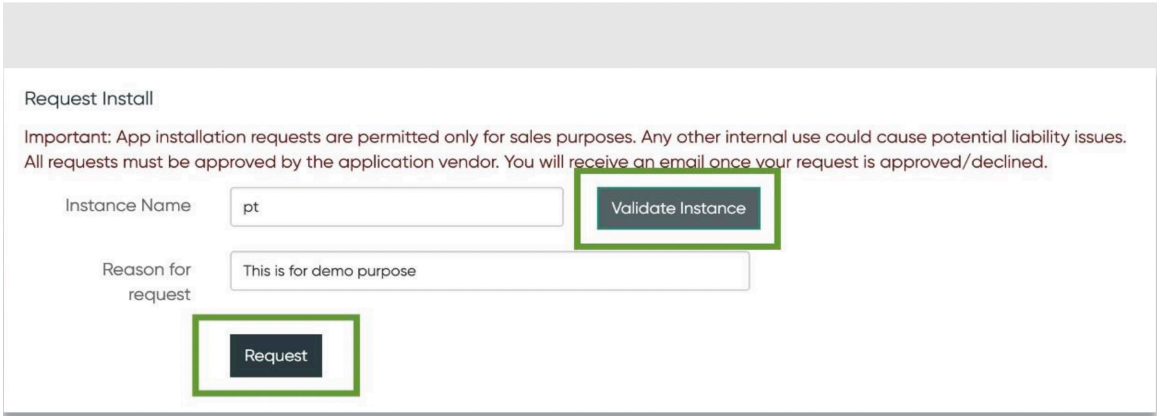
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log in to `https://store.servicenow.com`.
2. Search for the CRO Dashboard application.
3. Select the **Request Install** button to create the app installation request.
   Select **Request** to request the CRO Dashboard application plugin for the specified instance and provide the instance details with your reason for request and validate the instance.



4. Navigate to **System applications** > **All available applications**.
5. Search for and install the CRO Dashboard plugin (sn_cro_dashboard).
6. Assign roles to configure and view the CRO Dashboard.

   CRO Dashboard admin

   Assign the role sn_cro_dashboard.admin to users or groups who require configuration privileges on the dashboard.

   Note: Only users with this role are able to configure the CRO dashboard.

   CRO Dashboard end users

   Assign the user role sn_cro_dashboard.user to users or groups who must view the dashboard.

   Users must log out and log back in to enable their new roles after the admin assigns them. For more information on user roles, see Exploring user administration.

Chief Risk Officer Dashboard pillars

Organizing insights into these five pillars promotes CRO focus on delivering value quickly, improving productivity and optimizing risks.

The strategic pillars of the CRO dashboard show metrics related to Enterprise Risks and Issues, Internal Audits, Compliance, and BCM Governance.

Pillar	Focus Area	Metrics	Description
Enterprise Risks	High-level enterprise risks	• Entities at high risk • Net loss(YTD)	Real-time view of enterprise risk posture, severity distribution, and loss trends.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pillar	Focus Area	Metrics	Description
		• Risks by Impact • Active Risks by categories	
Enterprise Issues	Open issues in the enterprise	• All Open Issues • Unassigned issues • Open Issues by age • Issues resolved	Tracks issue backlog, ownership gaps, and resolution velocity across the enterprise.
Internal Audits	Rigor and tracking in the audit process	• Open audit issues • Failed controls • Open Audit issues • Failed controls trend	Measures audit workload, control failures, and remediation trends.
Compliance	Compliance with documentation and policy	• Document Compliance (%) • Policy Compliance (%) • Compliant Documents • Compliant policies	Monitors compliance maturity and documentation readiness across frameworks.
BCM Governance	Governance of business continuity management	• Global crisis events • Global emergency response events • Plan Status • Tests completed	Evaluates resilience, continuity plans, crisis response, and test execution.

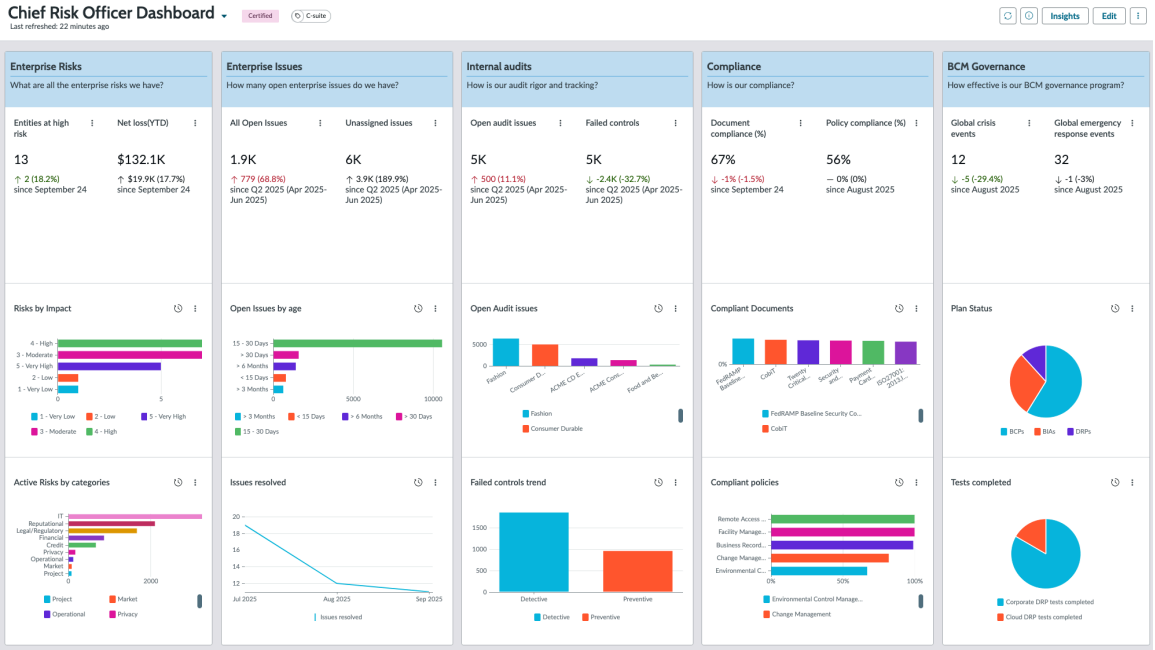
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



CRO Dashboard overview

This dashboard is for the Chief Risk Officer and others who require real-time insights into governance, risk, and compliance.

Purpose

The CRO Dashboard acts as a centralized command center for enterprise-wide risk governance, compliance oversight, business continuity readiness, and audit integrity.

It consolidates indicators such as risk impact, open issues, failed controls, compliance scores, and crisis response events, enabling senior leaders to assess:

- Enterprise-wide risk exposure and trends
- Audit and control effectiveness
- Policy and regulatory compliance maturity
- Business continuity preparedness and crisis handling performance
- Ownership, aging, and clearance of enterprise issues

This enables proactive decision-making, faster remediation, and stronger governance maturity.

Target audience

The CRO Dashboard is designed for executive leadership and governance stakeholders who need visibility into enterprise-wide risk posture, regulatory compliance, audit rigor, and continuity readiness.

Primary Stakeholders

- Chief Risk Officer (CRO)
- Chief Customer Operations Officer (CCO)
- Internal Audit Leadership
- Enterprise Risk and Governance Teams

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Business Continuity and Crisis Management Teams
- Executive Reviewers and Board Members

Chief Risk Officer Dashboard data visualizations

Use these data visualizations to get high-level and detailed views of how information security is addressed in your organization.

Column	Visualization	Visualization Type	Data Source
Enterprise Risks	Entities at high risk	Single Score	Entities at highest risk
Enterprise Risks	Net loss (YTD)	Single Score	Net loss (YTD)
Enterprise Risks	Risks by Impact	Horizontal Bar	Total Risks
Enterprise Risks	Active Risks by categories	Horizontal Bar	Active Risk
Enterprise Issues	All Open Issues	Single Score	All Open Issues
Enterprise Issues	Unassigned issues	Single Score	All Unassigned Issues
Enterprise Issues	Open Issues by age	Horizontal Bar	Issues Aging Indicator
Enterprise Issues	Issues resolved	Line	Issues resolved
Internal Audits	Open audit issues	Single Score	Open Audit Issue
Internal Audits	Failed controls	Single Score	Failed Controls
Internal Audits	Open Audit issues	Vertical Bar	Open Audit Issue
Internal Audits	Failed controls trend	Vertical Bar	Failed Controls
Compliance	Document compliance (%)	Single Score	Authority document compliance score percentage daily
Compliance	Policy compliance (%)	Single Score	Policy Compliance Score Percentage
Compliance	Compliant Documents	Vertical Bar	Authority document compliance score percentage
Compliance	Compliant policies	Horizontal Bar	Policy Compliance Score Percentage
BCM Governance	Global crisis events	Single Score	# of global crisis events
BCM Governance	Global emergency response events	Single Score	# of global emergency response events
BCM Governance	Plan Status	Pie	Plan status
BCM Governance	Tests completed	Pie	Tests completed

Chief Risk Officer Dashboard indicators

Indicators provide the data used in most of the dashboard's visualizations. The indicators are used across the dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This dashboard employs all three kinds of indicators, Automated, Formula, and Manual. For more information about configuring indicators, see

- Automated indicators
- Manual indicators

Column	Indicator	Source plugin	Indicator type	Indicator Source / Formula calculation / Additional conditions
Enterprise Risks	Entities at highest risk	sn_cro_dashboard	Automated	Entities at highest risk
Enterprise Risks	Net loss (YTD)	sn_cro_dashboard	Automated	Net loss (YTD) Calculation: Sum (net_amount)
Enterprise Risks	Total Risks	sn_cro_dashboard	Automated	Total Risks Condition: Active = true
Enterprise Risks	Active Risk	sn_risk	Automated	Active.Risk
Enterprise Issues	All Open Issues	sn_grc	Automated	All Open Issues Quarterly
Enterprise Issues	All Unassigned Issues	sn_grc	Automated	All Issues Quarterly Conditions: Assigned to is empty and Created on This quarter
Enterprise Issues	Issues Aging Indicator		Automated	All Open Issues Quarterly Conditions: Actual start date isn't empty and Actual end date isn't empty and Actual end date is more than 0 Hours after Actual start date
Enterprise Issues	Issues resolved	sn_grc	Automated	Resolved Issues
Internal Audits	Open Audit Issue	sn_audit	Automated	All Open Issues Quarterly Condition: Top task Number starts with ENG
Internal Audits	Failed Controls	sn_audit	Automated	Controls.With.Failed.ControlTest
Compliance	Authority document compliance score percentage daily	sn_compliance	Automated	GRC document compliance status • Conditions: Name Class = Authority document and Name Functional domain

Column	Indicator	Source plugin	Indicator type	Indicator Source / Formula calculation / Additional conditions
				CONTAINS IT risk and compliance • Calculation: Average (compliance_score)
Compliance	Policy Compliance Score Percentage	sn_compliance	Automated	All Active Policies Monthly Calculation: Average (compliance_score)
Compliance	Authority document compliance score percentage	sn_compliance	Automated	All Active Authority documents Monthly Calculation: Average (compliance_score)
BCM Governance	# of global crisis events		Manual	
BCM Governance	# of global emergency response events		Manual	
BCM Governance	Plan status		Manual	
BCM Governance	Tests completed		Manual	

Chief Risk Officer Dashboard roles

Two roles are associated with this dashboard.

Platform Analytics administrator

The dashboard administrator (sn_cro_dashboard.admin) is responsible for installing, configuring, and maintaining the CRO Dashboard and its underlying content.

Key duties include:

- Installing plugins and assigning the admin roles to configuration owners
- Defining verticals and business questions (for example, Value, Operations, Security)
- Selecting and tuning KPIs/KRIs, setting thresholds, and mapping data sources
- Creating and validating Platform Analytics indicators, breakdowns, and data-collection jobs
- Managing translations, plugin upgrades, and best-practice templates to ensure consistency

Business user

The user (sn_cro_dashboard.user) role is required to access the dashboard.

Typical activities:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

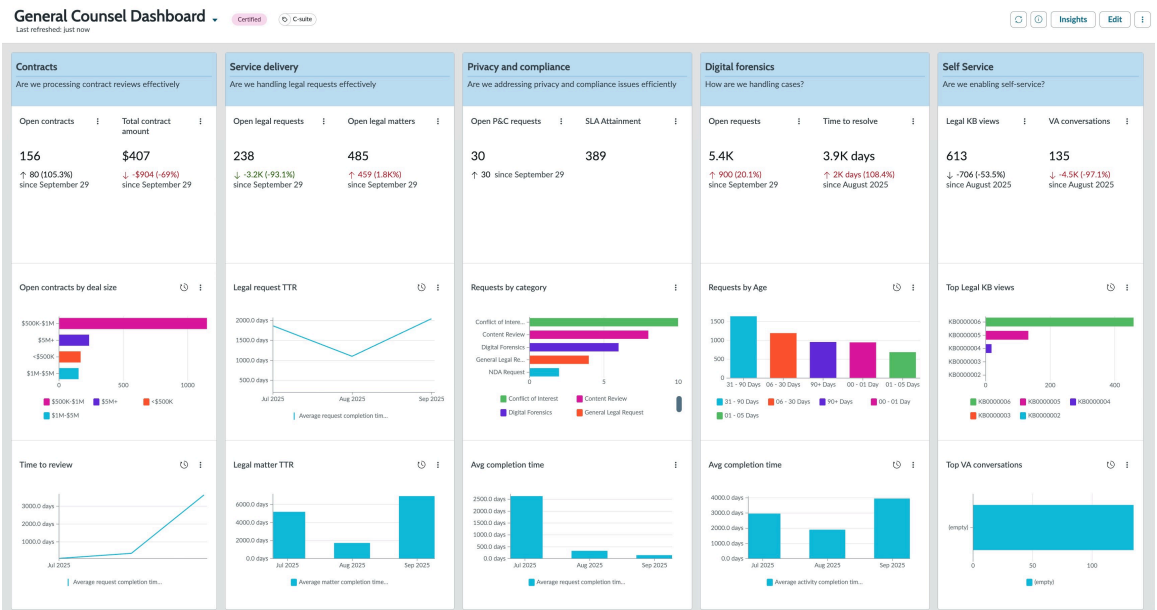
- Viewing real-time scorecards and visualizations aligned to strategic goals
- Applying filters, switching time frames, and drilling into underlying records (incidents, projects, security events)
- Exporting charts and reports for executive briefs or stakeholder presentations
- Subscribing to alerts and notifications when metrics cross defined thresholds
- Providing feedback on dashboard usability and data relevance to the admin team

General Counsel (GC) Dashboard

The General Counsel (GC) Dashboard provides transparency into legal service delivery and operations. The insights include visibility into contracts, legal requests, compliance issues, and digital forensics.

The GC Dashboard serves as a central command center for monitoring how effectively the legal function supports the organization. It consolidates high-value metrics such as contract volumes, legal request turnaround time, privacy request aging, invoice processing trends, and usage of legal self-service channels.

This dashboard visualizes the end-to-end performance of legal operations, including open contracts by deal size, legal request MTTR, privacy request backlogs, invoice cycle times, and adoption of digital legal services. These indicators help legal leaders understand workload distribution, identify operational bottlenecks, improve compliance responsiveness, and ensure that legal processes are timely, effective, and scalable.



Install the General Counsel (GC) Dashboard

For a general counsel, this dashboard provides transparency into legal service delivery and operations.

Before you begin

Role required: sn_lsd_dashboard.gc_dashboard_admin, sn_lsd_dashboard.gc_dashboard_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The General Counsel Dashboard application is free from the ServiceNow Store. However, the contents of the dashboard require professional entitlements to the following applications: Legal Services Delivery. This application includes a license for Platform Analytics.

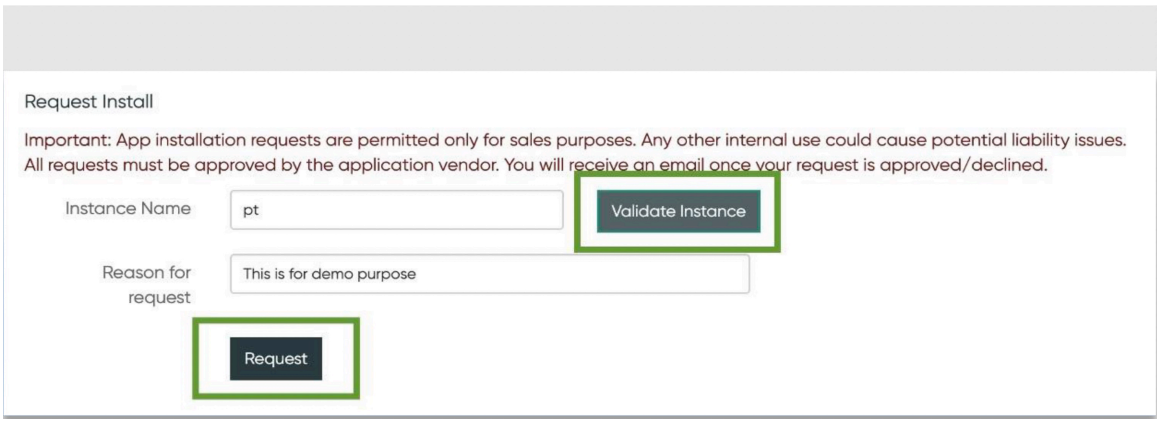
These solutions consist of Platform Analytics indicators and associated data collection jobs, used by the metrics on the GC Dashboard. If you don't have the prerequisite licenses, the installation proceeds. However, without the required plugins (found in the application manager) and applications (found in the ServiceNow store) and the underlying data, the dashboard won't show any relevant metrics. If you have any questions about your licensing and entitlements, consult your account executive.

Application plugins:

- sn_lg_ops
- sn_lg_matter
- sn_lg_lpa_core
- sn_lg_pa
- sn_lg_contracts
- sn_lg_coi
- sn_lg_forensics

Procedure

1. Log in to `https://store.servicenow.com`.
2. Search for the GC Dashboard application.
3. Select the **Request Install** button to create the app installation request.
   Select **Request** to request the GC Dashboard application plugin for the specified instance and provide the instance details with your reason for request and validate the instance.



4. Navigate to **System applications** > **All available applications**.
5. Search for and install the GC Dashboard plugin (sn_lsd_dashboard).
6. Assign roles to configure and view the GC Dashboard.

GC Dashboard admin

Assign the role sn_lsd_dashboard.gc_dashboard_admin to users or groups who require configuration privileges on the dashboard.

Note: Only users with this role are able to configure the GC dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GC Dashboard end users

Assign the user role sn_lsd_dashboard.gc_dashboard_user to users or groups who must view the dashboard.

Users must log out and log back in to enable their new roles after the admin assigns them. For more information on user roles, see Exploring user administration.

General Counsel Dashboard pillars

Organizing insights across these pillars enables legal leaders to streamline contract workflows, improve service responsiveness, maintain compliance, accelerate digital invoicing, and empower users through legal self-service.

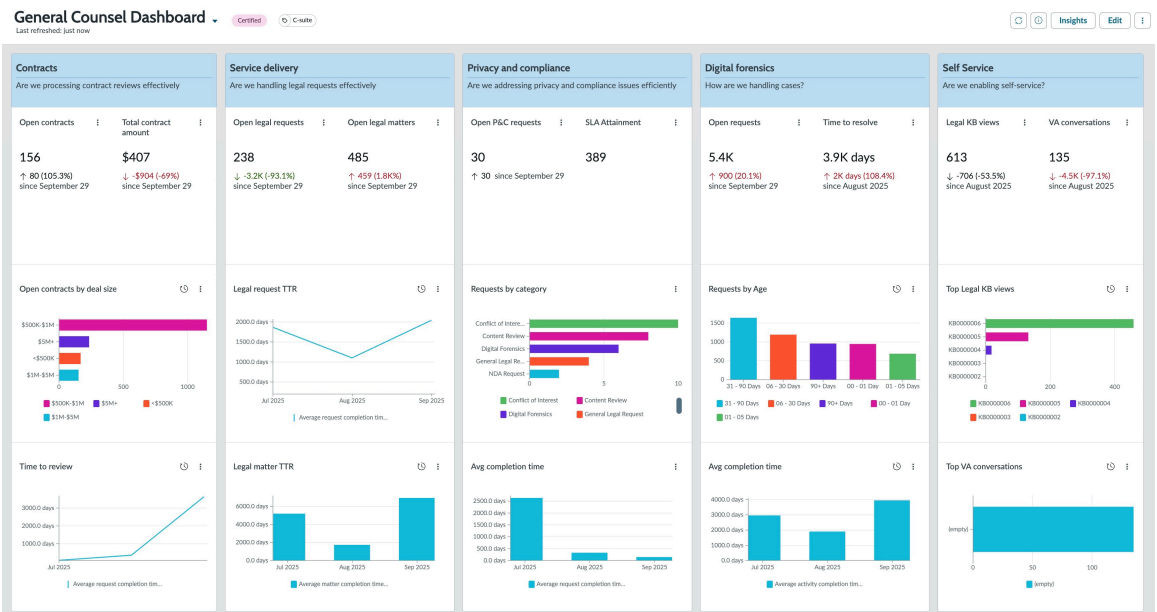
Strategic pillars

The strategic pillars of the GC dashboard show metrics related to Contracts, Service Delivery, Privacy and Compliance, Digital Forensics, and Self Service.

Pillar	Focus Area	Key Metrics	Description
Contracts	Contract velocity & deal hygiene	• Open Contracts • Total Contracts • Open Contracts by Deal Size • Contract Aging	Provides visibility into contract intake, backlog, and time-to-completion across deal sizes, helping legal teams prioritize work and improve turnaround time.
Service Delivery	Legal support performance	• Open Legal Requests • Closed Legal Requests • Avg Completion time • Legal Request MTTR	Tracks operational efficiency of legal service delivery, including request volumes, closure trends, and the speed of resolving legal work.
Privacy and Compliance	Data protection & regulatory adherence	• Open Privacy Requests • PII Categories • Request Distribution by Category • Aging of Requests	Monitors privacy workload, response timelines, and types of privacy inquiries, supporting stronger compliance and faster regulatory response.
Digital Forensics	Legal financial operations & invoice cycle time	• Open Invoices • Time to Resolution • Total Invoice Processing Days	Identifies trends and delays in invoice handling to improve legal vendor management and financial processing efficiency.
Self Service	Empowerment & shift-left efficiency	• Open Legal FAQs • Legal KB Views	Measures adoption of legal self-help tools to reduce repetitive queries

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pillar	Focus Area	Key Metrics	Description
		• Top Legal KB Articles • Self-Service Usage Trends	and enable faster access to legal information.



GC Dashboard overview

The General Counsel (GC) Dashboard provides a unified overview of legal operations performance, consolidating insights into contracts, service delivery, privacy and compliance, digital invoicing, and self-service efficiency across the enterprise.

Purpose

The GC Dashboard centralizes the performance indicators of legal operations to provide transparency into contract processing, legal workload, privacy compliance, financial invoicing, and self-service effectiveness. It enables the legal function to make data-driven decisions, improve turnaround times, reduce operational friction, and align legal processes with organizational needs.

By bringing together insights such as aging requests, MTTR, invoice resolution times, backlog volumes, and top self-service usage, the dashboard helps the legal department proactively manage risk, ensure compliance, and optimize the delivery of legal services across the enterprise.

Target audience

The GC Dashboard is designed for legal operations leaders, general counsel executives, privacy officers, and legal service delivery teams who require continuous visibility into legal workload, compliance response, and contract performance.

This dashboard also supports business leaders who depend on timely legal reviews, contract execution, privacy compliance, and accurate invoicing processes.

Primary Stakeholders

General Counsel Dashboard roles

Two roles are associated with this dashboard.

Platform Analytics administrator

The dashboard administrator (sn_lsd_dashboard.gc_dashboard_admin) is responsible for installing, configuring, and maintaining the GC Dashboard and its underlying content.

Key duties include:

- Installing plugins and assigning the admin roles to configuration owners
- Defining verticals and business questions (for example, Value, Operations, Security)
- Selecting and tuning KPIs/KRIs, setting thresholds, and mapping data sources
- Creating and validating Platform Analytics indicators, breakdowns, and data-collection jobs
- Managing translations, plugin upgrades, and best-practice templates to ensure consistency

Business user

The user (sn_lsd_dashboard.gc_dashboard_user) role is required to access the dashboard.

Typical activities:

- Viewing real-time scorecards and visualizations aligned to strategic goals
- Applying filters, switching time frames, and drilling into underlying records (incidents, projects, security events)
- Exporting charts and reports for executive briefs or stakeholder presentations

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

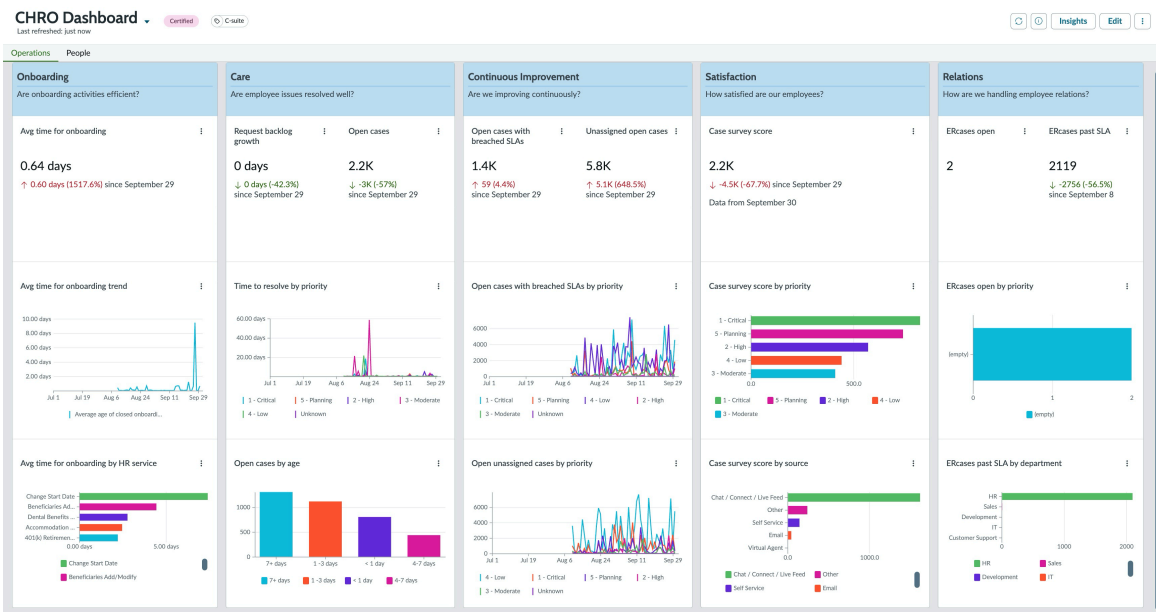
- Subscribing to alerts and notifications when metrics cross defined thresholds
- Providing feedback on dashboard usability and data relevance to the admin team

Chief Human Resources Officer (CHRO) Dashboard

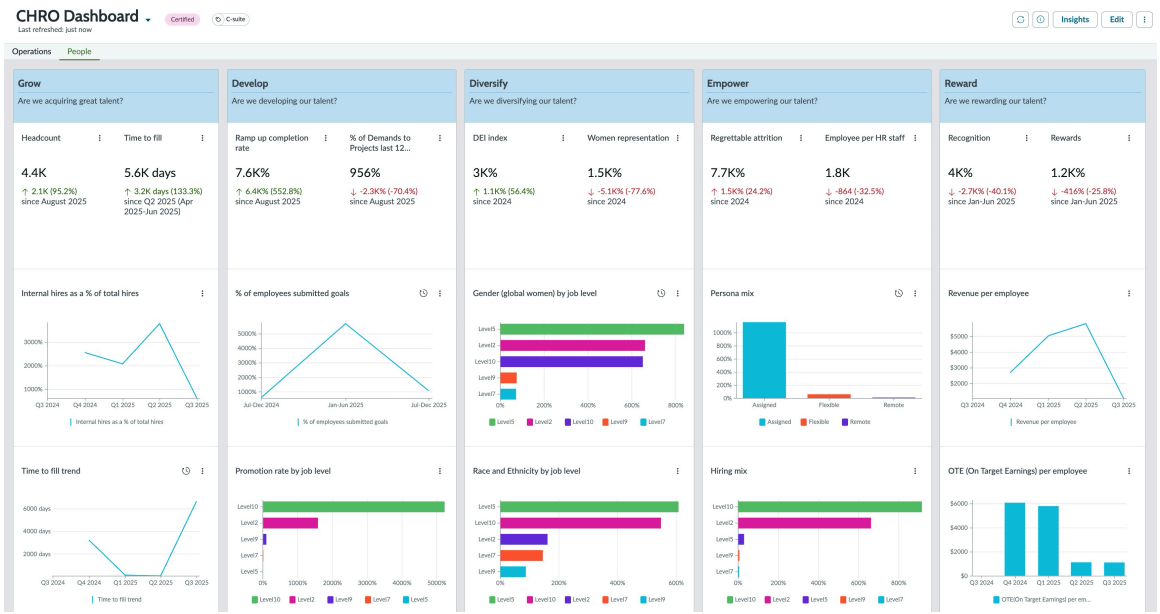
The Chief Human Resources Officer (CHRO) Dashboard helps the People leadership to run its business, to deliver value quickly, and to improve productivity and optimize risks. The CHRO Dashboard delivers a unified, real-time view of workforce operations and people strategy, providing insights across onboarding efficiency, employee care, continuous improvement, satisfaction, employee relations, talent acquisition, development, diversity, empowerment, and rewards.

The CHRO Dashboard serves as a comprehensive workspace for evaluating the health and performance of HR processes across the employee life cycle. It consolidates operational and strategic indicators - such as onboarding cycle time, employee care backlog, SLA breaches, satisfaction scores, headcount, time to fill, DEI metrics, attrition, and recognition trends - to help HR leadership make informed decisions.

This dashboard visualizes essential people insights, including onboarding trends by HR service, time to resolve employee issues, unassigned case backlogs, case survey results, SLA breaches by priority, hiring mix, promotion patterns, representation by job level, and revenue according to employee. These metrics help HR leaders improve workforce planning, strengthen employee experience, enhance operational efficiency, and support long-term talent strategy.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Install the Chief Human Resources Officer (CHRO) Dashboard

The CHRO Dashboard helps people leadership to run its business to deliver value quickly, improve productivity and optimize risks.

Before you begin

Role required: sn_chro_dashboard.chro_dashboard_admin, sn_chro_dashboard.chro_dashboard_user

Note: The CHRO Dashboard application is free from the ServiceNow Store. However, the contents of the dashboard require a professional entitlement to the HRSD (com.sn_hr_core) application. This professional entitlement includes a license for Platform Analytics and the content pack solutions for the associated applications.

These solutions consist of Platform Analytics indicators and associated data collection jobs, used by the metrics on the CHRO Dashboard. If you don't have the prerequisite licenses, the installation proceeds. However, without the required plugins (found in the application manager) and applications (found in the ServiceNow store) and the underlying data, the dashboard won't show any relevant metrics. If you have any questions about your licensing and entitlements, consult your account executive.

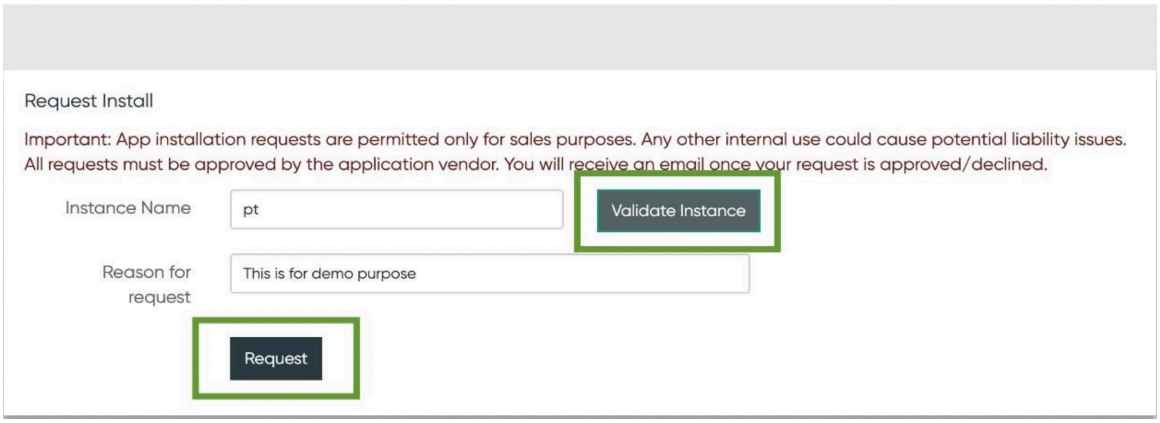
Plugins:

- sn_hr_er_pa
- sn_hr_le_pa
- sn_hr_pa

Procedure

1. Log in to `https://store.servicenow.com`.
2. Search for the CHRO Dashboard application.
3. Select the **Request Install** button to create the app installation request.
   Select **Request** to request the CHRO Dashboard application plugin for the specified instance and provide the instance details with your reason for request and validate the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Navigate to **System applications** > **All available applications**.
5. Search for and install the CHRO Dashboard plugin (sn_chro_dashboard).
6. Assign roles to configure and view the CHRO Dashboard.

   CHRO Dashboard admin

   Assign the role sn_chro_dashboard.chro_dashboard_admin to users or groups who require configuration privileges on the dashboard.

   Note: Only users with this role are able to configure the CHRO dashboard.

   CxO Dashboard end users

   Assign the user role sn_chro_dashboard.chro_dashboard_user to users or groups who must view the dashboard.

   Users must log out and log back in to enable their new roles after the admin assigns them. For more information on user roles, see Exploring user administration.

Chief Human Resources Officer Dashboard tabs

Organizing insights into these pillars enables HR leadership to strengthen operational delivery, improve employee experience, support talent growth, enhance diversity and inclusion, and reinforce organizational culture and performance.

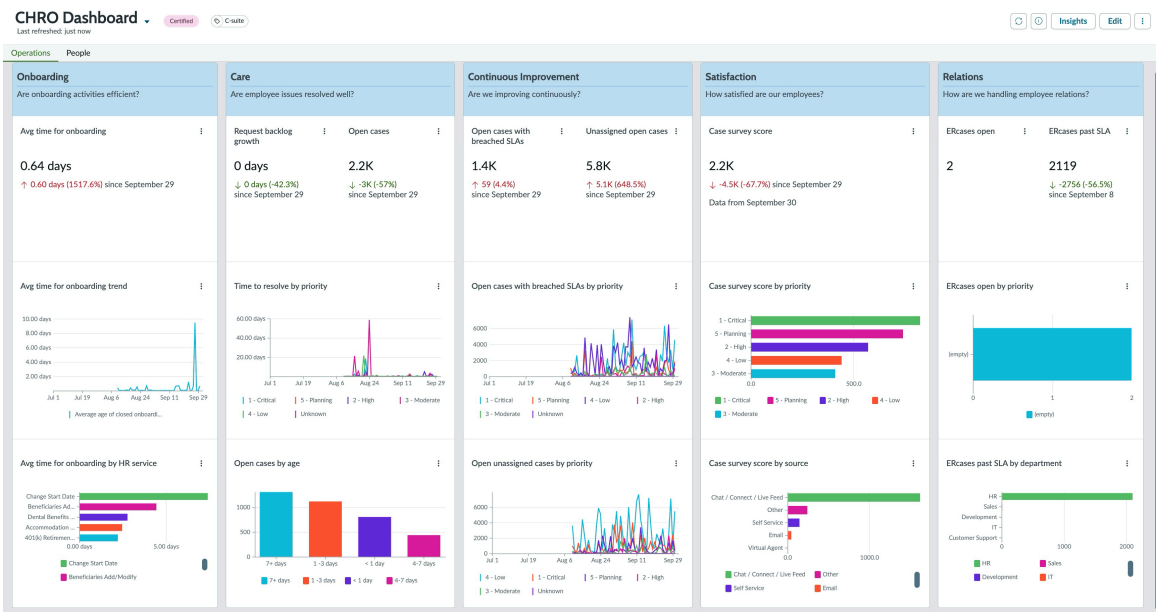
Operations tab

The strategic pillars of the **Operations** tab show metrics related to employee onboarding, HR cases, and satisfaction metrics.

Pillar	Focus Area	Key Metrics	Description
Onboarding	Efficiency of new-hire onboarding activities	• Avg onboarding time • Onboarding trends • Time by HR service	Measures how quickly new employees are onboarded, helping HR identify delays and streamline initiation workflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pillar	Focus Area	Key Metrics	Description
Care	Resolution of employee issues	• Request backlog • Open cases • Time to resolve by priority	Tracks volume and resolution of HR cases to ensure that employees receive timely, high-quality support.
Continuous Improvement	SLA performance and backlog health	• Open breached SLAs • Unassigned cases • Breaches by priority	Highlights systemic delays and SLA risks improving compliance and process quality.
Satisfaction	Employee experience and sentiment	• Case survey score • Survey results by priority & source	Assesses employee satisfaction with HR services and identifies areas with poor service perception.
Relations	Employee relations and compliance	• ER cases open • ER cases past SLA • ER cases by department	Monitors employee relations workload and SLA adherence to reduce risk and maintain healthy workplace relations.



People tab

The strategic pillars of the **People** tab show metrics related to taking care of employees' growth and empowerment, recognition, and rewards.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pillar	Focus Area	Key Metrics	Description
Grow	Talent acquisition & hiring health	• Headcount • Time to fill • Internal hire ratio • Hiring mix	Evaluates hiring velocity and sourcing effectiveness to support workforce expansion.
Develop	Talent development & performance	• Ramp-up completion rate • Goal submission rate • Promotion rate	Ensures that employees receive growth opportunities and stay aligned with performance expectations.
Diversify	Inclusion, representation & equity	• DEI index • Women representation • Race & ethnicity by level	Measures diversity across job levels to drive equitable workforce representation.
Empower	Engagement, mobility & retention	• Regrettable attrition • Employees according to HR staff • Persona mix	Tracks employee engagement and retention risk while evaluating HR capacity.
Reward	Compensation & recognition	• Recognition • Rewards • Revenue according to employee • OTE metrics	Assesses how well compensation, recognition, and reward programs support performance and engagement.

CHRO Dashboard overview

Purpose

The CHRO Dashboard provides an integrated view of HR operational performance and people strategy, enabling leaders to monitor workforce health, improve employee experience, and accelerate organizational growth.

It offers actionable insights into onboarding efficiency, case resolution, talent development, diversity, hiring outcomes, retention risks, and compensation trends—supporting both day-to-day HR operations and long-term workforce planning.

By centralizing key metrics across the employee life-cycle, the dashboard enables HR organizations to proactively address workforce challenges, optimize processes, and align people initiatives with organizational goals.

Target Audience

The CHRO Dashboard is designed for HR executives, HR operations teams, people analytics professionals, and business leaders who require real-time visibility into workforce performance and talent outcomes. It supports users who must track hiring pipelines, evaluate service delivery, strengthen engagement, manage risk, and drive diversity and inclusion initiatives.

The dashboard also serves HR business partners and department heads who rely on accurate HR insights to support organizational priorities and guide workforce decisions.

Primary Stakeholders

- Chief Human Resources Officer
- HR Operations and Shared Services Teams

Chief Human Resources Officer Dashboard roles

Two roles are associated with this dashboard.

Platform Analytics administrator

The dashboard administrator (sn_chro_dashboard.chro_dashboard_admin) is responsible for installing, configuring, and maintaining the CHRO Dashboard and its underlying content.

Key duties include:

- Installing plugins and assigning the admin roles to configuration owners
- Defining verticals and business questions
- Selecting and tuning KPIs/KRIs, setting thresholds, and mapping data sources
- Creating and validating Platform Analytics indicators, breakdowns, and data-collection jobs
- Managing translations, plugin upgrades, and best-practice templates to ensure consistency

Business user

The user (sn_chro_dashboard.chro_dashboard_user) role is required to access the dashboard.

Typical activities:

- Viewing real-time scorecards and visualizations aligned to strategic goals
- Applying filters, switching time frames, and drilling into underlying records
- Exporting charts and reports for executive briefs or stakeholder presentations
- Subscribing to alerts and notifications when metrics cross defined thresholds
- Providing feedback on dashboard usability and data relevance to the admin team

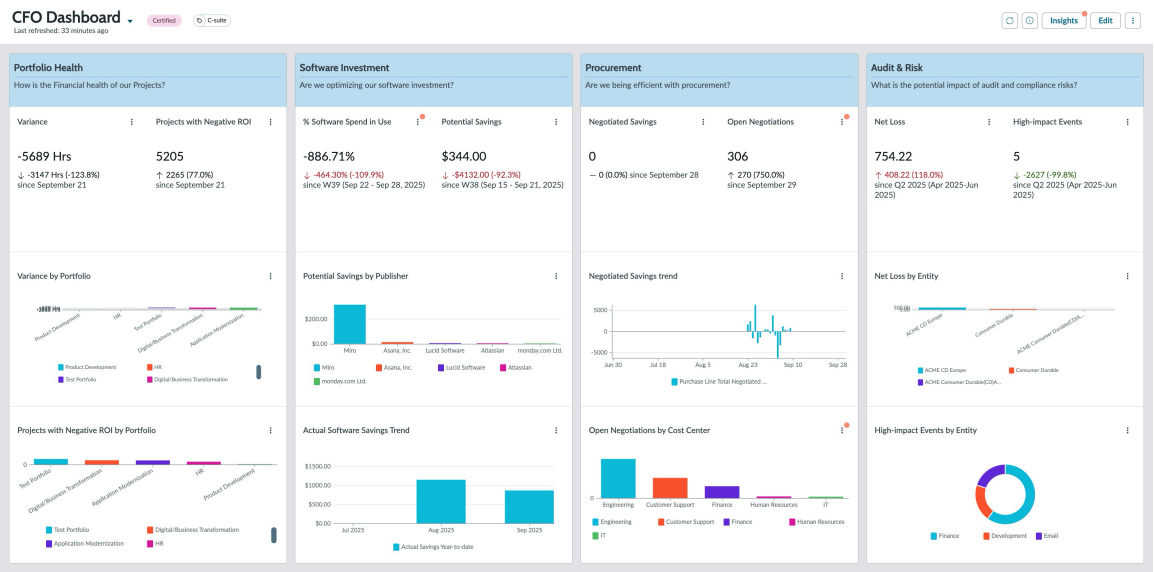
Chief Financial Officer (CFO) Dashboard

The Chief Financial Officer (CFO) Dashboard provides a single pane glass view of end-to-end financial operations at an organizational or project level.

The CFO dashboard is a critical tool for the day-to-day financial operations as it provides a detailed overview of the organization's or project's financial health. This dashboard assists CFOs in making key financial decisions by consolidating all types of financial metrics such as portfolios, investments, cost optimization efforts, audit performances, and risk profiles.

This dashboard presents a collection of data visualizations for key financial indicators such as Variance by portfolio, Potential savings, Actual savings, Negotiation trends, Net loss trends and so on, reflecting the trends over time, performance direction, and potential risks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Install the Chief Financial Officer (CFO) Dashboard

The Chief Financial Officer (CFO) Dashboard provides a unified, real-time view of enterprise financial performance across key dimensions such as portfolio health, software investments, procurement efficiency, and audit and risk management.

Before you begin

Roles required: sn_cfo_dashboard.admin, sn_cfo_dashboard.user

Note: The CFO Dashboard application is free from the ServiceNow Store. However, the contents of the dashboard require professional entitlements to the following applications:

- Performance Analytics - Content Pack - PPM Standard
- Performance Analytics – Software Asset Management Professional
- Performance Analytics for Sourcing and Procurement Operations
- GRC: Advanced Risk

These professional entitlements include a license for Platform Analytics.

These solutions consist of Platform Analytics indicators and associated data collection jobs, used by the metrics on the Chief Financial Officer Dashboard. If you don't have the prerequisite licenses, the installation proceeds. However, without the required plugins (found in the application manager) and applications (found in the ServiceNow store) and the underlying data, the dashboard won't show any relevant metrics. If you have any questions about your licensing and entitlements, consult your account executive.

Plugins:

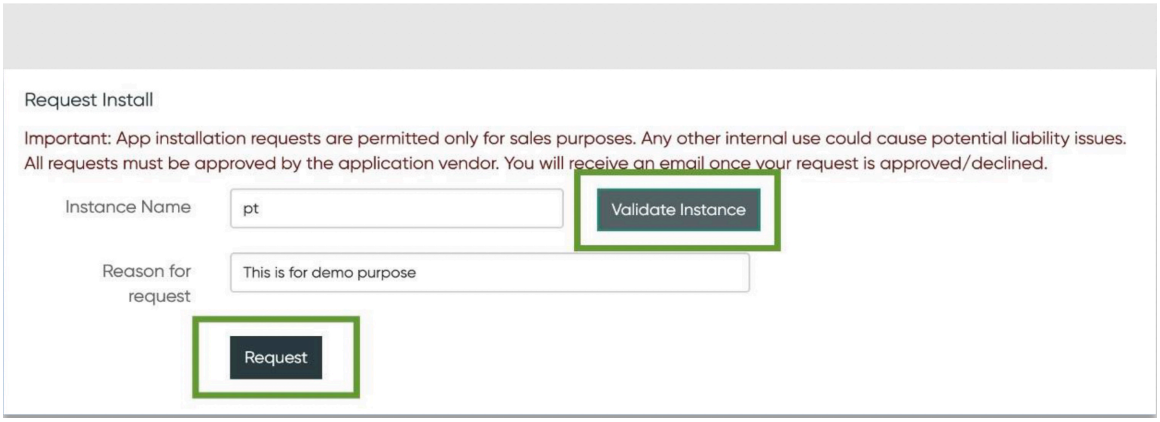
- com.snc.pa.pmo_dashboards
- sn_pa_samp
- sn_spend_pa
- sn_risk_advanced

Procedure

1. Log in to `https://store.servicenow.com`.
2. Search for the CFO Dashboard application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the **Request Install** button to create the app installation request.
   Select **Request** to request the CFO Dashboard application plugin for the specified instance and provide the instance details with your reason for request and validate the instance.



4. Navigate to **System applications** > **All available applications**.
5. Search for and install the CFO Dashboard plugin (sn_cfodashboard).
6. Assign roles to configure and view the CFO Dashboard.

   CFO Dashboard admin

   Assign the role sn_cfo_dashboard.admin to users or groups who require configuration privileges on the dashboard.

   Note: Only users with this role are able to configure the CFO dashboard.

   CFO Dashboard end users

   Assign the user role sn_cfo_dashboard.user to users or groups who must view the dashboard.

   Users must log out and log back in to enable their new roles after the admin assigns them. For more information on user roles, see Exploring user administration.

Chief Financial Officer Dashboard pillars

Organizing insights into these five pillars promotes CFO focus on delivering value quickly, improving productivity and optimizing risks.

Strategic pillars

The strategic pillars of the CFO dashboard show metrics related to Portfolio health, Software Investment, Procurement, Audit, and Risk.

Pillar	Focus Area	Metrics	Description
Portfolio Health	Financial performance	• Total Variance • Projects with Negative ROI	Provides a real-time overview of portfolio-level financial health, including variance, ROI, and budget utilization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pillar	Focus Area	Metrics	Description
		• Total Variance by Portfolio • Projects with Negative ROI by Portfolio	
Software Investment	Technology spend optimization	• % Software Spend in Use • Potential Savings • Potential Savings by Publisher • Actual Software Savings Trend	Tracks software spend, planned vs. actual savings, and license utilization to maximize investment returns.
Procurement	Cost efficiency and Vendor performance	• Negotiated Savings • Open Negotiations • Negotiated Savings Trend • Open Negotiations by Cost Center	Offers visibility into supplier savings, contract value realization, and sourcing effectiveness.
Audit & Risk	Compliance and financial risk	• Net Loss • High-impact Events • Net Loss by Entity • High-impact Events by Entity	Consolidates audit findings, risk indicators, and exception analysis for proactive governance.

CFO Dashboard overview

Purpose

The CFO Dashboard serves as a comprehensive financial command center, providing a unified, real-time view of enterprise financial performance across key dimensions- portfolio health, software investments, procurement efficiency, and audit and risk management.

It consolidates KPIs such as Portfolio Variance and ROI, software utilization, negotiated savings, and risk exposure, enabling finance leaders to evaluate how effectively the organization's resources are being allocated, invested, and governed.

These metrics help CFOs to:

- Assess portfolio-level budget performance and return on investment
- Optimize software spending and identify cost-saving opportunities
- Track procurement efficiency and vendor negotiation outcomes
- Monitor financial exposure and compliance through audit and risk indicators.

Target audience

The CFO Dashboard is designed for senior Financial, Technology, and Operational leadership who need holistic visibility into the organization's fiscal health. It caters to decision-makers seeking actionable insights into budget utilization, cost efficiency, technology investments, procurement effectiveness, and compliance health.

By integrating cross-functional data from finance, IT, procurement, and governance functions, the dashboard enables informed planning, continuous performance monitoring, and strategic alignment with business objectives.

Primary Stakeholders

- Chief Financial Officer (CFO)
- Chief Information Officer (CIO)

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

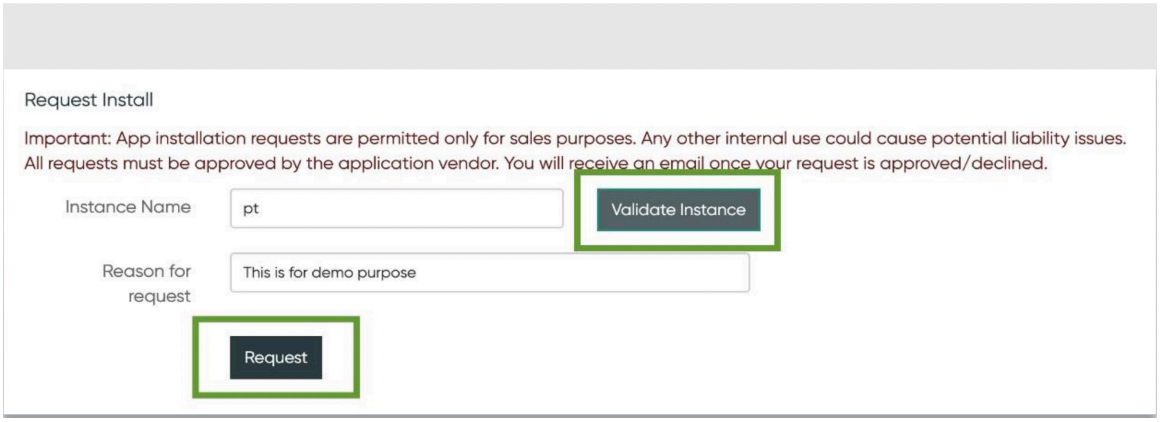
3. Select the **Request Install** button to create the app installation request.
   Select **Request** to request the CDO Dashboard application plugin for the specified instance and provide the instance details with your reason for request and validate the instance.



4. Navigate to **System applications** > **All available applications**.
5. Search for and install the CDO Dashboard plugin (sn_cdo_dashboard).
6. Assign roles to configure and view the CDO Dashboard.

   CDO Dashboard admin

   Assign the role sn_cdo_dashboard.cdo_dashboard_admin to users or groups who require configuration privileges on the dashboard.

   Note: Only users with this role are able to configure the CDO dashboard.

   CDO Dashboard end users

   Assign the user role sn_cdo_dashboard.cdo_dashboard_user to users or groups who must view the dashboard.

   Users must log out and log back in to enable their new roles after the admin assigns them. For more information on user roles, see Exploring user administration.

Chief Digital Officer (CDO) Dashboard pillars

Organizing insights into these five pillars promotes Chief Digital Officer (CDO) focus on delivering value quickly, improving productivity and optimizing risks.

Strategic pillars

The strategic pillars of the CDO dashboard show metrics related to digital experience sentiment, platform adoption and engagement, operational performance, self-service and automation maturity, and the financial outcomes of digital transformation initiatives

Pillar	Focus Area	Key metrics	Description
Sentiment	Customer satisfaction	• CSAT • Response volume • CSAT trends • Low cSAT drivers	Measures digital experience quality and user feedback to understand satisfaction levels and identify areas for experience improvement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pillar	Focus Area	Key metrics	Description
Usage	App usage	• MAU • Hits • Usage by application • Engagement trends	Monitors digital platform usage and adoption across applications to ensure that customers and employees are actively engaging and receiving value from digital solutions.
Operations	Continuous improvement	• P1 volume • P1 resolution trend • SLA attainment	Tracks major incident handling and SLA performance to safeguard operational stability and ensure dependable digital service delivery.
Transformation	Self-service enablement	• Self-service % • Automation % • Self-service resolution channels • Automation trend	Evaluates progress toward digital self-sufficiency, automation adoption, and shift-left initiatives to reduce manual workloads and accelerate service resolution.
Outcome	Spend optimization	• Cost savings • Total spend • Savings trends • Spend by business function	Provides financial visibility into digital transformation impact, tracking spending patterns and savings achieved from technology and automation initiatives.

CDO Dashboard overview

This dashboard is for the Chief Digital Officer and others who require real-time insights into the health and productivity of your company's digital properties.

Purpose

The CDO Dashboard provides a comprehensive, real-time view of digital experience, platform usage, operational performance, and transformation outcomes across the enterprise. It consolidates insights on user sentiment, technology adoption, self-service enablement, automation progress, and digital spend to help leaders evaluate how effectively digital initiatives are driving value, efficiency, and customer impact.

This dashboard enables Chief Digital Officer to:

- Monitor digital adoption and identify areas where usage must be increased.
- Assess customer satisfaction with digital platforms and experience touch-points.
- Track major incident performance and SLA delivery for critical digital services.
- Measure automation and self-service maturity to accelerate transformation initiatives
- Evaluate digital spend patterns and cost-saving opportunities

Target audience

The CDO Dashboard is designed for senior digital, technology, and business transformation leaders who require deep visibility into digital readiness, consumption trends, automation efforts, and experience quality. It supports strategic and operational decision-making for teams responsible for driving platform adoption, operational excellence, and measurable digital outcomes.

Primary Stakeholders

- Chief Digital Officer (CDO)
- Chief Information Officer (CIO)
- Chief Information Security Officer (CISO)
- IT Service Management process owners
- Service Desk and operations managers

Chief Digital Officer Dashboard roles

Two roles are associated with this dashboard

Platform Analytics administrator

The dashboard administrator (sn_cdodashboard.cdo_dashboard_admin) is responsible for installing, configuring, and maintaining the CDO Dashboard and its underlying content.

Key duties include:

- Installing plugins and assigning the admin roles to configuration owners
- Defining verticals and business questions (for example, Value, Operations, Security)
- Selecting and tuning KPIs/KRIs, setting thresholds, and mapping data sources
- Creating and validating Platform Analytics indicators, breakdowns, and data-collection jobs
- Managing translations, plugin upgrades, and best-practice templates to ensure consistency

Business user

The user (sn_cdodashboard.cdo_dashboard_user) role is required to access the dashboard.

Typical activities:

- Viewing real-time scorecards and visualizations aligned to strategic goals
- Applying filters, switching time frames, and drilling into underlying records (incidents, projects, security events)
- Exporting charts and reports for executive briefs or stakeholder presentations
- Subscribing to alerts and notifications when metrics cross defined thresholds
- Providing feedback on dashboard usability and data relevance to the admin team

Chief Customer Operations Officer (CCO) Dashboard

The Chief Customer Operations Officer (CCO) dashboard provides the visibility into customer support and operations that helps leadership to fine-tune the operations for effectiveness. It provides a unified view of customer experience, service performance, and customer-impacting risk across the organization.

The CCO dashboard is a mission-critical workspace for monitoring and elevating customer experience. It offers a comprehensive snapshot of key service and customer health insights by

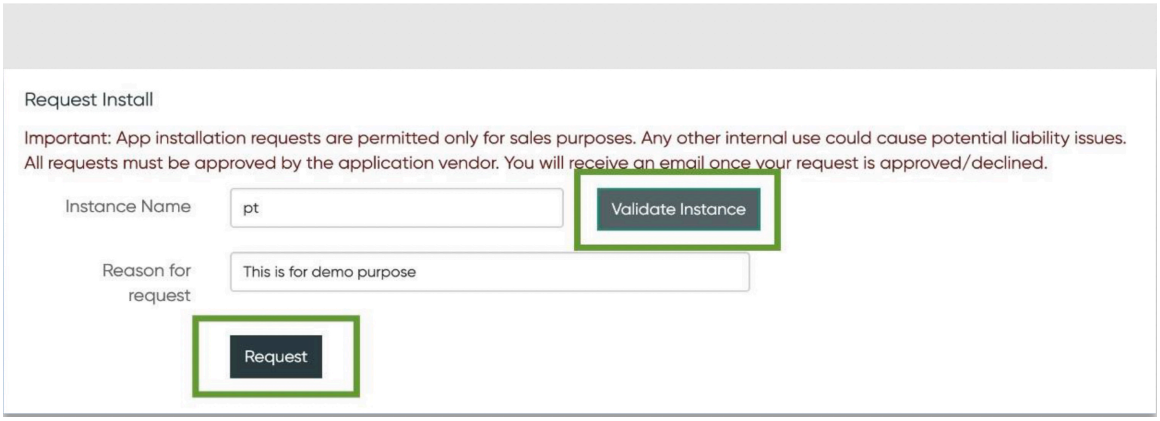
1. Log in to `https://store.servicenow.com`.
2. Search for the CCO Dashboard application.
3. Select the **Request Install** button to create the app installation request.
   Select **Request** to request the CCO Dashboard application plugin for the specified instance and provide the instance details with your reason for request and validate the instance.



4. Navigate to **System applications** > **All available applications**.
5. Search for and install the CCO Dashboard plugin (sn_cco_dashboard).
6. Assign roles to configure and view the CCO Dashboard.

CCO Dashboard admin

Assign the role sn_cco_dashboard.cco_dashboard_admin to users or groups who require configuration privileges on the dashboard.

Note: Only users with this role are able to configure the CCO dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CCO Dashboard end users

Assign the user role sn_cco_dashboard.cco_dashboard_user to users or groups who must view the dashboard.

Users must log out and log back in to enable their new roles after the admin assigns them. For more information on user roles, see Exploring user administration.

Chief Customer Operations Officer Dashboard tabs

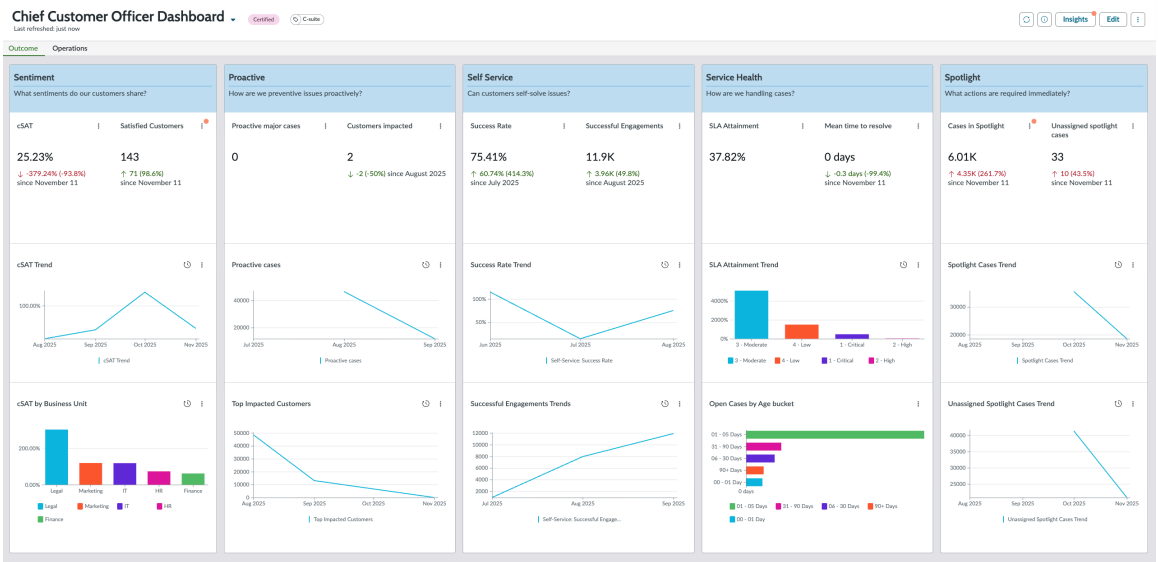
Organizing insights into these pillars enables Chief Customer Operations Officer (CCO) to improve customer experience, increase proactive service maturity, drive digital self-service adoption, strengthen service performance, and reduce customer risk.

Strategic pillars

The strategic pillars of the CFO dashboard show metrics related to Sentiment, Proactive Prevention, Self-Service, Service Health, Spotlight Escalations, Throughput, Availability, Risk, and Performance.

Outcome tab

The Outcome tab provides CCOs with a centralized view into customer experience, proactive service effectiveness, digital self-service performance, and escalation health. It helps CCOs quickly understand the customer sentiment trends, service impact, and overall experience outcomes to drive strategic improvements.



Pillar	Focus Area	Key Metrics	Description
Sentiment	Shared customer sentiment	• cSAT % • Number of Satisfied Customers • cSAT Trend • cSAT by Business Unit	Provides real-time visibility into customer sentiment, satisfaction ratings, and trends across business units to evaluate experience health.

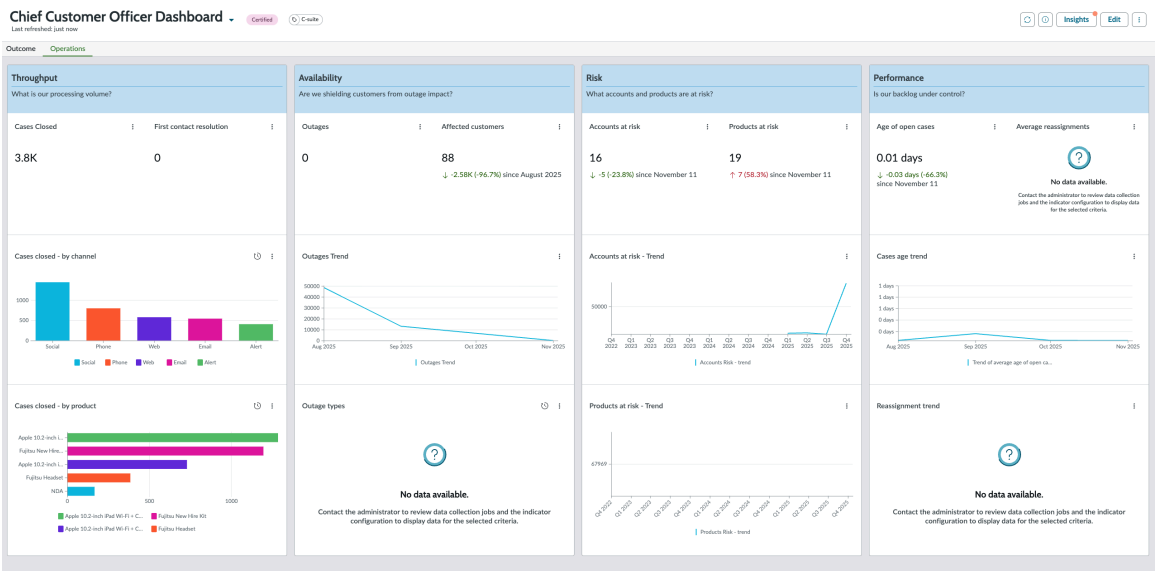
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pillar	Focus Area	Key Metrics	Description
Proactive	Issue prevention	• Major Proactive Cases • Customers Impacted • Proactive Case Trend • Top Impacted Customers	Tracks proactive issue detection, major incident prevention, and install base impact, helping minimize disruption and improve service quality upstream.
Self Service	Self-solution of issues	• Self-Service Success Rate • Successful Engagements • Self-Service Success and Engagement Trends • \	Monitors self-service utilization and successful deflection through knowledge, communities, catalog, and virtual agent to enhance self-solve capabilities.
Service Health	Case handling	• SLA Attainment • Mean time to Resolve • SLA Attainment Trend • Open Cases by Age Bucket	Measures resolution efficiency, SLA compliance, and case backlog aging to ensure reliable and timely service delivery.
Spotlight	What needs immediate attention	• Cases in Spotlight • Unassigned Spotlight Cases • Spotlight Case Trend	Highlights critical and at-risk customer cases requiring executive attention and tracks assignment to ensure urgent response.

Operations

The Operations tab focuses on the day-to-day execution of support services, including case handling efficiency, outage impact, customer risk indicators, and backlog management. It enables operational leaders to monitor case flow, resolve issues faster, and maintain consistent service quality at scale.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Pillar	Focus Area	Key Metrics	Description
Throughput	Processing volume	• Cases Closed • First Contact Resolution • Cases Closed by Channel • Cases Closed by Product	Provides insight into case resolution volume, first-touch resolution effectiveness, and distribution across channels and products.
Availability	Shielding customers from outage impact	• Outages • Affected Customers • Outage Trend • Outage Types	Tracks outage events, customer impact, trend analysis, and outage classification to improve service continuity and customer uptime.
Risk	Accounts and products at risk	• Accounts at Risk • Products at Risk • Risk Trends (Account & Product)	Identifies customer and product risk exposure and monitors emerging patterns to safeguard relationships and revenue.
Performance	Backlog control	• Average Age of Open Cases • Average Reassignments • Case Age Trend • Reassignment Trend	Evaluates operational workload, backlog management, and routing efficiency to maintain consistent service quality at scale.

Purpose

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Operations** tab serves as a customer-experience command center, delivering a unified, real-time view of customer sentiment, proactive case management, self-service adoption, service performance, and escalations.

It consolidates experience metrics such as satisfaction scores, proactive resolution rates, digital self-help effectiveness, SLA adherence, and customer risk indicators to empower leaders to safeguard and elevate customer experience across the enterprise.

This dashboard helps CCOs to:

- Assess overall customer sentiment and feedback trends
- Reduce customer issues through proactive detection and prevention
- Strengthen digital adoption and self-service efficiency
- Monitor SLA performance and resolution effectiveness
- Identify and act on critical customer escalations
- Manage service delivery, outage impact, and operational load
- Track customer and product risk indicators for early intervention

Target audience

The Chief Customer Operations Officer and other Customer Support executives who require real-time insights and a holistic visibility into service performance, customer sentiment, proactive operations, and escalation health.

Primary Stakeholder

Chief Customer Operations Officer

Chief Customer Operations Officer Dashboard indicators

Indicators provide the data used in most of the dashboard's visualizations. The indicators are used across the dashboard.

This dashboard employs all three kinds of indicators, Automated, Formula, and Manual. For more information about configuring indicators, see

- Automated indicators
- Manual indicators

Outcome tab

Column	Indicator	Source plugin	Indicator type	Indicator source / Formula calculation / Additional conditions

Chief Customer Operations Officer Dashboard roles

Two roles are associated with this dashboard.

Platform Analytics administrator

The dashboard administrator (sn_cco_dashboard.cco_dashboard_admin) is responsible for installing, configuring, and maintaining the CCO Dashboard and its underlying content.

Key duties include:

- Installing plugins and assigning the admin roles to configuration owners
- Defining verticals and business questions
- Selecting and tuning KPIs/KRIs, setting thresholds, and mapping data sources
- Creating and validating Platform Analytics indicators, breakdowns, and data-collection jobs
- Managing translations, plugin upgrades, and best-practice templates to ensure consistency

Business user

The user (sn_cco_dashboard.cco_dashboard_user) role is required to access the dashboard.

Typical activities:

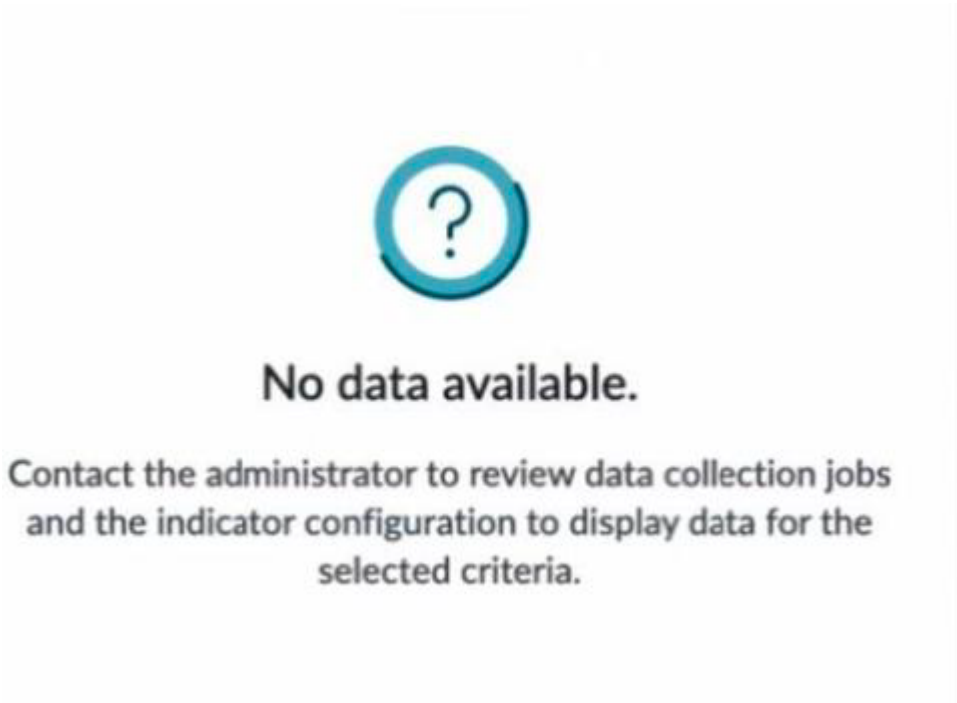
- Viewing real-time scorecards and visualizations aligned to strategic goals
- Applying filters, switching time frames, and drilling into underlying records
- Exporting charts and reports for executive briefs or stakeholder presentations
- Subscribing to alerts and notifications when metrics cross defined thresholds
- Providing feedback on dashboard usability and data relevance to the admin team

Troubleshooting executive dashboard empty state messages

When a visualization can’t render on a dashboard, it is because it either returns no data or the underlying indicator is misconfigured. Tou see an empty-state message indicating that no data is available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Insufficient data



If the error is due to insufficient data, do the following steps to troubleshoot"

1. Verify your date range and filter criteria on the dashboard.
2. Confirm that the underlying data source table (incidents, changes, and so on) contains records matching those criteria.
3. Run the relevant data collection jobs under **Platform Analytics Administration** > **Data Collector Jobs** to ensure that fresh snapshots exist.

Invalid configuration

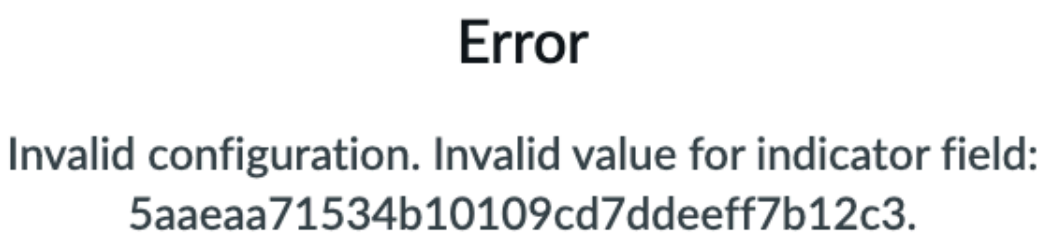
If the error is due to selection of invalid configuration breakdown, do the following steps to troubleshoot:

1. Select the required dashboard.
2. Select the required data visualization and view the associated indicators.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Check if the selected breakdown is present in the indicator, which is used as the data source for the visualization.
4. Select the appropriate/an available breakdown and save the data.
5. Run the relevant data collection jobs under **Platform Analytics Administration** > **Data Collector Jobs** to ensure that the data is refreshed.

Indicator non-existent



If the error is because the indicator doesn't exist, do the following steps to troubleshoot:

1. Select the required dashboard.
2. Select the required data visualization and view the associated indicators.
3. Check if the indicator, which is used as the data source for the visualization, is active in the system.
4. If no, activate the respective content pack plugin to activate the indicator.
5. Alternately, replace the indicator with another indicator, which is active in the system.
6. Run the relevant data collection jobs under **Platform Analytics Administration** > **Data Collector Jobs** to ensure that the data is refreshed.

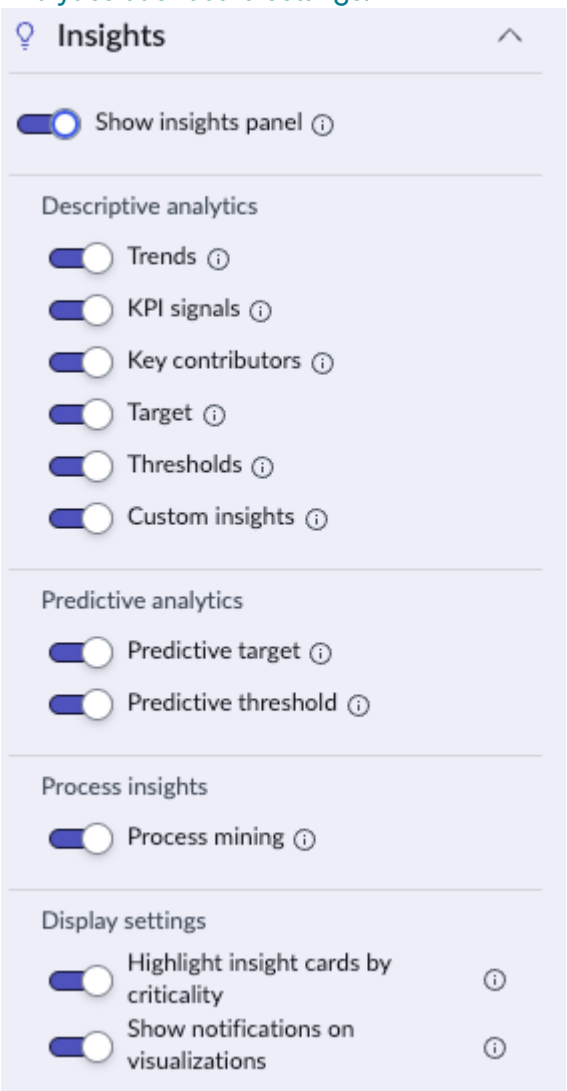
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Proactive analytics insights on dashboards

Proactive analytics automates the extraction of insights from your Performance Analytics indicators. Receive notifications on your Platform Analytics dashboards of potentially interesting changes and events in your processes.

Note:

- Proactive insights are a utility for use with Performance Analytics indicators on Platform Analytics dashboards. To benefit from this feature, you need to have indicators set up. These can be indicators you created yourself or indicators that are included in Platform Analytics Solutions. For more information, see Performance Analytics (Indicator data sources).
- You must have an active subscription to Performance Analytics to have Proactive analytics. For more information, see Activating your Performance Analytics subscription.
- To activate or deactivate Proactive analytics and select which types of insight cards to show, open the dashboard settings. For more information, see Configure Platform Analytics dashboard settings.



- Proactive analytics are available only on Platform Analytics dashboards, including technical dashboards. They are not available on responsive dashboards, including responsive dashboards that have been migrated to Platform Analytics in compatibility mode.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Types of insights/analytics

Proactive analytics consists of insight cards on your Platform Analytics dashboards. The system checks your indicators daily and generates insights cards for the following events:

Trends

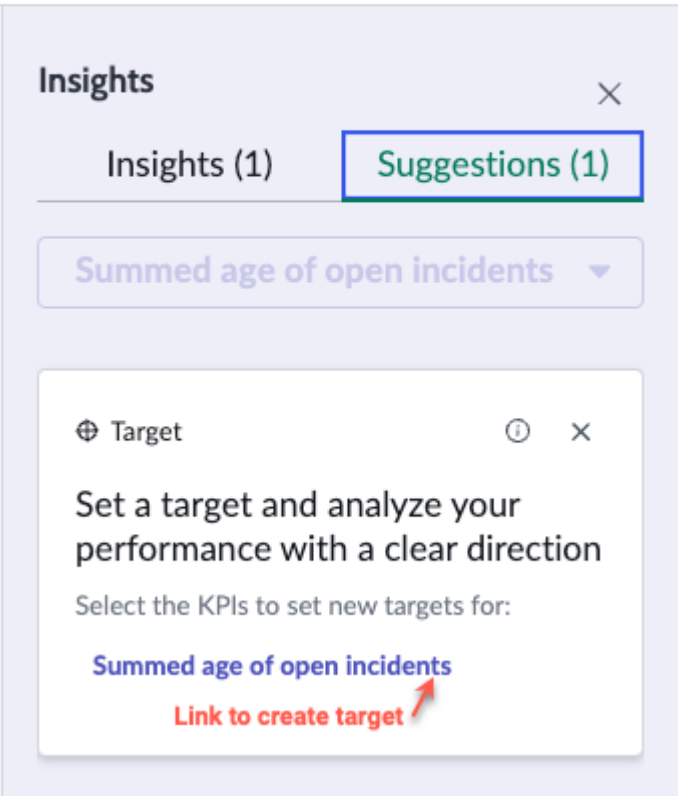
If an indicator is set to maximize or minimize but is trending in the opposite direction, an insight card is generated.

Indicator target or threshold event

An insight card is created for the following events:

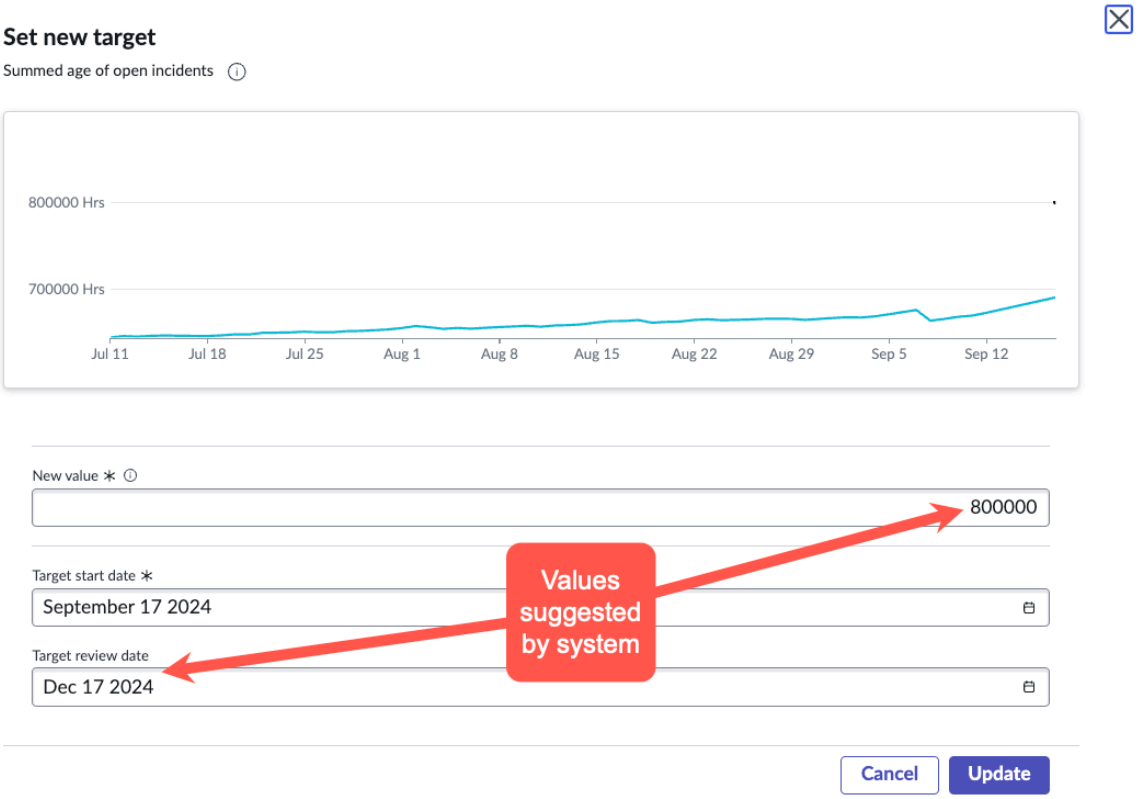
- The target on a Performance Analytics indicator (KPI) is missed.
- The target on an indicator is likely to be missed (**Predictive target**).
- The threshold of an indicator is breached. If the breach is an all-time high or low, this fact is mentioned.
- The threshold of an indicator is likely to be breached (**Predictive threshold**).

If you turn on target insights but targets are not set for all indicators that are shown on your dashboard, or not all targets have a review date, a Target Suggestion card is generated. The card has links for each indicator.



Selecting a link opens a modal for setting the target value and review date for that indicator. The system suggests values for you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For information about setting targets and thresholds on an indicator, see Performance Analytics targets and thresholds. You can also set targets and thresholds in a KPI Details page.

Process mining

If you are using Process Mining, an insight card can be generated for any potential bottleneck in the process flows related to the indicator. These insights are intended to help IT process owners. You can also receive suggestions for Process Mining projects to create, and such projects will also generate insights. For more information, see Creating Process Mining projects from Proactive Analytics suggestions.

Note:

- The sn_process_optimization_analyst role is necessary to see these insights.
- Process mining insights are included in the DA Process Mining Insights plugin.

KPI Signals event

A signal as defined in KPI Signals is generated. KPI Signals uses standard statistical Process Behavior Charts to identify significant changes in processes. The following signals generate Insights cards:

- Outlier: A score beyond the three standard deviation (3-sigma) upper or lower limit.
- Short run: Four consecutive scores all greater than or all less than the average value, with three of the scores outside two standard deviations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Long run: Seven consecutive scores all greater than or all less than the average value.
- "Anti-signal": Informational message that the indicator has been stable for a long time.

Important: KPI Signals must be configured for an indicator to generate KPI Signals events for that indicator. For more information, see Signal, no signal, and anti-signal and Activate KPI Signals monitoring for an indicator (KPI).

Key contributor guidance

A key contributor is a breakdown on a Performance Analytics indicator that the system identifies as having a particular impact. The system uses KPI Signals to make this determination, but you do not have to activate KPI Signals for the indicators. The system uses its own KPI Signals configuration.

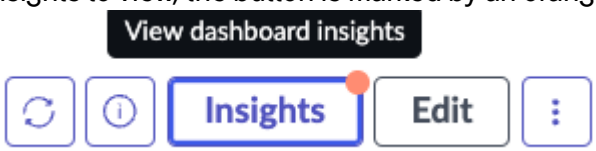
Warning: Be careful when you modify a Performance Analytics data collection job after the system has started to identify key contributors. You might alter the KPI Signals baseline or the evaluation interval or both. Consequently, you can have inconsistencies in the insights. If you notice such inconsistencies, identify the UUID for the affected indicator-breakdown combination. Then delete the corresponding record from the PA Correlation Analyzer State [pa_correlation_analyzer_state] table. For more information, see KPI Details UUIDs.

Custom insights

Some dashboards that are included with Platform Analytics Solutions or other applications might have custom insights. For information about such insights, see the documentation for the relevant Platform Analytics Solution or application.

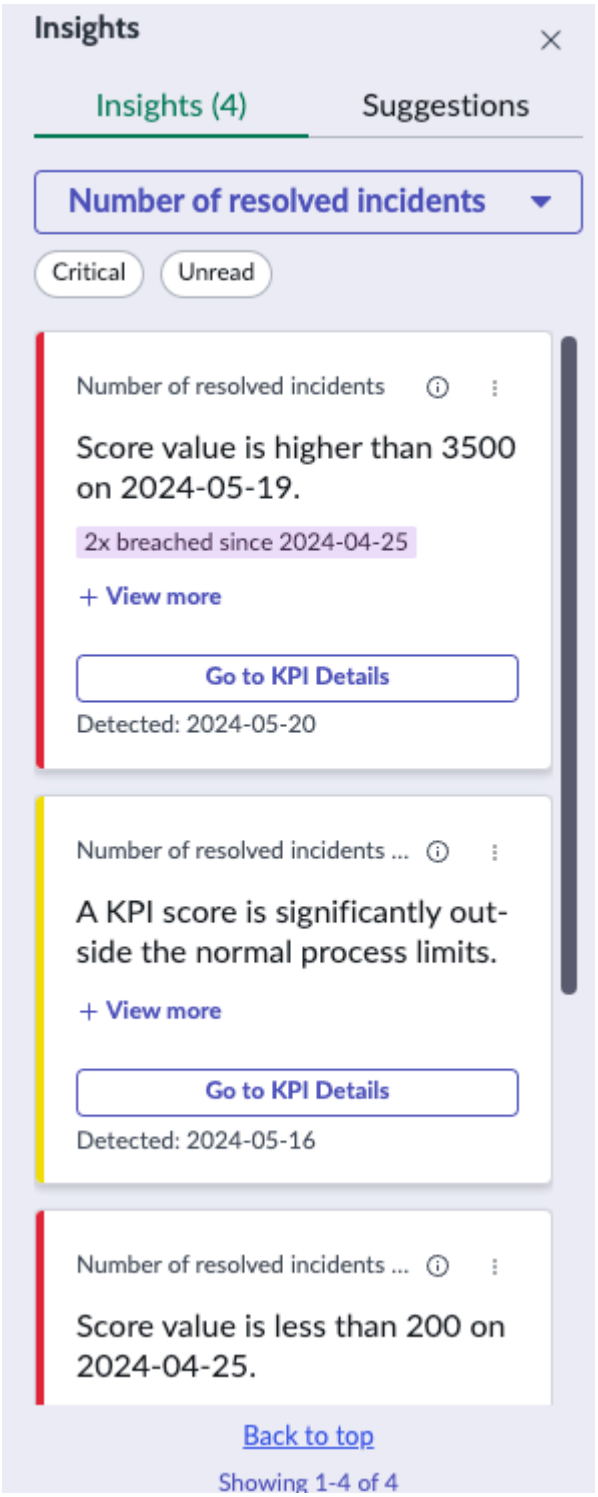
Viewing insights cards on dashboards

To see the insights cards, select the **Insights** button next to the **Edit** button. If there are new insights to view, the button is marked by an orange circle.



A panel opens displaying insights cards. These cards have a lifespan of 30 days. You can scroll through the cards. Insights of the same type are grouped onto a single card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Each card shows the type of event that has occurred and the event details. Each card also has a button that opens the appropriate page for follow-up, depending on the insight type:

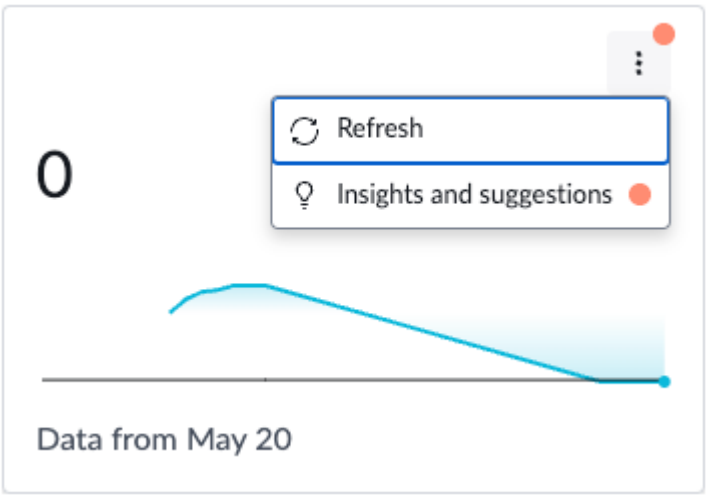
Insight type	Page opened
Target or threshold	KPI Details
Signal	KPI Details with KPI Signals pane open
Key contributor	KPI Details (you have to set the filter on the key contributor manually)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Insight type	Page opened
Process Mining finding	Analyst Workbench

Insights notifications in data visualizations

If **Show notifications on visualizations** is toggled on for a dashboard, visualizations on that dashboard will have a notification icon if there are any insights related to the indicators shown in that visualization. You can open the Insights pane from the More actions menu on that visualization.



Grouped insights cards

Multiple insights of the same type are aggregated into a single card. If more insights of the type are generated before the card expires (14 days), they are added to the existing card. If a dashboard shows both trend and either target or threshold insights, the trend is shown on any target or threshold insight cards. No separate trend cards are generated in this case.

Limitations and requirements

The Zurich version of Proactive analytics applies only to Performance Analytics indicators.

Target and threshold events are shown only when a target or threshold has been set on the indicator. For more information, see Performance Analytics targets and thresholds.

KPI Signals events are shown only for indicators with KPI Signals activated. For more information, see Activate KPI Signals monitoring for an indicator (KPI).

Key contributor guidance is provided only for Performance Analytics indicators with a daily frequency.

While key contributor events are also based on KPI Signals, they do not require KPI Signals to be activated on the indicator.

Creating Process Mining projects from Proactive Analytics suggestions

If you are using Proactive analytics with Process Mining, Proactive analytics can suggest new Process Mining projects. A single click from a suggestion creates and runs the project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An IT process owner might benefit from a Process Mining project that has not yet been created. If they are following their processes through indicators shown on a Platform Analytics dashboard, this feature can suggest Process Mining projects to create.

The feature works through a scheduled job, PA Indicator Recommendations. This job scans Performance Analytics indicators for anomalous behavior in the last 15 days and correlates that behavior against a set of variables to generate a score, which it stores on the par_indicator_model table. The job weighs the scores against the number of dashboards that each indicator is used in, then generates suggestions for the indicators with the three highest results. A single interaction with a suggestion creates a Process Mining project and generates insights based on that project. However, several requirements must be met.

Requirements on the dashboard side

- The DA Process Mining Insights plugin must be installed.
- On each relevant dashboard, Process Mining insights must be turned on.
- The relevant dashboard viewers must have the sn_process_optimization_analyst role.

Requirements for the suggestions to be created

- The facts tables for the relevant indicators must be set up to generate audit logs. For more information, see Configuring auditing for a table.
- A process configuration must exist for the facts tables of the relevant indicators. For more information, see Create process configuration using Classic view.
- A template project with table configurations specific to the facts table of the indicators should exist. To create such a project, see Create a project or template using Project Builder.

Requirements for insights to be created from the new project

Automated finding definitions must exist within the relevant process configurations, to ensure that the indicators are linked through the **Impacted KPIs** field. For more information, see Configuring improvement opportunities.

Dashboards in Platform Analytics

Create a process mining project from a suggestion

If your instance meets the requirements, you can create Process Mining projects from Suggestions cards in your Insights panel. Such projects generate their own insights.

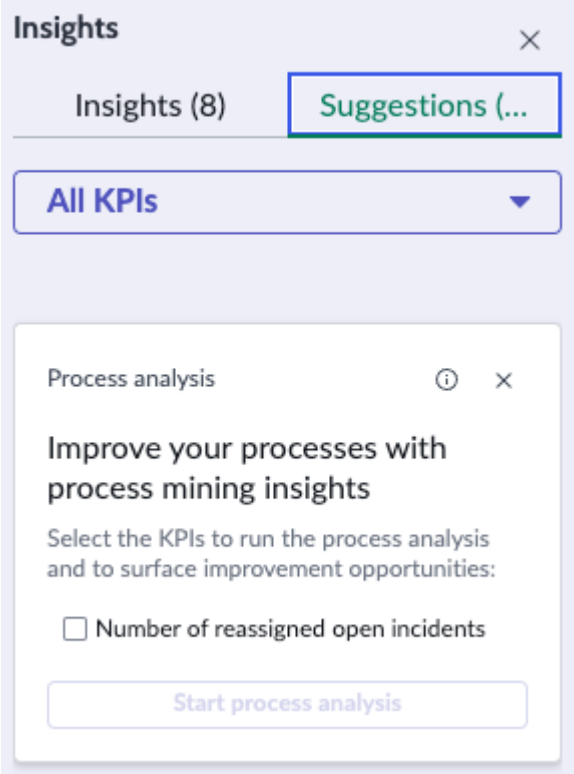
Before you begin

Role required: sn_process_optimization_analyst

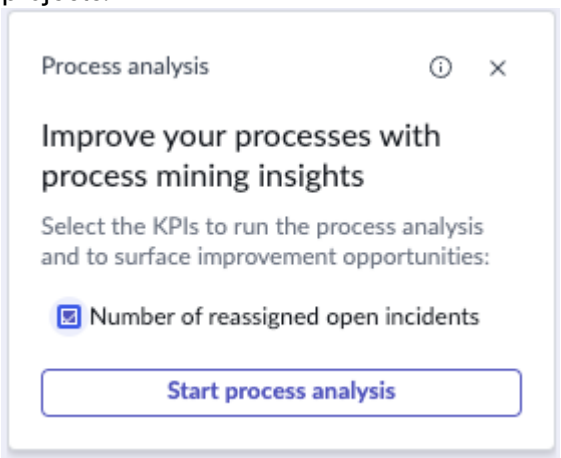
Procedure

1. Navigate to **Platform Analytics** > **Library** > **Dashboards**.
2. Open the relevant Platform Analytics dashboard.
3. Select **Insights** to open the Insights panel.
   Insights are not available in responsive dashboards, including ones that have been migrated to Platform Analytics in compatibility mode.
4. Open the Suggestions tab and review the suggestions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. In each suggestion, select all the indicators for which you want to create Process Mining projects.

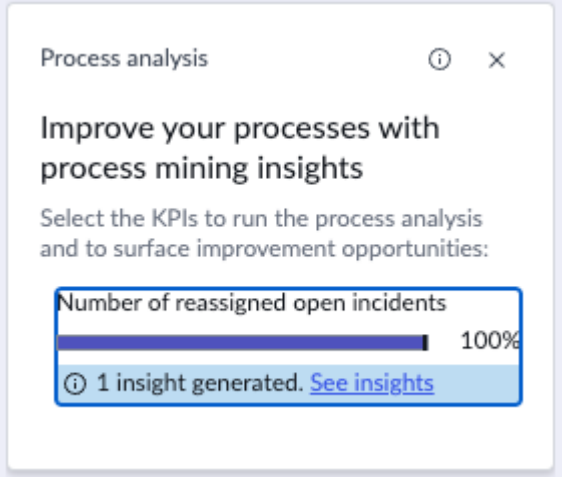


6. Start the process analysis.

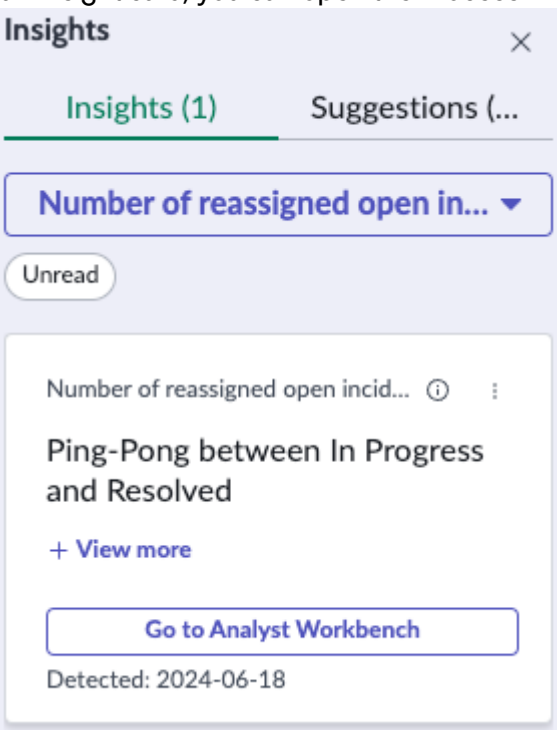
Result

The system generates and runs the Process Mining project. You can follow the progress in the Suggestion card. When the process is complete, the Suggestion provides a link to any insights that the project created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you select **See insights**, you see the cards for the insights that the project created. From such an insight card, you can open the Process Mining Analyst Workbench for the project.



Proactive analytics jobs

Proactive analytics insights are activated and generated through several jobs on the Sys Jobs [sys_job] table. All jobs run daily, at times set in Schedule Item [sys_trigger] records.

Proactive analytics jobs

Name	Java class	Job details	Scheduled item [sys_trigger]
KPI Signals Analytics Job	com.snc.pa.job.SignalsAnalyticsJob	Converts proactive signals to insights and/or proactive analytics flow trigger events.	KPI Signals Analytics Job

© 2026 ServiceNow, Inc. All rights reserved.

Proactive analytics jobs (continued)

Name	Java class	Job details	Scheduled item [sys_trigger]
PA Forecast Job	com.snc.pa.forecast.PAForecastJob	Checks targets per UUID against the forecast and generates any triggered notifications.	PA Forecast Job Schedule
PATarget	com.snc.pa.job.PATargetCheckJob	Fires a target notification summary event.	Check PA Targets
PAThreshold	com.snc.pa.job.PAThresholdCheckJob	Fires a threshold reached event for each threshold whose condition is satisfied.	Check PA Thresholds
Trend Insights Job	com.snc.pa.job.TrendAnalyzerJob	Analyzes indicator trends daily, flagging significant deviations within the last 30 days.	Trend Insights Job Schedule
TriggerDefinitionProactiveAnalyticsJob	com.snc.pa.job.TriggerDefinitionProactiveAnalyticsJob	Checks for the existence of a Performance Analytics Premium plugin, and if one is present, activates the Proactive Analytics trigger definition in sys_hub_trigger_definition.	Proactive Analytics Trigger Definition Activation Job

System properties for Proactive analytics

Several system properties that affect the generation of insights cards are available.

These properties either exist or can be created on the System Properties [sys_properties] table. The admin role is necessary to set system properties.

Note: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Properties for Proactive Analytics

Property	Description
com.snc.pa.insights.query_limit	Limit the number of rows when querying the par_computed_insight table in the GET response to the Insights API. • Type: Integer • Default value: 1000 • Location: The System Properties [sys_properties] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for Proactive Analytics (continued)

Property	Description
com.snc.pa.insight.max_days_in_past	By default, retrieve insights created within the number of days in the past that this property specifies. • Type: Integer • Default value: 14 • Location: To change the value, create this property in the System Properties table. • More information: Add a system property
com.snc.pa.correlation.enable_insights	Enables the generation of key contributor insight cards. • Type: true/false (Boolean) • Default value: true • Location: To change the value, create this property in the System Properties table. • More information: Add a system property
com.sys_par_insights_enabled	Enables the Proactive Analytics feature. • Type: true/false (Boolean) • Default value: true • Location: To change the value, create this property in the System Properties table. • More information: Add a system property
com.snc.pa.xmr.processes.limit	The maximum number of KPI Signals Configurations (pa_xmr_processes) that can be evaluated by the KPI Signals Insight Job. After this number of processes have been evaluated, the remaining processes are ignored. • Type: Integer • Default: 1000 • Maximum: 10,000

Technical dashboards

If you need more advanced or customized features in a dashboard than you can get through the inline editor, you can create a UI Builder page that is exposed as a dashboard. Such pages are called technical dashboards.

Technical dashboard overview

You create a technical dashboard in the dashboard editor. However, you cannot edit the dashboard contents in the inline editor. Instead of an **Edit** button, you have an **Open in UI Builder** button. In UI Builder, you can populate the dashboard will the full range of UI Builder containers

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

and components. You have some additional options, such as being able to use manual data sources or local data broker instances. You also are required to configure more technical details yourself, such as event handlers for filters and drilling down in data visualizations.

Only someone with the ui_builder_admin role can create a technical dashboard, edit its contents, or configure its UI Builder page options.

You can open a technical dashboard in the dashboard editor from the dashboard library, as you would for any dashboard. In the editor, you can share the dashboard, create a printable version, or edit its dashboard details. You can also expose technical dashboards in multiple workspaces as described in Add a dashboard to a Dashboards page.

Technical dashboards are kept in a dedicated UI Experience named Advanced Dashboards. However, it is better to open technical dashboards in the dashboard editor and use the **Open in UI Builder** button than to open them directly in UI Builder through the Advanced Dashboards experience.

⚠ Warning:

Do not try to create a technical dashboard directly in the Advanced Dashboards experience. The UI Builder page you create will not appear in the dashboards library and will be missing other preconfigurations.

Other technical dashboard topics

Technical dashboards compared to inline dashboards

The inline editor produces dashboard components with events and page properties preconfigured. The technical editor allows for a full range of UIB components but requires more back-end configuration.

Dashboard created inline	Technical dashboard
Can be created with any role.	Can only be created with the ui_builder_admin role.
Can contain the following: • Data visualizations • Filters • Headings • Images • Simple lists • Rich text	Can contain any component that is supported in UI Builder, including all components available for a dashboard created inline.
Can be duplicated.	Cannot be duplicated.
Can be exported.	Cannot be exported.
Data visualizations and filters support only predefined data sources.	Manual JSON data sources and local data instances are supported. (True for UI Builder pages in general.)
No event configuration for drilldowns. Default and preconfigured drilldowns are available as Chart interactions.	If you want viewers to drill down from a visualization, you have to configure a drilldown event on that visualization. You may need to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dashboard created inline	Technical dashboard
	configure other events. Chart interactions are not available.
Filter events are preconfigured to affect the relevant elements on the dashboard.	Filter event handlers must be configured manually.
If the viewer selects filter values and leaves the dashboard, those values are preselected for that viewer when they reopen the dashboard.	Filter values do not persist between user sessions.
Can be shared with or without editing rights depending on the roles of the sharer and what rights have been shared with them.	Same as dashboards created inline.
Can specify dashboard details, including exposing the dashboard in other experiences or configurable workspaces. The rights to edit dashboard details are limited to dashboard admins and the dashboard owner.	Same as dashboards created inline.

Chart interactions in a data visualization

Create a technical dashboard in UI Builder

Follow the Technical Editor option to create a dashboard using UI Builder. In UI Builder, you can use a wider range of features than the inline editor, including scripting and data binding.

Before you begin

Creating dashboards in UI Builder is recommended for developers. For more information, see UI Builder.

It isn't possible to edit the dashboard's details in the Analytics Center when you create a dashboard in the Technical Editor. However, you can share a technical dashboard from the Analytics Center.

Note: Data visualizations based on table data are automatically shared with users that you share a dashboard with.

Role required: ui_builder_admin

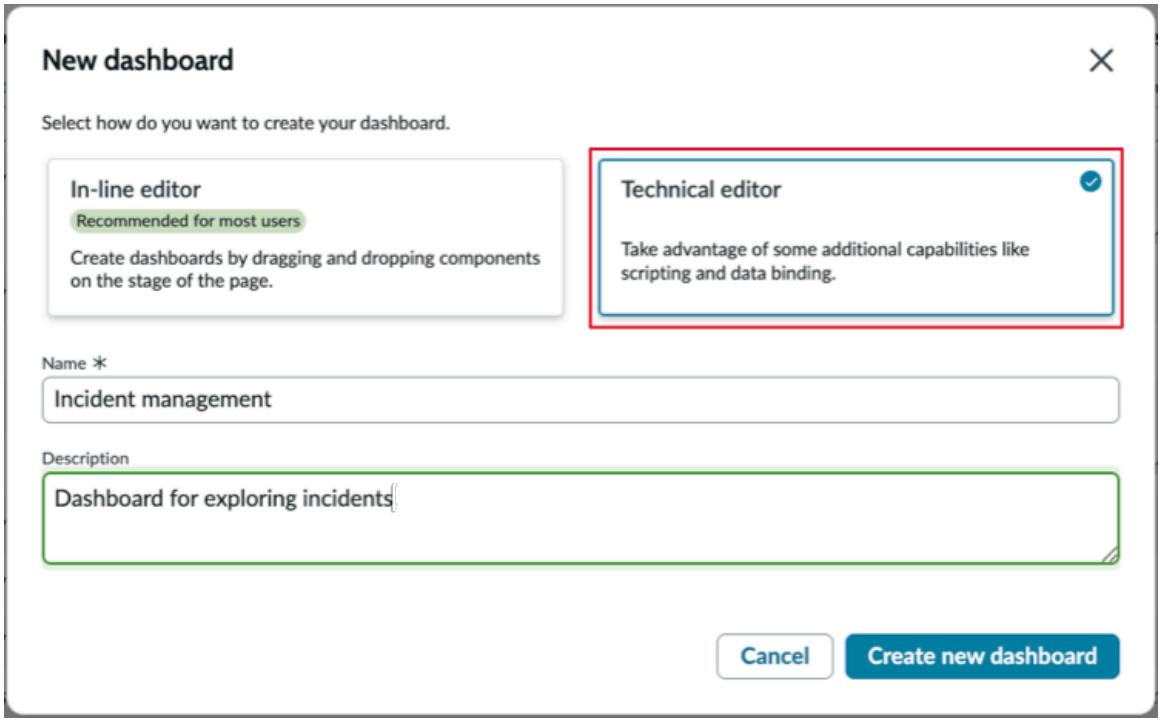
About this task

The technical editor lets you add any UI Builder component to your dashboard. You can also use all other UI Builder features, such as data resources, client scripts, and data binding of configuration properties. The technical editor creates dashboards in a special workspace named Advanced Dashboards, which is available under My Experiences in the UI Builder.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Dashboards**.
2. Select **Create new dashboard**.
3. Choose **Technical editor**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Warning: Do not try to create dashboards directly in the Advanced Dashboards experience on the UI Builder. Always begin in runtime from the Platform Analytics library. When you begin the technical dashboard in the library, it has an automatic connection to the par_dashboards table and is listed in the Dashboard overview component.

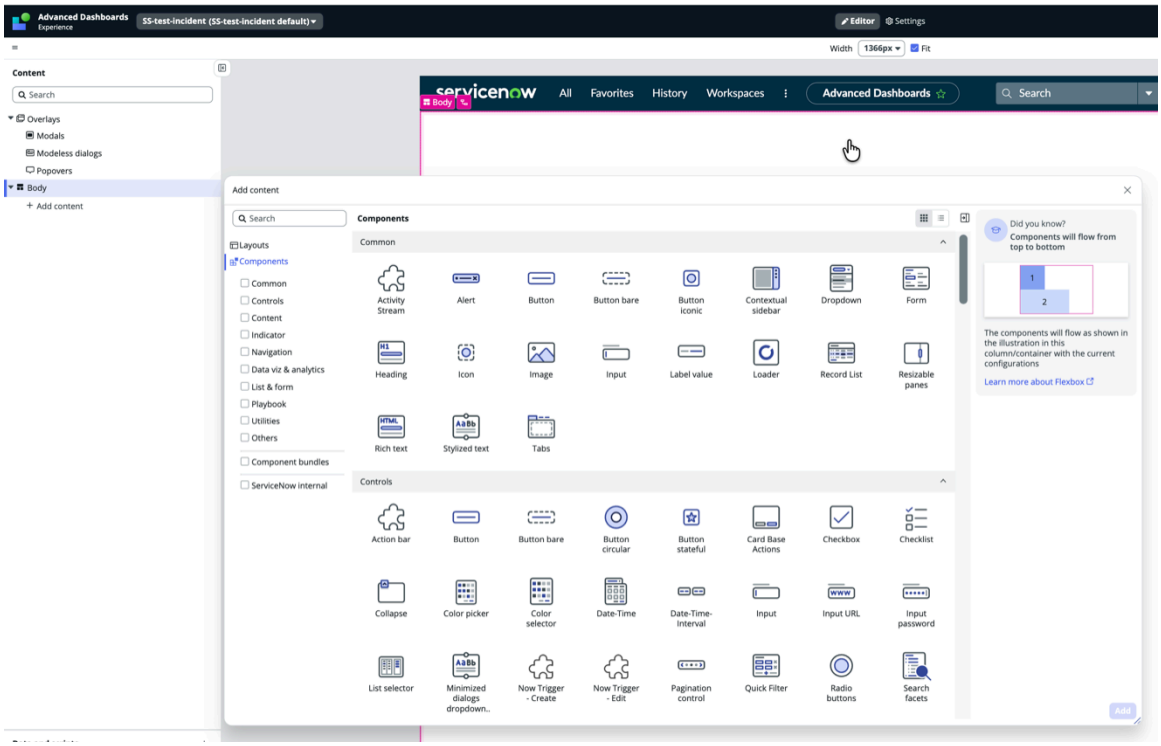
4. Provide a name and description of the dashboard you are going to create and select **Create new dashboard**.
   The Technical editor option opens an empty dashboard.
5. Select **Edit in UI Builder**.
6. In the Content tree view, add layouts or container components.
   Containers hold dashboard components including data visualizations, static text boxes, and images. If you're creating a tabbed dashboard, you can create each tab as a container under the parent Tabs component. For more information, see the Tabs component reference on the Developer Site.
7. On the right side of the UI Builder, in the **Styles** tab, choose a layout.

   Layouts organize container content in patterns.

   - Choose **Grid** to specify the number of rows and columns in the selected container. For more information, see Using CSS Grid layouts to build a page.
   - Choose **Flexbox** for more flexibility in the layouts between containers. For more information, see Using Flexbox layouts in UI Builder.
8. Add a component to the container.
   Select it from the **Components** menu on the left or click the Add content (**+**) icon in the staging area.

   The **Configure** panel on the right enables you to configure the component you've chosen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



9. **Optional:** Add more containers, components, and configurations.
10. If you have added a data visualization component and you want viewers to drill down to a more detailed data view from that component, follow the instructions in Add a drilldown event to a data visualization on a technical dashboard.
11. Click **Save** at any time to save the changes you've made to the dashboard.

Add a drilldown event to a data visualization on a technical dashboard

Technical dashboards do not support preconfigured destinations for drilling down from a data visualization. If you want a viewer to open a more detailed view of the data when they interact with a visualization, configure a custom drilldown event.

Before you begin

This procedure assumes that you have already created a technical dashboard and populated it with a data visualization component.

⚠ **Warning:** This procedure does not apply to Saved Visualization components.

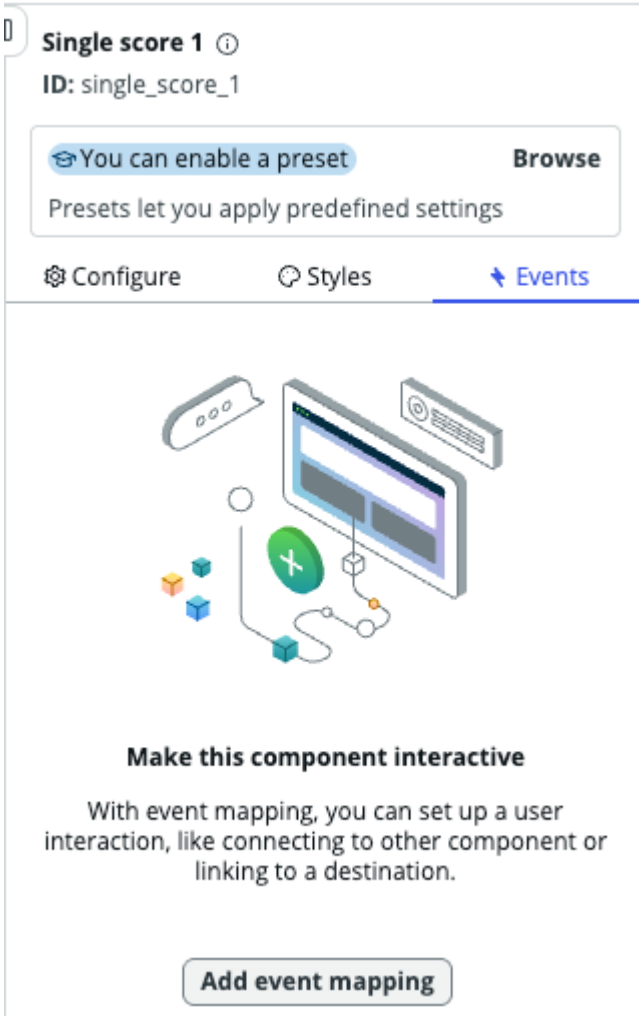
Role required: ui_builder_admin, rights to edit a technical dashboard

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Dashboards**.
2. Locate and open the desired technical dashboard.
3. Select **Edit in UI Builder**.
4. In the UI Builder, select the desired data visualization in the dashboard.
5. In the configuration panel for the data visualization, open the **Events** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

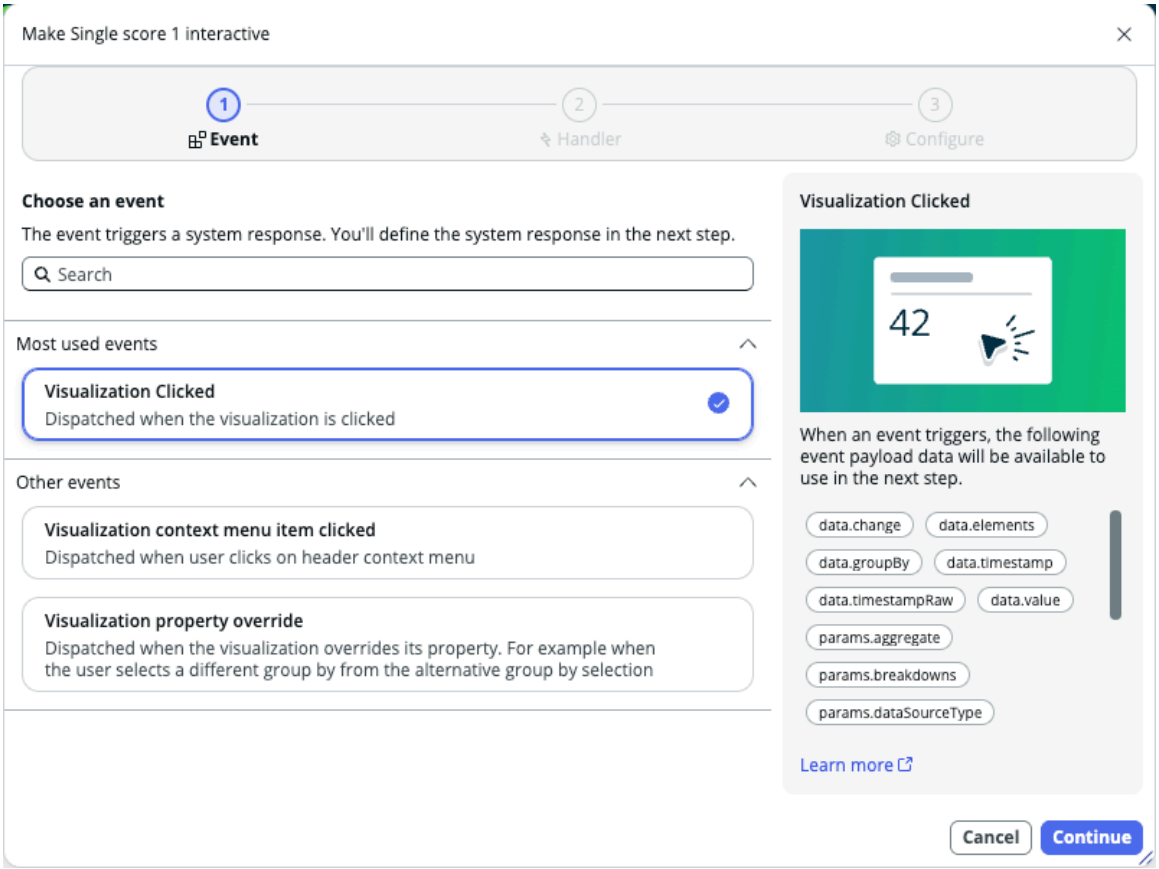
6. If your only option is to add an event mapping, do so.



a. Select **Add event mapping**.

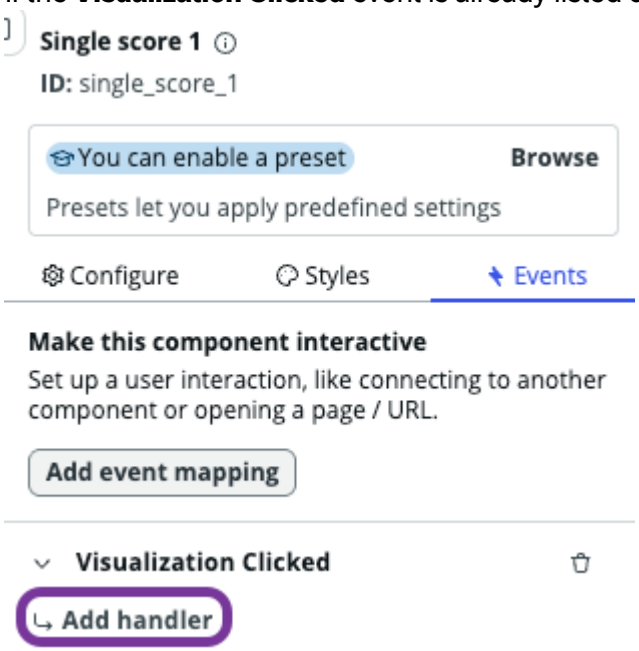
b. In the list of events, select **Visualization Clicked**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



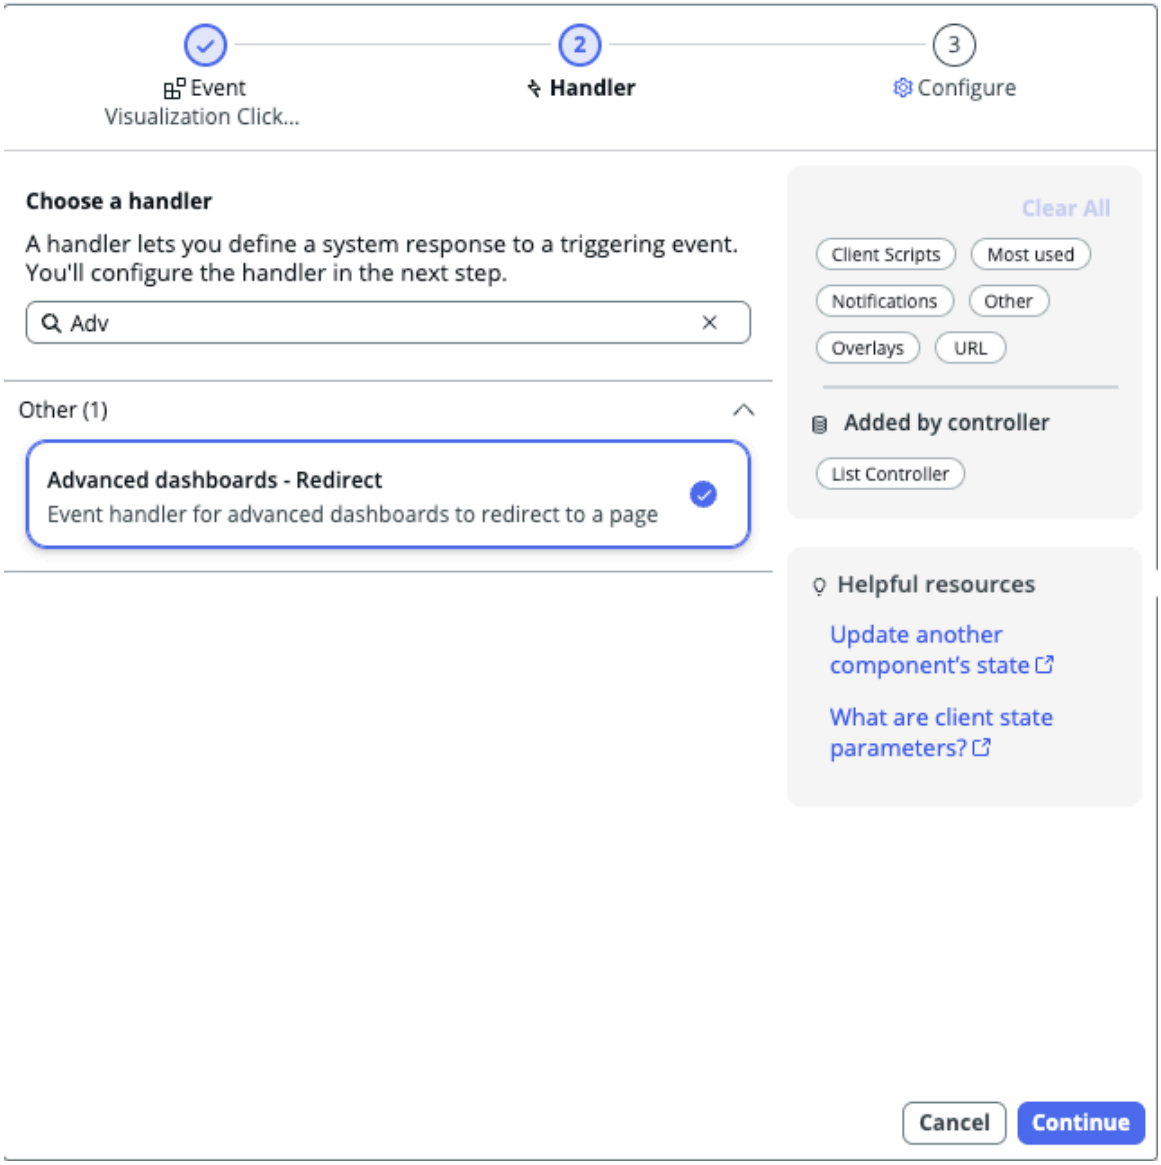
c. Select **Continue**.

7. If the **Visualization Clicked** event is already listed on the Events tab, select **Add handler** for it.



8. Search for and select the **Advanced dashboards - Redirect** event handler and **Continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



9. Configure the event handler as follows.

Field	JSON types	Description
Context	object, with a string property named path	The path of the experience where the destination page resides.
Route	none	The route name of the destination page.
Route fields	object, with all parameters as strings	Required parameters for the destination page.
Optional parameters		Optional parameters for the destination page.

The required and optional parameters for common targets follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Target	Route fields (required parameters)	Optional parameters
List	{table:@payload.params.table}	{query:@payload.params.query}
Record	{table: @payload.params.table, sysId: @payload.parms.row.sys_id.value}	None
KPI Details	{uuid:@payload.params.indicatorSysid}	None

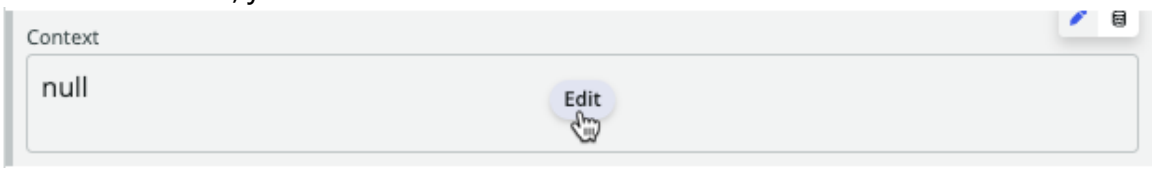
10. Select **Add**.

Example: Drilldown for a table data source

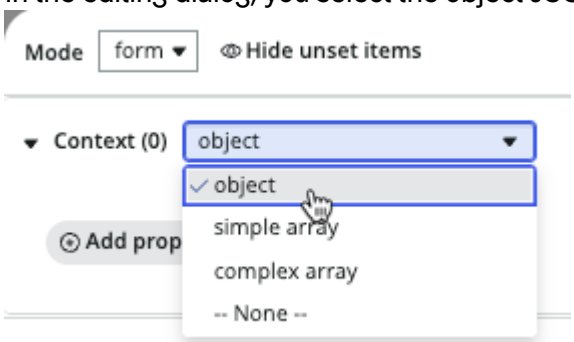
You have a vertical data visualization that shows the number of records on the Incident [incident] table grouped by Priority. When a viewer interacts with this visualization, you want it to open a list of Incident records in the Platform Analytics experience.

Note: This example uses the Context of the Platform Analytics experience and default Route names to components therein.

1. You follow Steps 1-8 in the general procedure, so you now have the configuration open for the Advanced dashboards - Redirect event handler for your vertical bar visualization.
2. In the Context field, you select **Edit**.

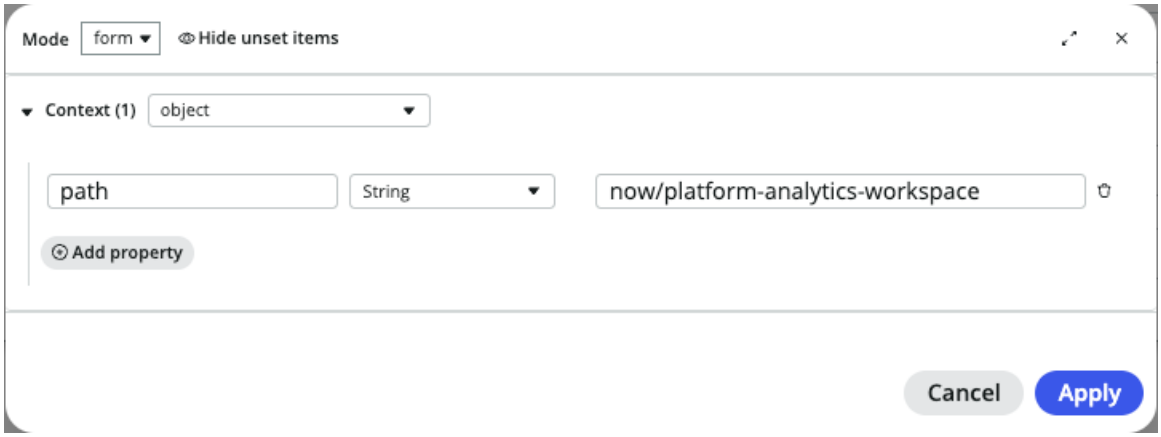


3. In the editing dialog, you select the object JSON type.



4. You select **Add property** and enter `path` as the property name and `now/platform-analytics-workspace` as the property value. These values specify that the viewer drills down to the Platform Analytics experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

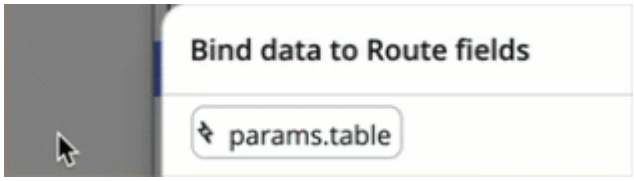


5. You select **Apply** and move on to the next field.
6. In the Route field, you enter `simplelist`. This route leads to the simplelist page in the Platform Analytics experience.
7. For the Route fields, you first choose to bind data.

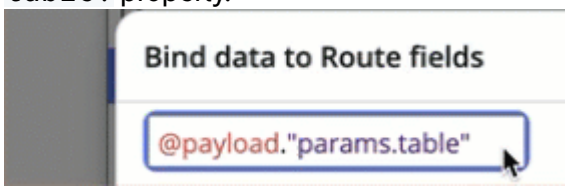
8. Then you add the property `{table: @payload.params.table}` to the field. This property passes the name of the table in your visualization to the simplelist page of the Platform Analytics experience.
   a. You select the Event payload property `params` and then `table`.

   b. You double-click, drag and drop, or select the arrow to add the property to the upper area of the editor.
   c. Double-click on the property in the upper area of the editor to open it for editing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



d. You surround the `@payload.params.table` property with curly brackets and add the `table:` property.



e. You select **Apply**.

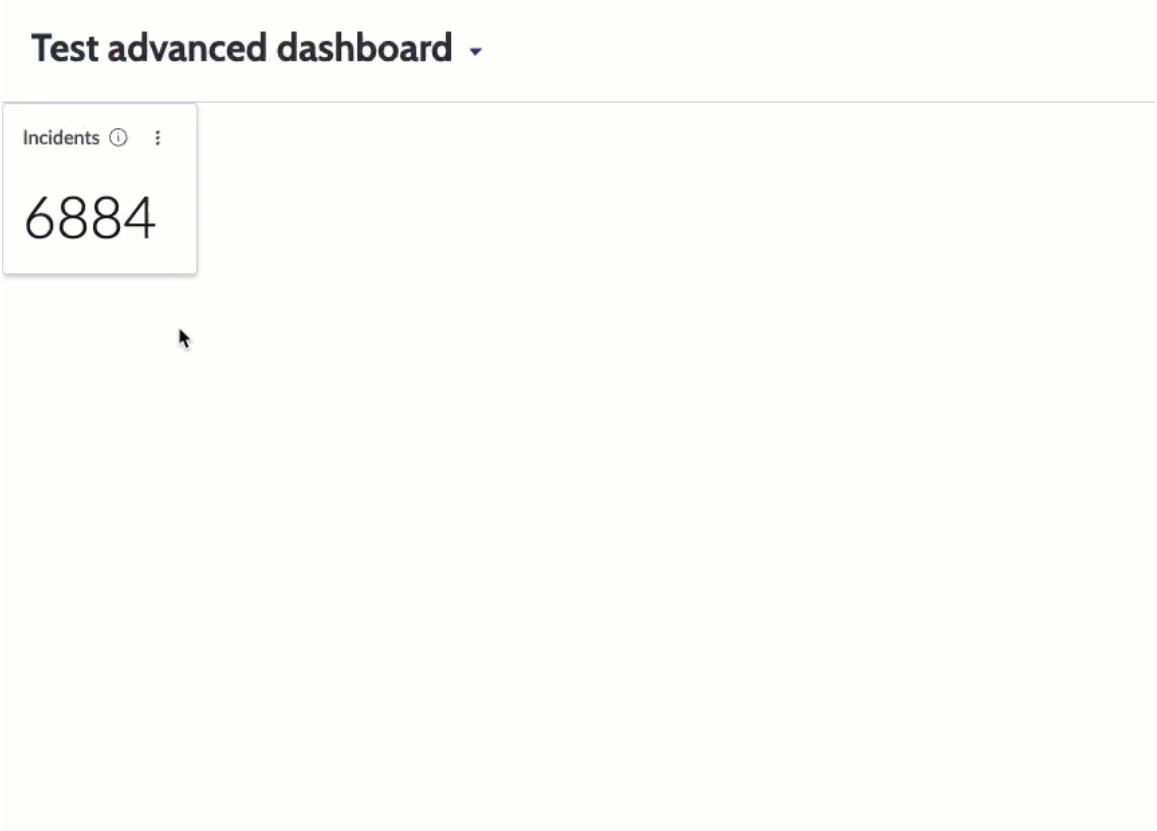
9. Similarly, you choose to bind data for the Optional parameters field and set the value `{query:@payload.params.concatenatedQuery}`.

The properties of your Advanced dashboards - Redirect event handler now appear as follows:

Field	Value
Context	{path:now/platform-analytics-workspace}
Route	simplelist
Route fields	{table:@payload.params.table}
Optional parameters	{query:@payload.params.query}

In runtime, a user can interact with the visualization to open a list of Incident records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Example: Drilldown for an indicator data source

You have a Line data visualization for the indicator Number of open incidents. When a viewer interacts with this visualization, you want it to open the KPI Details page for that indicator.

1. You repeat steps 1-5 from the Table data source example, because in this case too you are drilling down to a page on the Platform Analytics experience.
2. For the Route, you enter `ac_kpi_details`.
3. For the Route fields, you first choose to bind data

. Then you enter `{uuid:@payload.params.indicatorSysid}`. This parameter passes the id of the indicator, in this case Number of open incidents, to the Platform Analytics experience KPI Details page.

   Tip: First use autocomplete to add the data parameter `@payload.params.indicatorSysid`, then surround that parameter with curly brackets and add `uuid:`.

   The properties of your Advanced dashboards - Redirect event handler now appear as follows:

Field	Value
Context	{"path":"now/platform-analytics-workspace"}
Route	ac_kpi_details

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Route fields	{uuid:@payload.params.indicatorSysid}

4. No other parameters are necessary, so you select **Add** and then **Save** the UI Builder page.

In runtime, a viewer can interact with the visualization to open KPI Details for the Number of open incidents indicator.

More examples and information are available in KB2663434

Add a drilldown event to a saved data visualization on a technical dashboard

Technical dashboards do not support preconfigured destinations for drilling down from a data visualization. If you want a viewer to open a more detailed view of the data when they interact with a visualization, configure a custom drilldown event.

Before you begin

This procedure assumes that you have already created a technical dashboard and populated it with a data visualization component.
Role required: ui_builder_admin, rights to edit a technical dashboard

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Dashboards**.
2. Open the desired technical dashboard.
3. Select **Edit in UI Builder**.
4. In UI Builder, select the saved data visualization on the dashboard.
5. In the configuration panel for the data visualization, select the **Events** tab.
6. Select **Item clicked or View all** > **Add handler**.
7. Select the **Advanced dashboards - Redirect** event handler.
8. Configure the event handler as follows.

Field	JSON types	Description
Context	object, with a string property named path	The path of the experience where the destination page resides.
Route	none	The route name of the destination page.
Route fields	object, with all parameters as strings	Required parameters for the destination page.
Optional parameters		Optional parameters for the destination page.

9. Select **Add**.

Example: Drilldown to a simple list component

You have a vertical data visualization that shows the number of records on the Incident [incident] table grouped by Priority. When a viewer interacts with this visualization, you want it to open a list of Incident records in the Platform Analytics experience.

Note: This example uses the Context of the Platform Analytics experience and default Route names to components therein.

1. You follow Steps 1-8 in the general procedure, so you now have the configuration open for the Advanced dashboards - Redirect event handler for your vertical bar visualization.
2. In the Context field, you type `{"path":"now/platform-analytics-workspace"}`.

   This specifies that the viewer drills down to the Platform Analytics experience.
3. In the Route field, you enter `simplelist`. This route leads to the simplelist page in the Platform Analytics experience.
4. For the Route fields, you first choose to bind data.

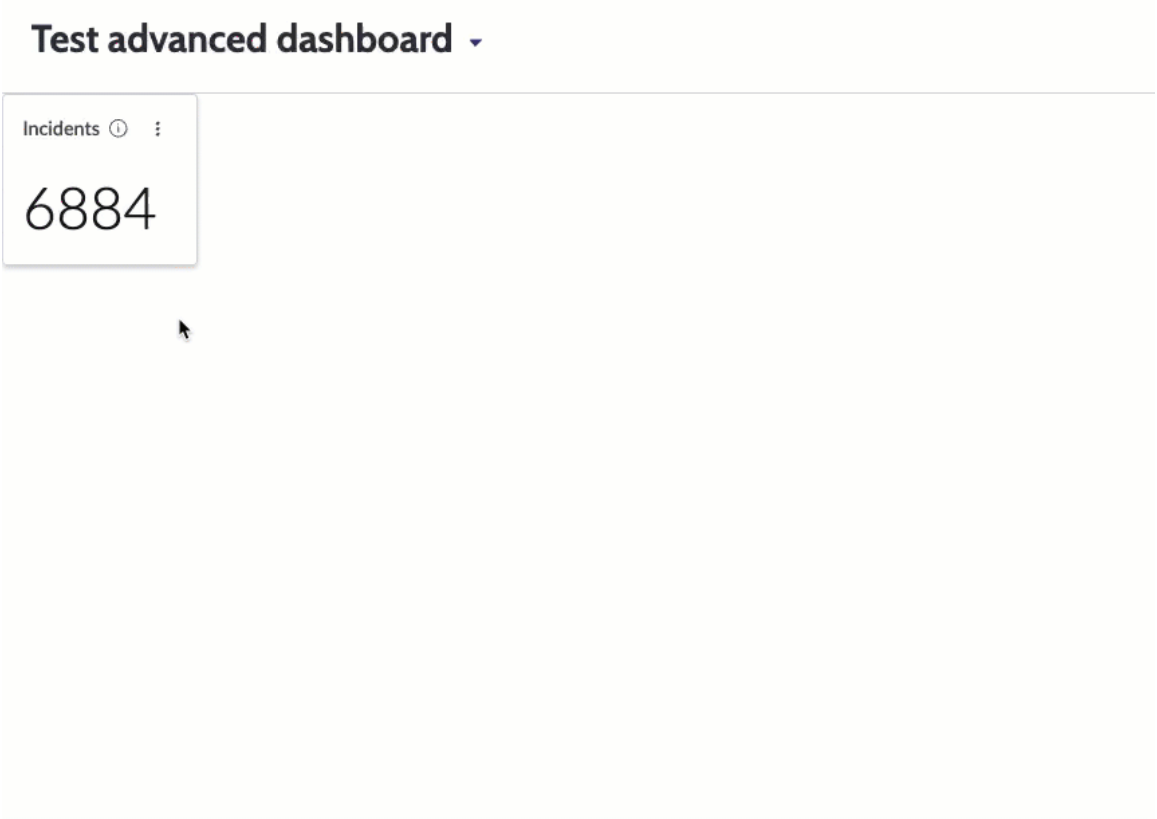
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Then you add the property `{table: @payload.payload.params.table}` to the field. This property passes the name of the table in your visualization to the simplelist page of the Platform Analytics experience.
6. Similarly, you choose to bind data for the Optional parameters field and set the value `{query: @payload.payload.params.query, listTitle: @payload.payload.title}`.

The properties of your Advanced dashboards - Redirect event handler now appear as follows:

Field	Value
Context	{path:now/platform-analytics-workspace}
Route	simplelist
Route fields	{table:@payload.params.table}
Optional parameters	{query: @payload.payload.params.query, listTitle: @payload.payload.title}

In runtime, a user can interact with the visualization to open a list of Incident records.



Example: Drilldown for an indicator data source

You have a Line data visualization for the indicator Number of open incidents. When a viewer interacts with this visualization, you want it to open the KPI Details page for that indicator.

1. You repeat steps 1-5 from the Table data source example, because in this case too you are drilling down to a page on the Platform Analytics experience.
2. For the Route, you enter `ac_kpi_details`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. For the Route fields, you first choose to bind data

. Then you enter `{uuid:@payload.payload.params.indicatorSysid}`. This parameter passes the id of the indicator, in this case Number of open incidents, to the Platform Analytics experience KPI Details page.

   Tip: First use autocomplete to add the data parameter `@payload.payload.params.indicatorSysid`, then surround that parameter with curly brackets and add `uuid:`.

   The properties of your Advanced dashboards - Redirect event handler now appear as follows:

Field	Value
Context	{"path":"now/platform-analytics-workspace"}
Route	ac_kpi_details
Route fields	{uuid:@payload.payload.params.indicatorSysid}

4. No other parameters are necessary, so you select **Add** and then **Save** the UI Builder page.

In runtime, a viewer can interact with the visualization to open KPI Details for the Number of open incidents indicator.

Configure an event handler for a Filter component

On a technical dashboard, configure a special client script-based event handler for a Filter component so it can be followed by any Lists or Data Visualizations. It is not necessary to configure an event handler for filters on inline dashboards.

Before you begin

This procedure assumes that the following tasks are complete:

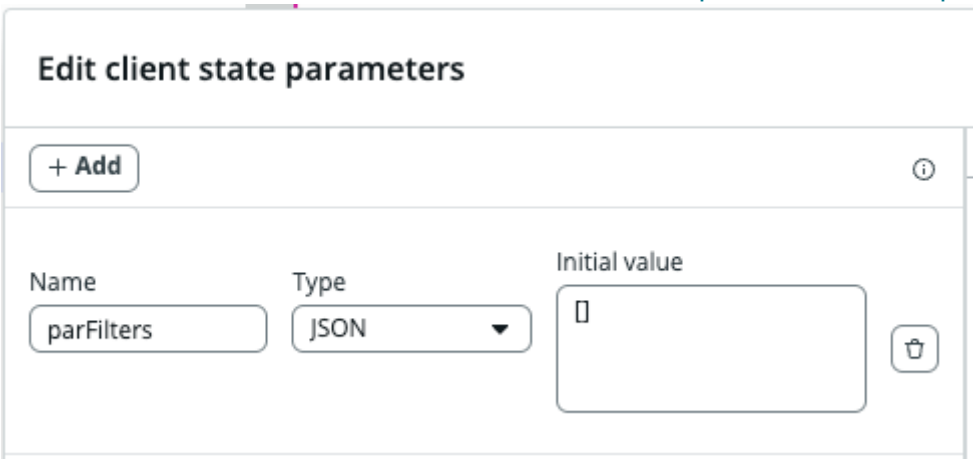
1. You have added the Filter component to the UI Builder page, as well as at least one Data Visualization or List component. The Filter can apply to multiple Data Visualizations or Lists.
2. You have configured the filter to source and the data to filter, if applicable, for the Filter component. If the Filter component is supposed to filter a List, you have specified the table that the List component shows as data to filter.
3. You have configured data sources for any Data Visualization components.
4. You have specified a table for any List components.

Role required: ui_builder_admin, admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the relevant UI Builder page.
   This page may be a technical dashboard.
2. Navigate to the UI Builder State section and add a state variable named *parFilters* of type JSON with a simple array initial value `[]`.
   For more information, see Create and bind a client state parameter to a component.

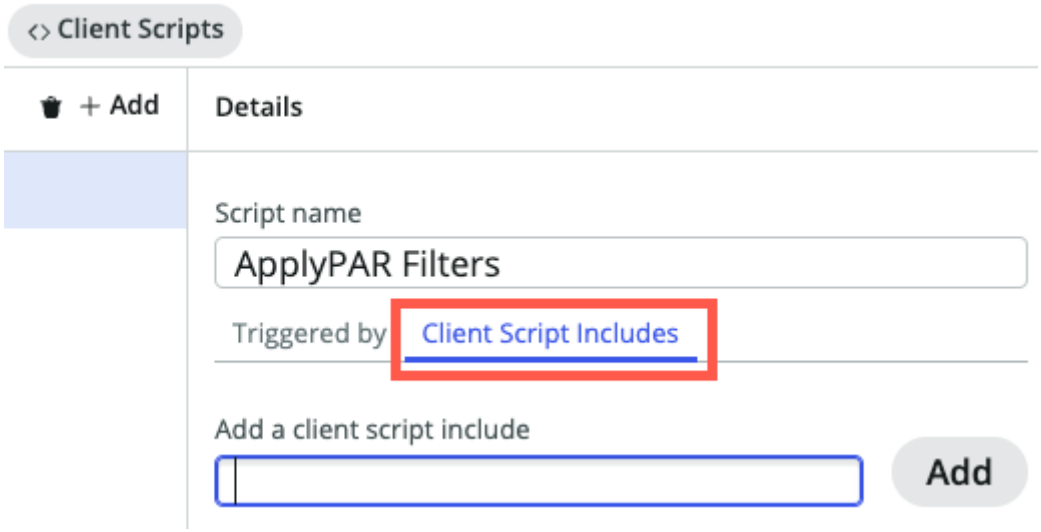


3. Add a second JSON state variable named *encodedQueries* of type Object with initial value `{}`.
4. Navigate to the Client Scripts section and create a custom script with a name such as "Apply PAR Filters" and the following content or a functional equivalent thereof:

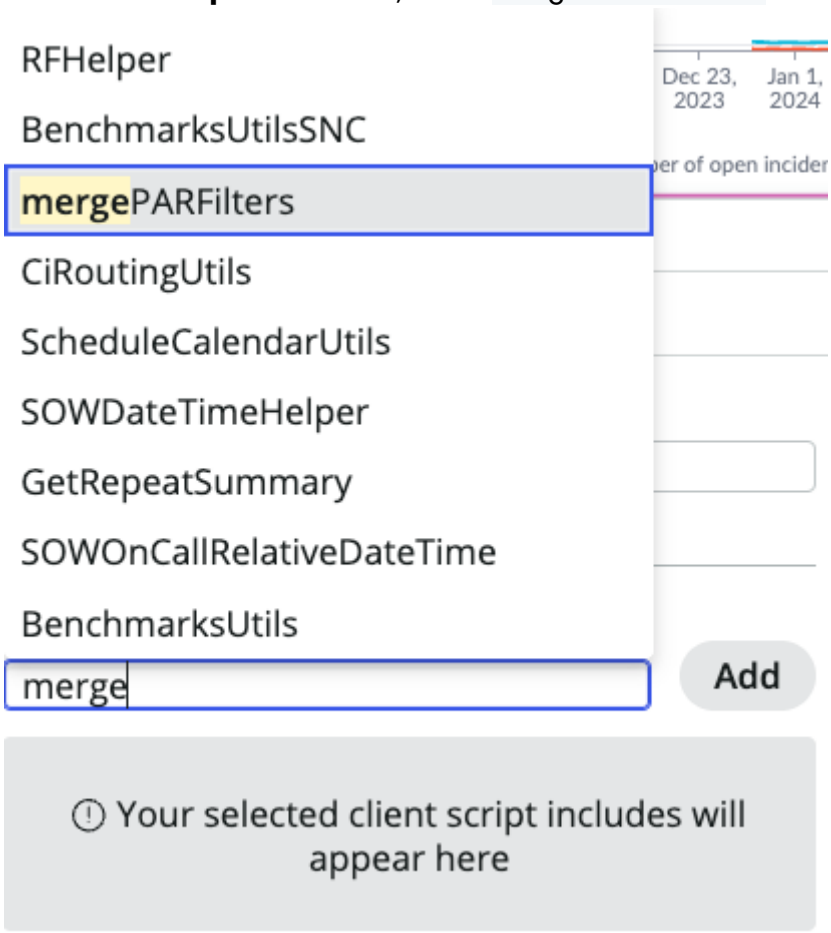
```
function handler({ api, event, helpers, imports }) {
 const mergePARFiltersV2 = imports["global.mergePARFilters"]().v2;
 const { appliedFilters } = event.payload;
 api.setState("parFilters", ({ currentValue, api }) => {
  const { parFilters, encodedQueries } = mergePARFiltersV2(
   currentValue,
   appliedFilters
  );
  api.setState("encodedQueries", encodedQueries);
  return parFilters;
 });
}
```

5. In the Client Scripts section, open the **Client Script Includes** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

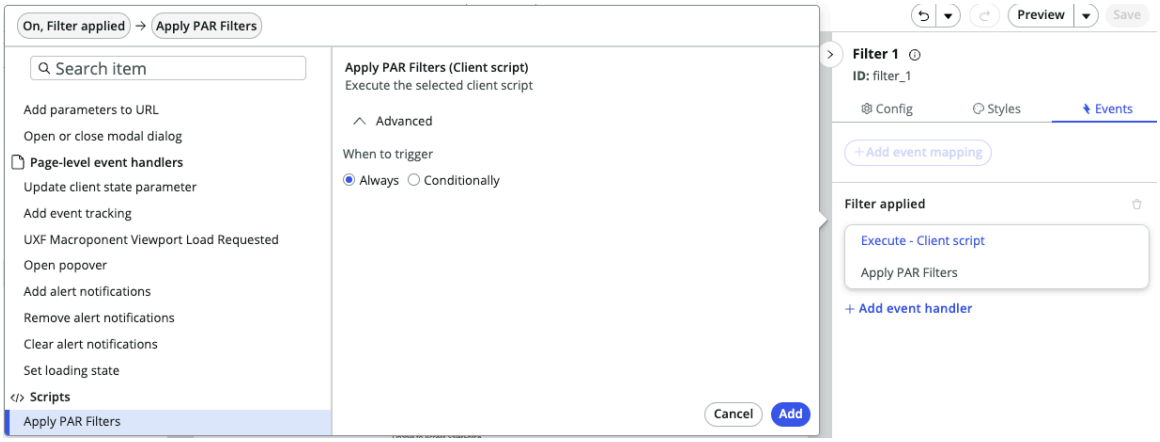


6. In the **Add a script include** field, select `mergePARFilters` and click **Add**.

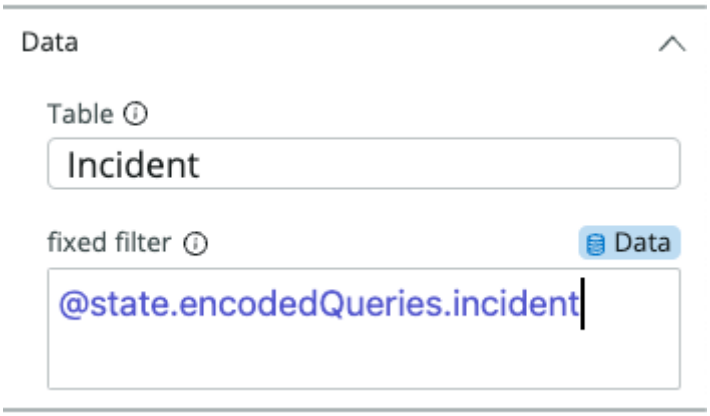


7. Close the window for configuring data, client state, and client scripts.
8. In the UI Builder, select the Filter component.
9. Select the **Events** tab in the configuration panel and add the page script you have created, which in our example is Apply PAR Filters, as an event handler.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



10. In the UI Builder, select a Record List component, if one exists.
11. Open the Presentational List subcomponent of the Record List in the configuration panel.
12. In the Data section, select **Edit fixed filter** and set this property [fixedQuery] as the dynamic binding expression `@state.encodedQueries.<list-datasource>`. Replace <list-datasource> with the data source for the List component. For example, if your List shows records from the Incident [incident] table, enter `@state.encodedQueries.incident`.



13. Repeat the previous two steps for any other List components.
14. Save the page.

Use a local data instance with a data visualization

For finer grained control of the data source than you have with preconfigured data sources, create a local data instance. Then bind the local data instance to the *dataPassthrough* property of the data visualization.

Before you begin

Important: This is an advanced procedure. Consider carefully whether you need a local data instance or can use a standard data source.

Before proceeding, review Dynamically expose data in UI Builder pages (advanced feature).

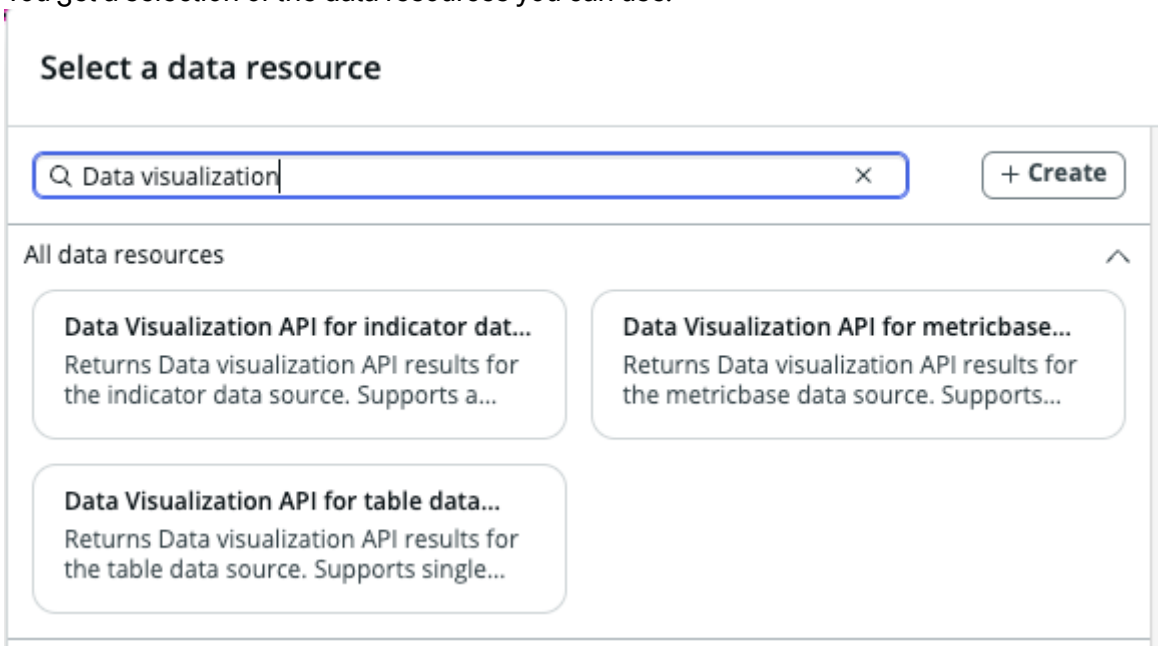
Role required: ui_builder_admin, admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the technical dashboard or other UI Builder page in UI Builder.
2. In the Data and scripts drawer, under Data resources, select **+ Add data resource**.

3. In the Select a data resource window, search for `Data visualization`.
   You get a selection of the data resources you can use.



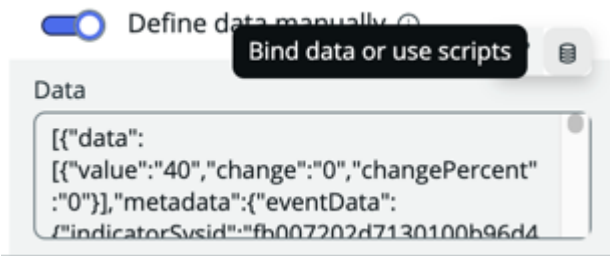
4. Select a data resource that matches the type of data you want to show.
5. Read through the information pane and copy or take notes on the configuration details.
6. Select **Add**.
7. Complete the configuration options that you need for the type of visualization with which you plan to use this data instance.
   Create and configure a separate local data instance for every type of visualization that you want to use the same data. For example, if you plan to have a bar and a time series that show scores from the same indicator, create two local data instances: one each for bar and time series visualizations, but both on the same indicator.

   Tip: You can add the data visualization to the page and compare its configuration panel to the options for the local data instance.

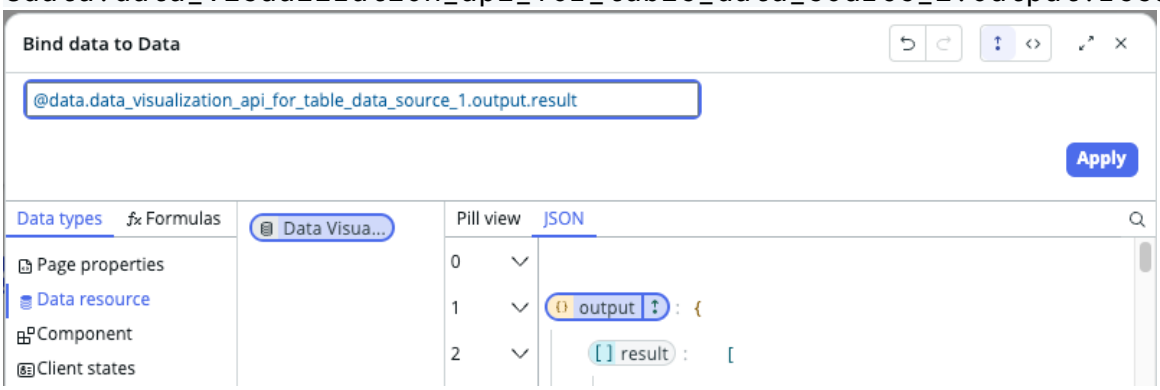
8. Copy the `@data` data bind for this data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Add the desired data visualization component to the page.
10. In the configuration panel for that data visualization, in the Data sources section, turn on **Define data manually**.
11. For the **Data** field, select **Bind data or use scripts**.



12. In the Bind data to Data dialog, under Data types, select **Data resource**.
13. Double-click in the Add a data output to this area section and paste the data bind to your local data instance into the blue box.
14. Append `.output.result` at the end of the data bind.
    For example, the completed data bind to the local data instance data_visualization_api_for_table_data_source_1 is `@data.data_visualization_api_for_table_data_source_1.output.result`.



15. Select **Apply**.

Result

You have created a local data instance and bound it to a data visualization. You can now complete the configuration of your data visualization.

Enable filters to apply to a local data instance

To enable a viewer to switch between which field values or breakdown elements they see in a data visualization, add filter components to the UI Builder page. For those filters to apply to a local data instance, configure that instance accordingly.

Before you begin

Role required: ui_builder_admin, admin

About this task

To enable filters to apply to a local data source, you first have to create a client state parameter named `parFilters` and then add that state parameter to the local data instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the UI Builder page with the local data instance and data visualizations you want to filter.
2. In the Data and scripts drawer, select **Client state parameters**.
3. Select **+ Add**.
4. In the Edit client state parameters dialog, name the new parameter `parFilters`, assign it type JSON, and set the initial value of `{}`.

5. Close the Edit client state parameters dialog.
6. In the Data and scripts drawer, under Data resources, select the desired local data instance.
7. In the Edit <name of local data instance> dialog, scroll down to the **Filter configurations** field.
8. Enter `@state.parFilters` into the **Filter configurations** field and close the data instance editor.
9. In the configuration panel of a data visualization that uses this local data resource, turn on **Follow filters** in the Data update section.
10. **Optional:** Turn on **Show filter icon**.
11. Save the UI Builder page.

What to do next

Add filter components to the UI Builder page and configure them for relevant values from the local data instance.

Related topics

Filters in Platform Analytics

Enable data caching for a local data instance

To help reduce the load time of data visualizations, and if real time or very fresh data is not necessary, enable data caching on the data source.

Before you begin

Role required: ui_builder_admin, admin

Procedure

1. Open the UI Builder page with the local data instance whose data you want to cache.
2. In the Data and scripts drawer, under Data resources, select the desired local data instance.
3. Scroll down to **Use data cache** and turn it on.
   Any data visualization that uses this data source, uses the cache settings on the data source. The data cache settings on the visualization itself are removed from the configuration panel.
4. Set other caching properties as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
Cache expiration time	How long the cache, once created, is retained before being updated in the cache refresh job.
Invalidate cache	Use this setting with extra logic you create to invalidate the cache and fetch fresh data. For example, you can add a Button component to the page and script its event handler to invalidate the cache.
Additional key	Enter a string that will contribute to generating the unique hash key for each data cache created on this data instance. Use a unique additional key value for each local data instance.

Local data instances for multiple data visualizations

A special Data Visualization API data resource is available to fetch data for multiple data visualizations simultaneously. This data resource reduces the number of API calls and thus can speed up data fetching.

When to use

You can use the “Data Visualization API for multiple data visualizations” data resource in the following scenarios:

- Multiple data visualizations of the same type have the same data source. For example, you have five visualizations where the visualization type is Single Score and the data source is the Incident [incident] table with the filter `active=true`. If you have several groups of indicators with the same type and data source, you can create an instance of the same multiple visualization data resource for each group.
- A data visualization has multiple data resources that reference the same data source. For example, you have a Line visualization with a data resource from the "Number of open incidents" indicator and another data resource from the "Average age of open incidents" indicator. Both of these indicators use the Incident.Open data source. For efficiency, you can convert this visualization to use only one data resource.

When not to use

- There is only one data visualization on the UI Builder page.
- The data visualizations on the page are likely to take a long time to load data. In that case, it's better to keep the data loading split between separate data resources.

Set up a multiple visualization data resource

If your use case meets the criteria for a multiple visualization data resource, you can follow this procedure.

Before you begin

Review the use case for a single data resource for multiple visualizations in Local data instances for multiple data visualizations.

Role required: ui_builder_admin, admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

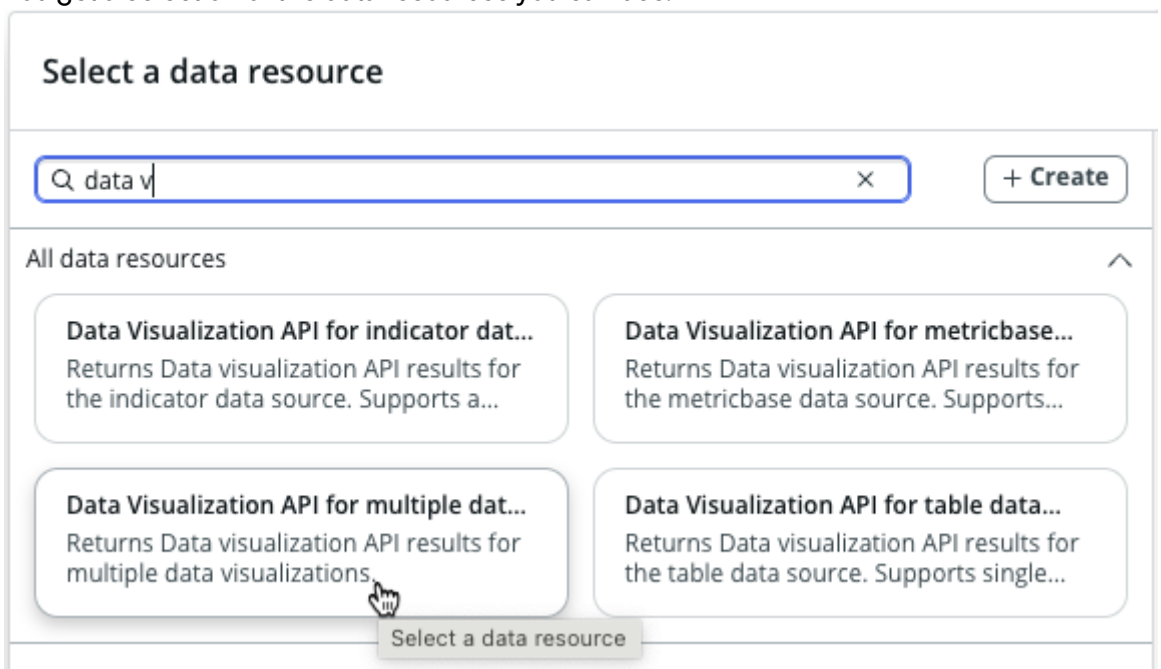
About this task

Important: This data resource merges multiple calls into a single one. The single call is executed as a single transaction on a single thread. Therefore, use this data resource with extra care, especially when handling a large amount of data, as in some cases this might lead to transaction timeouts. Depending on the quantity of the data, the setup of the page, and the targeted user experience, you might have better results by using separate data resources.

Procedure

1. Navigate to the technical dashboard or UIB page with the data visualizations.
2. Verify that the data visualizations on the page meet the criteria in **When to use**.
   For example, you have several Dial visualizations on the Incident table data source, and the amount of data fetched is not too large.
3. In the Data and scripts drawer, under Data resources, select **+ Add data resource**.

4. In the Select a data resource window, search for `Data visualization`.
   You get a selection of the data resources you can use.



5. Select "Data Visualization API for multiple data visualizations."
6. Set the type as **Data configurations**.
7. In the request field, fill in the JSON.
   See the Example at the end of this procedure.
8. In each data visualization that you want to use this data resource, perform the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the data visualization.

b. Open the Configuration panel.

c. Turn on **Define data manually**.

d. Use data binding to bind a script to the Data field.

Example: Data resource for three Single score visualizations with the same data source

In this example, we start with a UIB page that contains three Data Visualization components. These components all are of the Single Score visualization type, and all use the same data source.

You follow the general procedure through Step 6. Now you have a Data Visualization API for multiple data visualizations on your Dashboards page.

Next you write the JSON for the request, as follows:

```
[
    {
        "details": {
            "visualizationId": "vis_1",
            "followFilter": true
        },
        "configurations": {
            "dataConfigurations": [
                {
                    "sourceType": "table",
                    "dataCategory": "simple",
                    "order": 0,
                    "tableOrViewName": "incident",
                    "aggregateFunction": "COUNT"
                }
            ]
        }
    },
    {
        "details": {
            "visualizationId": "vis_2",
            "followFilter": true
        },
        "configurations": {
            "dataConfigurations": [
                {
                    "sourceType": "table",
                    "dataCategory": "simple",
                    "order": 0,
                    "tableOrViewName": "incident",
                    "aggregateFunction": "AVG",
                    "aggregateField": "business_duration"
                }
            ]
        }
    },
    {
        "details": {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

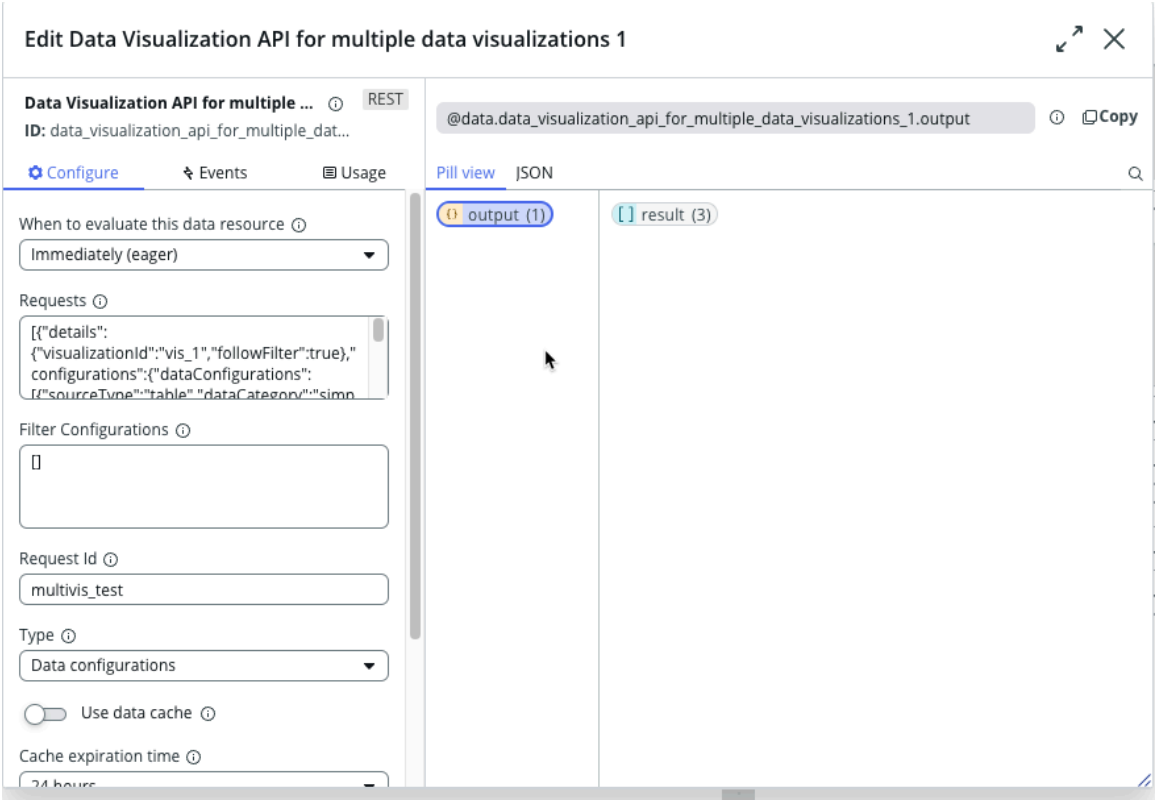
```
                "visualizationId": "vis_3",
                "followFilter": true
            },
            "configurations": {
                "dataConfigurations": [
                    {
                        "sourceType": "table",
                        "dataCategory": "simple",
                        "order": 0,
                        "tableOrViewName": "incident",
                        "aggregateFunction": "AVG",
                        "aggregateField": "priority"
                    }
                ]
            }
        }
]
```

The request is an array of objects, one for each data visualization. Each visualization has a *details* property with an arbitrary value for the *visualizationId* and a boolean *followFilter* setting whether the visualization follows filter components on the page. In this case, all three visualizations follow filters.

Each visualization also has a *configurations* property, containing only a *dataConfigurations* array. Because all the visualizations are of the same type, Single Score, and this visualization type shows only a simple value, all three *dataCategory* properties are "simple." Similarly, all the visualizations use the same data source. Because the data source is the Incident [incident] table, all three visualizations have a *sourceType* of "table" and a *tableOrViewName* of "incident." The only place where the visualizations can vary is in the aggregates they use. Here you see the first one uses a COUNT aggregation, the second takes an AVG aggregate on the business_duration field, and the third takes an AVG of the priority field.

The final configuration of the data resource looks like this:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Lastly, for each data visualization, you bind the following script to the data field. You use the arbitrary *visualizationId* value you gave each visualization as the `vizId` value in the script for that visualization.

```
function evaluateProperty({api, helpers}) {
  const data =
 api.data.data_visualization_api_for_multiple_data_visualization
s_1.output;
  if (!data) {
    return [];
  }
  const vizId = 'vis_1';
  const dataForViz = data.result.find(d =>
 d.details.visualizationId === vizId);
    return dataForViz.dataResponses;
}
```

Example: Request JSON for an indicator

The request for a visualization on an indicator differs from the previous example, which was for a table. Here is the JSON for a time series visualization, which shows a trend over time, for the Number of open incidents indicator, grouped by the Priority breakdown:

```
[
    {
        "details": {
            "visualizationId": "vis1",
            "followFilter": true
        },
        "configurations": {
            "dataConfigurations": [
                {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                        "sortBy": "choice",
                        "sortOrder": "asc",
                        "sourceType": "indicator",
                        "dataCategory": "trend",
                        "order": 0,
                        "splitView": false,
                        "numberOfGroups": 2,
                        "uuid": {
                            "indicator": "fb007202d7130100b96d45a3ce6103b4",
                            "breakdowns": []
                        },
                        "trendBy": "anything",
                        "trendInterval": "date",
                        "groupBy": [
                            "0df47e02d7130100b96d45a3ce610399"
                        ],
                        "removeMissingIntervalData": false
                    }
                ]
            }
        }
]
```

The first and obvious differences are that the *sourceType* is "indicator" and the *dataCategory* is "trend." You also see that instead of a *tableOrViewName* property, you have a *uuid* object with the uuid of the Number of open incidents indicator and an empty array that could hold the uuid's of breakdowns for filtering that indicator. Because this visualization supports group-by values, you have a *groupBy* array that in this case contains only the uuid of the Priority breakdown. Having a group-by implies sorting, and here you see that the *sortBy* is "choice," reflecting the data type of the Priority breakdown, and the *sortOrder* is ascending.

Dashboard reference

Reference topics provide a list of roles and translatable fields for Platform Analytics dashboards.

Translatable fields in dashboard elements

For fields that show the **Translatable turned on** badge, you can add translations of the field value in the Messages [sys_ui_message] table.

Translations of ServiceNow AI Platform® User interface (UI) elements are stored in one of five tables, as described in Translation tables. When you see a field in the configuration panel of a dashboard element, and this field has the badge **Translatable turned on**, you can add translations of the field value in the Messages [sys_ui_message] table.

In the Messages table, records have a key, a language, and a message field. You set the key value equal to the original text. Then you select a language, and enter the translation in that language into the Message field. Only ServiceNow AI Platform admins can create and edit these records. For more information, see Translate a client script message.

Note: For more information about how keys are stored for translatable fields, see this ServiceNow Community blog post. This post also includes a prototype Localization Framework artifact that finds all translatable fields in all UI Builder components on an instance, including dashboard components.

Platform Analytics dashboard roles

Platform Analytics dashboards have few role restrictions. Editing rights are granted by sharing, independent of role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users with any role can create dashboards and share them with groups, users, and roles. These users can share a dashboard that has been shared with them if sharing rights were also granted. They can pass along editing rights if granted.

The dashboard_admin role allows a user to configure, edit, or delete any dashboards, regardless of ownership or editing rights. Certain configuration tasks also require dashboard_admin, as described in Configuring dashboards.

Tasks that integrate dashboards with Process Mining require the sn_process_optimization_analyst role. These tasks are listed in Configuring dashboards.

Users with the analytics_categories_admin role can create, edit, or delete dashboard categories.

For a full guide to roles connected to Platform Analytics dashboards, see Platform Analytics roles.

Dashboard roles

Use case	Required role
Create a dashboard	Any role
Share a dashboard	Any role to share a data visualization that you created or that was shared with you with sharing rights. With the viz_admin role or higher, you can share any data visualization on the instance. When you share a data visualization, you can pass along the rights to share that visualization further. You also decide whether to share with editing rights or only viewing rights. If a data visualization has been shared with you with sharing and editing rights, you can also pass along editing rights. dashboard_admin to share any dashboard A role with read access to the Roles [sys_user_role] table to share with roles
Edit a dashboard	Any role, if you created the dashboard or have had it shared with you with editing rights. dashboard_admin or higher for any dashboard Technical dashboards also require ui_builder_admin
Duplicate a dashboard	Any role, if you can view the dashboard. You cannot duplicate technical dashboards.
Create a printer-friendly copy of a dashboard	Any role, if you can view the dashboard.
Export a dashboard	Any role, if you can view the dashboard.
Schedule the export of a dashboard	par_scheduler for dashboards that you own or that have been shared with you. dashboard_admin or higher for any dashboard

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dashboard roles (continued)

Use case	Required role
Delete the scheduled export of a dashboard	sn_par_sche_export.par_scheduler_admin (contained in dashboard_admin)
Bookmark a dashboard	Any role, if you can view the dashboard.
Delete a dashboard	Any role, if you created the dashboard. dashboard_admin or higher for any dashboard
Configure dashboard details	Any role, if you created the dashboard or have had it shared with you with editing rights. dashboard_admin or higher for any dashboard
Configure dashboard settings except scheduled refreshes	Any role, if you created the dashboard or have had it shared with you with editing rights. dashboard_admin or higher for any dashboard
Schedule dashboard refreshes	dashboard_admin or higher
Configure dashboard tab cache timeout	admin
Create dashboard categories	analytics_categories_admin or higher
Assign categories to a dashboard	Any role, if you can edit the dashboard. analytics_categories_admin or higher to assign a category to any dashboard.

Platform Analytics dashboard tables

The following tables relate to Platform Analytics dashboards and can be accessed through scripts.

Table	Description
par_automated_kpi_promin_project	Stores references to Process Mining maps that are on Platform Analytics dashboards.
par_computed_insight	Contains all standard proactive analytics insights
par_custom_insight_content	Contains all custom-built proactive analytics insights
par_dashboard	Contains all dashboards in the dashboard library. Technical dashboards can be identified by belonging to the Advanced Dashboards experience. Extends sys_metadata.
par_dashboard_cache	Stores all changes to Platform Analytics dashboard layouts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
par_dashboard_canvas	Stores the names, descriptions, and layouts of Platform Analytics dashboards and dashboard tabs. Extends sys_metadata.
par_dashboard_config	Contains the macroponent definitions for each type of data visualization that you can create inside a dashboard. Extends sys_metadata.
par_dashboard_filter	Lists all filters on Platform Analytics dashboards and the name of the dashboard.
par_dashboard_permission	Contains the role, group, and user permissions for all dashboards in the dashboard library. Extends sys_metadata.
par_dashboard_tab	Contains the name, domain, application scope, and parent dashboard of all Platform Analytics dashboard tabs. Extends sys_metadata.
par_dashboard_user_metadata	Contains all options set by a dashboard viewer that persist between that viewer's user sessions. Extends sys_metadata.
par_dashboard_visibility	Cross-references all dashboards in the library by which experiences and workspaces contain them. Extends sys_metadata.
par_dashboard_widget	Cross-references all components that appear on dashboards by the dashboard canvas and the library component, if any. Extends sys_metadata.
par_dashboard_widget_group	Contains the configuration for a set of grouped widgets including name, coordinates, and color properties for border and background.
par_dashboard_widget_group_mapping	Contains a mapping of elements in a widget group to those elements. Group this table by Elements Group to see the widgets in each group clearly.
par_export	Lists all scheduled dashboard and data visualization exports.
par_export_dashboard	Stores the export details of all scheduled dashboard exports. Extends par_export.
par_export_job	Stores details of every attempt to export a dashboard or data visualization.
par_indicator_model	Contains recommendations related to Performance Analytics analytics in proactive analytics insights.
par_insight_user_actions	Stores actions that viewers took on proactive analytics insights.
par_notification	Lists email notification definitions of scheduled dashboard and data visualization exports.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
par_notification_email	Stores subject line and message body of scheduled dashboard and data visualization export emails. Extends par_notification.
par_notification_email_recipients	Stores groups and users who receive a notification email with a scheduled dashboard and data visualization export.
par_recommendation	Stores recommendations of Process Mining projects to create. These recommendations are given through Process Mining insights.
par_recommendation_user_action	Stores whether users accepted or dismissed a Process Mining insight recommendation.

Dashboard terms

Dashboards in Platform Analytics and the classic environment use terms that describe how data is organized, displayed, and shared.

bookmark

A saved reference to a dashboard that you can access quickly from the Dashboards library. Bookmarked dashboards appear in a dedicated list in the library overview.

category

A label assigned to one or more dashboards to support searching and filtering in the Dashboards library. Users with the analytics_categories_admin role create and manage categories. Dashboard owners apply categories to their dashboards.

certification badge

An indicator on a dashboard that shows the dashboard is company-approved and recommended for use. Only users with the admin or dashboard_admin role can certify a dashboard.

dashboard

A canvas for organizing and sharing data visually. Dashboards contain data visualizations, filters, and other visual elements. Users can share dashboards with other users, groups, or roles to create a shared view of data.

data visualization

A graphic representation of table, indicator, or other instance data placed on a Platform Analytics dashboard. Data visualizations replace reports and Performance Analytics widgets from the Core UI. Types include bar charts, dial charts, gauge charts, geomaps, heatmaps, pivot tables, single scores, and time series charts.

element

A visual object placed on a Platform Analytics dashboard. Elements include data visualizations, dividers, filters, filter groups, headings, images, lists, Now Assist Context Menus, Process Mining maps, rich text, workbenches, and funnels.

filter

A dashboard element that narrows the data shown in visualizations based on specified criteria. Filters can be placed on individual tabs or above the tabs so they apply to all tabs. Filter types include data filters and domain filters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

filter group

A set of filters that can be applied simultaneously to multiple visualizations on a dashboard. Use a filter group when multiple filters apply to multiple visualizations.

inline editor

The built-in dashboard editing tool in Platform Analytics. The inline editor enables users with edit rights to add, resize, and rearrange elements directly on the dashboard canvas without leaving the dashboard view.

library

The central location in Platform Analytics where users access dashboards, data visualizations, and indicators. The library shows all content the user has permission to view, including content they own, content shared with them, and bookmarked content.

tab

A named section within a dashboard used to organize related content. A dashboard can have multiple tabs. Filters placed above the tabs apply to all tabs, while filters placed on a tab apply only to that tab's content.

top stage

The area of a tabbed dashboard that is visible regardless of which tab is active. Elements placed in the top stage, including filters, apply to content on all tabs.

widget

An object added to a Core UI dashboard. Widget types include reports, Performance Analytics visualizations, interactive filters, and content blocks. Widgets are not available on Platform Analytics dashboards; on migrated dashboards, widgets are displayed in iframes.

Data visualizations in Platform Analytics

Data Visualizations use graphics to show table, indicator, and other data. They combine and extend the functions of reports and Performance Analytics widgets from the Core UI, which they replace in Platform Analytics.

Important: You cannot place reports or Performance Analytics widgets on a Platform Analytics dashboard. You must create data visualizations instead.

https://player.vimeo.com/video/1125354918?h=26cf18fff5&badge=0&autopause=0&player_id=0&app_id=58479

To access data visualizations, navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**. Owners of a data visualization can access and share that visualization. Users whom the owner has shared a visualization with can access that visualization. Any user with access to data can create a data visualization based on that data.

Exploring the Data Visualizations library

Find any data visualization in the Platform Analytics Data Visualizations library so that you can share information about your data with stakeholders and other users to evaluate the trends with real-time data. With the appropriate role, you can also create a visualization.

Data Visualizations Library overview

On Zurich instances, you can find both Core UI reports and Platform Analytics experience data visualizations in the Data Visualizations library.

When you edit Core UI dashboards and their content, you do so in the Core UI tools including Report Designer. For more information, see Reporting, dashboards, and Performance Analytics in the Core UI and Using reporting

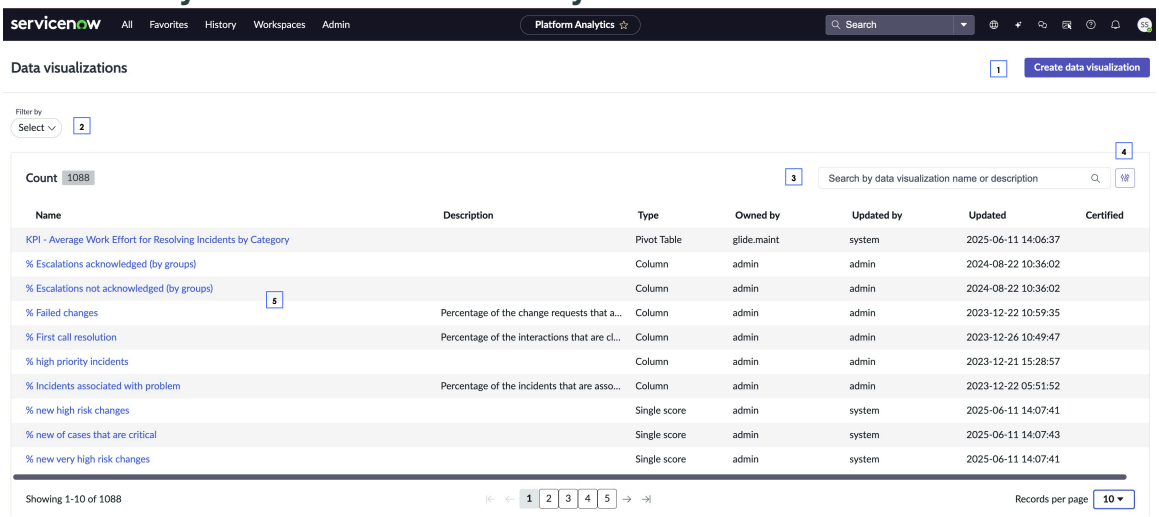
To open the data visualizations library, navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Visualizations library elements

The following example shows the Data Visualizations library elements.

Platform Analytics Data Visualizations library features



The following table lists the Data Visualizations library elements. Refer to the numbered call-outs in the image and their descriptions in the table.

Data Visualizations library elements

No.	Field (or) Element name	Description
1	**Create data visualization**	Option to create data visualizations.
2	**Filter by**	Option for filtering the data visualizations list to display the data based on the following predefined conditions: • **Bookmarked**. Your bookmarked visualizations. Bookmark any data visualization that you have access to so that you can find it easily. To bookmark a visualization, see Bookmark a visualization in the Visualization Designer. • **Certified**Visualizations that an administrator has certified. To certify a data visualization, see Certify a data visualization in the Visualization Designer. • **Owned by me**. Visualizations that you own or you created. • **Shared with me**. Visualizations that have been shared with you as a user, member of a group, or role. To share a data visualization, see Share a data visualization in the Visualization Designer.
3	**Search**	Search box with a list filter to filter the list of data visualizations by name or description. For example, by searching the word Data, you can see the list of visualizations that contain Data in the Name or Description columns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Visualizations library elements (continued)

No.	Field (or) Element name	Description
4	**Personalize List**	Option to add or remove columns in the data visualizations list ( ).
5	**Data visualization List**	List of all data visualizations. You can personalize and also sort the list by Name, Description, Views, and Certified.

Creating data visualizations

See how to create data visualizations using different data sources.

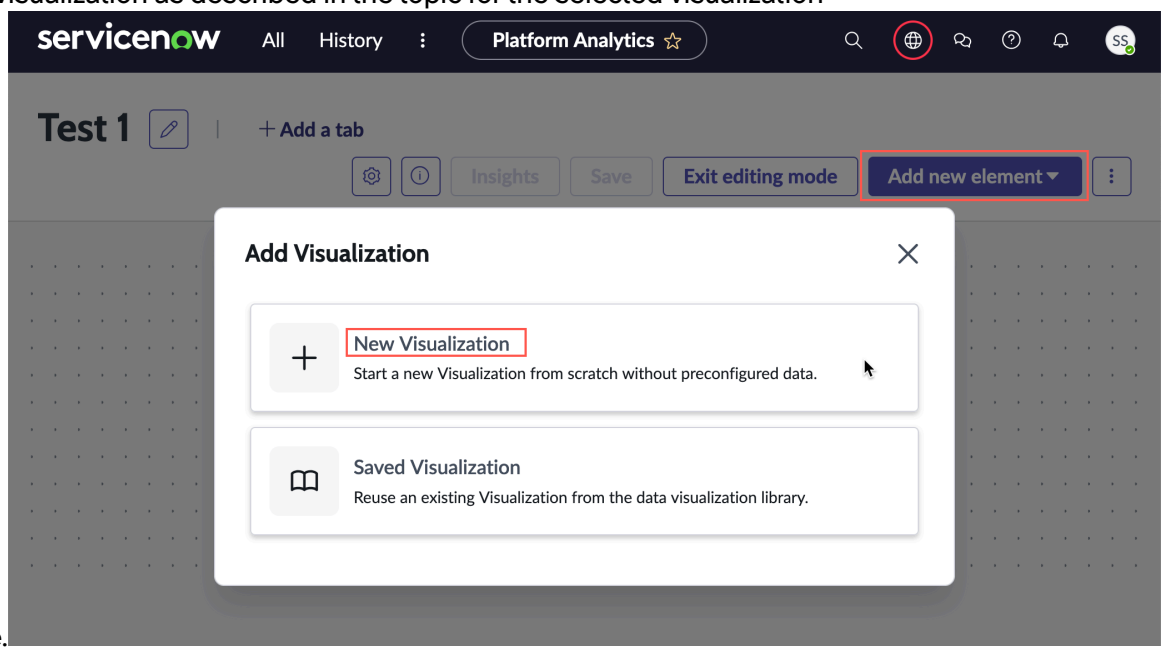
https://player.vimeo.com/video/1056788508?h=5ed0de97fd&badge=0&autopause=0&player_id=0&app_id=58479

Note: In the Zurichrelease, visualizations are based on Highcharts version 10.3.3.

Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

Creating data visualizations in a dashboard editor

To create a data visualization from a dashboard, select **Add new element** and then choose **New visualization**. You can then configure the visualization as described in the topic for the selected visualization type.



Creating data visualizations in the Visualization Designer

To create data visualizations in the Visualization Designer, navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations** and select **New**. You can then configure the visualization as described in the topic for the selected visualization type.

Instructions for creating data visualizations by type

Overview of data visualization types

When you create a data visualization, you select the type of visualization to display. Each visualization type is suited to show different data.

Score visualizations

This type of data visualization shows a single value or score as a number or percentage. Scores are often used to show how a particular value or metric compares to a target or benchmark. They can be useful for tracking progress or identifying areas for improvement, for example showing a company's or division's overall performance.

Visualization	Description
Single score visualization	Single-score visualizations display a single aggregate value that is important to your business. Single score data visualization example
Dial visualization	Dial visualizations show where a single value lies across a range from minimum to maximum expected values. Visually, a "needle" points to the value, and the dial is colored in for values up to the needle. Dial visualization example
Gauge visualization	Like dials, gauges show where a single value lies across a range from minimum to maximum expected values. In addition to dial functionality, you can set colored data ranges to help users understand what the value represents. Gauge visualization example

Time series visualizations

Time Series visualizations show data over time. All time series visualization types share configuration options. They differ in use case, depending on whether you want to emphasize data trends or the differences between individual data points. For more information about these use cases, see Create time series data visualizations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: In addition to data from within your instances and imported data sources, you can also use MetricBase data in time series visualizations. For more information, see MetricBase application.

Time series visualization types

Visualization	Description and use case
Visualizing trends in a data source	
Line	Shows how one or more values change over time by connecting a series of data points with straight lines. Use a line visualization to emphasize the trend in the data. Consider line visualizations to be the default choice for showing a time series. If you're unsure of which visualization to use, use a line.
Spline	Shows how one or more values change over time by connecting a series of data points with a fitted curve. The curve emphasizes the trend over individual data points. Spline visualizations let you take a limited set of known data points and approximate intervening values.
Scatter	Shows unconnected points for values in the Y-axis against time in the X-axis. Usually the trend line is also shown. Use with a spread of data that can't be usefully connected with a line.
Comparing scores in a data source	
Column	Shows changes in data over time by showing values as proportional vertical columns. Use either to visualize changes in one data source or to compare data sources. To compare data sources with a column visualization, either add data sources to the visualization, or place several column visualizations next to each other in a dashboard.
Step	Emphasizes changes in a data source between discreet points in time. Use to show small incremental changes, especially when a line visualization smudges the data.
Comparing scores or trends between data sources	
Area	Resembles a line visualization, but the area between the axis and line is emphasized with colors. Use with multiple data sources to highlight the relative contribution that each data source makes to the whole.

Bar visualizations

Bar visualizations enable you to compare scores across data dimensions. Horizontal and vertical bar visualization types are available. They share all configuration options. In general, use horizontal bars for nominal or categorical data. Use vertical bars for ordinal or sequential data. Use different colors or patterns to distinguish different groups or categories. For more information, see Create a horizontal or vertical bar data visualization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Visualization	Description
Horizontal bar visualization	Bar visualizations show categories labeled on one axis and values on the other. Use vertical bars to compare ordinal data, especially when there aren't too many categories, such as sales numbers grouped into buckets. Use horizontal bar charts with nominal data, such as incident severity or assignment group. • Horizontal bar visualization example • Vertical bar visualization example Pareto bar visualizations help you identify the most important dimension in a large set of dimensions. Columns show data in descending order. A line shows cumulative percentage. Pareto visualizations contain both bar and line graphs. The bars display the data in descending order from left to right, and the line graph shows the cumulative totals from each category in the same order. The left Y axis is the record count, and the right Y axis is the cumulative percentage of the total number of records evaluated.
Vertical bar visualization	
Pareto bar visualization	

Pie and Donut visualizations

Pie and donut visualizations show the relationship between parts and the whole of a data set. The segments of these visualizations should total to 100%. For more information, see Create a pie or donut data visualization.

Visualization	Description
Pie visualizations	Pie visualizations are best when comparing 5–7 segments that total 100%, when no two segments have a value within 10% of each other. Donut visualizations are best for comparing no more than five segments that total 100%, when no two segments have a value within 10% of each other. The center of the donut can be used to show additional information. Semi-donut visualizations are best for comparing no more than four segments that total 100%, when no two segments have a value within 10% of each other. • Pie visualization example • Donut visualization example
Donut visualizations	
Semi-donut visualizations	

Multidimensional charts

Multidimensional visualizations enable you to show multiple variables in a single chart, and it can be useful for showing the relationships between different variables. They are useful when you have a lot of data, and you want to find patterns or trends that might not be immediately obvious. They're also good to use when you want to show the relationship between three or more variables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Visualization	Description
Pivot table visualization	Pivot tables allow for several kinds of aggregation between its fields. You can also filter the data. The columns represent one field or breakdown, while a hierarchy of rows represents multiple other fields or breakdowns. Pivot visualization example
Heatmap visualization	Heatmaps show the relationship between two table fields or indicator breakdowns. The changes in color as you move along the axes reveal patterns in the value of one or both fields/breakdowns. Heatmap visualization example
Bubble chart visualization	Bubble charts are circles of different sizes along an x-y axis. The x and y axes represent different numeric fields, such as values or amounts. Use the relative size and position of the circles to compare fields and see their relationships. You can also group the data by a third field, which can be qualitative. The third field is differentiated by color. Use bubble charts to answer binary questions, such as whether two fields have a relationship, and to highlight patterns. Bubble data visualization example

Other visualizations

Data visualizations can also show calendars, simple lists, indicator scorecards, and location.

Visualization	Description
Calendar report visualization	Displays data-driven events in a calendar format.
Indicator scorecard	The Indicator scorecard component enables you to visualize and compare data between multiple Performance Analytics indicators. #unique_242
List	Shows a list of table records.
Box plot	Use a box plot to show the median and lower and upper quartiles of numeric data along with outliers. You can also compare the distribution of different groups of this data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Visualization	Description
Geomap	Displays data by country, state, or city. Users can use table data that contains location information to visualize in the chart.

Create a single score data visualization

Use a single score to show a value as a number or percentage. Visualize how the value compares to a target or benchmark, to track progress, or to identify areas for improvement.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

For information about the use of a Single Score visualization in a dashboard, see the Developer Site. This site gives information about Single score data visualization components in the UI Builder, and some configuration options may differ from the Visualization Designer.

Note: Workflow Data Fabric sources do not support real-time update on single score, dial, and gauge visualizations.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select **Create data visualization**.
3. Select the Single score ( ) visualization type.
4. Configure the **Header and border**. Header and border options are the same for all data sources.

Header and border fields	Description
Show header	The visualization header, including title and icons.
Show header separator	Option to display a line separating the header from the rest of the component.
Chart title	Title of the visualization.
Description	A short overview about the visualization that the end user sees. Descriptions help users find the visualization.
Wrap title	Option to wrap long titles onto a second line. If false, displays an ellipsis to truncate long titles.
Wrap labels	Select to wrap long elements labels on the axis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header and border fields	Description
Max label size, px	Specify the maximum label size for element names on the axis. Default=100 px.
Truncation type	Specify where to truncate long labels with an ellipsis. Options are Beginning, Middle, and End.
Show border	Option to display a line around the component.
Bare	Option to remove padding around data visualization to provide more compact positioning on the page. Only available when **Show border** is turned off.
Show refresh option	Option to show or hide the refresh option from data visualizations. If cache is enabled on a dashboard, the Refresh option is always hidden.
Show export options	Option to show or hide the visualization's export types.
Header background color	Specify the color behind the title of the visualization.
Title color	Specify the text color of the title. The default title color is black, but you can choose a color that contrasts better with the header background. Only available when **Header background color** is selected.

5. Choose a data source.
   For general descriptions of the data sources, see Data sources for data visualizations.

   - Table (available in the base system). When you select a table, you can filter it by custom or preconfigured conditions. Custom conditions can include questions or Service Catalog variables.

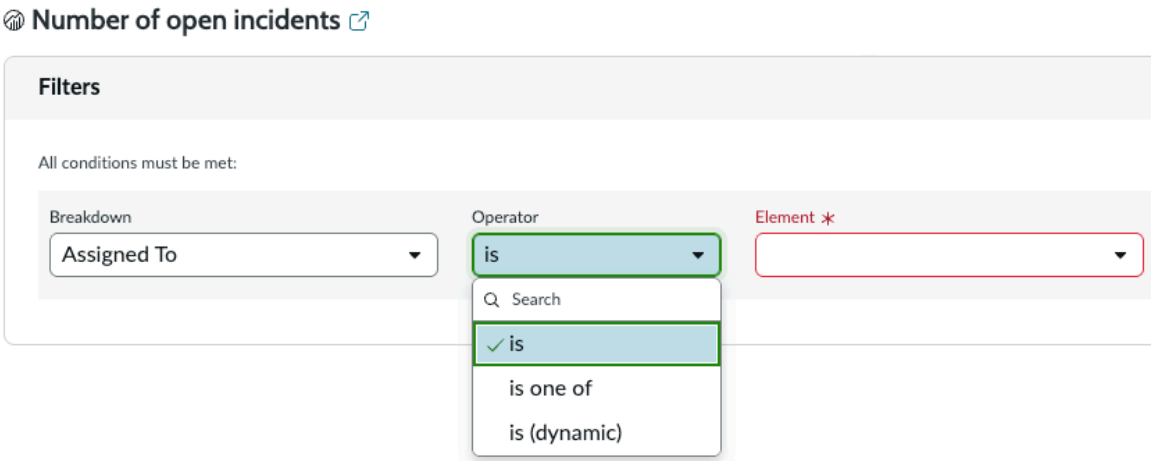
     Configured report sources appear in the **Predefined conditions** list. For more information, see Report sources.

     To help you create a custom filter, there is a preview list of records that would be included in the visualization. You can change which fields are shown as columns and the width of columns in the list actions.

     
   - Indicator (available in the base system). You can filter the indicator scores by breakdowns and elements.

     Note: Benchmark indicators are not supported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:

You might have a multiple select (is one of) or dynamic (is (dynamic)) operator on the breakdown element filter. These operators require the indicator and breakdown to support them. For more information about the configurations that support these operators, see "Is one of" and "Is (Dynamic)" operators on breakdown conditions in data visualizations.

- Usage Insights (available with the User Experience PAR Integration application, to users with a required role). Choose one of up to three KPIs included with this application, depending on the visualization type. For more information, see User Experience Analytics data sources for data visualizations.

6. Select the options for your data source.
   - If your visualization represents table data, go to Table data options for single score visualizations.
   - If your visualization represents indicator data, go to Indicator data options for single score visualizations.
   - If your visualization represents Usage Insights data, go to Usage Insights data options for Single Score data visualizations.
7. Under **Presentation**, provide display and color information.

Field	Description
Display settings	
Score size	Sets the size of the score. Options include: ○ XS `xs` ○ S `sm` ○ M `md` ○ L `lg` ○ XL `xl` ○ XXL `xxl` ○ Auto `auto`: Size adjusts automatically between the preceding sizes depending on

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	the viewport size and the space available after all details have been added in the **Additional settings**.
Score icon	Select one of the icons provided with the design system to precede the score. Optional. **Note:** See https://developer.servicenow.com/dev.do#!/reference/next-experience/xanadu/now-components/now-icon/gallery for more information.
Icon style	Select "With background" to apply color to the background of the icon. Select "No background" to apply color to the icon itself.
Metric label position	Position for the metric label. Options include: ○ Above score `top` ○ Below score `bottom` This property applies only with table data sources and when **Show metric label** is true.
Sparkline style	Style of sparkline chart. Options include: ○ Area `area`: Option to display the sparkline as a line with the area between its points and the horizontal axis colored in. ○ Line `line`: Option to display the sparkline as a line. This property applies only with indicator data sources and when **Show sparkline** is true.
Colors	
Set color type	○ Default: A color or set of colors that come from the UX Theme that is applied to the instance. For more information, see Working with themes in Next Experience. ○ Single color/Colors per metric: Select a single color in the **Set value color** field. Interacting with that field opens a selector where you can choose the color from either a set of icons or from a list. You can also search for a color. Entering a search value has the selector show you a list of colors filtered by that search value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Alternatively, you can add a rule to define a dynamic color. For more information, see Create coloring rules for data visualizations.

8. Under **Chart interaction**, set what if anything happens when a viewer clicks a chart or a chart segment on the visualization.

Chart interactions

Field	Description
Allow chart interaction	Enable an event to occur when a user clicks in a visualization or one of its segments.
Action	Choose the event that occurs when a user clicks in a visualization or one of its segments. Choices depend on the visualization type and data source. Applies only when **Allow chart interaction** is on. For more information, see Chart interactions in a data visualization. ○ **Go to data view** opens a list view, KPI Details page, or Usage Insights overview page relevant to the associated segment or visualization. For table data, a system property determines whether a Core UI list or a Platform Analytics list opens. For more information, see Data views for different data sources. ○ **Go to URL** opens the specified URL, which can be on the instance or external. You have the option of specifying a page name to appear in the tooltip, for those visualizations with tooltips. ○ **Drill down to chart** (Visualization Designer only) Opens a different data visualization that is filtered by the selected data. You can add a drill-down visualization for each metric on the parent visualization. **Note:** The last level of drill down in the Platform Analytics experience is always a Core UI list. Records do not open in Workspace embedded lists. **Drill down to chart** supports only table data sources.

9. Select **Save** to continue editing the visualization, or **Save and close** to return to the Analytics Center main screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Add a visualization to a dashboard from the Visualization Designer
- Share a data visualization in the Visualization Designer
- Bookmark a visualization in the Visualization Designer

Table data options for single score visualizations

When you select a table data source for a single score visualization, the following Data configuration options are available.

Field	Description
Data	
Data source	You have selected a Table data source in Create a single score data visualization.
Metric	
Label	Label of the metric. By default it is the same as the name of the data source.
Select an aggregation	Computational method for aggregating data. The default is **Count**, which displays the number of records selected. **Note:** If you select **Count Distinct**, only unique records are counted. For example, you want to generate a report with a distinct number of users who have one or more of the roles in a given list of roles. Users with more than one role would be counted twice unless you use **Count Distinct**.
Field	Field to apply the metric to, for **Average**, **Sum**, or **Count Distinct** aggregations. You may further be able to aggregate on fields from extended tables. The data is shown in a format that matches the field type. For example, if you select an integer field, such as the **Priority** field, the data is expressed as a number. If you select a duration field, such as **Business duration** on the Incident table, the aggregated data is expressed in days, hours, and minutes. If function fields were created in Report Designer for the table, they are available in the dropdown list. For more information, see Report on function fields.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Additional settings	
Show metric label	Option to show the metric label. In donut charts, the value is not shown if it cannot fit the donut.
Show score update time	Option to display the time of the last update.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Use relative score time	Available if Show score update time is selected. Select to show how long ago the score was last updated.
Show 0 when no data is available	When toggled on, shows empty (NULL) values as zero (0). Default is true.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Real-time update	Option to update score in real time. If you enable both real-time update and data caching, real-time update overrides data caching. **Note:** • When a condition is dot-walked to another table, high traffic on the table suspends real-time data updates. • For tables, real-time updating supports only COUNT data aggregations. • Real-time updating is not supported on single score, dial, and gauge visualizations based on remote tables or Workflow Data Fabric tables.
No data message This section is not available when **Show zero** is on. Zero is then the no data message.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Indicator data options for single score visualizations

When you select an indicator data source for a single score visualization, the following Data configuration options are available.

Field	Description
Data	
Data source	You have selected an Indicator data source in Create a single score data visualization.
Metric	
Label	Label of the metric. By default it is the same as the name of the data source.
Time aggregation	Time aggregation to apply to the metric, such as 7-day running SUM or By-month AVG. Default is the same as the indicator period. For more information, see Applying time series aggregations.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Date range	
Apply date range	When turned on, this option allows date filters on the dashboard or UIB page to apply to this visualization. The date range can also be configured in the visualization, but date filters override visualization settings.
Show data for selected period as	Available when **Apply date range** is selected. The indicator aggregation logic for how scores from the selected period are shown, such as Latest score, Sum, or Average.
Set absolute period	Option to set absolute start and end date. Available when **Apply date range** is selected.
Period start	Start date for the absolute period. This property applies only when **Set absolute period** is true.
Period end	End date for the absolute period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This property applies only when **Set absolute period** is true. Select **Use current date for period end** to automatically update the end date to the current date. (Not available if the start date is in the future.)
Period	Time interval for each date period. • Days `D` • Months `M` • Years `Y` This property applies only when **Set absolute period** is false.
Number of periods	Number of date periods to display. This property applies only when **Set absolute period** is true.
Additional settings	
Show metric label	Option to show the metric label. In donut charts, the value is not shown if it cannot fit the donut.
Show change	Displays the change compared to the previous score or period.
Show change %	Displays the change percentage compared to the previous score or period.
Show change from	Shows the change from a previous value, the previous aggregate period, or the value at the start of the period.
Show target	If it is defined for the indicator, displays the global target value.
Show gap %	Displays the percentage difference between the current value and the target.
Show sparkline	Displays a line graph representing the change over time.
Show score date	Display the date of the score.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter

Field	Description
	is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Real-time update	Option to update score in real time. **Note:** • This setting is available for automated, non-scripted indicators with a non-scripted breakdown mapping. • Real-time score updating does not support MIN, MAX, or COUNT DISTINCT aggregations.
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Usage Insights data options for Single Score data visualizations

When you select a Usage Insights data source for a single score visualization, the following Data configuration options are available.

Note: If you add a Platform Analytics data visualization with Usage Insights (UXA) data to an inline dashboard, the default drilldown for that data visualization is to open the corresponding UXA analytics page. This feature provides a quick and efficient way to drill down and explore specific user behavior from your Platform Analytics dashboard.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Data	
Data source	You have selected a Usage Insights data source in Create a single score data visualization.
Metric	
Metric	Label of the metric. By default it is the same as the name of the data source: Events or Sessions. For sessions, you can configure the metric to reflect the number of sessions, average session duration, average pages per session, or average sessions per user.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Date range	
Show data for selected period as	Available when **Apply date range** is selected. The indicator aggregation logic for how scores from the selected period are shown, such as Latest score, Sum, or Average.
Show maximum range	Option to show the maximum range of available dates.
Set absolute period	Option to set absolute start and end date. Available when **Apply date range** is selected.
Period start	Start date for the absolute period. This property applies only when **Set absolute period** is true.
Period end	End date for the absolute period. This property applies only when **Set absolute period** is true. Select **Use current date for period end** to automatically update the end date to the current date. (Not available if the start date is in the future.)
Period	Time interval for each date period. • Days D • Months M • Years Y This property applies only when **Set absolute period** is false.
Number of periods	Number of date periods to display. This property applies only when **Set absolute period** is true.
Additional settings	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Show metric label	Option to show the metric label. In donut charts, the value is not shown if it cannot fit the donut.
Show 0 when no data is available	When toggled on, shows empty (NULL) values as zero (0). Default is false. When true, the **No data message** section is not available, because the no data message is 0.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
No data message This section is not available when **Show zero** is on. Zero is then the no data message.	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Single score data visualization example

Use a single score visualization when you want to show a single value or metric, such as overall revenue or number of open incidents. The basic score visualizes a single value with a descriptive heading and date/timestamp.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

Single score visualizations have the advantage that you can color code them to show if the value is good for your business or requires improvement. For example, the number of open incidents is a value you want to keep low. Revenue, on the other hand, you want to be high. Let's create a single score for open incidents.

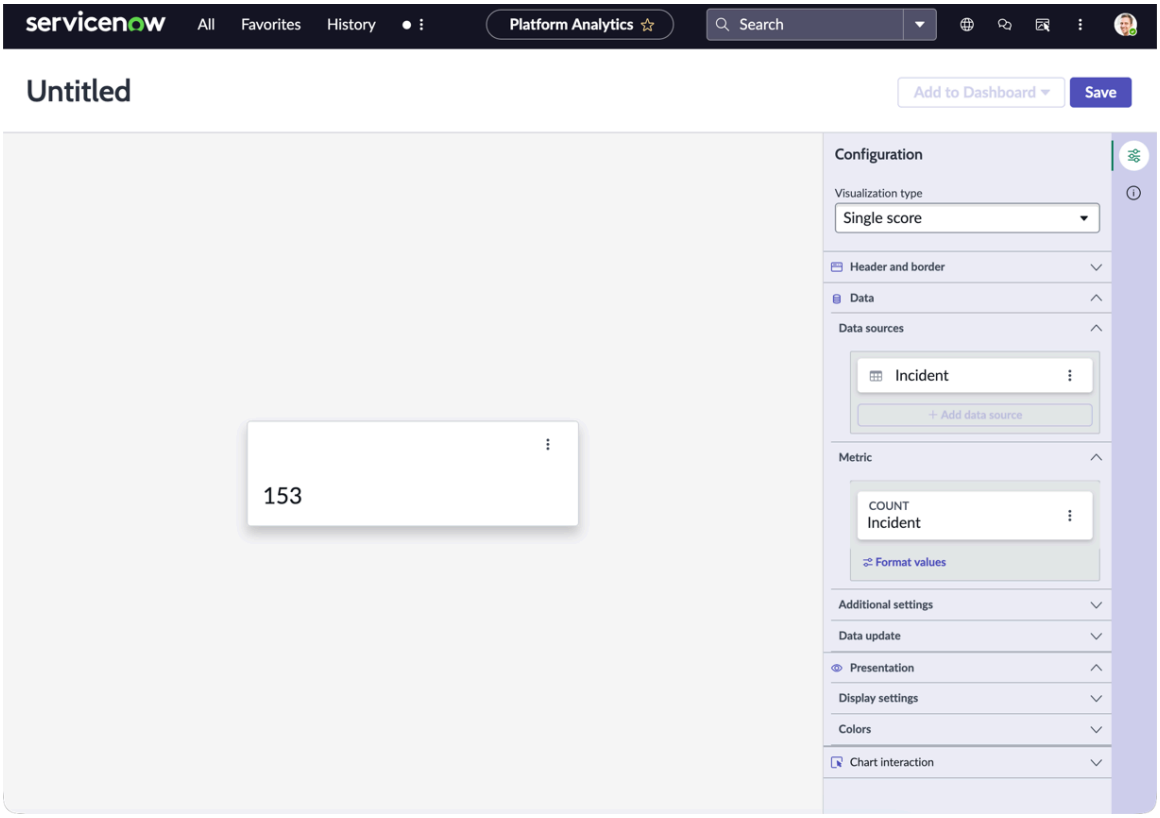
In this example, you create a single score visualization that shows the number of open incidents and color code the visualization to highlight the value's desirability.

Procedure

1. Follow the first steps to Create a single score data visualization:
   a. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
   b. Select **Create data visualization**.
   c. From the Scores section, select the Single score visualization type.
2. For the moment, skip the header and border section and move to the data source.
   a. Select **Add data source**.
   b. Choose the Incident [incident] table.
   c. Because this visualization shows open incidents, let's add the Incidents.Open condition in the Filters section.
   With this filter selected, the visualization only shows the number of active incidents.
   d. **Optional:** Select **Run** to preview the records that the visualization will be based on.
   e. Select **Add this source**.

   A single score data visualization with the current value of the selected data appears in the Visualization Designer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Now that you can see the visualization, let's add some context for the user.

   a. Expand the Header and border section.

   b. Select **Show header** and provide the title `Number of open incidents`.
   When **Show header** is selected, you can add a title and a description. The chart title isn't necessarily the same as the visualization name. The visualization name identifies it in the Visualization Designer and in a list. The chart title appears within the visualization.

   c. Enter a description of the visualization: `Number of open incidents of all priorities and categories`.
   While the description and title fields aren't required, this information makes the visualization easier to understand on a dashboard and easier to identify in a list.

4. Skip over the Metric section.
   Some data visualizations support multiple data sources, but the single score visualization doesn’t. Because we only want to see the number of open incidents, you don't need to change the default metric, Count, or its label, Incident.

5. Under Additional settings, configure some extra information about the visualization.

   a. Leave the **Show metric label** unselected.
   Because the name of the visualization is `Number of open incidents`, the metric label, Incident, is redundant.

   b. Select **Show score update time**.
   Alone, this option shows the time of day the score was last updated. You can also select Use relative score time to show the elapsed time since the last update, for example just now, five minutes ago, and so on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Show zero**.
In some cases, a value of zero isn't interesting to the audience of a visualization. In this case, however, you want to show off having zero open incidents.

6. Under Data update, configure how the audience interacts with the visualization.

a. Select **Follow filters**.
This option enables the visualization to follow interactive filters on the dashboards it's placed on that are based on the same table.

b. Select **Show filter icon** to show the number of filters applied to the visualization.
For example, if dashboard filters limit the value of the visualization, the icon indicates that you're seeing the number of open incidents that match the filters. You can then check to see which filters are in effect.

c. Select **Enable drilldown** to let viewers navigate to relevant information by selecting a data point in the chart.
Some visualizations only drill down to the list of associated data. Table data is generally restricted by access control lists (ACLs) and viewers may not see all of the associated records.

This control mirrors **Allow chart interaction**. Under Chart Interaction, you can also select the destination of drilling down.

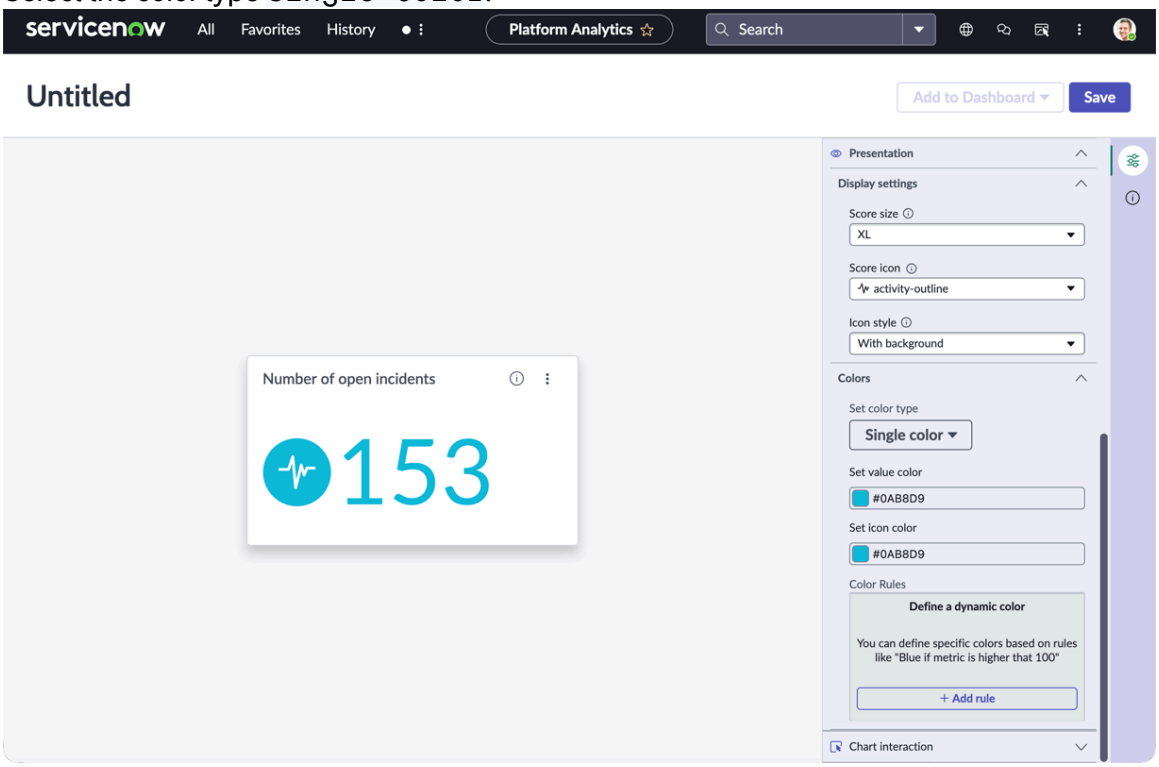
7. Under Presentation, configure the size and base color of the score value.

a. Under Display settings, change the score size from the default AUTO to XL (extra large) to emphasize it.

b. Choose a Score icon and an icon style to distinguish this data visualization from others on the dashboard you add it to.
For example, select the Activity Outline icon with background.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select the color type `Single color`.



8. Configure a color rule for the score.
Because you want to emphasize the state of open incidents, define a dynamic color rule that changes the score's color based on its value.

a. In the Display settings, choose the `Single color` color type.

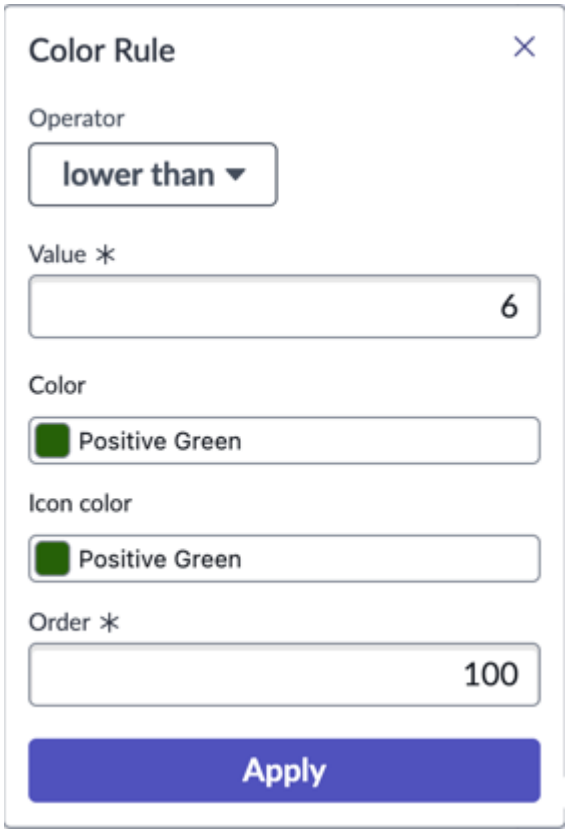
b. Under Color Rules, select **+ Add rule**.

c. For the first color rule, choose the **Operator** `lower than`, enter the **Value** `6`, and choose the color `Positive Green` for both the color and the icon color, and select **Apply**.

The value is up to the specified number but not including it.

Retain the order 100.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



d. To indicate a value that requires more attention, create a second rule with the **Operator** `between`, the values `5` and `25`, the color and icon color `Warning Orange`, and the order `50`.

e. To show values that require the highest attention, create a third rule with the **Operator** `greater than`, the value `25`, the color and icon color `Critical Red`, and the order `25`.

You've created three rules to show whether the single score value is in line with what you want to see.

9. Select **Save**.

Result

You have created a single score visualization based on a single metric, open incidents. You have also configured user options regarding filters and drilldowns, and configured a color, an icon, and coloring rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a box plot data visualization

Use a box plot to show the median and lower and upper quartiles of numeric data along with outliers. You can also compare the distribution of different groups of this data.

Before you begin

Important: The box plot visualization is included in the latest data visualizations application from the ServiceNow® Store.

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

The Box Plot visualization only supports table data. Indicator, MetricBase, and Usage Insights data is not supported.

For information about the use of a Box plot visualization in a dashboard, see the Developer Site. This site gives information about Box plot components in the UI Builder, and some configuration options may differ from the Visualization Designer.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select **Create data visualization**.
3. Select the Box Plot ( ) visualization type.
4. Configure the **Header and border**. Header and border options are the same for all data sources.

Header and border fields	Description
Show header	The visualization header, including title and icons.
Show header separator	Option to display a line separating the header from the rest of the component.
Chart title	Title of the visualization.
Description	A short overview about the visualization that the end user sees. Descriptions help users find the visualization.
Wrap title	Option to wrap long titles onto a second line. If false, displays an ellipsis to truncate long titles.
Wrap labels	Select to wrap long elements labels on the axis.
Max label size, px	Specify the maximum label size for element names on the axis. Default=100 px.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header and border fields	Description
Truncation type	Specify where to truncate long labels with an ellipsis. Options are Beginning, Middle, and End.
Show border	Option to display a line around the component.
Bare	Option to remove padding around data visualization to provide more compact positioning on the page. Only available when **Show border** is turned off.
Show refresh option	Option to show or hide the refresh option from data visualizations. If cache is enabled on a dashboard, the Refresh option is always hidden.
Show export options	Option to show or hide the visualization's export types.
Header background color	Specify the color behind the title of the visualization.
Title color	Specify the text color of the title. The default title color is black, but you can choose a color that contrasts better with the header background. Only available when **Header background color** is selected.

5. Open the Data Source selector and select a table.
6. Configure the data settings as described in Table data options for box plot visualizations.
7. Under **Presentation**, provide display and color information..

Field	Description
Display settings	
Y axis	
Hide axis	Option to hide the primary axis.
Primary axis title	Title to display on the vertical axis of the visualization. This property applies only when **Hide primary axis** is false. If there is more than one Y-axis, you have additional axis titles, representing the properties yAxis1Title, yAxis2Title, etc. Add a Y-axis scale for a metric in the **More options** menu for the metric.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Axis range - from	Starting point for the values on the primary axis.
Axis range - to	End point for the values on the primary axis.
Axis position	Position of the primary axis. Options include: ○ Left ○ Right This property applies only when **Hide axis** is false. If there is more than one primary axis, such as multiple Y axes on a vertical bar visualization, you can set each axis position separately.
Show grid	Shows a grid of fine lines perpendicular to the primary axis, to help align values against that axis.
Axis style	Style of the primary axis. ○ Clean `clean`: Adds a straight line to the primary axis. ○ No tick lines `noTicks`: Option to remove all marks from the primary axis. ○ Standard `default`: Adds a line and tick marks to the primary axis.
X axis	
X axis title	Title to display on the horizontal axis of the visualization.
Wrap labels	Select to wrap long elements labels on the axis.
Max label size, px	Specify the maximum label size for element names on the axis. Default=100 px.
Colors	
Set color type	○ Default: A color or set of colors that come from the UX Theme that is applied to the instance. For more information, see Working with themes in Next Experience. ○ Single color/Colors per metric: Select a single color in the **Set value color** field. Interacting with that field opens a selector where you can choose the color from either a set of icons or from a list. You can also search for a color. Entering a search value has the selector show you a list of colors filtered by that search value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Under **Chart interaction**, set what if anything happens when a viewer clicks a chart or a chart segment on the visualization.

Chart interactions

Field	Description
Allow chart interaction	Enable an event to occur when a user clicks in a visualization or one of its segments.
Action	Choose the event that occurs when a user clicks in a visualization or one of its segments. Choices depend on the visualization type and data source. Applies only when **Allow chart interaction** is on. For more information, see Chart interactions in a data visualization. ○ **Go to data view** opens a list view, KPI Details page, or Usage Insights overview page relevant to the associated segment or visualization. For table data, a system property determines whether a Core UI list or a Platform Analytics list opens. For more information, see Data views for different data sources. ○ **Go to URL** opens the specified URL, which can be on the instance or external. You have the option of specifying a page name to appear in the tooltip, for those visualizations with tooltips. ○ **Drill down to chart** (Visualization Designer only) Opens a different data visualization that is filtered by the selected data. You can add a drill-down visualization for each metric on the parent visualization. **Note:** The last level of drill down in the Platform Analytics experience is always a Core UI list. Records do not open in Workspace embedded lists. **Drill down to chart** supports only table data sources.

9. Select **Save** to continue editing the visualization, or **Save and close** to return to the Analytics Center main screen.

What to do next

- Add a visualization to a dashboard from the Visualization Designer
- Share a data visualization in the Visualization Designer
- Bookmark a visualization in the Visualization Designer

Table data options for box plot visualizations

When you select a table data source for a box plot visualization, the following Data configuration options are available.

Field	Description
Data	
Data source	You have selected a Table data source in Create a box plot data visualization.
Metric	
Label	Label of the metric. By default it is the same as the name of the data source.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Group by	
Field for [table]	The field to group by. For example, in a visualization of incident data grouped by **Assignment group**, all incidents that belong to Software, Service Desk, and Network are placed in separate groups. If the table contains variables or question fields, you have the option to group by one of them at the end of the list of fields. **Note:** • It is not possible to group or stack data by the **Tags** field, or by certain field types, such as MEDIUMTEXT. • If you want to group by a field with continuous values, such as date or integer, the values are automatically grouped according to any report ranges that are defined for the data. For more information, see Report ranges.
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the visualization may be grouped by. The viewer of the visualization can then select which of these items to group the data by. The viewer toggles the visibility of the selector in the visualization's More actions menu. In the additional items dialog, you can set whether this selector is visible by default by toggling **Selector visible by default**. If you select a value in **Group by**, that is the default group-by value. You do not have to select a **Group by** value to specify alternative group-by values. In this case, no default group-by value is used. For more information about setting alternative group-bys for multiple metrics, see Options for time series data visualizations with multiple metrics. For more information about the viewer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	experience selecting from alternative group-by values, see Select a group-by value in a data visualization as a viewer. **Important:** • Only up to three metrics on one visualization support alternative group-by. • Alternative group-by does not support data binding on the data source
Measured by	
Field for [table]	The numeric field from the table for the Y-axis. A viewer cannot substitute this field with an alternative group-by field.
Sorting	
Sort by	Sorting options of the main and alternative groups set in **Group by**. Options include: • Name: Sorts the values alphabetically by field or element name. • Value: Sorts the values numerically or by count. • Element order: If you are grouping by records on the Choice [sys_choice] table, either directly or through a breakdown, this option sorts the groups according to the value of the Sequence field. • Group bucket: Sorts the elements by bucket group, when applicable. Only available for indicator data sources and when the breakdown used for the **Group by** is based on a bucket group. • Report range: Sorts the table field values by range. Only available for table data sources and when the table field used for the **Group by** has a report range associated with it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • The choices of what to sort by are based on the main, default **Group by**, if one is defined. This sorting applies to any alternative group-bys if possible. If the sorting criterion selected for the main group-by cannot apply to an alternative group-by (such as sorting by Element order when the alternative group-by is not on the Choice table), sorting for that group-by defaults to Value. • If no main **Group by** has been set, but alternative group-bys are defined, you can sort only by Name or Value. • Sorting is not available for Pareto bar visualizations. Pareto charts are always sorted by value in descending order.
Sort by order	Ascending or descending. Limitations: • You can only order by the **Group By** or the **Stack by** field. • You can only order by one field. It is not possible to sort by Additional group by fields.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	entire dashboard, and applies only while that dashboard is open.
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Create a bubble data visualization in the Visualization Designer

Use bubble visualizations to show multiple separate metrics on a single visualization and to answer binary questions, such as whether two fields have a relationship, and to highlight patterns.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

For information about the use of a Bubble visualization in a dashboard, see the Developer Site. This site gives information about Bubble visualization components in the UI Builder, and some configuration options may differ from the Visualization Designer.

Bubble visualizations aggregate information over three different metrics, using the X axis, Y axis, and bubble size.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select **Create data visualization**.
3. Select the Bubble ( ) visualization type.
4. Configure the **Header and border**. Header and border options are the same for all data sources.

Header and border fields	Description
Show header	The visualization header, including title and icons.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header and border fields	Description
Show header separator	Option to display a line separating the header from the rest of the component.
Chart title	Title of the visualization.
Description	A short overview about the visualization that the end user sees. Descriptions help users find the visualization.
Wrap title	Option to wrap long titles onto a second line. If false, displays an ellipsis to truncate long titles.
Wrap labels	Select to wrap long elements labels on the axis.
Max label size, px	Specify the maximum label size for element names on the axis. Default=100 px.
Truncation type	Specify where to truncate long labels with an ellipsis. Options are Beginning, Middle, and End.
Show border	Option to display a line around the component.
Bare	Option to remove padding around data visualization to provide more compact positioning on the page. Only available when **Show border** is turned off.
Show refresh option	Option to show or hide the refresh option from data visualizations. If cache is enabled on a dashboard, the Refresh option is always hidden.
Show export options	Option to show or hide the visualization's export types.
Header background color	Specify the color behind the title of the visualization.
Title color	Specify the text color of the title. The default title color is black, but you can choose a color that contrasts better with the header background. Only available when **Header background color** is selected.

5. Choose a data source.
   For general descriptions of the data sources, see Data sources for data visualizations.

   You can choose one or more tables (available in the base system). When you select a table, you can filter it by conditions.

   Note: You can choose to define a data source manually in JSON. However, this method is intended only for experts.

6. Select the options for your data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Go to Table data options for bubble visualizations.

7. Under **Presentation**, provide display and color information. In the **Colors** section, configure the colors and color rules.

Field	Description
Show data table	Shows a table with chart and graph data for easier screen reader access. Data includes the percentage of the total for each value, when appropriate.
Show % of total in tooltip	Enable to show the percentage each data point contributes to the total alongside absolute values in the tooltip.
Show legend	Available when you configure a group by or have more than one metric. Select to display the legend.
Legend position	Legend location relative to the visualization: Above, Below, Right, or Left.
Set color type	○ Default: A color or set of colors that come from the UX Theme that is applied to the instance. For more information, see Working with themes in Next Experience. ○ Single color/Colors per metric: Select a single color in the **Set value color** field. Interacting with that field opens a selector where you can choose the color from either a set of icons or from a list. You can also search for a color. Entering a search value has the selector show you a list of colors filtered by that search value.

8. Under **Chart interaction**, set what if anything happens when a viewer clicks a chart or a chart segment on the visualization.

Field	Description
Allow chart interaction	Enable an event to occur when a user clicks in a visualization or one of its segments.
Action	Choose the event that occurs when a user clicks in a visualization or one of its segments. Choices depend on the visualization type and data source. Applies only when **Allow chart interaction** is on. For more information, see Chart interactions in a data visualization. ○ **Go to data view** opens a list view, KPI Details page, or Usage Insights overview page relevant to the associated segment or visualization. For table data, a system property determines whether a Core UI list

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	or a Platform Analytics list opens. For more information, see Data views for different data sources. ○ **Go to URL** opens the specified URL, which can be on the instance or external. You have the option of specifying a page name to appear in the tooltip, for those visualizations with tooltips. ○ **Drill down to chart** (Visualization Designer only) Opens a different data visualization that is filtered by the selected data. You can add a drill-down visualization for each metric on the parent visualization. **Note:** The last level of drill down in the Platform Analytics experience is always a Core UI list. Records do not open in Workspace embedded lists. **Drill down to chart** supports only table data sources.

9. Select **Save** to continue editing the visualization, or **Save and close** to return to the Analytics Center main screen.

What to do next

- Add a visualization to a dashboard from the Visualization Designer
- Select the More actions menu icon (⋮) to duplicate, share, export, schedule, or bookmark the visualization.

Table data options for bubble visualizations

When you select a table data source for a bubble visualization, the following Data configuration options are available.

Field	Description
Data	
Data source	You've selected a Table data source in Create a bubble data visualization in the Visualization Designer.
Metric	
Metric (bubble size)	Choose the computational method for aggregating data and the field that determines the size of bubbles in the visualization. The default aggregation is **Count**, which displays the number of records selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If you select **Count Distinct**, only unique records are counted. For example, you want to generate a report with a distinct number of users who have one or more of the roles in a given list of roles. Users with more than one role would be counted twice unless you use **Count Distinct**.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Only available when **Use custom formatting** is true
Dimensions	
Y axis	Numeric table field with values on the bubble chart's y-axis.
X axis	Numeric table field with values on the bubble chart's x-axis.
Group by	Any table field other than the x- and y-axes. Different groups are distinguished by bubble color.
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the visualization may be grouped by. The viewer of the visualization can then select which of these items to group the data by. The viewer toggles the visibility of the selector in the visualization's More actions menu. In the additional items dialog, you can set whether this selector is visible by default by toggling **Selector visible by default**. If you select a value in **Group by**, that is the default group-by value. You do not have to select a **Group by** value to specify alternative group-by values. In this case, no default group-by value is used. For more information about setting alternative group-bys for multiple metrics, see Options for time series data visualizations with multiple metrics. For more information about the viewer experience selecting from alternative group-by values, see Select a group-by value in a data visualization as a viewer. **Important:** • Only up to three metrics on one visualization support alternative group-by. • Alternative group-by does not support data binding on the data source
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
No data message This section is not available when **Show zero** is on. Zero is then the no data message.	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Bubble data visualization example

The bubble data visualization is used to do compare fields and see their relationships.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

Use a bubble visualization to show two ordinal fields, such as Priority and Age, as circles of different sizes along an x-y axis. Use the relative size and position of the circles to compare fields and see their relationships. You can also group the data by a third field, which can be qualitative. The third field is differentiated by color.

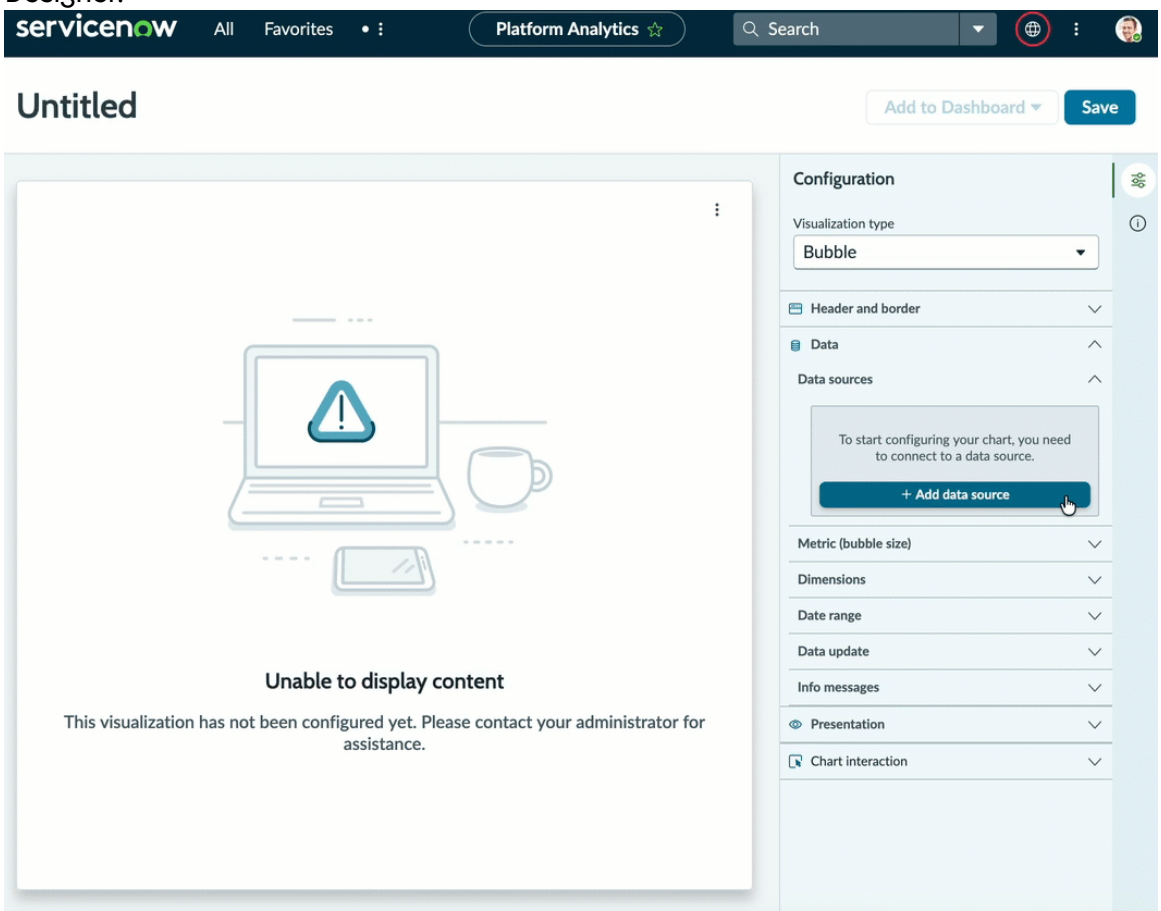
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this example, you create a bubble visualization that shows the number of open incidents and color code the visualization to highlight the value's desirability.

Procedure

1. Follow the first steps to Create a bubble data visualization in the Visualization Designer:
   a. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
   b. Select **Create data visualization**.
   c. Select the **Bubble** visualization type from Multidimensional charts.
2. For the moment, skip the header and border section and move to the data source.
   a. Select **Add data source**.
   b. Choose the Incident [incident] table.
   c. Because this visualization shows open incidents, let's add the Incidents.Open condition in the Filters section.
   With this filter selected, the visualization only shows the number of active incidents.
   d. **Optional:** Select **Run** to preview the records that the visualization will be based on.
   e. Select **Add this source**.

A bubble visualization with the current values of the selected data appears in the Visualization Designer.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Now that you can see the visualization, let's add some context for the user.

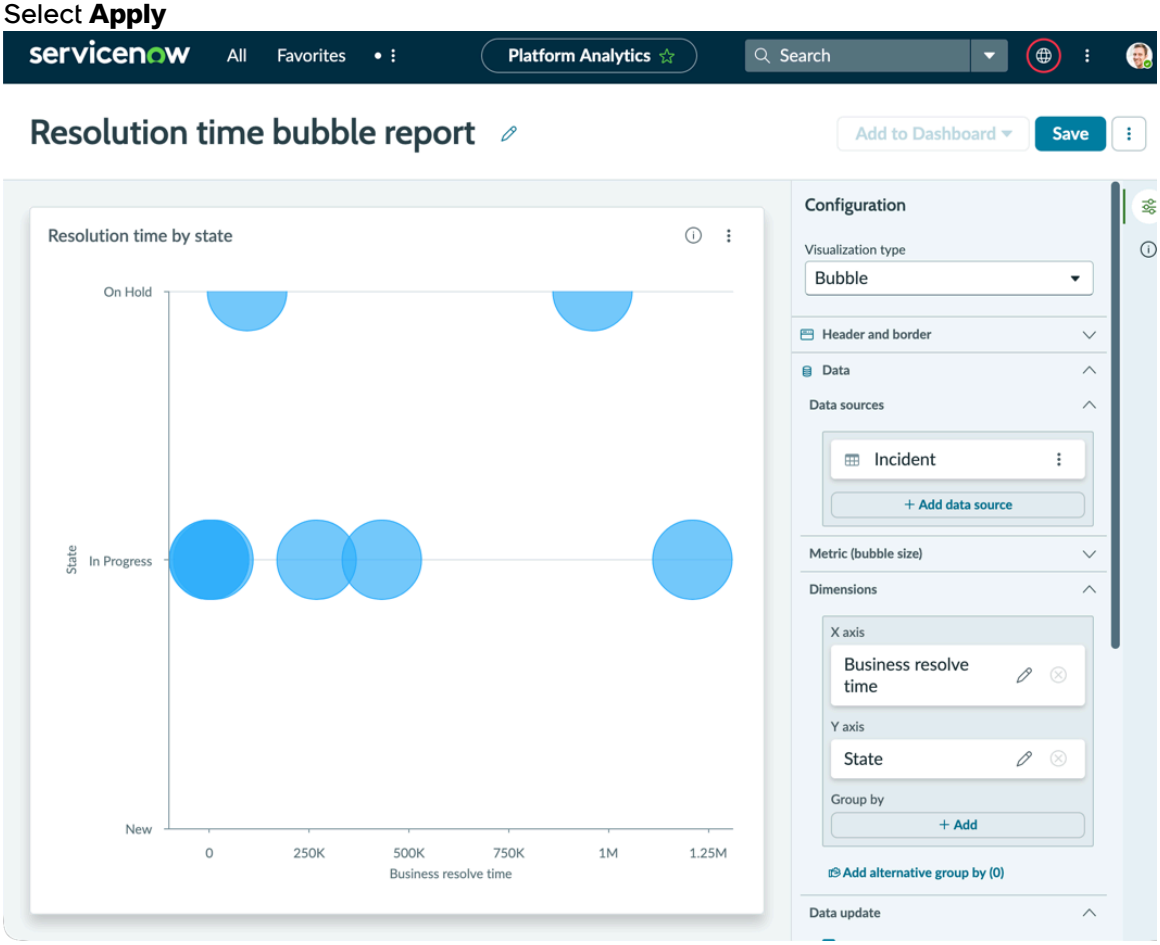
   a. Expand the Header and border section.

   b. Select **Show header** and provide the visualization title `Resolution time by state`.
   When **Show header** is selected, you can add a title and a description. The chart title isn't necessarily the same as the visualization name. The visualization name identifies it in the Visualization Designer and in a list. The chart title appears within the visualization.

   c. Enter a description of the visualization: `Bubble report showing incident resolution times with state`.
   While the description and title fields aren't required, this information makes the visualization easier to understand on a dashboard and easier to identify in a list.

4. Skip the Data source sections
   While the bubble report does support multiple data sources, you're just working with incidents. Because we only want to see the number of open incidents, you don't need to change the default metric, Count, or its label, Incident.

5. In the Dimensions section, keep the X axis field, Business resolve time, and select `State` for the Y axis field.
   Select **Apply**



6. Under Data update, configure how the audience interacts with the visualization.

   a. Select **Follow filters**.
   This option enables the visualization to follow interactive filters on the dashboards it's placed on that are based on the same table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Select **Show filter icon** to show the number of filters applied to the visualization.
For example, if dashboard filters limit the value of the visualization, the icon indicates that you're seeing the number of open incidents that match the filters. You can then check to see which filters are in effect.

c. Select **Enable drilldown** to let viewers navigate to relevant information by selecting a data point in the chart.
Some visualizations only drill down to the list of associated data. Table data is generally restricted by access control lists (ACLs) and viewers may not see all of the associated records.

This control mirrors **Allow chart interaction**. Under Chart Interaction, you can also select the destination of drilling down.

7. Under **Presentation** > **Colors**, Choose the **Default** color type for the visualization.
   - **Default** applies the colors associated with your UX theme.
   - **Single** specifies the same color for each bubble. All data visualizations that use fixed element colors show the same element in the same color.

Result
You've created a bubble visualization sorted on two values. You've also configured the visualization's colors.

Create a dial data visualization

Use a dial visualization to show where a value lies between expected minimum and maximum values. Use the dial visualization to show how a value compares to a target or benchmark, track progress, or to identify areas for improvement.

Before you begin
Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task
For information about the use of a Dial visualization in a dashboard, see the Developer Site.
This site gives information about Dial data visualization components in the UI Builder, and some configuration options may differ from the Visualization Designer.

Note: Workflow Data Fabric sources do not support real-time update on single score, dial, and gauge visualizations.

Procedure
1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select **Create data visualization**.
3. Select the Dial ( ) visualization type.
4. Configure the **Header and border**. Header and border options are the same for all data sources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header and border fields	Description
Show header	The visualization header, including title and icons.
Show header separator	Option to display a line separating the header from the rest of the component.
Chart title	Title of the visualization.
Description	A short overview about the visualization that the end user sees. Descriptions help users find the visualization.
Wrap title	Option to wrap long titles onto a second line. If false, displays an ellipsis to truncate long titles.
Wrap labels	Select to wrap long elements labels on the axis.
Max label size, px	Specify the maximum label size for element names on the axis. Default=100 px.
Truncation type	Specify where to truncate long labels with an ellipsis. Options are Beginning, Middle, and End.
Show border	Option to display a line around the component.
Bare	Option to remove padding around data visualization to provide more compact positioning on the page. Only available when **Show border** is turned off.
Show refresh option	Option to show or hide the refresh option from data visualizations. If cache is enabled on a dashboard, the Refresh option is always hidden.
Show export options	Option to show or hide the visualization's export types.
Header background color	Specify the color behind the title of the visualization.
Title color	Specify the text color of the title. The default title color is black, but you can choose a color that contrasts better with the header background. Only available when **Header background color** is selected.

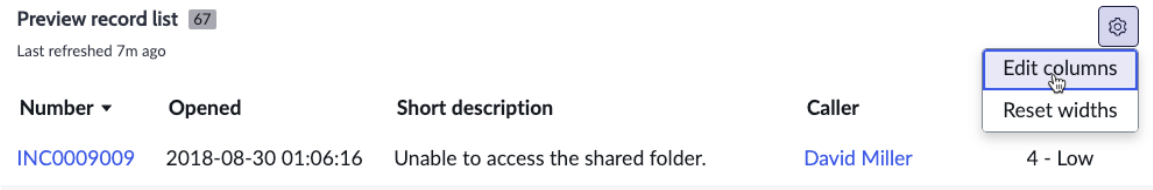
5. Choose a data source.
   For general descriptions of the data sources, see Data sources for data visualizations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Table (available in the base system). When you select a table, you can filter it by custom or preconfigured conditions. Custom conditions can include questions or Service Catalog variables.

  Configured report sources appear in the **Predefined conditions** list. For more information, see Report sources.

  To help you create a custom filter, there is a preview list of records that would be included in the visualization. You can change which fields are shown as columns and the width of columns in the list actions.



- Indicator (available in the base system). You can filter the indicator scores by breakdowns and elements.

  Note: Benchmark indicators are not supported.

  Note:

  You might have a multiple select (is one of) or dynamic (is (dynamic)) operator on the breakdown element filter. These operators require the indicator and breakdown to support them. For more information about the configurations that support these operators, see "Is one of" and "Is (Dynamic)" operators on breakdown conditions in data visualizations.

- Usage Insights (available with the User Experience PAR Integration application, to users with a required role). Choose one of up to three KPIs included with this application, depending on the visualization type. For more information, see User Experience Analytics data sources for data visualizations.

6. Select the options for your data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If your visualization represents table data, go to Table data options for dial visualizations.
- If your visualization represents indicator data, go to Indicator data options for dial data visualizations.
- If your visualization represents Usage Insights data, go to Usage Insights data options for dial data visualizations.

7. Under **Presentation**, provide display and color information.

Field	Description
Display settings	
Value label size	Characters that represent dynamic sizes: small (S), medium (M), or large (L). The actual size of the type changes in proportion to the size of the chart.
Min value	Set the lowest value shown on the visualization. If not specified, zero is the default.
Max value	Set the highest value shown on the visualization.
Inner radius	Specify the ratio of the visualization's inner radius to the outer. Allowed values are 0.7–0.95.
Show data table	Shows a table with chart and graph data for easier screen reader access. Data includes the percentage of the total for each value, when appropriate.
Colors	
Set color type	○ Default: A color or set of colors that come from the UX Theme that is applied to the instance. For more information, see Working with themes in Next Experience. ○ Single color/Colors per metric: Select a single color in the **Set value color** field. Interacting with that field opens a selector where you can choose the color from either a set of icons or from a list. You can also search for a color. Entering a search value has the selector show you a list of colors filtered by that search value. Alternatively, you can add a rule to define a dynamic color. For more information, see Create coloring rules for data visualizations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Under **Chart interaction**, set what if anything happens when a viewer clicks a chart or a chart segment on the visualization.

Field	Description
Allow chart interaction	Enable an event to occur when a user clicks in a visualization or one of its segments.
Action	Choose the event that occurs when a user clicks in a visualization or one of its segments. Choices depend on the visualization type and data source. Applies only when **Allow chart interaction** is on. For more information, see Chart interactions in a data visualization. ○ **Go to data view** opens a list view, KPI Details page, or Usage Insights overview page relevant to the associated segment or visualization. For table data, a system property determines whether a Core UI list or a Platform Analytics list opens. For more information, see Data views for different data sources. ○ **Go to URL** opens the specified URL, which can be on the instance or external. You have the option of specifying a page name to appear in the tooltip, for those visualizations with tooltips. ○ **Drill down to chart** (Visualization Designer only) Opens a different data visualization that is filtered by the selected data. You can add a drill-down visualization for each metric on the parent visualization. **Note:** The last level of drill down in the Platform Analytics experience is always a Core UI list. Records do not open in Workspace embedded lists. **Drill down to chart** supports only table data sources.

9. Select **Save** to continue editing the visualization, or **Save and close** to return to the Analytics Center main screen.

What to do next

- Add a visualization to a dashboard from the Visualization Designer
- Share a data visualization in the Visualization Designer
- Bookmark a visualization in the Visualization Designer

Table data options for dial visualizations

When you select a table data source for a dial visualization, the following Data configuration options are available.

Field	Description
Data	
Data source	You have selected a Table data source in Create a dial data visualization.
Metric	
Label	Label of the metric. By default it is the same as the name of the data source.
Select an aggregation	Computational method for aggregating data. The default is **Count**, which displays the number of records selected. **Note:** If you select **Count Distinct**, only unique records are counted. For example, you want to generate a report with a distinct number of users who have one or more of the roles in a given list of roles. Users with more than one role would be counted twice unless you use **Count Distinct**.
Field	Field to apply the metric to, for **Average**, **Sum**, or **Count Distinct** aggregations. You may further be able to aggregate on fields from extended tables. The data is shown in a format that matches the field type. For example, if you select an integer field, such as the **Priority** field, the data is expressed as a number. If you select a duration field, such as **Business duration** on the Incident table, the aggregated data is expressed in days, hours, and minutes. If function fields were created in Report Designer for the table, they are available in the dropdown list. For more information, see Report on function fields.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Additional settings	
Show metric label	Option to show the metric label. In donut charts, the value is not shown if it cannot fit the donut.
Show 0 when no data is available	When toggled on, shows empty (NULL) values as zero (0). Default is false. When true, the **No data message** section is not available, because the no data message is 0.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Real-time update	Option to update score in real time. If you enable both real-time update and data caching, real-time update overrides data caching. **Note:** • When a condition is dot-walked to another table, high traffic on the table suspends real-time data updates. • For tables, real-time updating supports only COUNT data aggregations. • Real-time updating is not supported on single score, dial, and gauge visualizations based on remote tables or Workflow Data Fabric tables.
No data message This section is not available when **Show zero** is on. Zero is then the no data message.	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Alignment	The alignment of the illustration and text in the message.

Indicator data options for dial data visualizations

When you select an indicator data source for a dial visualization, the following Data configuration options are available.

Field	Description
Data source	You have selected an indicator data source in Create a dial data visualization.
Metric	
Label	Label of the metric. By default it is the same as the name of the data source.
Time aggregation	Time aggregation to apply to the metric, such as 7-day running SUM or By-month AVG. Default is the same as the indicator period. For more information, see Applying time series aggregations.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Date range	
Apply date range	When turned on, this option allows date filters on the dashboard or UIB page to apply to this visualization. The date range can also be configured in the visualization, but date filters override visualization settings.
Show data for selected period as	Available when **Apply date range** is selected. The indicator aggregation logic for how scores from the selected period are shown, such as Latest score, Sum, or Average.
Set absolute period	Option to set absolute start and end date. Available when **Apply date range** is selected.
Period start	Start date for the absolute period. This property applies only when **Set absolute period** is true.
Period end	End date for the absolute period. This property applies only when **Set absolute period** is true. Select **Use current date for period end** to automatically update the end date to the current date. (Not available if the start date is in the future.)
Period	Time interval for each date period. • Days D • Months M • Years Y

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This property applies only when **Set absolute period** is false.
Number of periods	Number of date periods to display. This property applies only when **Set absolute period** is true.
Additional settings	
Show metric label	Option to show the metric label. In donut charts, the value is not shown if it cannot fit the donut.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Real-time update	Option to update score in real time. **Note:** • This setting is available for automated, non-scripted indicators with a non-scripted breakdown mapping. • Real-time score updating does not support MIN, MAX, or COUNT DISTINCT aggregations.
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Usage Insights data options for dial data visualizations

When you select a Usage Insights data source for a dial visualization, the following Data configuration options are available.

Field	Description
Data source	You have selected a Usage Insights data source in Create a dial data visualization.
Metric	
Metric	Label of the metric. By default it is the same as the name of the data source: Events or Sessions. For sessions, you can configure the metric to reflect the number of sessions, average session duration, average pages per session, or average sessions per user.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP`

© 2026 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Dial visualization example

Dial visualizations show where a single value lies across a range from minimum to maximum expected values. Visually, a "needle" points to the value, and the dial is colored in for values up to the needle.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

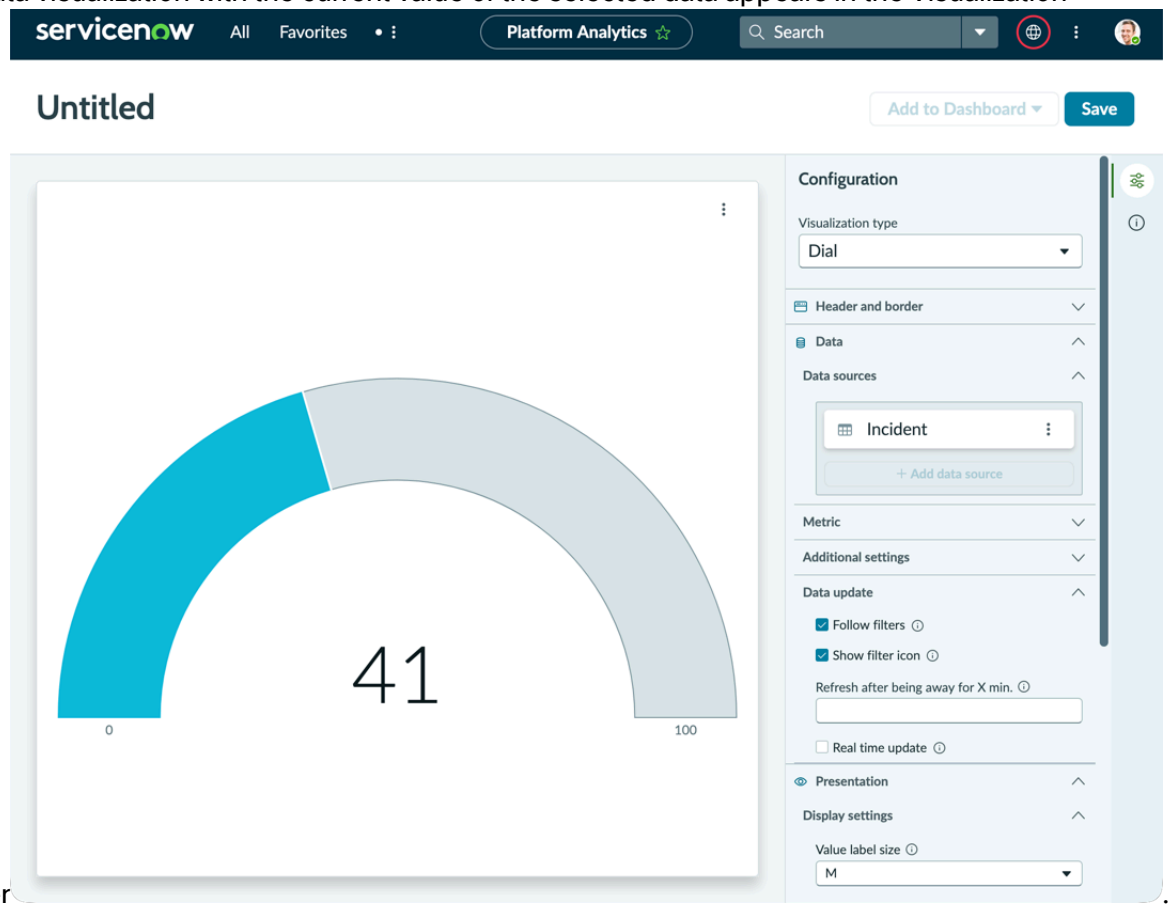
Use the dial visualization when you want to compare a current value to a target or benchmark, such as a company's sales compared to its goal. You can configure the dial visualization with colors to show where the current value lies compared to the goal. In a single score, you can color code the value to show if it's in a positive or negative range. With a dial, you color code the part of the visualization that represents the value.

Procedure

1. Follow the first steps to Create a dial data visualization:
   a. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
   b. Select **Create data visualization**.
   c. Select the dial visualization type from the Scores section.
2. For the moment, skip the header and border section and move to the data source.
   a. Select **Add data source**.
   b. Choose the Incident [incident] table.
   c. Because this visualization shows open incidents, let's add the Incidents.Open condition in the Filters section.
   With this filter selected, the visualization only shows the number of active incidents.
   d. **Optional:** Select **Run** to preview the records that the visualization will be based on.
   e. Select **Add this source**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A dial data visualization with the current value of the selected data appears in the Visualization Designer.



3. Now that you can see the visualization, let's add some context for the user.

   a. Expand the Header and border section.

   b. Select **Show header** and provide the title `Open incidents - Dial`.
   When **Show header** is selected, you can add a title and a description. The chart title isn't necessarily the same as the visualization name. The visualization name identifies it in the Visualization Designer and in a list. The chart title appears within the visualization.

   c. Enter a description of the visualization: `Number of open incidents of all priorities and categories`.
   While the description and title fields aren't required, this information makes the visualization easier to understand on a dashboard and easier to identify in a list.

4. Skip over the Metric section.
   Some data visualizations support multiple data sources, but the dial visualization doesn’t. Because you only want to see the number of open incidents, you don't need to change the default metric, Count, or its label, Incident.

5. Under Additional settings, select **Show 0 when no data available**.
   Because the name of the visualization is `Number of open incidents`, the metric label, Incident, is redundant.

   In some cases, a value of zero isn't interesting to the audience of a visualization. In this case, however, you want to show off having zero open incidents.

6. Under Data update, configure how the audience interacts with the visualization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Follow filters**.
This option enables the visualization to follow interactive filters on the dashboards it's placed on that are based on the same table.

b. Select **Show filter icon** to show the number of filters applied to the visualization.
For example, if dashboard filters limit the value of the visualization, the icon indicates that you're seeing the number of open incidents that match the filters. You can then check to see which filters are in effect.

c. Select **Enable drilldown** to let viewers navigate to relevant information by selecting a data point in the chart.
Some visualizations only drill down to the list of associated data. Table data is generally restricted by access control lists (ACLs) and viewers may not see all of the associated records.

This control mirrors **Allow chart interaction**. Under Chart Interaction, you can also select the destination of drilling down.

7. Under Presentation, configure the sizes of the score and the dial itself, and the visualization's minimum and maximum values.

a. Under Display settings, change the score size from the default M (medium) to L (large) to emphasize it.

b. Choose a minimum and maximum value for the dial.
The default values are 0 and 100. In this case, the minimum is zero if there are no open incidents. Keep the default value for the maximum as well, but consider realistic maximum values when you create your own dial visualizations.

c. Ignore the inner radius parameter for the purposes of this example.
The inner radius is the ratio of the visualization's inner radius to the outer. Allowed values are 0.7–0.95.

8. Configure a color rule for the score.
Because you want to emphasize the state of open incidents, define a dynamic color rule that changes the dial's color based on its value.

a. In the Display settings, choose the `Single color` color type.

b. Under Color Rules, select **+ Add rule**.

c. For the first color rule, choose the **Operator** `lower than`, enter the **Value** 6, and choose the color `Positive Green` for both the color and the icon color (if available), and select **Apply**.

The value is up to the specified number but not including it.

Retain the order 100.

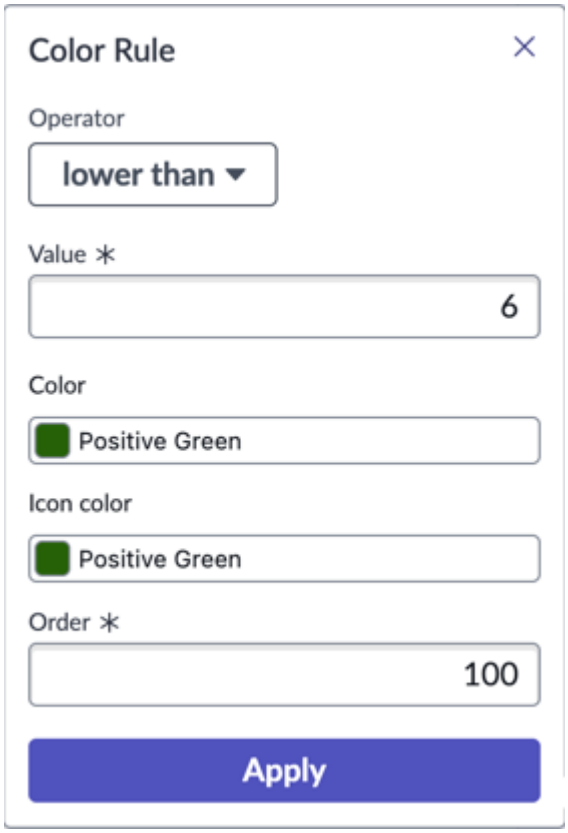
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

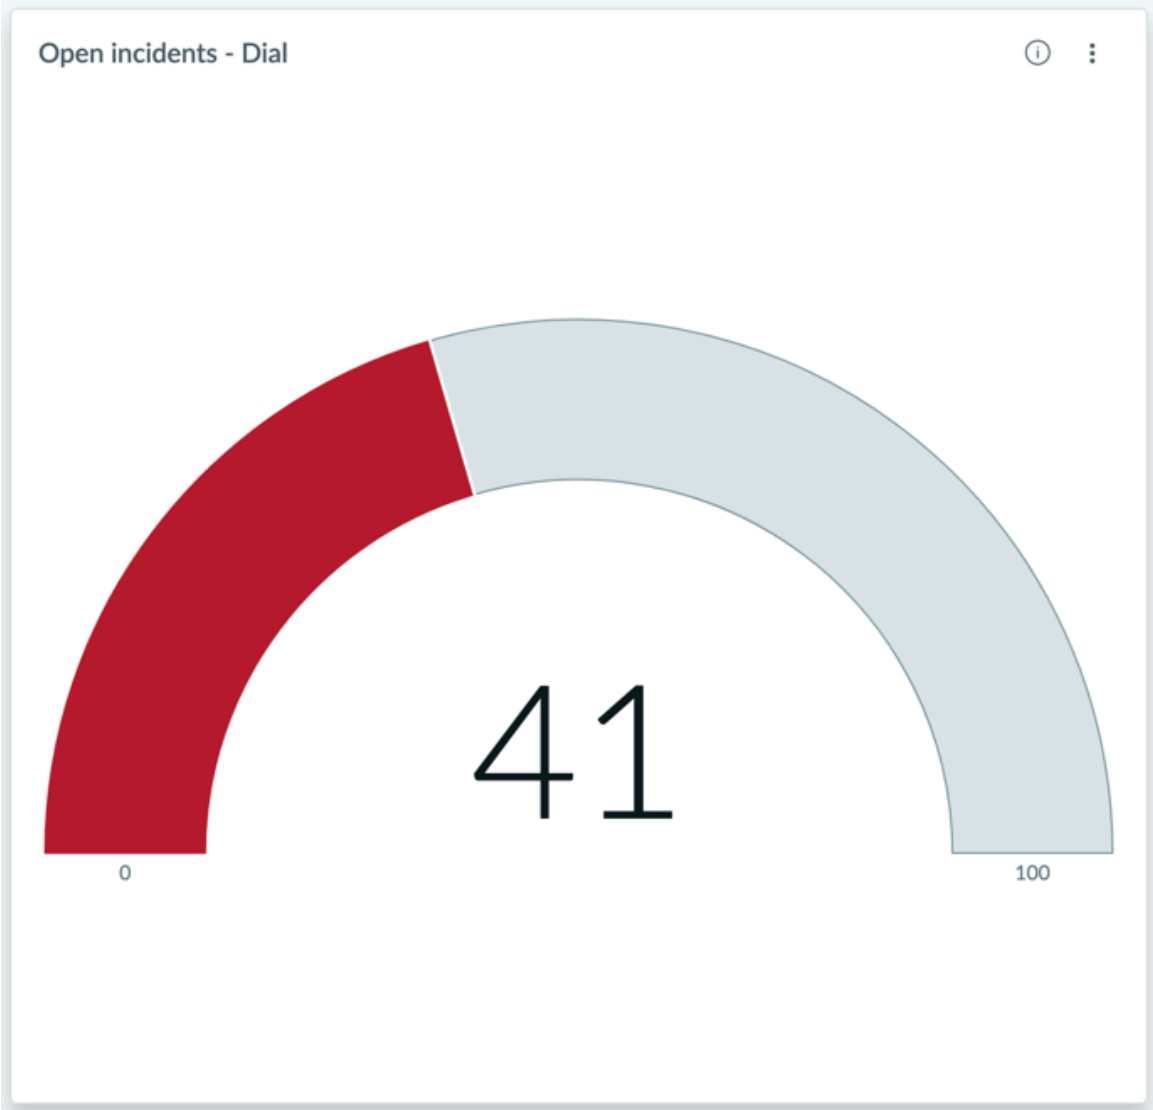


d. To indicate a value that requires more attention, create a second rule with the **Operator** `between`, the values 5 and 25, the color and icon color `Warning Orange`, and the order 50.

e. To show the values that require the highest attention, create a third rule with the **Operator** `greater than`, the value 25, the color and icon color `Red`, and the order 25.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You've created three rules to show whether the single score value is in line with what you want to see.



Result

You have created a dial visualization based on a single metric, open incidents. You have also configured user options regarding filters and drilldowns, and configured the visualization's size and coloring rules.

Create a gauge data visualization in the Visualization Designer

A gauge visualization shows where a value lies between expected minimum and maximum values. Use the gauge visualization to follow progress with color-coded value ranges.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

For information about the use of a Gauge visualization in a dashboard, see the Developer Site. This site gives information about Gauge data visualization components in the UI Builder, and some configuration options may differ from the Visualization Designer.

Note: Workflow Data Fabric sources do not support real-time update on single score, dial, and gauge visualizations.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select **Create data visualization**.
3. Select the Gauge ( ) visualization type.
4. Configure the **Header and border**. Header and border options are the same for all data sources.

Header and border fields	Description
Show header	The visualization header, including title and icons.
Show header separator	Option to display a line separating the header from the rest of the component.
Chart title	Title of the visualization.
Description	A short overview about the visualization that the end user sees. Descriptions help users find the visualization.
Wrap title	Option to wrap long titles onto a second line. If false, displays an ellipsis to truncate long titles.
Wrap labels	Select to wrap long elements labels on the axis.
Max label size, px	Specify the maximum label size for element names on the axis. Default=100 px.
Truncation type	Specify where to truncate long labels with an ellipsis. Options are Beginning, Middle, and End.
Show border	Option to display a line around the component.
Bare	Option to remove padding around data visualization to provide more compact positioning on the page. Only available when **Show border** is turned off.
Show refresh option	Option to show or hide the refresh option from data visualizations. If cache is enabled on a dashboard, the Refresh option is always hidden.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header and border fields	Description
Show export options	Option to show or hide the visualization's export types.
Header background color	Specify the color behind the title of the visualization.
Title color	Specify the text color of the title. The default title color is black, but you can choose a color that contrasts better with the header background. Only available when **Header background color** is selected.

5. Choose a data source.
   For general descriptions of the data sources, see Data sources for data visualizations.

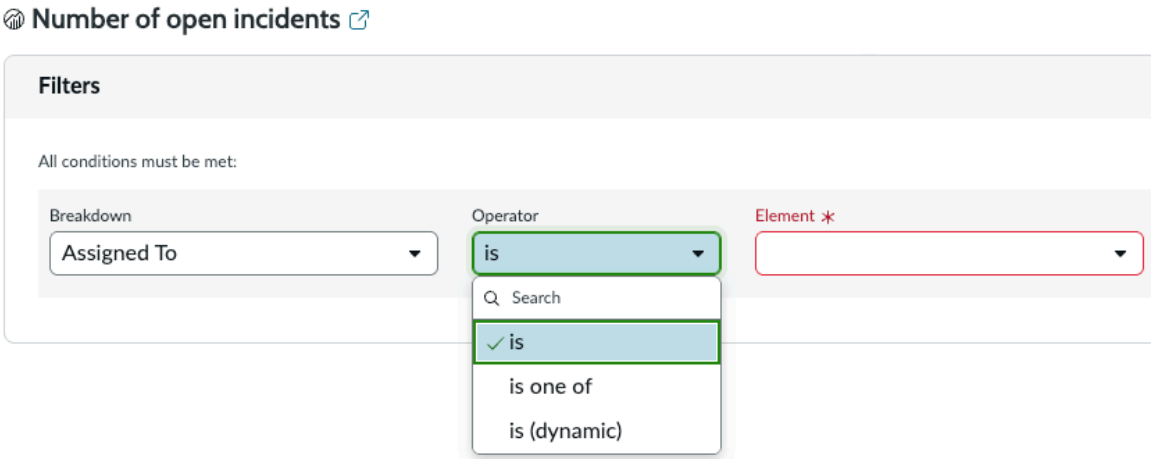
   - Table (available in the base system). When you select a table, you can filter it by custom or preconfigured conditions. Custom conditions can include questions or Service Catalog variables.

     Configured report sources appear in the **Predefined conditions** list. For more information, see Report sources.

     To help you create a custom filter, there is a preview list of records that would be included in the visualization. You can change which fields are shown as columns and the width of columns in the list actions.

     
   - Indicator (available in the base system). You can filter the indicator scores by breakdowns and elements.

     Note: Benchmark indicators are not supported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

You might have a multiple select (is one of) or dynamic (is (dynamic)) operator on the breakdown element filter. These operators require the indicator and breakdown to support them. For more information about the configurations that support these operators, see "Is one of" and "Is (Dynamic)" operators on breakdown conditions in data visualizations.

- Usage Insights (available with the User Experience PAR Integration application, to users with a required role). Choose one of up to three KPIs included with this application, depending on the visualization type. For more information, see User Experience Analytics data sources for data visualizations.

6. Select the options for your data source.
   - If your visualization represents table data, go to Table data options for gauge data visualizations.
   - If your visualization represents indicator data, go to Indicator data options for gauge data visualizations.
   - If your visualization represents Usage Insights data, go to Usage Insights data options for gauge visualizations.
7. Under **Presentation**, provide display and color information.

Field	Description
Display settings	
Gauge arc angle	Choice of sizes for the gauge, in degrees.
Value label size	Characters that represent dynamic sizes: small (S), medium (M), or large (L). The actual size of the type changes in proportion to the size of the chart.
Inner radius	Specify the ratio of the visualization's inner radius to the outer. Allowed values are 0.7–0.95.
Show data table	Shows a table with chart and graph data for easier screen reader access. Data includes the percentage of the total for each value, when appropriate.
Range	
Min value	Set the lowest value shown on the visualization. If not specified, zero is the default.
Max value	Set the highest value shown on the visualization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Configure ranges	Specify the number of ranges to divide the gauge into; default 3. You select the number of ranges, the start and end values of each range, the labels, and the color spectrum.
Legend	
Show legend	Option to display the legend. Activated automatically at 400% zoom.
Legend position	Legend location relative to the chart: Above, Below, Right, or Left
Legend orientation	Options for how to display the register. ○ Horizontal `horizontal`: Option to display the legend horizontally. ○ Vertical `vertical`: Option to display the legend vertically up to five lines. This property applies only when **Legend position** is Below.
Horizontal alignment	Horizontal alignment of elements in the legend: Start, Center, or End
Max legend item width, px	Number of pixels after which the item in the legend is truncated.
Labels	
Score label [scoreLabel]	The label of the score in the center of the gauge: ○ No label (None) ○ The same label as the visualization metric (Metric label) ○ The label that you set for the range that the score falls into, in Configure ranges (Range label) Labels are disabled and replaced by legends at 400% zoom.
Show range limit [showRangeLimit]	When true, the limits that you configured for the ranges are shown. If you did not configure any ranges, the default min and max values are shown.
Show range labels [showRangeLabels]	When true, any labels you configured for ranges are shown. This property is available only if you configured ranges and specified labels for them.
Show label as primary	Available when the score label is configured as Range label. Changes the places of the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	score value and label to make the score value small and emphasize the range value.

8. Under **Chart interaction**, set what if anything happens when a viewer clicks a chart or a chart segment on the visualization.

Field	Description
Allow chart interaction	Enable an event to occur when a user clicks in a visualization or one of its segments.
Action	Choose the event that occurs when a user clicks in a chart or one of its segments. Choices depend on the visualization type and data source. Applies only when **Allow chart interaction** [chartInteractionEnabled] is true. ○ **Go to data view** opens the records view in a Core UI list or KPI Details relevant to the associated segment or visualization. Records do not open in Workspace embedded lists. Usage Insights data sources redirect to the appropriate user, sessions, page, event pages that are based on corresponding usage data. ○ **Go to URL** opens the specified URL, which can be on the instance or external. You have the option of specifying a page name to appear in the tooltip, for those visualizations with tooltips.

9. Select **Save** to continue editing the visualization, or **Save and close** to return to the Analytics Center main screen.

What to do next

- Add a visualization to a dashboard from the Visualization Designer
- Share a data visualization in the Visualization Designer
- Bookmark a visualization in the Visualization Designer

Table data options for gauge data visualizations

When you select a table data source for a gauge visualization, the following Data configuration options are available.

Field	Description
Data	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Data source	You have selected a Table data source in Create a gauge data visualization in the Visualization Designer.
Metric	
Label	Label of the metric. By default it is the same as the name of the data source.
Select an aggregation	Computational method for aggregating data. The default is **Count**, which displays the number of records selected. **Note:** If you select **Count Distinct**, only unique records are counted. For example, you want to generate a report with a distinct number of users who have one or more of the roles in a given list of roles. Users with more than one role would be counted twice unless you use **Count Distinct**.
Field	Field to apply the metric to, for **Average**, **Sum**, or **Count Distinct** aggregations. You may further be able to aggregate on fields from extended tables. The data is shown in a format that matches the field type. For example, if you select an integer field, such as the **Priority** field, the data is expressed as a number. If you select a duration field, such as **Business duration** on the Incident table, the aggregated data is expressed in days, hours, and minutes. If function fields were created in Report Designer for the table, they are available in the dropdown list. For more information, see Report on function fields.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Additional settings	
Show 0 when no data is available	When toggled on, shows empty (NULL) values as zero (0). Default is false. When true, the **No data message** section is not available, because the no data message is 0.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Real-time update	Option to update score in real time. If you enable both real-time update and data caching, real-time update overrides data caching. **Note:** • When a condition is dot-walked to another table, high traffic on the table suspends real-time data updates. • For tables, real-time updating supports only COUNT data aggregations. • Real-time updating is not supported on single score, dial, and gauge visualizations based on remote tables or Workflow Data Fabric tables.
No data message This section is not available when **Show zero** is on. Zero is then the no data message.	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Indicator data options for gauge data visualizations

When you select an indicator data source for a gauge visualization, the following Data configuration options are available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Data source	You have selected an indicator data source in Create a gauge data visualization in the Visualization Designer.
Metric	
Label	Label of the metric. By default it is the same as the name of the data source.
Time aggregation	Time aggregation to apply to the metric, such as 7-day running SUM or By-month AVG. Default is the same as the indicator period. For more information, see Applying time series aggregations.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Date range	
Apply date range	When turned on, this option allows date filters on the dashboard or UIB page to apply to this visualization. The date range can also be configured in the visualization, but date filters override visualization settings.
Show data for selected period as	Available when **Apply date range** is selected. The indicator aggregation logic for how scores from the selected period are shown, such as Latest score, Sum, or Average.
Set absolute period	Option to set absolute start and end date. Available when **Apply date range** is selected.
Period start	Start date for the absolute period. This property applies only when **Set absolute period** is true.
Period end	End date for the absolute period. This property applies only when **Set absolute period** is true. Select **Use current date for period end** to automatically update the end date to the current date. (Not available if the start date is in the future.)
Period	Time interval for each date period. • Days D • Months M • Years Y This property applies only when **Set absolute period** is false.
Number of periods	Number of date periods to display.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This property applies only when **Set absolute period** is true.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Real-time update	Option to update score in real time. **Note:** • This setting is available for automated, non-scripted indicators with a non-scripted breakdown mapping. • Real-time score updating does not support MIN, MAX, or COUNT DISTINCT aggregations.
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Usage Insights data options for gauge visualizations

When you select a Usage Insights data source for a gauge visualization, the following Data configuration options are available.

Note: If you add a Platform Analytics data visualization with Usage Insights (UXA) data to an inline dashboard, the default drilldown for that data visualization is to open the corresponding UXA analytics page. This feature provides a quick and efficient way to drill down and explore specific user behavior from your Platform Analytics dashboard.

Field	Description
Data source	You have selected a Usage Insights data source in Create a gauge data visualization in the Visualization Designer.
Metric	
Metric	Label of the metric. By default it is the same as the name of the data source: Events or Sessions. For sessions, you can configure the metric to reflect the number of sessions, average session duration, average pages per session, or average sessions per user.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Gauge visualization example

Like dials, gauges show where a single value lies across a range from minimum to maximum expected values. In addition to dial functionality, you can set colored data ranges to help users understand what the value represents.

Before you begin

Role required: No role is required to see the Platform Analytics workspace. With any internal role, you can create a data visualization, but you need the viz_creator role to save your visualizations to the Visualization Library. To create a meaningful visualization, you must have permission to access the data you want to report on.

About this task

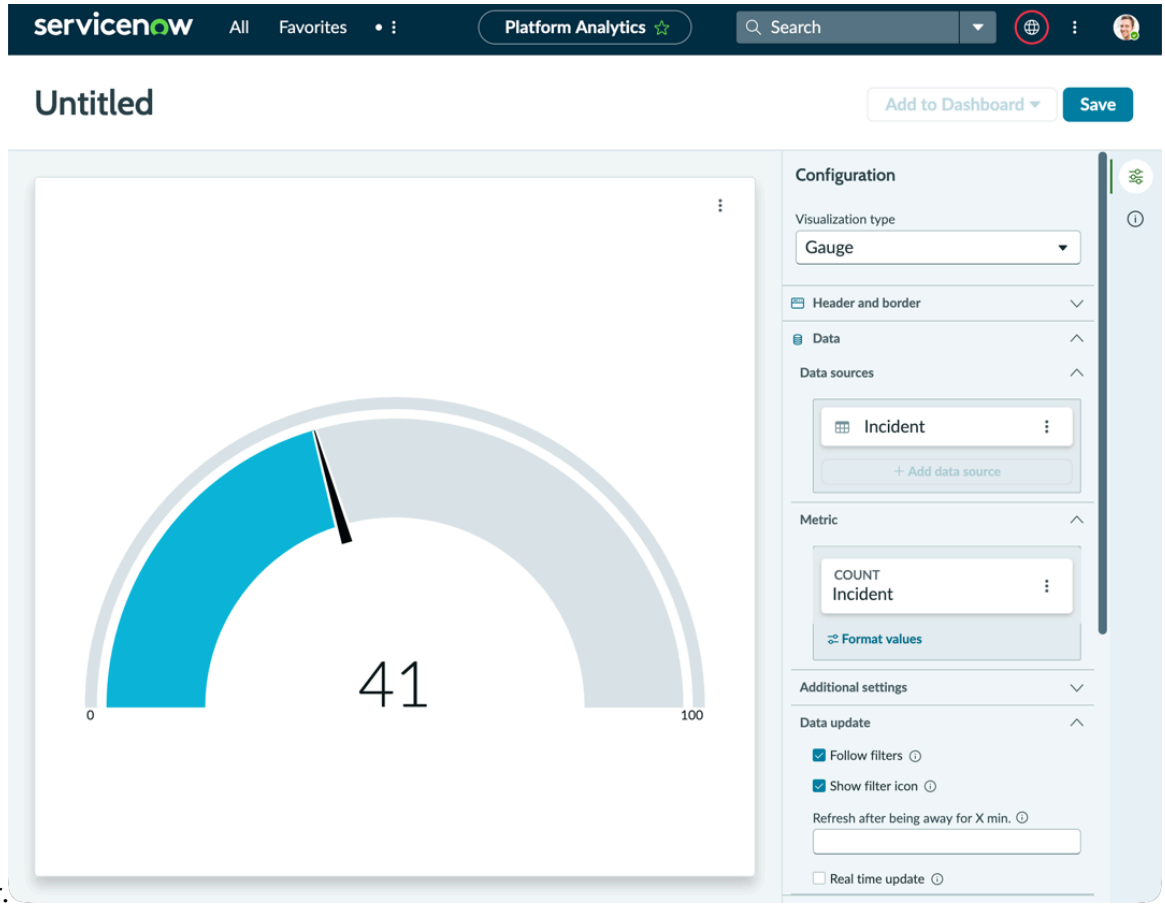
Use the gauge visualization when you want to compare a value to a target or benchmark, such as a company's sales compared to its goal. You can configure the visualization with colors to show where the current value lies compared to the goal. With a dial, you color code the part of the visualization that represents the value. With a gauge visualization, you color code the ranges and a needle points to the value.

Procedure

1. Follow the first steps to Create a gauge data visualization in the Visualization Designer:
   a. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
   b. Select **Create data visualization**.
   c. From the Scores section, Select the gauge visualization type.
2. For the moment, skip the header and border section and move on to the data source.
   a. Select **Add data source**.
   b. Choose the Incident [incident] table.
   c. Because this visualization shows open incidents, let's add the Incidents.Open condition in the Filters section.
   With this filter selected, the visualization only shows the number of active incidents.
   d. **Optional:** Select **Run** to preview the records that the visualization will be based on.
   e. Select **Add this source**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A gauge data visualization with the current value of the selected data appears in the Visualization Designer.



3. Now that you can see the visualization, let's add some context for the user.

   a. Expand the Header and border section.

   b. Select **Show header** and provide the visualization title `Open incidents - Gauge`.
   When **Show header** is selected, you can add a title and a description. The title isn't necessarily the same as the visualization name. The visualization name identifies it in the Visualization Designer and in a list. The title appears within the visualization.

   c. Enter a description of the visualization: `Number of open incidents of all priorities and categories`.
   While the description and title fields aren't required, this information makes the visualization easier to understand on a dashboard and easier to identify in a list.

4. Under Additional settings, select **Show 0 when no data available**.
   In some cases, a value of zero isn't interesting to the audience of a visualization. In this case, however, you want to show off having zero open incidents. When you don't select **Show 0 when no data available**, you have the option to configure a message to show when there is no data.

5. Under Data update, configure how the audience interacts with the visualization.

   a. Select **Follow filters**.
   This option enables the visualization to follow interactive filters on the dashboards it's placed on that are based on the same table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

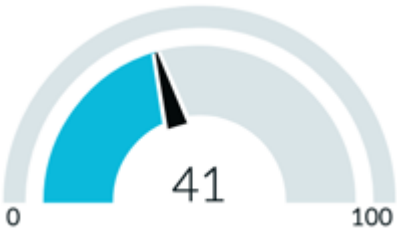
b. Select **Show filter icon** to show the number of filters applied to the visualization.
For example, if dashboard filters limit the value of the visualization, the icon indicates that you're seeing the number of open incidents that match the filters. You can then check to see which filters are in effect.

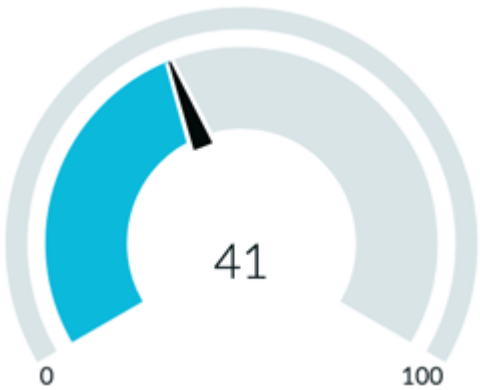
c. Select **Enable drilldown** to let viewers navigate to relevant information by selecting a data point in the chart.
Some visualizations only drill down to the list of associated data. Table data is generally restricted by access control lists (ACLs) and viewers may not see all of the associated records.

This control mirrors **Allow chart interaction**. Under Chart Interaction, you can also select the destination of drilling down.

6. Under Presentation, configure the shape of the gauge and the size of the gauge value.

a. Under Display settings, choose 180 degrees as the gauge arc angle.
180 degrees shows the gauge as a semicircle. 240 degrees shows the gauge as three quarters of a circle.

180 degree gauge	240 degree gauge
	




b. Change the value label size from the default M (medium) to L (large) to emphasize it.

c. Ignore the inner radius parameter for the purposes of this example.
The inner radius is the ratio of the visualization's inner radius to the outer. Allowed values are 0.7–0.95.

7. Under Ranges, choose the minimum and maximum values of the gauge.
The default values are 0 and 100. In this case, the minimum is zero if there are no open incidents. Keep the default value for the maximum as well, but consider realistic maximum values when you create your own gauge visualizations.

8. Select **Configure ranges**.
Ranges are the color bands that show how the value meets the goals associated with the visualization. For the purpose of this example, you configure three ranges to illustrate the value.

a. Keep the default number of ranges, 3, and the default color scheme of `Green to red`.

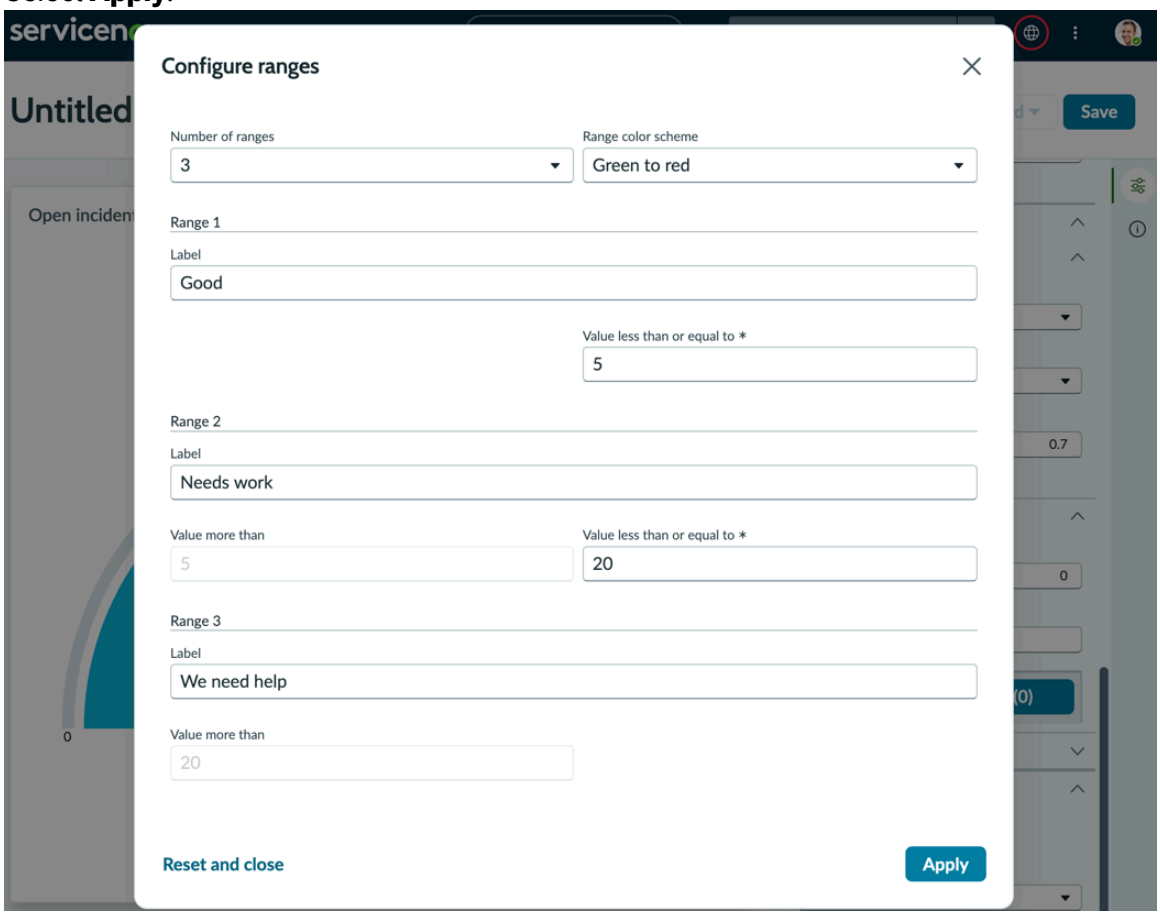
b. Label the first range `Good` and specify **Values less than or equal to** 5.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Label the second range `Needs work` and specify **Values less than or equal to** `20`.
The lower value is taken from the first range.

d. Label the third range `We need help`.
The value of this range is taken from the second range.

e. Select **Apply**.



9. Configure the **Labels** for the gauge.

a. Choose the Score label `None`.
The other choices are Metric label and Range label. Because the metric is in the name of the visualization, it's redundant to label the value in the gauge with Incidents. The Range label provides the option to make the label the visualization's primary text rather than the value.

b. Select **Show range limit**.
The range limit adds the lower values of each range, and the upper limit of the gauge to the visualization.

c. Select **Show range labels**.
The range labels that you configured add context for each of the ranges.

You've created three rules to show whether the single score value is in line with what you want to see.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
You have created a gauge visualization based on a single metric, open incidents. You have also configured user options regarding filters and drill downs, and configured the visualization's size, labeling, and ranges.

Create a geomap data visualization

A geomap visualization shows the geographical distribution of data for a world, country, region, or province/state. Use Geomaps to show table data that contains location information.

Before you begin
Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task
For information about the use of a Geomap visualization in a dashboard, see the Developer Site. This site gives information about Geomap data visualization components in the UI Builder, and some configuration options may differ from the Visualization Designer.

Procedure
1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select **Create data visualization**.
3. Select the Geomap visualization type.
4. Choose a table data source.
   For general descriptions of the data sources, see Data sources for data visualizations.
   a. Configure the map settings.
   b. Enable drill-down to enable or disable map navigation between levels and list redirection.
5. Configure the **Header and border**. Header and border options are the same for all data sources.

Header and border fields	Description
Show header	The visualization header, including title and icons.
Show header separator	Option to display a line separating the header from the rest of the component.
Chart title	Title of the visualization.
Description	A short overview about the visualization that the end user sees. Descriptions help users find the visualization.
Wrap title	Option to wrap long titles onto a second line. If false, displays an ellipsis to truncate long titles.
Show border	Option to display a line around the component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header and border fields	Description
Bare	Option to remove padding around data visualization to provide more compact positioning on the page. Only available when **Show border** is turned off.

6. Set the options for your data source.
   Go to Table data options for Geomap visualizations.
7. Under **Presentation**, provide display and color information.

Field	Description
Show data table	Shows a table with chart and graph data for easier screen reader access. Data includes the percentage of the total for each value, when appropriate.
Show % of total in tooltip	Enable to show the percentage each data point contributes to the total alongside absolute values in the tooltip.
Map	Map to plot the data, such as the world map or the map of a country.
Show data label	Enables the data labels.
Legend	Displays the legend.
Legend position	Legend location in relation to the visualization. Options include: ○ Above ○ Below ○ Right ○ Left
Set color type	Type of color scheme to apply to the component. The choices are: ○ Default: A color or set of colors that come from the UX Theme that is applied to the instance. For more information, see Working with themes in Next Experience. ○ Color range: A spectrum of colors between a color for the lowest value and a color for the highest value. You can select these colors from a set of icons, from a list of colors including their icons, or by searching for the color name or hexadecimal value. The colors are taken from the Color Definition [sys_report_color] table.

8. Under **Chart interaction**, set what if anything happens when a viewer clicks a chart or a chart segment on the visualization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Allow chart interaction	Enable an event to occur when a user clicks in a visualization or one of its segments.
Action	Only the **Go to data view** interaction is available for geomaps. This action opens the underlying records view.

9. Select **Save** to continue editing the visualization, or **Save and close** to return to the Analytics Center main screen.

What to do next

- Add a visualization to a dashboard from the Visualization Designer
- Share a data visualization in the Visualization Designer
- Bookmark a visualization in the Visualization Designer

Table data options for Geomap visualizations

When you select a table data source for a Geomap visualization, the following Data configuration options are available.

Field	Description
Data	
Data source	You have selected a Table data source in Create a geomap data visualization.
Metric	
Label	Label of the metric. By default it is the same as the name of the data source.
Select an aggregation	Computational method for aggregating data. The default is **Count**, which displays the number of records selected. **Note:** If you select **Count Distinct**, only unique records are counted. For example, you want to generate a report with a distinct number of users who have one or more of the roles in a given list of roles. Users with more than one role would be counted twice unless you use **Count Distinct**.
Field	Field to apply the metric to, for **Average**, **Sum**, or **Count Distinct** aggregations. You may further be able to aggregate on fields from extended tables. The data is shown in a format that matches the field type. For example, if you select an

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	integer field, such as the **Priority** field, the data is expressed as a number. If you select a duration field, such as **Business duration** on the Incident table, the aggregated data is expressed in days, hours, and minutes. If function fields were created in Report Designer for the table, they are available in the dropdown list. For more information, see Report on function fields.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Only available when **Use custom formatting** is true
Group by	
Field for [table]	Select a field that is in a geomap for map sources. By default, the fields you can select point to the Location [cmn_location] table, such as Assigned to.Location. You must select a reference field that points to a table, like Location, that has an associated entry in the Map sources [viz_map_source] table. If only one field on the main level references a location table, this field is selected by default. For more information, including how to create map sources for geomaps, see Map sources for geomap data visualizations.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
No data message	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Map sources for geomap data visualizations

Geomap data visualizations are connected to location tables in a special map source.

Map sources for geomaps are organized in map source hierarchies. All map sources that reference the same table are in the same hierarchy. A map source hierarchy consists of a parent source and up to four levels of child sources. The parent source references only the table and the child sources reference fields in the table.

By default, your instance has a map source hierarchy for geomaps that references the Location [cmn_location] table. You can therefore have a Group by field on your geomap that references a field on Location. The Group by field can be at the top level of the data source table, or you can dot-walk to it. You can create additional map source hierarchies that reference custom location tables.

Differences between map sources for data visualizations and for reports

If you're familiar with Map reports in Core UI, you might have noticed that the map sources for geomaps are different than map sources for map reports. They're different enough to be on different Map sources tables, sys_report_map_source and viz_map_source. The most significant difference is in how they reference tables.

In map reports, the map source references the facts table, such as Incident [incident]. The map source also includes a reference field that points to the location table. Child map sources dot-walk to a field on the location table. This structure results in a separate map source hierarchy for every data table you want as a data source for a map.

Map sources for map reports

Name	Table	Field
Search	Search	Search
Table: change_request (4)		
Change request by location	Change Request [change_request]	location
Change request by location (level 1)	Change Request [change_request]	location.country
Change request by location (level 2)	Change Request [change_request]	location.state
Change request by location (level 3)	Change Request [change_request]	location.city
Table: change_task (4)		
Change task by location	Change Task [change_task]	location
Change task by location (level 1)	Change Task [change_task]	location.country
Change task by location (level 2)	Change Task [change_task]	location.state
Change task by location (level 3)	Change Task [change_task]	location.city

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Map sources for geomaps point directly to location tables. They don't reference facts tables. The facts table is specified only in the geomap data visualization. Thanks to this structure, you can reuse one map hierarchy for all geomaps on your instance, regardless of the data they display.

Map sources for geomap data visualizations

Name ▲	Table	Field
Search	Search	Search
Location mapping	Location [cmn_location]	
Location mapping (level 1)	Location [cmn_location]	country
Location mapping (level 2)	Location [cmn_location]	state
Location mapping (level 3)	Location [cmn_location]	city

Create a data visualization map source

To use a custom location table in geomap data visualizations, define a map source that links to the table. Add more map sources at different levels of the hierarchy.

Before you begin

Role required: report_admin, viz_admin, pa_admin

About this task

Procedure

1. Append `viz_map_source_list.do` to your instance URL in the browser URL field.

   Example
   For example, if your instance is `https://instance.example.com`, enter `https://instance.example.com/viz_map_source_list.do`.

2. Verify whether the location table that you want to reference is already used in a map source. The set of map sources that reference the same table is called a map source hierarchy.
3. If there are no map sources that reference the desired location table, create the top-level map source for that table:

   a. Select **New**.
   An empty Map source [viz_map_source] record opens.

   b. Specify the following information:

Field	Description
Name	Add a name for the map source. Use a descriptive name that suggests the table contents. Include this name as part of the names of all other map sources that you create in this hierarchy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Table	Select a location table that is not already being used in a data visualization map source. The table you select must also not reference a table, such as cmn_location, that is already being used in a data visualization map source.

c. Select **Submit**.

You now have the parent map source of a new map source hierarchy. You can add more levels to the hierarchy.

4. If a map source hierarchy for your table exists, open the map source that is one level above the map source that you want to create.

Note: You can have no more than four levels of map source below the top-level parent.

5. In the **Map sources** related list, select **New**.
A new Map source [viz_map_source] record opens, with the Table and Parent fields read-only.
6. Specify the following information:

Map source fields

Field	Description
Name	Enter a name for the map source. Include the level in the names of map source levels. Generally give all map sources in the same hierarchy the same root name. Differentiate them only by level, such as Location mapping (level 2) and Location mapping (level 3).
Table (read-only)	The same table is used throughout a map source hierarchy, and is specified in the top-level map source.
Field	Select a field of location data that is one level more granular than the map you are displaying it on. For example, imagine you are configuring data for a level 1 map source that is displayed on the world map. Because the data for countries are displayed on the world map, select **Location Country**. Similarly, if you are configuring data to display on a map of Germany or the United States, select **Location State / Province**. **Note:** The city is the most granular location level that you can display when drilling down into a map report. For example: If you want to report on various site locations within a city, and define the bottom-level map source field to include location.name, the map report displays the multiple locations as the corresponding city labels. As a result, reporting on multiple locations which have the same location.city value results in displaying multiple map dots with the same label, but with different aggregated values, and which drill down to different locations.
Level	Select a hierarchy level for this map source. You must select a level that is one level lower than the parent map source's level. You can have a maximum of four levels. Each map source level corresponds to a drill level on the map hierarchy, and these levels much match. Only

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	one map source of the same level can exist in a hierarchy at the same time.
Active	Clear this check box to make this map source unavailable when creating map reports.

7. In the **Data transformation** section, specify the following information:

Field	Description
How to use data	Select how to use data in this map source. ○ **Use data on table**: Use the data in the ServiceNow AI Platform® without transforming it. Select this option when the data already matches the JSON key values that you're mapping to. ○ **Use mapping**: The most common use case. Transform data so it matches the JSON key values that you're mapping to. For geographical map sources that use the hc-key geoJSON key, always select this option. This option can't be used with data below the state/province level, because **Region and state** is the lowest level mapping. ○ **Use latitude and longitude**: Always select this option for the bottom map level, such as level 3. Ensure that your data has latitude and longitude values. ⚠ **Warning:** Because the **Use longitude and latitude** option disables drilling down, select this option only on map source levels that are the bottom level in a hierarchy.
Use these mappings	If you selected **Use mapping**, select a mapping group to use. A mapping group is a collection of key-value pair mappings that transform data. To review the mappings in a mapping group, go to the Locations Mappings [sys_report_map_source_mapping] table. For example, if you're transforming field value **USA** to hc-key value **us**, select **Country mappings**, which contains the relevant key-value pair mapping.

8. In the **JSON key** section, select a JSON key to connect the map source data to maps. Geographical maps typically use hc-key.

   Every geomap has a JSON definition. Select one JSON key-value pair to map the data to. The data to appear on the map must match the JSON key values. So the key that you select determines whether you must transform your data with the settings in the **How to use data** section. All default platform maps and mappings use the geoJSON hc-key and ISO 3166 standard values. For custom maps, you can enter a different JSON key.

9. Select **Update**.

Create a heatmap data visualization

Use a heatmap visualization to show the relationship between two table fields or indicator breakdowns. The changes in color as you move along the axes reveal patterns in the value of one or both fields/breakdowns.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

For information about the use of a Heatmap visualization in a dashboard, see the Developer Site. This site gives information about Heatmap data visualization components in the UI Builder, and some configuration options may differ from the Visualization Designer.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select **Create data visualization**.
3. Select the Heatmap ( ) visualization type.
4. Configure the **Header and border**. Header and border options are the same for all data sources.

Header and border fields	Description
Show header	The visualization header, including title and icons.
Show header separator	Option to display a line separating the header from the rest of the component.
Chart title	Title of the visualization.
Description	A short overview about the visualization that the end user sees. Descriptions help users find the visualization.
Wrap title	Option to wrap long titles onto a second line. If false, displays an ellipsis to truncate long titles.
Wrap labels	Select to wrap long elements labels on the axis.
Max label size, px	Specify the maximum label size for element names on the axis. Default=100 px.
Truncation type	Specify where to truncate long labels with an ellipsis. Options are Beginning, Middle, and End.
Show border	Option to display a line around the component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header and border fields	Description
Bare	Option to remove padding around data visualization to provide more compact positioning on the page. Only available when **Show border** is turned off.
Show refresh option	Option to show or hide the refresh option from data visualizations. If cache is enabled on a dashboard, the Refresh option is always hidden.
Show export options	Option to show or hide the visualization's export types.
Header background color	Specify the color behind the title of the visualization.
Title color	Specify the text color of the title. The default title color is black, but you can choose a color that contrasts better with the header background. Only available when **Header background color** is selected.

5. Choose a data source.
   For general descriptions of the data sources, see Data sources for data visualizations.

   - Table (available in the base system). When you select a table, you can filter it by conditions.

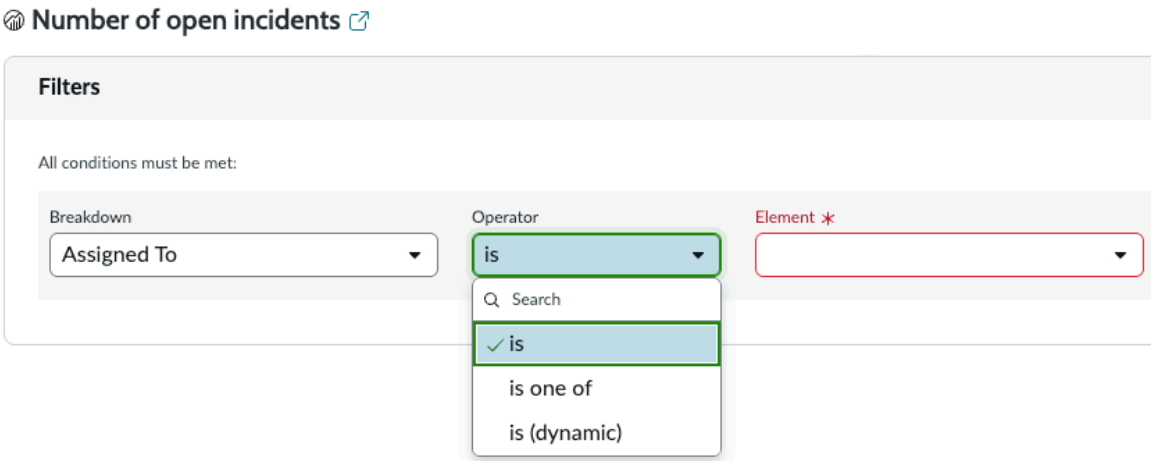
     Configured report sources appear in the **Predefined conditions** list. For more information, see Report sources.

     To help you create a custom filter, there is a preview list of records that would be included in the visualization. You can change which fields are shown as columns and the width of columns in the list actions.

     
   - Indicator (available in the base system). You can filter the indicator scores by breakdowns and elements.

     Note: Benchmark indicators are not supported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:

You might have a multiple select (is one of) or dynamic (is (dynamic)) operator on the breakdown element filter. These operators require the indicator and breakdown to support them. For more information about the configurations that support these operators, see "Is one of" and "Is (Dynamic)" operators on breakdown conditions in data visualizations.

6. Select the options for your data source.
   - If your visualization represents table data, go to Table data options for heatmap visualizations.
   - If your visualization represents indicator data, go to Indicator data options for heatmap visualizations.
7. Under **Presentation**, provide display and color information.

Field	Description
Display settings	
Show data table	Shows a table with chart and graph data for easier screen reader access. Data includes the percentage of the total for each value, when appropriate.
Show % of total in tooltip	Enable to show the percentage each data point contributes to the total alongside absolute values in the tooltip.
Data label	
Show data labels	Option to display the score for each data point.
Legend	
Show legend	Option to display the legend. Activated automatically at 400% zoom.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Legend position	Legend location relative to the chart: Above, Below, Right, or Left
Colors	
Set color type	Type of color scheme to apply to the component. The choices are: ○ Default `default`: A color from the UX Theme Properties [sys_ux_theme_property] table. The specific colors depend on which theme variant in the UX Themes [sys_ux_theme] table is applied to the instance. ○ Color range: A spectrum of colors between a color for the lowest value and a color for the highest value

8. Under **Chart interaction**, set what if anything happens when a viewer clicks a chart or a chart segment on the visualization.

Field	Description
Allow chart interaction	Enable an event to occur when a user clicks in a visualization or one of its segments.
Action	Choose the event that occurs when a user clicks in a visualization or one of its segments. Choices depend on the visualization type and data source. Applies only when **Allow chart interaction** is on. For more information, see Chart interactions in a data visualization. ○ **Go to data view** opens a list view, KPI Details page, or Usage Insights overview page relevant to the associated segment or visualization. For table data, a system property determines whether a Core UI list or a Platform Analytics list opens. For more information, see Data views for different data sources. ○ **Go to URL** opens the specified URL, which can be on the instance or external. You have the option of specifying a page name to appear in the tooltip, for those visualizations with tooltips. ○ **Drill down to chart** (Visualization Designer only) Opens a different data visualization that is filtered by the selected data. You can add a drill-down visualization for each metric on the parent visualization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The last level of drill down in the Platform Analytics experience is always a Core UI list. Records do not open in Workspace embedded lists. **Drill down to chart** supports only table data sources.

9. Select **Save**.
   Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations** to return to the Data Visualization list.

What to do next

- Add a visualization to a dashboard from the Visualization Designer
- Share a data visualization in the Visualization Designer
- Bookmark a visualization in the Visualization Designer

Table data options for heatmap visualizations

When you select a table data source for a heatmap visualization, the following Data configuration options are available.

Field	Description
Data	
Data source	You have selected a Table data source in Create a heatmap data visualization.
Metric	
Label	Label of the metric. By default it is the same as the name of the data source.
Select an aggregation	Computational method for aggregating data. The default is **Count**, which displays the number of records selected. **Note:** If you select **Count Distinct**, only unique records are counted. For example, you want to generate a report with a distinct number of users who have one or more of the roles in a given list of roles. Users with more than one role would be counted twice unless you use **Count Distinct**.
Field	Field to apply the metric to, for **Average**, **Sum**, or **Count Distinct** aggregations. You may further be able to aggregate on fields from extended tables. The data is shown in a format that matches the field type. For example, if you select an

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	integer field, such as the **Priority** field, the data is expressed as a number. If you select a duration field, such as **Business duration** on the Incident table, the aggregated data is expressed in days, hours, and minutes. If function fields were created in Report Designer for the table, they are available in the dropdown list. For more information, see Report on function fields.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Only available when **Use custom formatting** is true
Show original number in tooltips	Option to include a tooltip to show the unformatted number on point to. **Note:** Only available when **Use custom formatting** and **Enable abbreviation** are true.
Group by, for column and row	
Field for [table]	The field to group by. For example, in a visualization of incident data grouped by **Assignment group**, all incidents that belong to Software, Service Desk, and Network are placed in separate groups. If the table contains variables or question fields, you have the option to group by one of them at the end of the list of fields. **Note:** • It is not possible to group or stack data by the **Tags** field, or by certain field types, such as MEDIUMTEXT. • If you want to group by a field with continuous values, such as date or integer, the values are automatically grouped according to any report ranges that are defined for the data. For more information, see Report ranges.
Max number of groups	Select the maximum number of groups to display. Groups in excess of this number, determined by sorting, are aggregated into the Others group. You can show that aggregate with the **Show others** option. By default, you cannot show more than 50 groups. If you have the admin role, you can change this limit in the *par_viz.table_data.max_groups* system property. Data for the Max number of groups is evaluated across all periods in the time series to ensure consistent group membership across all dates in the visualization.
Show others	If **Max number of groups** is set and this option is turned on, an aggregate of the groups

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	beyond the maximum number is displayed as the Others group.
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the visualization may be grouped by. The viewer of the visualization can then select which of these items to group the data by. The viewer toggles the visibility of the selector in the visualization's More actions menu. In the additional items dialog, you can set whether this selector is visible by default by toggling **Selector visible by default**. If you select a value in **Group by**, that is the default group-by value. You do not have to select a **Group by** value to specify alternative group-by values. In this case, no default group-by value is used. For more information about setting alternative group-bys for multiple metrics, see Options for time series data visualizations with multiple metrics. For more information about the viewer experience selecting from alternative group-by values, see Select a group-by value in a data visualization as a viewer. **Important:** • Only up to three metrics on one visualization support alternative group-by. • Alternative group-by does not support data binding on the data source
Sorting	
Sort by	Sorting options of the main and alternative groups set in **Group by**. Options include: • Name: Sorts the values alphabetically by field or element name. • Value: Sorts the values numerically or by count. • Element order: If you are grouping by records on the Choice [sys_choice] table, either directly or through a breakdown, this option sorts the groups according to the value of the Sequence field. • Group bucket: Sorts the elements by bucket group, when applicable. Only available for indicator data sources and when the breakdown used for the **Group by** is based on a bucket group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• Report range: Sorts the table field values by range. Only available for table data sources and when the table field used for the **Group by** has a report range associated with it. **Note:** • The choices of what to sort by are based on the main, default **Group by**, if one is defined. This sorting applies to any alternative group-bys if possible. If the sorting criterion selected for the main group-by cannot apply to an alternative group-by (such as sorting by Element order when the alternative group-by is not on the Choice table), sorting for that group-by defaults to Value. • If no main **Group by** has been set, but alternative group-bys are defined, you can sort only by Name or Value. • Sorting is not available for Pareto bar visualizations. Pareto charts are always sorted by value in descending order.
Sort by order	Ascending or descending.
Additional settings	
Show 0 when no data is available	When toggled on, shows empty (NULL) values as zero (0). Default is true.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Info messages	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Indicator data options for heatmap visualizations

When you select an indicator data source for a heatmap visualization, the following Data configuration options are available.

Field	Description
Data	
Data source	You have selected an Indicator data source in Create a pivot table data visualization in the Visualization Designer.
Metric	
Label	Label of the metric. By default it is the same as the name of the data source.
Time aggregation	Time aggregation to apply to the metric, such as 7-day running SUM or By-month AVG. Default is the same as the indicator period. For more information, see Applying time series aggregations.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Group by	
Breakdown	List of breakdowns to choose from for grouping indicator scores.
Max number of groups	The maximum number of breakdown elements to display in columns. This property does not apply to rows.
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the visualization may be grouped by. The viewer of the visualization can then select which of these items to group the data by. The viewer toggles the visibility of the selector in the visualization's More actions menu. In the additional items dialog, you can set whether this selector is visible by default by toggling **Selector visible by default**. If you select a value in **Group by**, that is the default group-by value. You do not have to select a **Group by** value to specify alternative group-by values. In this case, no default group-by value is used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For more information about setting alternative group-bys for multiple metrics, see Options for time series data visualizations with multiple metrics. For more information about the viewer experience selecting from alternative group-by values, see Select a group-by value in a data visualization as a viewer. **Important:** • Only up to three metrics on one visualization support alternative group-by. • Alternative group-by does not support data binding on the data source
Sorting	
Sort by	Sorting options of the main and alternative groups set in **Group by**. Options include: • Name: Sorts the values alphabetically by field or element name. • Value: Sorts the values numerically or by count. • Element order: If you are grouping by records on the Choice [sys_choice] table, either directly or through a breakdown, this option sorts the groups according to the value of the Sequence field. • Group bucket: Sorts the elements by bucket group, when applicable. Only available for indicator data sources and when the breakdown used for the **Group by** is based on a bucket group. • Report range: Sorts the table field values by range. Only available for table data sources and when the table field used for the **Group by** has a report range associated with it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • The choices of what to sort by are based on the main, default **Group by**, if one is defined. This sorting applies to any alternative group-bys if possible. If the sorting criterion selected for the main group-by cannot apply to an alternative group-by (such as sorting by Element order when the alternative group-by is not on the Choice table), sorting for that group-by defaults to Value. • If no main **Group by** has been set, but alternative group-bys are defined, you can sort only by Name or Value. • Sorting is not available for Pareto bar visualizations. Pareto charts are always sorted by value in descending order.
Sort by order	Ascending or descending.
Date range	
Apply date range	When turned on, this option allows date filters on the dashboard or UIB page to apply to this visualization. The date range can also be configured in the visualization, but date filters override visualization settings.
Show data for selected period as	Available when **Apply date range** is selected. The indicator aggregation logic for how scores from the selected period are shown, such as Latest score, Sum, or Average.
Set absolute period	Option to set absolute start and end date. Available when **Apply date range** is selected.
Period start	Start date for the absolute period. This property applies only when **Set absolute period** is true.
Period end	End date for the absolute period. This property applies only when **Set absolute period** is true. Select **Use current date for period end** to automatically update the end date to the current date. (Not available if the start date is in the future.)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Period	Time interval for each date period. • Days `D` • Months `M` • Years `Y` This property applies only when **Set absolute period** is false.
Number of periods	Number of date periods to display. This property applies only when **Set absolute period** is true.
Additional settings	
Show 0 when no data is available	When toggled on, shows empty (NULL) values as zero (0). Default is true.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Heatmap visualization example

The heatmap data visualization shows the relationship between two table fields or indicator breakdowns as a spectrum of shading between two colors. The changes in color as you move along the axes reveal patterns in the value of one or both fields or breakdowns.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

By observing how cell colors change across each axis, you can observe if there are any patterns in value for one or both variables.

Procedure

1. Follow the first steps to Create a heatmap data visualization:
   a. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
   b. Select **Create data visualization**.
   c. From the Multidimensional charts, select the Heatmap visualization type.
2. For the moment, skip the header and border section and move to the data source.
   a. Select **Add data source**.
   b. Choose the Incident [incident] table.
   c. Because this visualization shows open incidents, let's add the Incidents.Open condition in the Filters section.
   d. **Optional:** Select **Run** to preview the records that the visualization will be based on.
   e. Select **Add this source**.
   A heatmap data visualization with the current value of the selected data appears in the Visualization Designer. Because the only information you've given is that the visualization represents open incidents, you see only a single block indicating closed incidents. You add columns and rows in the next step.
3. Now that you can see the visualization, let's add some context for the user.
   a. Expand the Header and border section.
   b. Select **Show header** and provide the title `Open incidents - Priority and Assignment Group`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When **Show header** is selected, you can add a title and a description. The chart title isn't necessarily the same as the visualization name. The visualization name identifies it in the Visualization Designer and in a list. The chart title appears within the visualization.

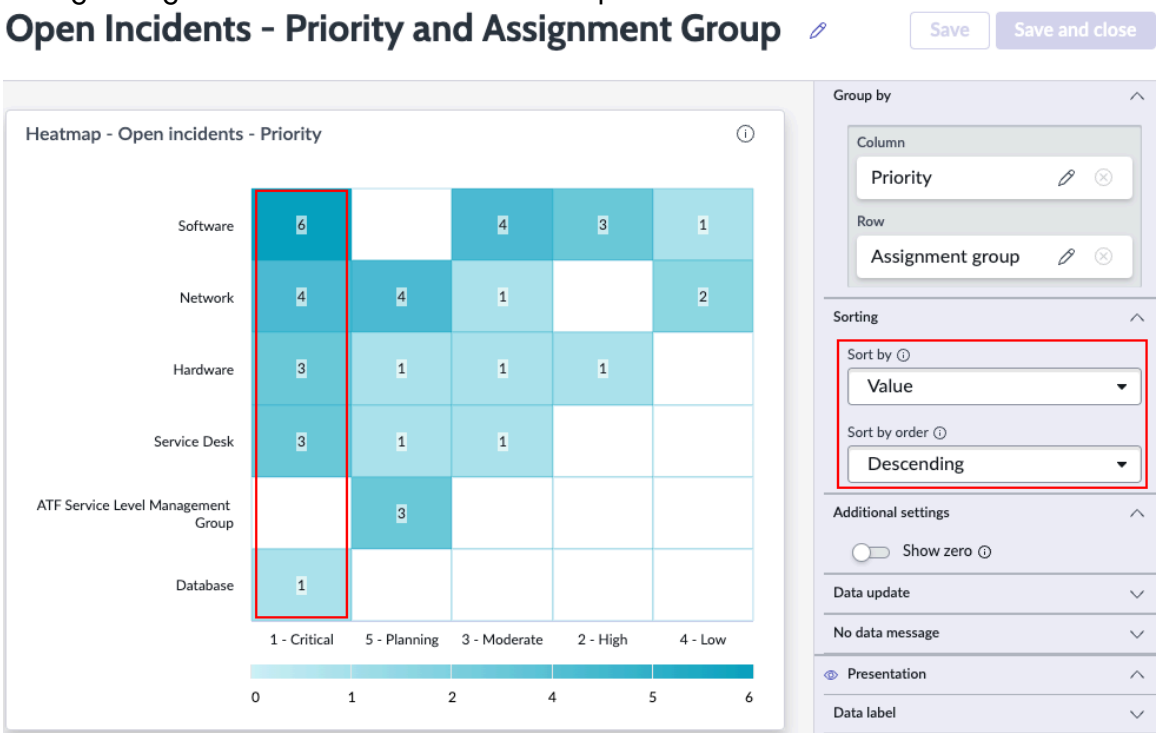
c. Enter a description of the visualization: `Open incidents of all assignment groups grouped by priority and assignment group.`
While the description and title fields aren't required, this information makes the visualization easier to understand on a dashboard and easier to identify in a list.

d. Select **Save** and give the report the title `Heatmap - Open Incidents - Priority and Assignment Group`.

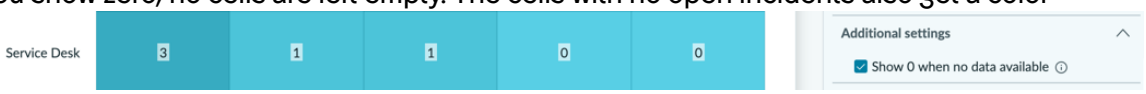
4. Skip the Metric section.
5. Under Group by, add one column and multiple rows to show the data from multiple perspectives.
   a. Add the **Priority** column to show the top level of information.
   b. Add the row **Assignment group**.
6. Under Sorting, choose the field to sort by and the order of the sorting.

   a. Choose to sort by `Value`.

   b. Choose `Descending` for the sort order.
   The columns are ordered with those assignment groups having the highest number of incidents at the top.



7. Under Additional settings, select **Show 0 when no data available**.
   When you show zero, no cells are left empty. The cells with no open incidents also get a color coding.



8. Under Data update, configure how the audience interacts with the visualization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Follow filters**.
This option enables the visualization to follow interactive filters on the dashboards it's placed on that are based on the same table.

b. Select **Show filter icon** to show the number of filters applied to the visualization.
For example, if dashboard filters limit the value of the visualization, the icon indicates that you're seeing the number of open incidents that match the filters. You can then check to see which filters are in effect.

c. Select **Enable drilldown** to let viewers navigate to relevant information by selecting a data point in the chart.
Some visualizations only drill down to the list of associated data. Table data is generally restricted by access control lists (ACLs) and viewers may not see all of the associated records.

This control mirrors **Allow chart interaction**. Under Chart Interaction, you can also select the destination of drilling down.

9. Choose how to show what the cells in the heatmap describe.
   - **Show data labels** controls whether the value is shown in the heatmap's cells. This option is enabled by default. When it's inactive, only the colors give an idea of the cells' relative values.
   - **Show Legend** gives examples of the color coding for each cell in the visualization and its associated value. You can choose whether to show the legend and where to place it.

   a. Select **Show legend** to enable legend options.

   b. Play with where to place the legend around the visualization.
   You can choose to place the legend above, below, or to the right or left of the visualization.

10. Play with the color settings.
    The default color type has shades of blue. You can also choose a custom color range with specified colors for upper and lower values.

Result
You have created a heatmap visualization sorted on two values and configured its values, labels, and data updates. You have also configured the visualization's colors.

Create a horizontal or vertical bar data visualization

Use bar visualizations to show information in segments that are proportional to the values they represent. Vertical bar and horizontal bar visualizations compare numeric values that represent either nominal or ordinal data.

Before you begin
Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

For more information about this visualization type, see Bar Visualization Overview on the ServiceNow Developer Site. This site gives information about Horizontal and Vertical bar data

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

visualization components in the UI Builder, and some configuration options may differ from the Visualization Designer.

About this task

In general, use horizontal bars to graph nominal data, such as the number of users in each assignment group. Use vertical bars to graph ordinal data, such as the number of open incidents in different age buckets. For information about the use of a Bar visualization in a dashboard, see the Developer Site.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select **Create data visualization**.
3. Select the horizontal bar ( ) or vertical bar ( ) visualization type.
4. Configure the **Header and border**. Header and border options are the same for all data sources.

Header and border fields	Description
Show header	The visualization header, including title and icons.
Show header separator	Option to display a line separating the header from the rest of the component.
Chart title	Title of the visualization.
Description	A short overview about the visualization that the end user sees. Descriptions help users find the visualization.
Wrap title	Option to wrap long titles onto a second line. If false, displays an ellipsis to truncate long titles.
Wrap labels	Select to wrap long elements labels on the axis.
Max label size, px	Specify the maximum label size for element names on the axis. Default=100 px.
Truncation type	Specify where to truncate long labels with an ellipsis. Options are Beginning, Middle, and End.
Show border	Option to display a line around the component.
Bare	Option to remove padding around data visualization to provide more compact positioning on the page. Only available when **Show border** is turned off.
Show refresh option	Option to show or hide the refresh option from data visualizations. If cache is enabled on a dashboard, the Refresh option is always hidden.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header and border fields	Description
Show export options	Option to show or hide the visualization's export types.
Header background color	Specify the color behind the title of the visualization.
Title color	Specify the text color of the title. The default title color is black, but you can choose a color that contrasts better with the header background. Only available when **Header background color** is selected.

5. Choose a data source.
   For general descriptions of the data sources, see Data sources for data visualizations.

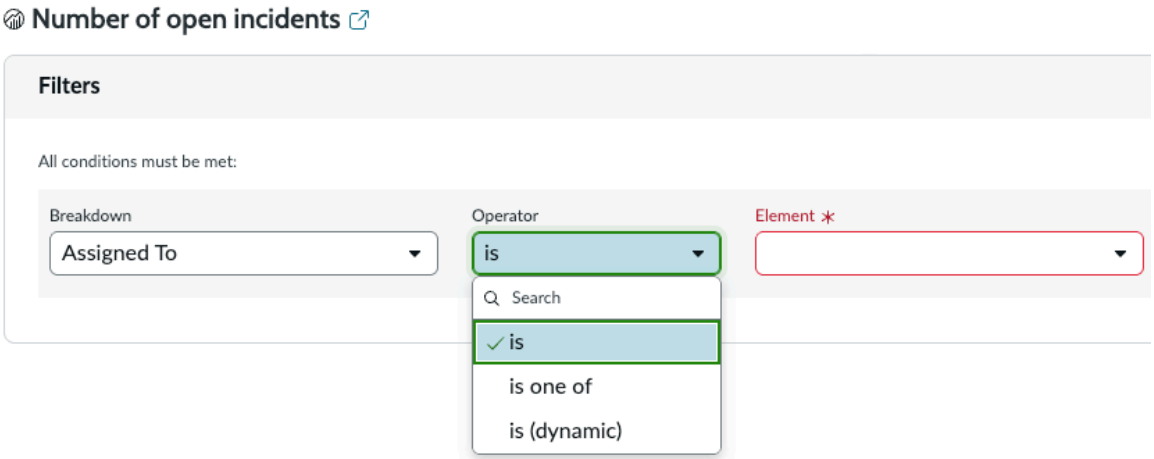
   - Table (available in the base system). When you select a table, you can filter it by custom or preconfigured conditions. Custom conditions can include questions or Service Catalog variables.

     Configured report sources appear in the **Predefined conditions** list. For more information, see Report sources.

     To help you create a custom filter, there is a preview list of records that would be included in the visualization. You can change which fields are shown as columns and the width of columns in the list actions.

     
   - Indicator (available in the base system). You can filter the indicator scores by breakdowns and elements.

     Note: Benchmark indicators are not supported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

You might have a multiple select (is one of) or dynamic (is (dynamic)) operator on the breakdown element filter. These operators require the indicator and breakdown to support them. For more information about the configurations that support these operators, see "Is one of" and "Is (Dynamic)" operators on breakdown conditions in data visualizations.

- Usage Insights (available with the User Experience PAR Integration application, to users with a required role). Choose one of up to three KPIs included with this application, depending on the visualization type. For more information, see User Experience Analytics data sources for data visualizations.

Note: You can choose multiple data sources for this visualization. However, all data sources must be of the same type: table, indicator, or Usage Insights. For more information, see Multiple data sources.

6. Select the options for your data source.
   - If your visualization represents table data, go to Table data options for horizontal and vertical bar visualizations.
   - If your visualization represents indicator data, go to Indicator data options for horizontal and vertical bar visualizations.
   - If your visualization represents Usage Insights data, go to Usage Insights data options for bar visualizations.
7. Under **Presentation**, provide display and color information.

Note: For horizontal bar visualizations, the X axis is the primary. For vertical bar visualizations, the Y axis is primary.

Field	Description
Display settings	
Show only one data point in tooltip	When turned on, the tooltip shows only the data point being hovered over. When turned off, the tooltip shows all data points. Default: Off, except when zoom is 400%, which automatically turns it on.
Show data table	Shows a table with chart and graph data for easier screen reader access. Data includes the percentage of the total for each value, when appropriate.
Show % of total in tooltip	Enable to show the percentage each data point contributes to the total alongside absolute values in the tooltip.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
X and Y axis (Some options are only available on the primary or secondary axis. On horizontal bar visualizations, the X axis is primary. On vertical bar visualizations, the Y axis is primary.)	
Hide axis	Option to hide the primary axis.
Axis title	Title to display on the X or Y axis.
Axis range - from	Starting point for the values on the primary axis.
Axis range - to	End point for the values on the primary axis.
Axis position	Position of the primary axis. Options include: ○ Left ○ Right This property applies only when **Hide axis** is false. If there is more than one primary axis, such as multiple Y axes on a vertical bar visualization, you can set each axis position separately.
Show grid	Shows a grid of fine lines perpendicular to the primary axis, to help align values against that axis.
Axis style	Style of the primary axis. ○ Clean `clean`: Adds a straight line to the primary axis. ○ No tick lines `noTicks`: Option to remove all marks from the primary axis. ○ Standard `default`: Adds a line and tick marks to the primary axis.
Wrap labels	Wrap long labels in the secondary axis.
Max label size, px.	The length in pixels at which the label of the secondary axis is wrapped or truncated.
Truncation type	Determines where to truncate long labels for the secondary axis. Options include: ○ Start `start` ○ Middle `middle` ○ End `end`
Legend	
Show legend	Option to display the legend. Activated automatically at 400% zoom.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Show legend value	Option to display the value corresponding to the area of the chart you hover on. The value displays as a tooltip and in the chart legend.
Legend position	Legend location relative to the chart: Above, Below, Right, or Left
Horizontal alignment	Horizontal alignment of elements in the legend: Start, Center, or End
Max legend item width, px	Number of pixels after which the item in the legend is truncated.
Expand legend vertically	When turned on, the legend contents take as much space as needed to fit the legend without scrolling, instead of the maximum 2 lines.
Data label	
Show data labels	Option to display the score for each data point.
Colors	
Set color type	Type of color scheme to apply to the component. Options include: ○ Default: A color or set of colors that come from the UX Theme that is applied to the instance. For more information, see Working with themes in Next Experience. ○ Color palette: List of color palettes to select from predefined system palettes in the Chart Color Scheme [pa_chart_color_schemes] table. For grouped or stacked data, the colors apply in order from highest value to lowest. For multiple data sources, palette colors apply in the order of data sources. For example, the first color of a palette applies to the first data source, and the second palette color applies to the second source. All visualizations that use the same color palette show the same colors, regardless of what data they display. ○ Single color/Colors per metric: Select a single color in the **Set value color** field. Interacting with that field opens a selector where you can choose the color from either a set of icons or from a list. You can also search for a color. Entering a search value

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	has the selector show you a list of colors filtered by that search value. If the visualization has more than one metric, you see the Colors per metric option instead. This option lets you select a single color for each metric. ○ Fixed element color: Use a specific color from the Chart Colors table [sys_report_chart_color] for each element. All data visualizations that use fixed element colors show the same element, such as critical incidents in the Global scope, in the same color. This option is available only for Table data sources and only if no more than one data source or metric is added, and a Group by is defined.

8. Under **Chart interaction**, set what if anything happens when a viewer clicks a chart or a chart segment on the visualization.

Field	Description
Allow chart interaction	Enable an event to occur when a user clicks in a visualization or one of its segments.
Action	Choose the event that occurs when a user clicks in a visualization or one of its segments. Choices depend on the visualization type and data source. Applies only when **Allow chart interaction** is on. For more information, see Chart interactions in a data visualization. ○ **Go to data view** opens a list view, KPI Details page, or Usage Insights overview page relevant to the associated segment or visualization. For table data, a system property determines whether a Core UI list or a Platform Analytics list opens. For more information, see Data views for different data sources. ○ **Go to URL** opens the specified URL, which can be on the instance or external. You have the option of specifying a page name to appear in the tooltip, for those visualizations with tooltips. ○ **Apply as filter** filters all data visualizations on the dashboard by the value of the selected segment, where applicable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: **Apply as filter** is available only for table and indicator data sources. It does not work when the Group by field is a duration field. ○ **Drill down to chart** (Visualization Designer only) Opens a different data visualization that is filtered by the selected data. You can add a drill-down visualization for each metric on the parent visualization. **Note:** The last level of drill down in the Platform Analytics experience is always a Core UI list. Records do not open in Workspace embedded lists. **Drill down to chart** supports only table data sources.

9. Select **Save**.
   Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations** to return to the Data Visualization list.

What to do next

- Add a visualization to a dashboard from the Visualization Designer
- Share a data visualization in the Visualization Designer
- Bookmark a visualization in the Visualization Designer

Table data options for horizontal and vertical bar visualizations

When you select a table data source for a horizontal or vertical bar visualization, the following Data configuration options are available.

Field	Description
Data	
Data source	You have selected a Table data source in Create a horizontal or vertical bar data visualization.
Metric You can set multiple metrics. You can set whether dashboard filters apply to individual metrics. For more information, see Options for time series data visualizations with multiple metrics.	
Label	Label of the metric. By default it is the same as the name of the data source.
Select an aggregation	Computational method for aggregating data. The default is **Count**, which displays the number of records selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If you select **Count Distinct**, only unique records are counted. For example, you want to generate a report with a distinct number of users who have one or more of the roles in a given list of roles. Users with more than one role would be counted twice unless you use **Count Distinct**.
Field	Field to apply the metric to, for **Average**, **Sum**, or **Count Distinct** aggregations. You may further be able to aggregate on fields from extended tables. The data is shown in a format that matches the field type. For example, if you select an integer field, such as the **Priority** field, the data is expressed as a number. If you select a duration field, such as **Business duration** on the Incident table, the aggregated data is expressed in days, hours, and minutes. If function fields were created in Report Designer for the table, they are available in the dropdown list. For more information, see Report on function fields.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Group by	
Field for [table]	The field to group by. For example, in a visualization of incident data grouped by **Assignment group**, all incidents that belong to Software, Service Desk, and Network are placed in separate groups. If the table contains variables or question fields, you have the option to group by one of them at the end of the list of fields. Only one **Group by** can be defined in the Pareto chart. The **Alternative Group By** can be defined for a Pareto visualization. For vertical bar, horizontal bar, and pivot reports with multiple data sources: If you group the first source by a choice field, you can group the second source by any applicable choice field. • It is not possible to group or stack data by the **Tags** field, or by certain field types, such as MEDIUMTEXT. • If you want to group by a field with continuous values, such as date or integer, the values are automatically grouped according to any report ranges that are defined for the data. For more information, see Report ranges.
Max number of groups	Select the maximum number of groups to display. Groups in excess of this number, determined by sorting, are aggregated into the Others group. You can show that aggregate with the **Show others** option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	By default, you cannot show more than 50 groups. If you have the admin role, you can change this limit in the *par_viz.table_data.max_groups* system property. Data for the Max number of groups is evaluated across all periods in the time series to ensure consistent group membership across all dates in the visualization.
Show others	If **Max number of groups** is set and this option is turned on, an aggregate of the groups beyond the maximum number is displayed as the Others group.
Hide elements with values of 0	When toggled on, elements with a value of NULL or 0, such as rows or data points, are not displayed. This control is not available when the metric is COUNT.
Group by	The first group by determines the bars in the visualization. Select a second value to stack by. For example, select Priority first to show the number of tasks of each priority and then choose Active to stack the active and inactive tasks of each priority.
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the visualization may be grouped by. The viewer of the visualization can then select which of these items to group the data by. The viewer toggles the visibility of the selector in the visualization's More actions menu. In the additional items dialog, you can set whether this selector is visible by default by toggling **Selector visible by default**. If you select a value in **Group by**, that is the default group-by value. You do not have to select a **Group by** value to specify alternative group-by values. In this case, no default group-by value is used. For more information about setting alternative group-bys for multiple metrics, see Options for time series data visualizations with multiple metrics. For more information about the viewer experience selecting from alternative group-by values, see Select a group-by value in a data visualization as a viewer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Important: • Only up to three metrics on one visualization support alternative group-by. • Alternative group-by does not support data binding on the data source
Sorting	
Sort by	Sorting options of the main and alternative groups set in **Group by**. Options include: • Name: Sorts the values alphabetically by field or element name. • Value: Sorts the values numerically or by count. • Element order: If you are grouping by records on the Choice [sys_choice] table, either directly or through a breakdown, this option sorts the groups according to the value of the Sequence field. • Group bucket: Sorts the elements by bucket group, when applicable. Only available for indicator data sources and when the breakdown used for the **Group by** is based on a bucket group. • Report range: Sorts the table field values by range. Only available for table data sources and when the table field used for the **Group by** has a report range associated with it. **Note:** • The choices of what to sort by are based on the main, default **Group by**, if one is defined. This sorting applies to any alternative group-bys if possible. If the sorting criterion selected for the main group-by cannot apply to an alternative group-by (such as sorting by Element order when the alternative group-by is not on the Choice table), sorting for that group-by defaults to Value. • If no main **Group by** has been set, but alternative group-bys are defined, you can sort only by Name or Value. • Sorting is not available for Pareto bar visualizations. Pareto charts are always sorted by value in descending order.
Sort by order	Ascending or descending.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Limitations: • You can only order by the **Group By** or the **Stack by** field. • You can only order by one field. It isn't possible to sort by Additional group by fields.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Follow filter per metric	If the visualization shows multiple metrics, toggle filter following on and off for each metric. Default: All metrics follow filters if Follow filters is on. For more information, see Following filters per metric.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Indicator data options for horizontal and vertical bar visualizations

When you select an indicator data source for a horizontal or vertical bar visualization, the following Data configuration options are available.

Field	Description
Data	
Data source	You have selected an Indicator data source in Create a horizontal or vertical bar data visualization.
Metric You can set multiple metrics. You can set whether dashboard filters apply to individual metrics. For more information, see Options for time series data visualizations with multiple metrics.	
Label	Label of the metric. By default it is the same as the name of the data source.
Time aggregation	Time aggregation to apply to the metric, such as 7-day running SUM or By-month AVG. Default is the same as the indicator period. For more information, see Applying time series aggregations.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Group by	
Breakdown	List of breakdowns to choose from for grouping indicator scores. **Important:** • Scripted breakdowns are not supported in dashboard filters. • Only two levels of breakdown are supported in total, including data visualization and dashboard filters.
Group by	The first group by determines the bars in the visualization. Configure additional group by elements to enable presentation based on additional items in the data. **Note:** It is not possible to stack bars in data visualizations based on indicator data.
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the visualization may be grouped by. The viewer of the visualization can then select which of these items to group the data by. The viewer toggles the visibility of the selector in the visualization's More actions menu. In the additional items dialog, you can set whether this selector is visible by default by toggling **Selector visible by default**. If you select a value in **Group by**, that is the default group-by value. You do not have to select a **Group by** value to specify alternative

Field	Description
	group-by values. In this case, no default group-by value is used. For more information about setting alternative group-bys for multiple metrics, see Options for time series data visualizations with multiple metrics. For more information about the viewer experience selecting from alternative group-by values, see Select a group-by value in a data visualization as a viewer. **Important:** • Only up to three metrics on one visualization support alternative group-by. • Alternative group-by does not support data binding on the data source
Sorting	
Sort by	Sorting options of the main and alternative groups set in **Group by**. Options include: • Name: Sorts the values alphabetically by field or element name. • Value: Sorts the values numerically or by count. • Element order: If you are grouping by records on the Choice [sys_choice] table, either directly or through a breakdown, this option sorts the groups according to the value of the Sequence field. • Group bucket: Sorts the elements by bucket group, when applicable. Only available for indicator data sources and when the breakdown used for the **Group by** is based on a bucket group. • Report range: Sorts the table field values by range. Only available for table data sources and when the table field used for the **Group by** has a report range associated with it.

Field	Description
	Note: • The choices of what to sort by are based on the main, default **Group by**, if one is defined. This sorting applies to any alternative group-bys if possible. If the sorting criterion selected for the main group-by cannot apply to an alternative group-by (such as sorting by Element order when the alternative group-by is not on the Choice table), sorting for that group-by defaults to Value. • If no main **Group by** has been set, but alternative group-bys are defined, you can sort only by Name or Value. • Sorting is not available for Pareto bar visualizations. Pareto charts are always sorted by value in descending order.
Sort by order	Ascending or descending. Limitations: • You can only order by the **Group By** or the **Stack by** field. • You can only order by one field. It is not possible to sort by Additional group by fields.
Date range	
Apply date range	When turned on, this option allows date filters on the dashboard or UIB page to apply to this visualization. The date range can also be configured in the visualization, but date filters override visualization settings.
Show data for selected period as	Available when **Apply date range** is selected. The indicator aggregation logic for how scores from the selected period are shown, such as Latest score, Sum, or Average.
Set absolute period	Option to set absolute start and end date. Available when **Apply date range** is selected.
Period start	Start date for the absolute period. This property applies only when **Set absolute period** is true.
Period end	End date for the absolute period.

© 2026 ServiceNow, Inc. All rights reserved.

Field	Description
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Usage Insights data options for bar visualizations

When you select a Usage Insights data source for a horizontal or vertical bar visualization, the following Data configuration options are available.

Note: If you add a Platform Analytics data visualization with Usage Insights (UXA) data to an inline dashboard, the default drilldown for that data visualization is to open the corresponding UXA analytics page. This feature provides a quick and efficient way to drill down and explore specific user behavior from your Platform Analytics dashboard.

Field	Description
Data	
Data source	You have selected a Usage Insights data source in Create a horizontal or vertical bar data visualization.
Metric You can set multiple metrics. You can set whether dashboard filters apply to individual metrics. For more information, see Options for time series data visualizations with multiple metrics.	
Metric	Label of the metric. By default it is the same as the name of the data source: Events or Sessions. For sessions, you can configure the metric to reflect the number of sessions, average session duration, average pages per session, or average sessions per user.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Group by	
Event property	Properties of the Usage Insights data source. **Note:** Available only for Events and Sessions metrics, in which case it is mandatory.
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the visualization may be grouped by. The viewer of the visualization can then select which of these items to group the data by. The viewer toggles the visibility of the selector in the visualization's More actions menu. In the

Field	Description
	additional items dialog, you can set whether this selector is visible by default by toggling **Selector visible by default**. If you select a value in **Group by**, that is the default group-by value. You do not have to select a **Group by** value to specify alternative group-by values. In this case, no default group-by value is used. For more information about setting alternative group-bys for multiple metrics, see Options for time series data visualizations with multiple metrics. For more information about the viewer experience selecting from alternative group-by values, see Select a group-by value in a data visualization as a viewer. **Important:** • Only up to three metrics on one visualization support alternative group-by. • Alternative group-by does not support data binding on the data source
Sorting	
Sort by	Sorting options of the main and alternative groups set in **Group by**. Options include: • Name: Sorts the values alphabetically by field or element name. • Value: Sorts the values numerically or by count. • Element order: If you are grouping by records on the Choice [sys_choice] table, either directly or through a breakdown, this option sorts the groups according to the value of the Sequence field. • Group bucket: Sorts the elements by bucket group, when applicable. Only available for indicator data sources and when the breakdown used for the **Group by** is based on a bucket group. • Report range: Sorts the table field values by range. Only available for table data sources and when the table field used for the **Group by** has a report range associated with it.

Field	Description
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Following filters per metric

If you are showing multiple metrics in a horizontal or vertical bar visualization, you can have filters on a dashboard apply only to specific metrics.

If **Follow filters** is activated on a time series or bar visualization that shows multiple metrics, the configuration panel shows an expandable item called **Follow filters per metric**. Expand this item to toggle filter following on or off for each metric.

For example, consider a bar visualization that shows the Number of open problems and the Average age of open problems. You can configure this visualization so that the Number of open problems follows any applicable filters on a dashboard, but the Average age of problems does not.

Bar visualization examples

Bar visualizations enable you to show the comparative size or frequency of different categories or groups, for example, sales in different regions or over different periods of time.

Horizontal bar use case

Use the horizontal bar to show data by named values, such as departments, agencies, or regions.

Vertical bar use case

Use vertical bar to show numbered values, such as age or monetary ranges, or time periods.

Horizontal bar visualization example

Horizontal bar visualizations enable you to show the comparative size or frequency of different categories or groups, such as incident priority or sales group. You can also add a group by or stack by to a bar visualization, such as the assignment group.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

Use the horizontal bar visualization type to compare different categories or groups and clearly show the distribution of a data set. In this example, you show incidents by priority and stack them by assignment group.

Procedure

1. Follow the first steps to Create a horizontal or vertical bar data visualization:
   a. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
   b. Select **Create data visualization**.
   c. From the Bars section, select the Horizontal bar visualization type.
2. For the moment, skip the header and border section and move to the data source.
   a. Select **Add data source**.
   b. Choose the Incident [incident] table.
   c. Because this visualization shows open incidents, let's add the Incidents.Open condition in the Filters section.
   With this filter selected, the visualization only shows the number of active incidents.
   d. **Optional:** Select **Run** to preview the records that the visualization will be based on.
   e. Select **Add this source**.

   A horizontal bar data visualization with the current value of the selected data appears in the Visualization Designer. Because the only information you've given is that the visualization represents active incidents, you

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

see only a single block. You add priority and assignment group in step

4. 
3. Now that you can see the visualization, let's add some context for the user.

   a. Expand the Header and border section.

   b. Select **Show header** and provide the title `Number of open incidents - Priority and Assignment Group`.
   When **Show header** is selected, you can add a title and a description. The chart title isn't necessarily the same as the visualization name. The visualization name identifies it in the Visualization Designer and in a list. The chart title appears within the visualization.

   c. Enter a description of the visualization: `Number of open incidents of all priorities grouped by assignment group`.
   While the description and title fields aren't required, this information makes the visualization easier to understand on a dashboard and easier to identify in a list.

   d. Select **Save** and give the report the title `Horizontal bar - Open incidents`.

4. Skip the Metric section.

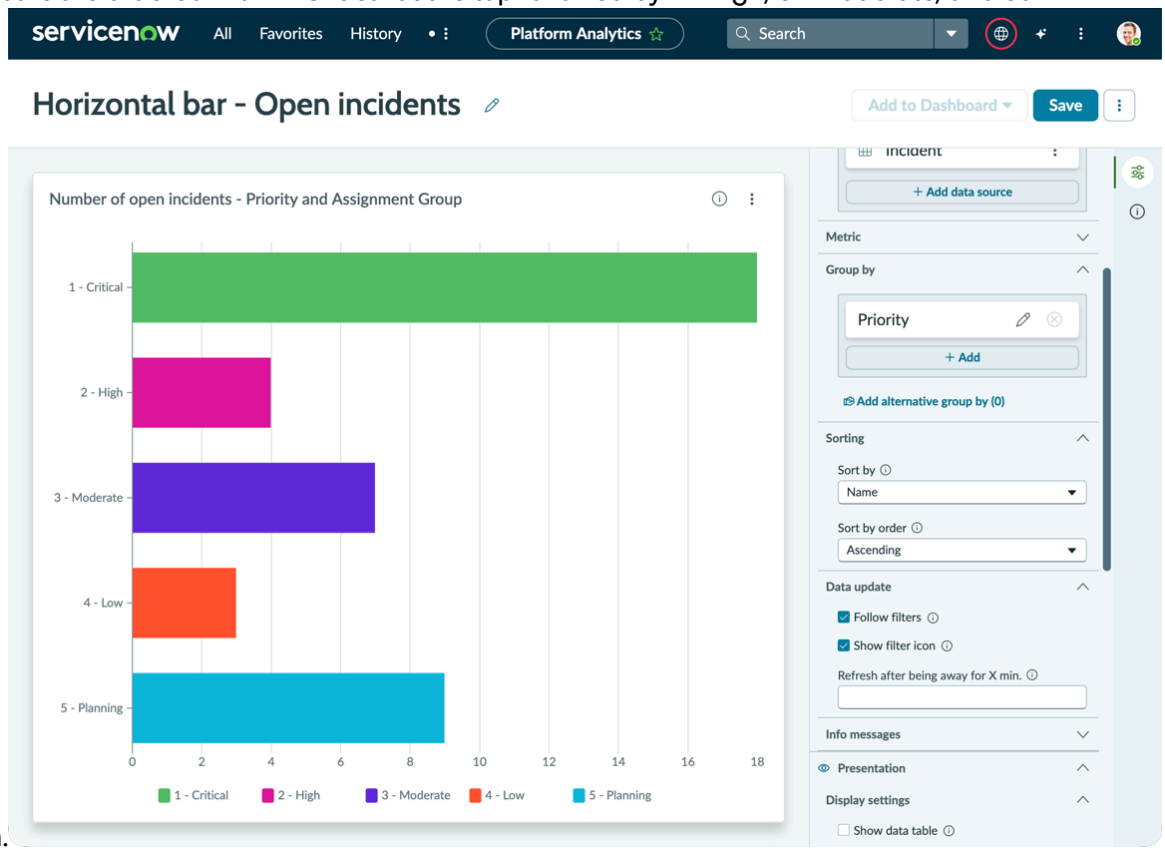
5. Add a Group by to differentiate the information in the visualization.
   Under Group by, select **Active** and change the grouping to `Priority` and select **Apply**.

6. Under Sorting, choose the field to sort by and the order of the sorting.

   a. Choose to sort by `Name`.
   The priority names each start with a number so that the bars are 1 - Critical, 2 - High, and so forth.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Choose `Ascending` for the sort order.
The bars are ordered with 1 - Critical at the top followed by 2 - High, 3 - Moderate, and so forth.



7. Under Data update, configure how the audience interacts with the visualization.

a. Select **Follow filters**.
This option enables the visualization to follow interactive filters on the dashboards it's placed on that are based on the same table.

b. Select **Show filter icon** to show the number of filters applied to the visualization.
For example, if dashboard filters limit the value of the visualization, the icon indicates that you're seeing the number of open incidents that match the filters. You can then check to see which filters are in effect.

c. Select **Enable drilldown** to let viewers navigate to relevant information by selecting a data point in the chart.
Some visualizations only drill down to the list of associated data. Table data is generally restricted by access control lists (ACLs) and viewers may not see all of the associated records.

This control mirrors **Allow chart interaction**. Under Chart Interaction, you can also select the destination of drilling down.

8. Configure the X axis.
You can specify several options including the text on the axis, the range of values, and the axis position. You can even select **Hide axis** if you want to hide the axis and its values and show only the comparative sizes of the bars.

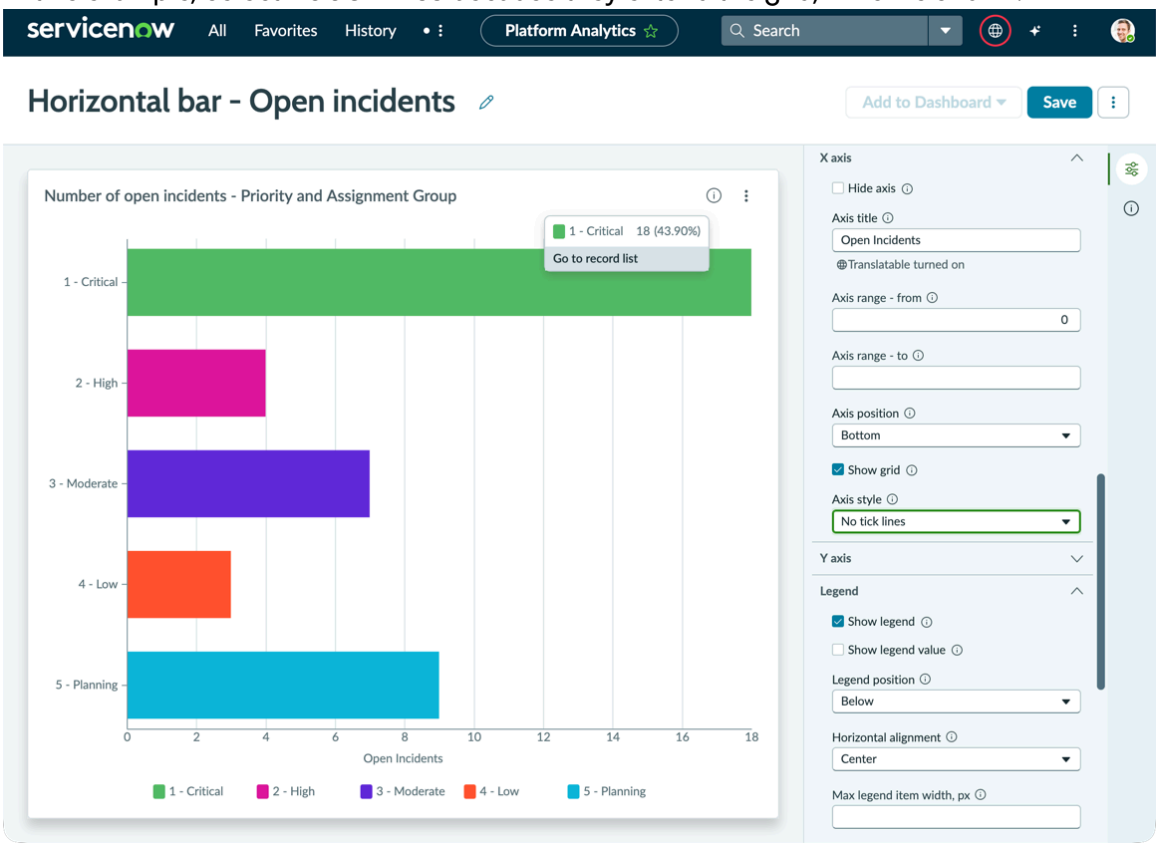
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. You can give the X axis the title `Open Incidents`, but this information is already in the title of the visualization, so leave it empty.

b. Enter `0` for the Axis range's **From** value.
There are cases in which a larger value makes sense, but the downside is that the relative sizes of the bars become less accurate, and may be misleading.

c. Keep the default empty value for the Axis range's **To** value.
When this value is empty, the highest value in the range is the same as the highest value of the largest bar in the visualization. In this example, that value is 18.

d. The Show grid and Axis style options are minor aesthetic changes that you can adjust to your own preference.
In this example, select **No tick lines** because they extend the grid, which is shown.



9. Configure the Y axis.
Y axis configuration addresses how the labels are displayed for the vertical axis. In this example, you have relatively short labels. However, if the maximum label size is smaller than the labels, you can choose to truncate or wrap the label text. You can truncate the text at the beginning of the label or at the end.

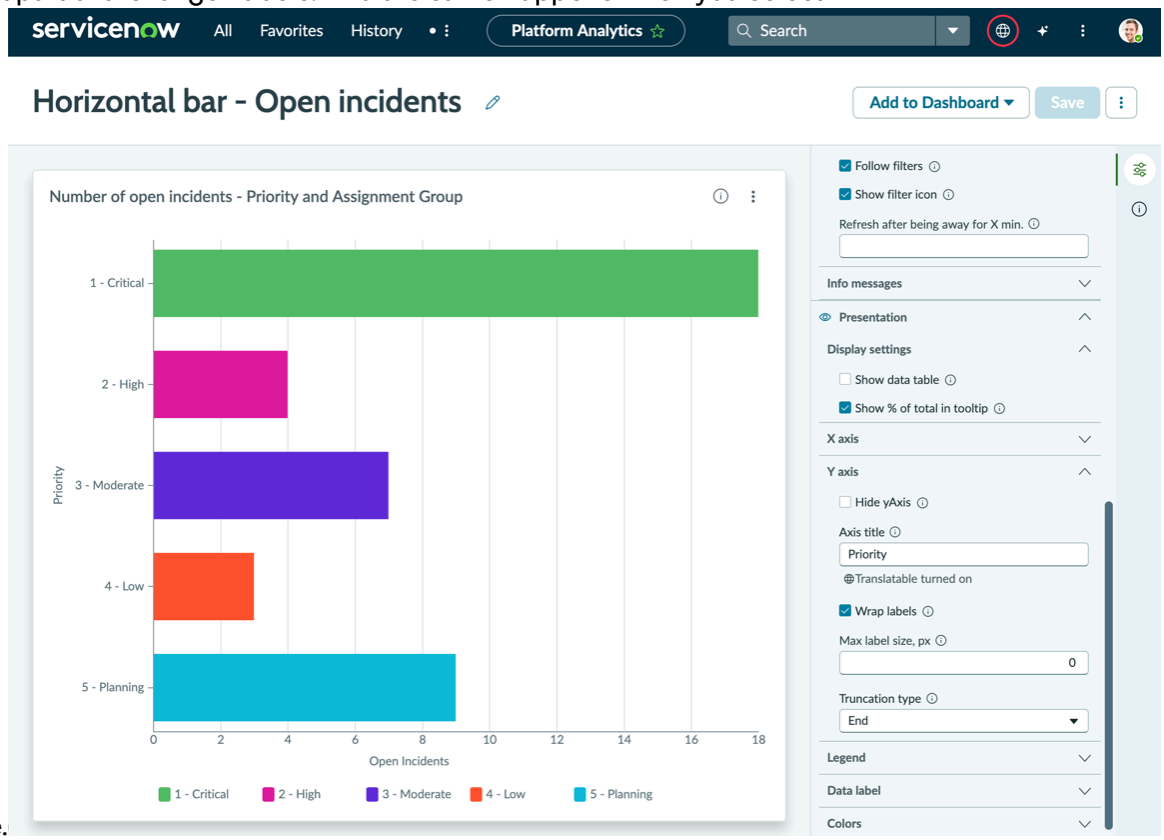
a. You can give the Y axis the title `Priority`, but this information is already in the title of the visualization, so leave it empty.

b. Select **Wrap labels**.
You don't see any change in the label's display because the Max label size of 0 means that the largest label determines the size.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Change the Max label size to 50.
The labels wrap to additional lines. The Truncation type doesn't make a difference, because the labels are wrapped.

d. Clear the **Wrap labels** option.
When you change the Truncation type, you can see that End replaces the ends of the longer labels with three dots. Select Start and the three dots replace the first part of the longer labels. And the same happens when you select middle.



10. Configure the visualization's legend.
The legend gives examples of the color coding for each value on the Y axis. You can choose whether to show the legend, where to place it and how much to show. Ideal placement depends on the size of its container on a dashboard. If you have more horizontal space, place the legend to the left or right. If you have more vertical space, place it above or below.

a. Select **Show legend** and **Show legend value**.
Show legend value adds the number associated with the metric. In this case, 18 is added to the **1 - Critical** incidents because that is how many Critical incidents there are. Alternately, you can choose **Show data labels** (in the Data label section) to place this value on the bar itself.

b. Place the legend above the visualization.
You can choose to place the legend above, below, or to the right or left of the visualization.

c. Select the Center **Horizontal alignment**.
Start and End move the legend to the left or right of the visualization. (Start and End are right and left for languages that read from right to left.)

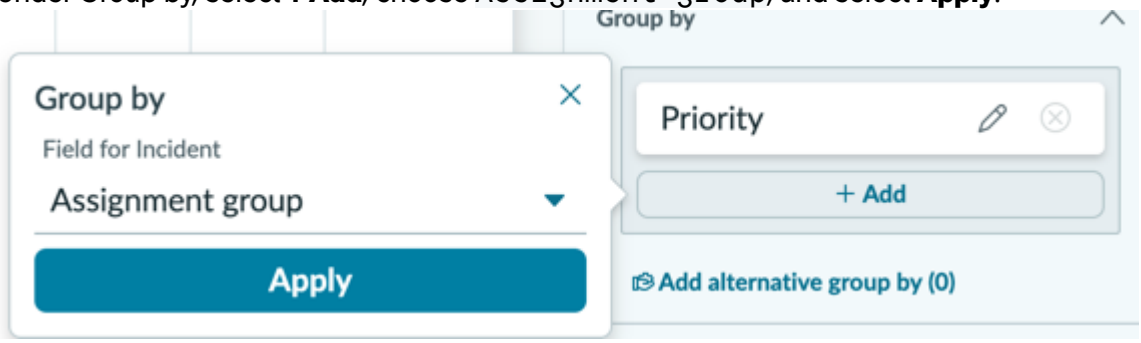
d. Change the Max legend item width to give those values more or less room.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. **Expand legend vertically** provides additional lines to the legend so that users don't have to scroll beyond the default two lines.
In this example, you only need one line for the five incident priorities. In a visualization that has bars for 15 or 20 different regions or assignment groups, you might want to show more in the legend without a scrollbar.

11. Add an additional Group by to provide more information in the visualization.
Remember that you called this visualization `Number of open incidents - Priority and Assignment Group`. Add the assignment group.

a. Under Group by, select **+ Add**, choose `Assignment group`, and select **Apply**.

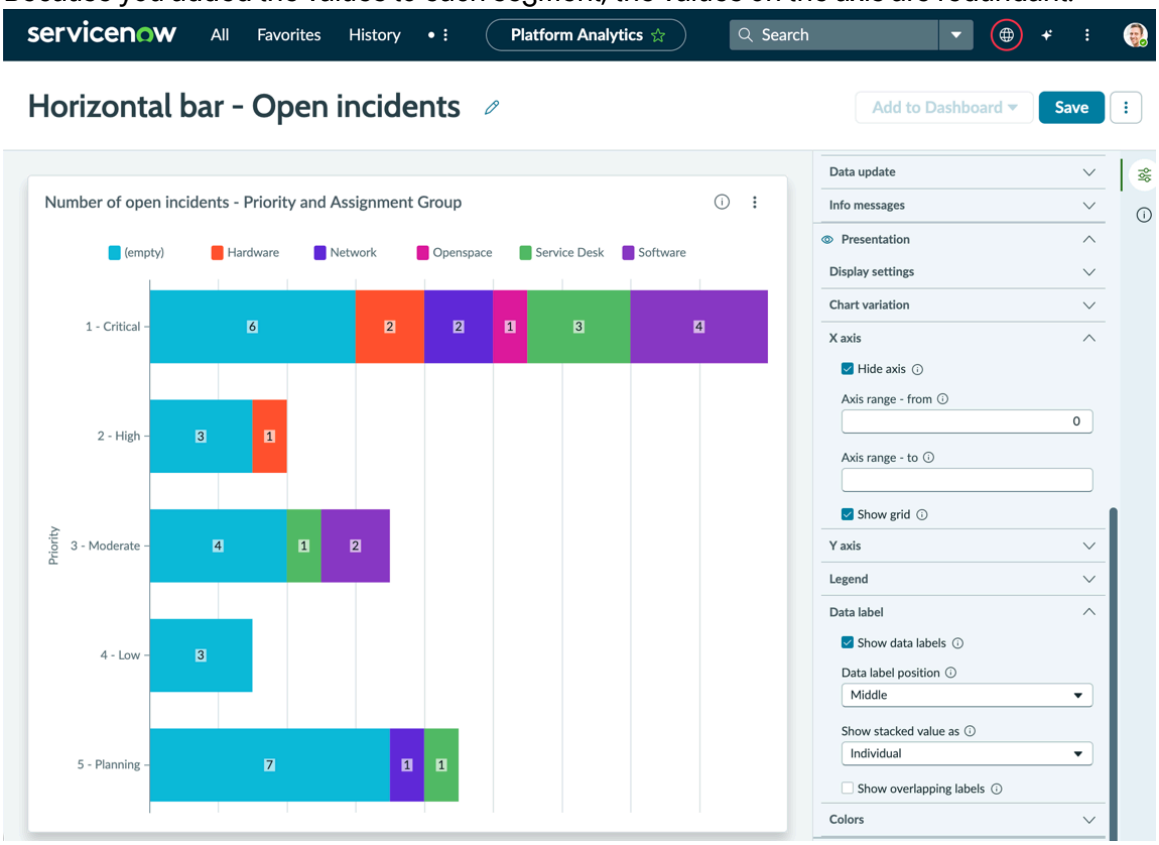


b. Show the data labels in the middle.
With the additional group by, you have stacked values: Assignment group on top of Priority. You can choose to show the data value as the individual number of incidents per assignment group, as a cumulative value (each segment added to the previous value), or simply show the total. Choose Individual to show each segment's value.

c. Hide the X Axis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Because you added the values to each segment, the values on the axis are redundant.



12. Choose the **Default** color type for the visualization.
    - **Default** applies the colors associated with your UX theme.
    - **Color palette** uses hues of the same color, for example Blue Light to Dark.

    - **Fixed element** specifies the same color for each element, such as hardware incidents. All data visualizations that use fixed element colors show the same element in the same color.

Result

You have created a horizontal bar visualization grouped on two fields. You have also configured the visualization's labeling, legend and ranges.

Vertical bar visualization example

Vertical bar visualizations enable you to show the comparative size or frequency of different categories or groups, for example, sales in different regions or over different periods of time. The X axis of a vertical usually shows a numerical value such years or date ranges, age ranges, or salary ranges.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

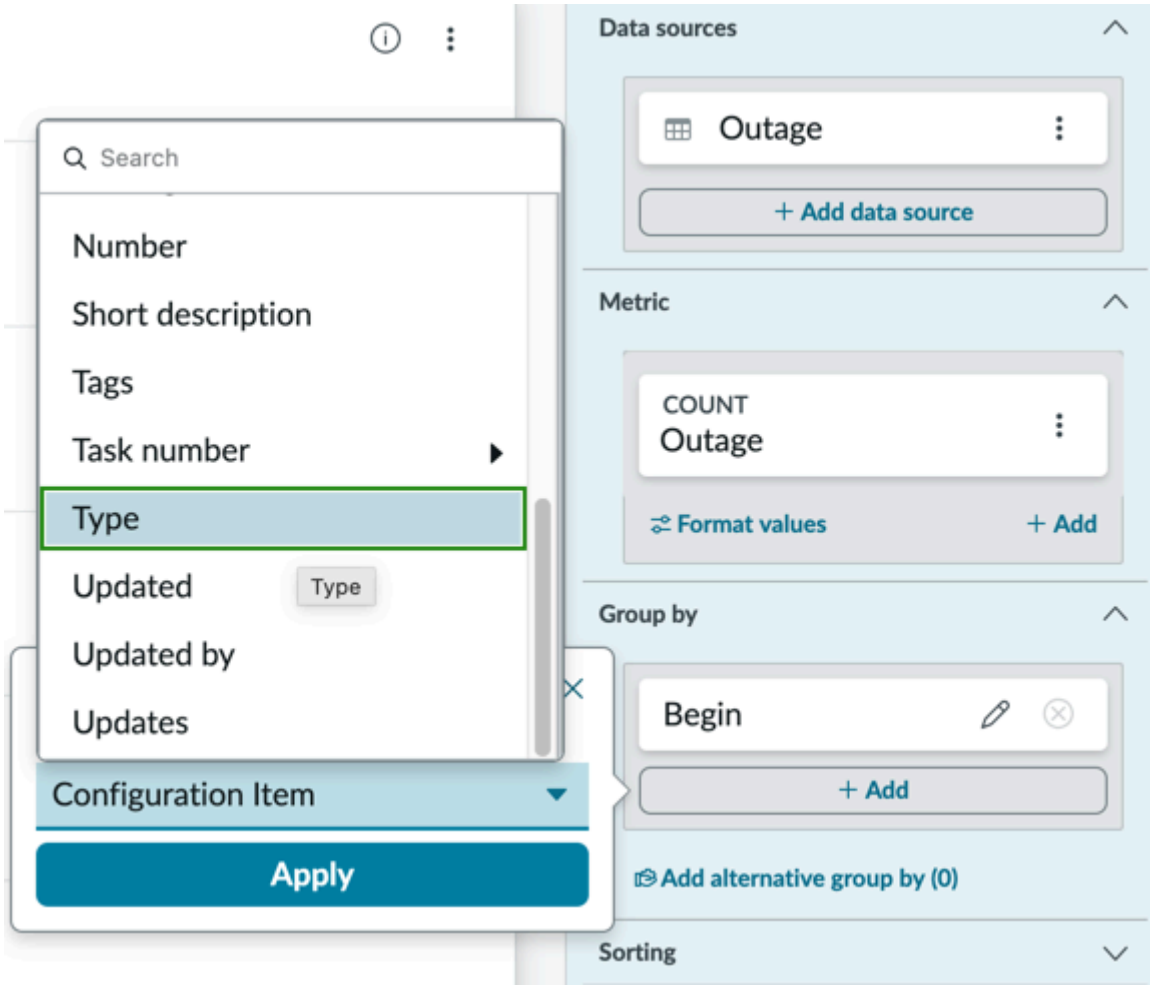
Use the vertical bar visualization type to compare different categories or groups and clearly show the distribution of a data set. In this example, you show outages by type.

Procedure

1. Follow the first steps to Create a horizontal or vertical bar data visualization:
   a. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
   b. Select **Create data visualization**.
   c. From the Bars section, select the Vertical bar visualization type.
2. For the moment, we can skip the header and border section and move to the data source.
   a. Select **Add data source**.
   b. Choose the Outage [cmdb_ci_outage] table.
   This table lists outages of various services.
   c. **Optional:** Select **Run** to preview the records that the visualization will be based on.
   d. Select **Add this source**.

   A vertical bar data visualization with the current value of the selected data appears in the Visualization Designer. The visualization is grouped by the first field (alphabetically) in the table, Begin. This is useful because it shows the outages distributed by a time measurement.
3. Now that you can see the visualization, let's add some context for the user.
   a. Expand the Header and border section.
   b. Select **Show header** and provide the title `Outages by type`.
   When **Show header** is selected, you can add a title and a description. The chart title isn't necessarily the same as the visualization name. The visualization name identifies it in the Visualization Designer and in a list. The chart title appears within the visualization.
   c. Enter a description of the visualization: `CMDB outages grouped by when they began and stacked by type.`.
   While the description and title fields aren't required, this information makes the visualization easier to understand on a dashboard and easier to identify in a list.
   d. Select **Save** and give the report the title `Vertical bar - CMDB outages`.
4. Skip the Metric section.
5. In the Group by section, select **Add** to differentiate the information in the visualization.
   Select **Type** and choose **Apply**. The columns now show different colors to distinguish the different types of outages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Under Sorting, maintain the Sort by `Value` and Sort by order `Descending`.
   These options show one logical way of visualizing the data. Change the sorting options to see what works best for you.
7. Under Data update, configure how the audience interacts with the visualization.

   a. Select **Follow filters**.
   This option enables the visualization to follow interactive filters on the dashboards it's placed on that are based on the same table.

   b. Select **Show filter icon** to show the number of filters applied to the visualization.
   For example, if dashboard filters limit the value of the visualization, the icon indicates that you're seeing the number of open incidents that match the filters. You can then check to see which filters are in effect.

   c. Select **Enable drilldown** to let viewers navigate to relevant information by selecting a data point in the chart.
   Some visualizations only drill down to the list of associated data. Table data is generally restricted by access control lists (ACLs) and viewers may not see all of the associated records.

   This control mirrors **Allow chart interaction**. Under Chart Interaction, you can also select the destination of drilling down.

8. Chart variations show the data one of three different ways:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Stacked

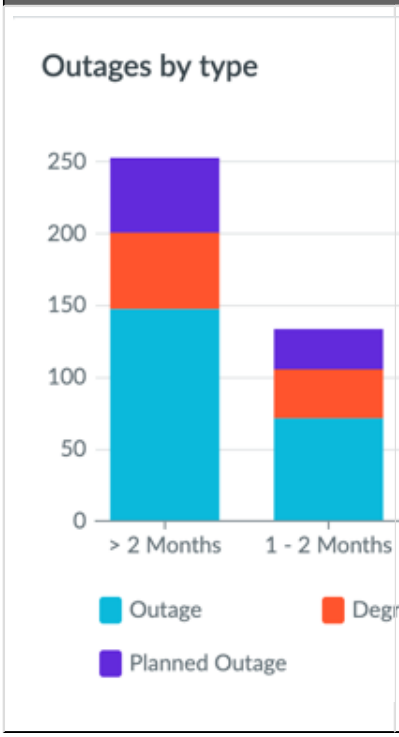
Shows the grouped elements (type in this case) stacked one type over the next.

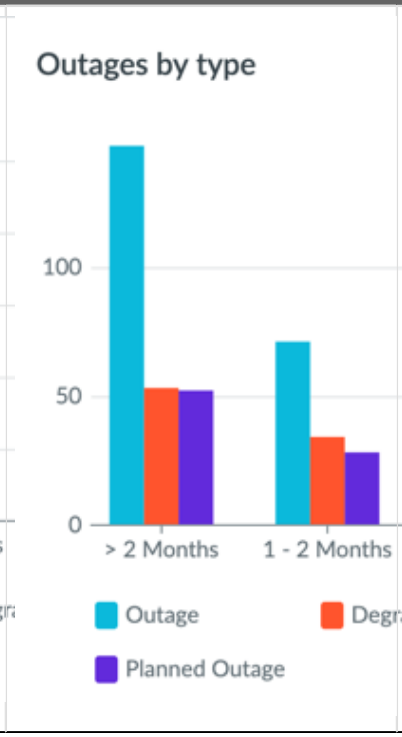
Side-by-side

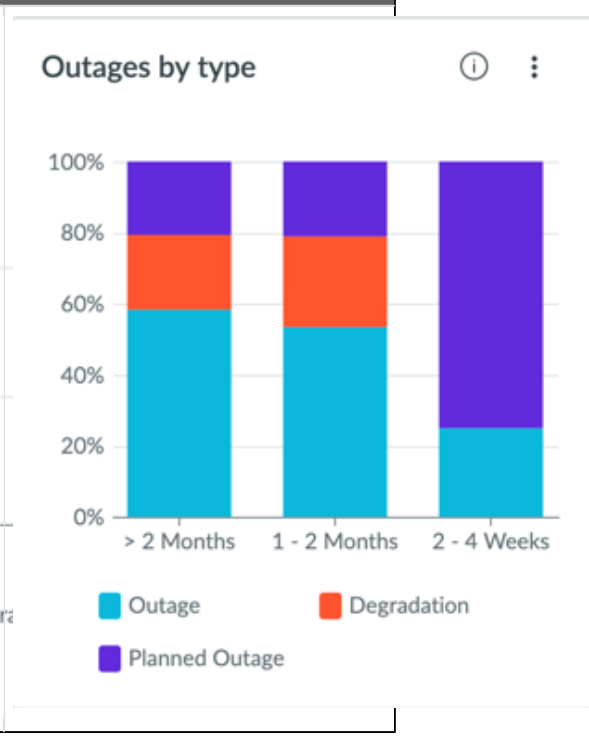
Shows a different bar for each type.

Normalized

Shows stacked bars of the same height for each group, with the colors showing the percent of the total.

Stacked	Side-by-side	Normalized
		






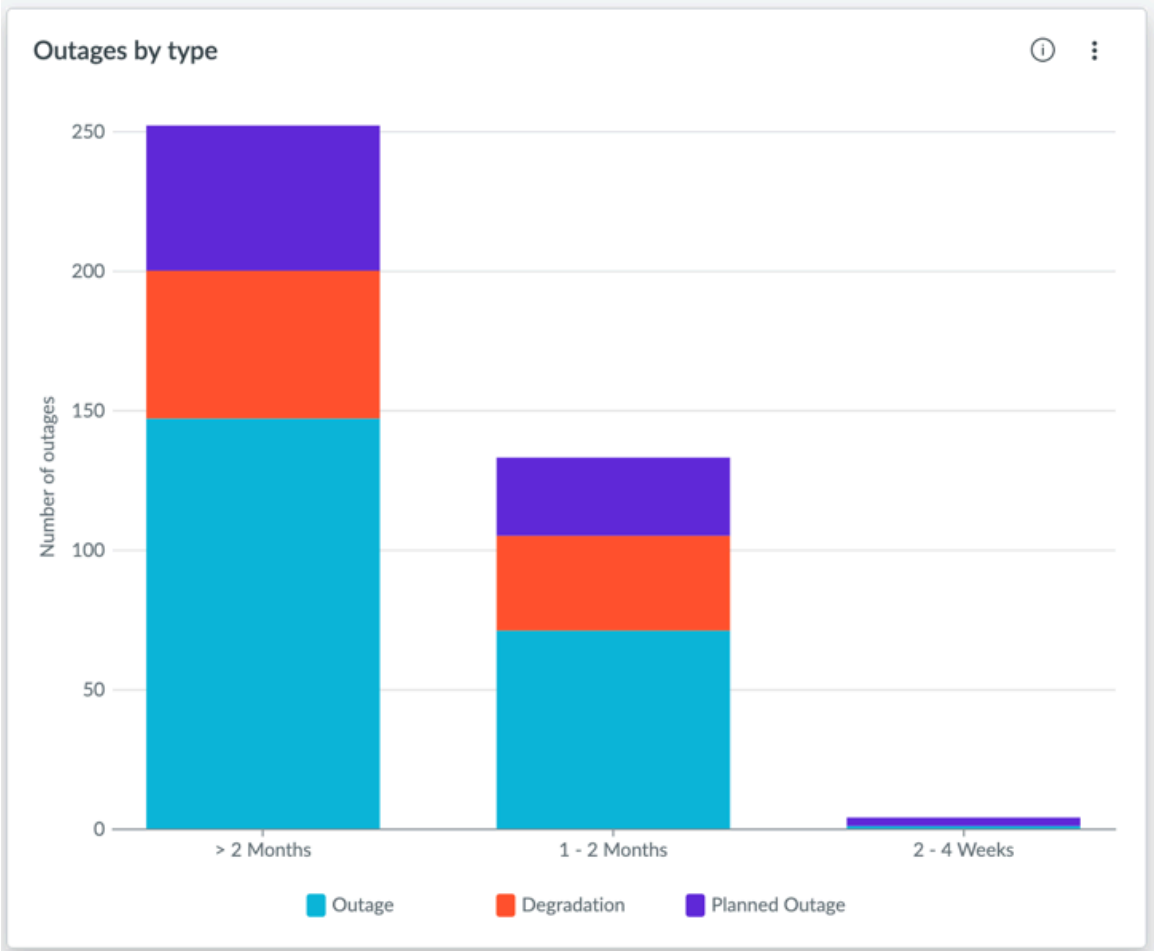
9. Configure the Y axis.
   You can specify several options including the text on the axis, the range of values, and the axis position. You can even select **Hide axis** if you want to hide the axis and its values and show only the comparative sizes of the bars.

   a. You can give the Y axis the title `Number of outages`, but this information is already in the title of the visualization, so leave it empty.

   b. You can specify lower and upper ranges for the bars, but because both of these values are useful, leave **Axis range - from** and **Axis range - to** empty.
   There are cases in which a larger **From** value makes sense, but the downside is that the relative sizes of the bars become less accurate. When the **To** value is empty, the highest value in the range is the same as the highest value of the largest bar in the visualization.

   c. The Show grid and Axis style options are minor aesthetic changes that you can adjust to your own preference.
   In this example, select **Clean** because it's a little bit neater.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



d. Change the Max label size to 50.
The labels wrap to additional lines. The Truncation type doesn't make a difference, because the labels are wrapped.

10. Configure the X axis.
You can specify several options including the text on the axis, the range of values, and the axis position.

X axis configuration addresses how the labels are displayed for the vertical axis. In this example, you have relatively short labels. However, if the maximum label size is smaller than the labels, you can choose to truncate or wrap the label text. You can truncate the text at the beginning of the label or at the end.

a. You can give the X axis the title `CMDB Outages`, but this information is already in the title of the visualization, so leave it empty.

b. Select **Wrap labels**.
You don't see any change in the label's display because the Max label size of 0 means that the largest label determines the size.

11. Configure the visualization's legend.
The legend gives examples of the color coding for each value on the X axis. You can choose whether to show the legend, where to place it and how much to show. Ideal placement depends on the size of its container on a dashboard. If you have more horizontal space, place the legend to the left or right. If you have more vertical space, place it above or below.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Show legend** and **Show legend value**.
Show legend value adds the number associated with the selected metric. Alternately, you can choose **Show data labels** (in the Data label section) to place these value on the bar itself.

b. Place the legend above the visualization.
You can choose to place the legend above, below, or to the right or left of the visualization.

c. Select the Center **Horizontal alignment**.
Start and End move the legend to the left or right of the visualization. (Start and End are right and left for languages that read from right to left.)

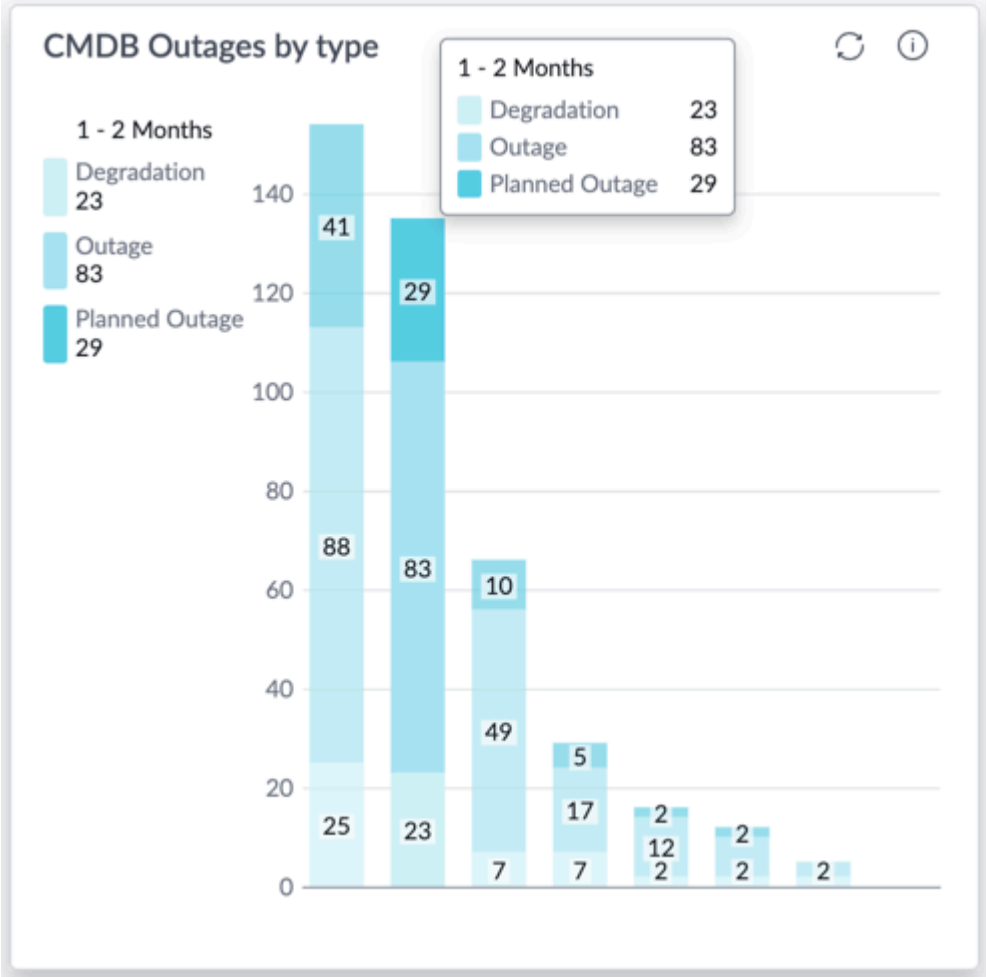
d. Change the Max legend item width to give those values more or less room.

e. **Expand legend vertically** provides additional lines to the legend so that users don't have to scroll beyond the default two lines.
In this example, you only need one line for the three outage types. In a visualization that has bars for 15 or 20 different regions or assignment groups, you might want to show more in the legend without a scrollbar.

12. Choose the **Default** color type for the visualization.

- **Default** applies the colors associated with your UX theme.
- **Color palette** uses hues of the same color, for example Sequential - Blues Light to Dark.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- **Fixed element color** specifies the same color for each element, such as hardware incidents. All data visualizations that use fixed element colors show the same element in the same color.

Result

You have created a vertical bar visualization grouped on two fields. You have also configured the visualization's labeling, legend and ranges.

Create a pie or donut data visualization

Use pie, donut, and semi-donut visualizations to compare the size of parts of a data set to the whole. The segments of these visualizations should total to 100%.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

For more information about this visualization type, see Pie/Donut Visualization Overview on the ServiceNow Developer Site.

About this task

For information about the use of a Pie, Donut, or Semi-donut visualization in a dashboard, see the Developer Site. This site gives information about Pie and donut data visualization components in the UI Builder, and some configuration options may differ from the Visualization Designer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select **Create data visualization**.
3. Select the pie ( ), donut ( ), or semi-donut ( ) visualization type.
4. Configure the **Header and border**. Header and border options are the same for all data sources.

Header and border fields	Description
Show header	The visualization header, including title and icons.
Show header separator	Option to display a line separating the header from the rest of the component.
Chart title	Title of the visualization.
Description	A short overview about the visualization that the end user sees. Descriptions help users find the visualization.
Wrap title	Option to wrap long titles onto a second line. If false, displays an ellipsis to truncate long titles.
Wrap labels	Select to wrap long elements labels on the axis.
Max label size, px	Specify the maximum label size for element names on the axis. Default=100 px.
Truncation type	Specify where to truncate long labels with an ellipsis. Options are Beginning, Middle, and End.
Show border	Option to display a line around the component.
Bare	Option to remove padding around data visualization to provide more compact positioning on the page. Only available when **Show border** is turned off.
Show refresh option	Option to show or hide the refresh option from data visualizations. If cache is enabled on a dashboard, the Refresh option is always hidden.
Show export options	Option to show or hide the visualization's export types.
Header background color	Specify the color behind the title of the visualization.
Title color	Specify the text color of the title. The default title color is black, but you can choose a color that contrasts better with the header

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header and border fields	Description
	background. Only available when **Header background color** is selected.

5. Choose a data source.
   For general descriptions of the data sources, see Data sources for data visualizations.

   - Table (available in the base system). When you select a table, you can filter it by custom or preconfigured conditions. Custom conditions can include questions or Service Catalog variables.

     Configured report sources appear in the **Predefined conditions** list. For more information, see Report sources.

     To help you create a custom filter, there is a preview list of records that would be included in the visualization. You can change which fields are shown as columns and the width of columns in the list actions.

     
   - Indicator (available in the base system). You can filter the indicator scores by breakdowns and elements.

     Note: Benchmark indicators are not supported.

     
     Note:

     You might have a multiple select (is one of) or dynamic (is (dynamic)) operator on the breakdown element filter. These operators require the indicator and breakdown to support them. For more information about the configurations that support these operators, see "Is one of" and "Is (Dynamic)" operators on breakdown conditions in data visualizations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Usage Insights (available with the User Experience PAR Integration application, to users with a required role). Choose one of up to three KPIs included with this application, depending on the visualization type. For more information, see User Experience Analytics data sources for data visualizations.

6. Select the options for your data source.
   - If your visualization represents table data, go to Table data options for pie and donut visualizations.
   - If your visualization represents indicator data, go to Indicator data options for pie and donut visualizations.
   - If your visualization represents Usage Insights data, go to Usage Insights data options for pie and donut visualizations
7. Under **Presentation**, provide display and color information.

Field	Description
Display settings	
Show data table	Shows a table with chart and graph data for easier screen reader access. Data includes the percentage of the total for each value, when appropriate.
Show % of total in tooltip	Enable to show the percentage each data point contributes to the total alongside absolute values in the tooltip.
Legend	
Show legend	Option to display the legend. Activated automatically at 400% zoom.
Show legend value	Option to display the value corresponding to the area of the chart you hover on. The value displays as a tooltip and in the chart legend.
Legend position	Legend location relative to the chart: Above, Below, Right, or Left
Legend orientation	Options for how to display the register. ○ Horizontal `horizontal`: Option to display the legend horizontally. ○ Vertical `vertical`: Option to display the legend vertically up to five lines. This property applies only when **Legend position** is Below.
Horizontal alignment	Horizontal alignment of elements in the legend: Start, Center, or End

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Max legend item width, px	Number of pixels after which the item in the legend is truncated.
Expand legend vertically	When turned on, the legend contents take as much space as needed to fit the legend without scrolling, instead of the maximum 2 lines.
Data label	
Show data labels	Option to display the score for each data point.
Colors	
Set color type	Type of color scheme to apply to the component. Options include: ○ Default: A color or set of colors that come from the UX Theme that is applied to the instance. For more information, see Working with themes in Next Experience. ○ Color palette: List of color palettes to select from predefined system palettes in the Chart Color Scheme [pa_chart_color_schemes] table. For grouped or stacked data, the colors apply in order from highest value to lowest. For multiple data sources, palette colors apply in the order of data sources. For example, the first color of a palette applies to the first data source, and the second palette color applies to the second source. All visualizations that use the same color palette show the same colors, regardless of what data they display. ○ Fixed element color: Use a specific color from the Chart Colors table [sys_report_chart_color] for each element. All data visualizations that use fixed element colors show the same element, such as critical incidents in the Global scope, in the same color. This option is available only for Table data sources and only if no more than one data source or metric is added, and a Group by is defined.

8. Under **Chart interaction**, set what if anything happens when a viewer clicks a chart or a chart segment on the visualization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chart interaction

Field	Description
Allow chart interaction	Enable an event to occur when a user clicks in a visualization or one of its segments.
Action	Choose the event that occurs when a user clicks in a visualization or one of its segments. Choices depend on the visualization type and data source. Applies only when **Allow chart interaction** is on. For more information, see Chart interactions in a data visualization. ○ **Go to data view** opens a list view, KPI Details page, or Usage Insights overview page relevant to the associated segment or visualization. For table data, a system property determines whether a Core UI list or a Platform Analytics list opens. For more information, see Data views for different data sources. ○ **Go to URL** opens the specified URL, which can be on the instance or external. You have the option of specifying a page name to appear in the tooltip, for those visualizations with tooltips. ○ **Apply as filter** filters all data visualizations on the dashboard by the value of the selected segment, where applicable. **Note:** **Apply as filter** is available only for table and indicator data sources. It does not work when the Group by field is a duration field. ○ **Drill down to chart** (Visualization Designer only) Opens a different data visualization that is filtered by the selected data. You can add a drill-down visualization for each metric on the parent visualization. **Note:** The last level of drill down in the Platform Analytics experience is always a Core UI list. Records do not open in Workspace embedded lists. **Drill down to chart** supports only table data sources.

9. Select **Save**.
   Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations** to return to the Data Visualization list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Add a visualization to a dashboard from the Visualization Designer
- Share a data visualization in the Visualization Designer
- Bookmark a visualization in the Visualization Designer

Table data options for pie and donut visualizations

When you select a table data source for a pie or donut visualization, the following Data configuration options are available.

Field	Description
Data	
Data source	You have selected a Table data source in Create a pie or donut data visualization.
Metric	
Label	Label of the metric. By default it is the same as the name of the data source.
Select an aggregation	Computational method for aggregating data. The default is **Count**, which displays the number of records selected. **Note:** If you select **Count Distinct**, only unique records are counted. For example, you want to generate a report with a distinct number of users who have one or more of the roles in a given list of roles. Users with more than one role would be counted twice unless you use **Count Distinct**.
Field	Field to apply the metric to, for **Average**, **Sum**, or **Count Distinct** aggregations. You may further be able to aggregate on fields from extended tables. The data is shown in a format that matches the field type. For example, if you select an integer field, such as the **Priority** field, the data is expressed as a number. If you select a duration field, such as **Business duration** on the Incident table, the aggregated data is expressed in days, hours, and minutes. If function fields were created in Report Designer for the table, they are available in the dropdown list. For more information, see Report on function fields.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Group by	
Field for [table]	The field to group by. For example, in a visualization of incident data grouped by **Assignment group**, all incidents that belong to Software, Service Desk, and Network are placed in separate groups. If the table contains variables or question fields, you have the option to group by one of them at the end of the list of fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • It is not possible to group or stack data by the **Tags** field, or by certain field types, such as MEDIUMTEXT. • If you want to group by a field with continuous values, such as date or integer, the values are automatically grouped according to any report ranges that are defined for the data. For more information, see Report ranges.
Max number of groups	Select the maximum number of groups to display. Groups in excess of this number, determined by sorting, are aggregated into the Others group. You can show that aggregate with the **Show others** option. By default, you cannot show more than 50 groups. If you have the admin role, you can change this limit in the *par_viz.table_data.max_groups* system property. Data for the Max number of groups is evaluated across all periods in the time series to ensure consistent group membership across all dates in the visualization.
Show others	If **Max number of groups** is set and this option is turned on, an aggregate of the groups beyond the maximum number is displayed as the Others group.
Hide elements with values of 0	When toggled on, elements with a value of NULL or 0, such as rows or data points, are not displayed. This control is not available when the metric is COUNT.
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the visualization may be grouped by. The viewer of the visualization can then select which of these items to group the data by. The viewer toggles the visibility of the selector in the visualization's More actions menu. In the additional items dialog, you can set whether this selector is visible by default by toggling **Selector visible by default**. If you select a value in **Group by**, that is the default group-by value. You do not have to select a **Group by** value to specify alternative group-by values. In this case, no default group-by value is used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For more information about setting alternative group-bys for multiple metrics, see Options for time series data visualizations with multiple metrics. For more information about the viewer experience selecting from alternative group-by values, see Select a group-by value in a data visualization as a viewer. **Important:** • Only up to three metrics on one visualization support alternative group-by. • Alternative group-by does not support data binding on the data source
Sorting	
Sort by	Sorting options of the main and alternative groups set in **Group by**. Options include: • Name: Sorts the values alphabetically by field or element name. • Value: Sorts the values numerically or by count. • Element order: If you are grouping by records on the Choice [sys_choice] table, either directly or through a breakdown, this option sorts the groups according to the value of the Sequence field. • Group bucket: Sorts the elements by bucket group, when applicable. Only available for indicator data sources and when the breakdown used for the **Group by** is based on a bucket group. • Report range: Sorts the table field values by range. Only available for table data sources and when the table field used for the **Group by** has a report range associated with it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • The choices of what to sort by are based on the main, default **Group by**, if one is defined. This sorting applies to any alternative group-bys if possible. If the sorting criterion selected for the main group-by cannot apply to an alternative group-by (such as sorting by Element order when the alternative group-by is not on the Choice table), sorting for that group-by defaults to Value. • If no main **Group by** has been set, but alternative group-bys are defined, you can sort only by Name or Value. • Sorting is not available for Pareto bar visualizations. Pareto charts are always sorted by value in descending order.
Sort by order	Ascending or descending.
Additional settings	
Show total value	Option to show the overall total value. Value is still hidden if it does not fit in the donut, due to width/height settings, page resizing, or similar issues. Clicking the total value opens a list of contributing table records or KPI Details for the indicator.
Show metric label	Option to show the metric label. In donut charts, the value is not shown if it cannot fit the donut.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Indicator data options for pie and donut visualizations

When you select an indicator data source for a pie or donut visualization, the following Data configuration options are available.

Field	Description
Data	
Data source	You have selected an Indicator data source in Create a pie or donut data visualization.
Metric	
Label	Label of the metric. By default it is the same as the name of the data source.
Time aggregation	Time aggregation to apply to the metric, such as 7-day running SUM or By-month AVG. Default is the same as the indicator period. For more information, see Applying time series aggregations.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Group by	
Breakdown	List of breakdowns to choose from for grouping indicator scores. **Important:** • Scripted breakdowns are not supported in dashboard filters. • Only two levels of breakdown are supported in total, including data visualization and dashboard filters.
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the visualization may be grouped by. The viewer of the visualization can then select which of these items to group the data by. The viewer

Field	Description
	Note: • The choices of what to sort by are based on the main, default **Group by**, if one is defined. This sorting applies to any alternative group-bys if possible. If the sorting criterion selected for the main group-by cannot apply to an alternative group-by (such as sorting by Element order when the alternative group-by is not on the Choice table), sorting for that group-by defaults to Value. • If no main **Group by** has been set, but alternative group-bys are defined, you can sort only by Name or Value. • Sorting is not available for Pareto bar visualizations. Pareto charts are always sorted by value in descending order.
Sort by order	Ascending or descending.
Date range	
Apply date range	When turned on, this option allows date filters on the dashboard or UIB page to apply to this visualization. The date range can also be configured in the visualization, but date filters override visualization settings.
Show data for selected period as	Available when **Apply date range** is selected. The indicator aggregation logic for how scores from the selected period are shown, such as Latest score, Sum, or Average.
Set absolute period	Option to set absolute start and end date. Available when **Apply date range** is selected.
Period start	Start date for the absolute period. This property applies only when **Set absolute period** is true.
Period end	End date for the absolute period. This property applies only when **Set absolute period** is true. Select **Use current date for period end** to automatically update the end date to the current date. (Not available if the start date is in the future.)

Field	Description
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Usage Insights data options for pie and donut visualizations

When you select a Usage Insights data source for a pie or donut visualization, the following Data configuration options are available.

Important: Pie and donut visualizations are only suitable for Events data, not Users or Sessions. Only Events have a value to group by.

Field	Description
Data	
Data source	You have selected a Usage Insights data source in Create a pie or donut data visualization.
Metric	
Metric	Label of the metric. By default it is the same as the name of the data source: Events or Sessions. For sessions, you can configure the metric to reflect the number of sessions, average session duration, average pages per session, or average sessions per user.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Group by	
Event property	Properties of the Usage Insights data source. **Note:** Available only for Events and Sessions metrics, in which case it is mandatory.
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Pie visualization example

The pie data visualization uses a circular shape to show the proportion or percentage of different categories or groups. Each part of the circle (or "slice") represents a different category or group, and the size of each slice is proportional to the size of the group or category it represents.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

Use this visualization type to show the proportion of parts that make a whole, such as the distribution of expenses in a budget or the distribution of incidents across assignment groups.

Procedure

1. Follow the first steps to Create a pie or donut data visualization:
   a. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
   b. Select **Create data visualization**.
   c. From the Pies and Donuts section, select the Pie visualization type.
2. For the moment, skip the header and border section and move to the data source.
   a. Select **Add data source**.
   b. Choose the Incident [incident] table.
   c. Because this visualization shows open incidents, let's add the Incidents.Open condition in the Filters section.
   With this filter selected, the visualization only shows the number of active incidents.
   d. **Optional:** Select **Run** to preview the records that the visualization will be based on.
   e. Select **Add this source**.

   A pie visualization with the current value of the selected data appears in the Visualization Designer. Because the only information you've given is that the visualization represents active incidents, you see only a two wedges for Active=True and Active=False. You add priority and assignment group in step 4.
3. Now that you can see the visualization, let's add some context for the user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Expand the Header and border section.

b. Select **Show header** and provide the title `Open incidents - Assignment Group`.
When **Show header** is selected, you can add a title and a description. The chart title isn't necessarily the same as the visualization name. The visualization name identifies it in the Visualization Designer and in a list. The chart title appears within the visualization.

c. Enter a description of the visualization: `Open incidents of all priorities by assignment group`.
While the description and title fields aren't required, this information makes the visualization easier to understand on a dashboard and easier to identify in a list.

d. Select **Save** and give the report the title `Pie - Open incidents`.

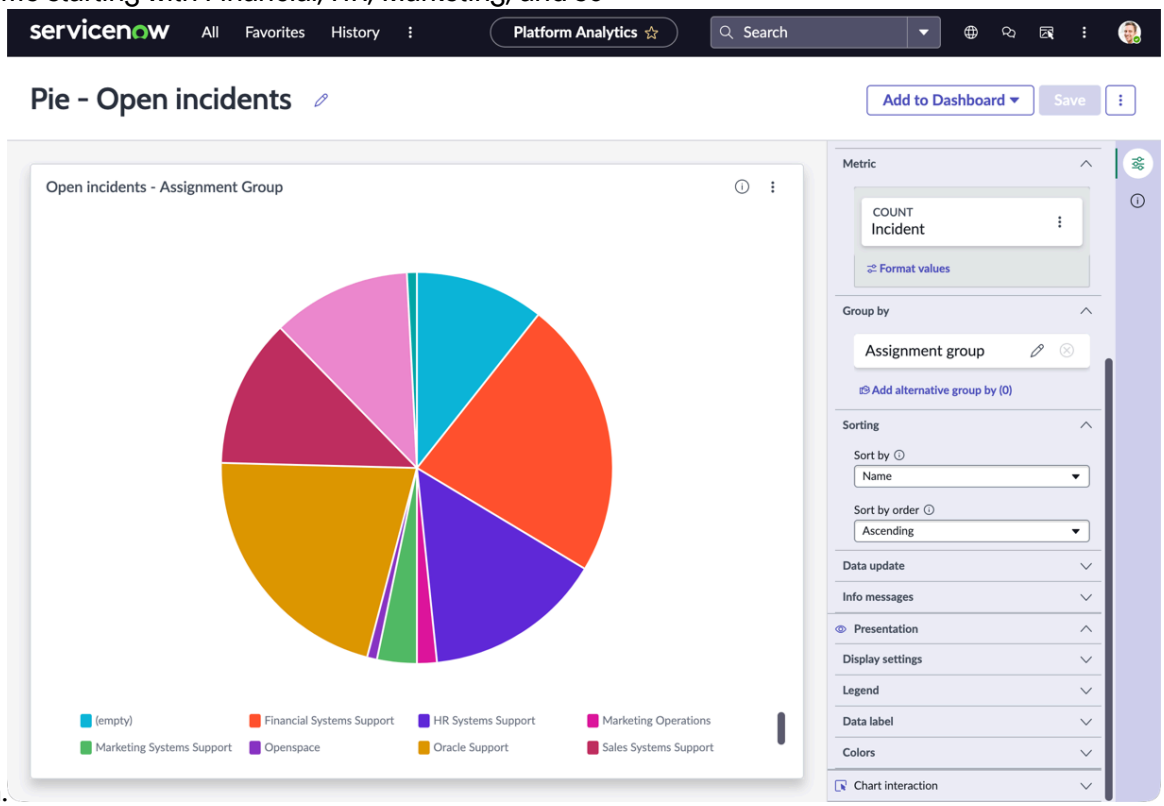
4. Skip the Metric section.

5. Add a Group by to differentiate the information in the visualization.
Under Group by, select **Active** and change the grouping to `Assignment group`.

6. Under Sorting, choose the field to sort by and the order of the sorting.

a. Choose to sort by `Name`.

b. Choose `Ascending` for the sort order.
The segments are ordered by the assignment group name starting with Financial, HR, Marketing, and so on.



7. Under Data update, configure how the audience interacts with the visualization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Follow filters**.
This option enables the visualization to follow interactive filters on the dashboards it's placed on that are based on the same table.

b. Select **Show filter icon** to show the number of filters applied to the visualization.
For example, if dashboard filters limit the value of the visualization, the icon indicates that you're seeing the number of open incidents that match the filters. You can then check to see which filters are in effect.

c. Select **Enable drilldown** to let viewers navigate to relevant information by selecting a data point in the chart.
Some visualizations only drill down to the list of associated data. Table data is generally restricted by access control lists (ACLs) and viewers may not see all of the associated records.

This control mirrors **Allow chart interaction**. Under Chart Interaction, you can also select the destination of drilling down.

8. Choose how to show what the wedges in the pie describe.
   - **Show Legend** gives examples of the color coding for each value in the visualization. You can choose whether to show the legend, where to place it and how much to show. Ideal placement depends on the size of its container on a dashboard. If you have more horizontal space, place the legend to the left or right. If you have more vertical space, place it above or below.
   - **Show data labels** adds the label and value information next to the segments of the visualization.

a. Select **Show legend** to enable legend options.

b. Select **Show legend value**.
This option adds the number associated with the metric. In this case, 18 is added to the incidents assigned to the **HR Systems Support** assignment group because that is how many HR Systems incidents there are.

c. Select **Show value on the same line** to keep the value with the assignment group name.

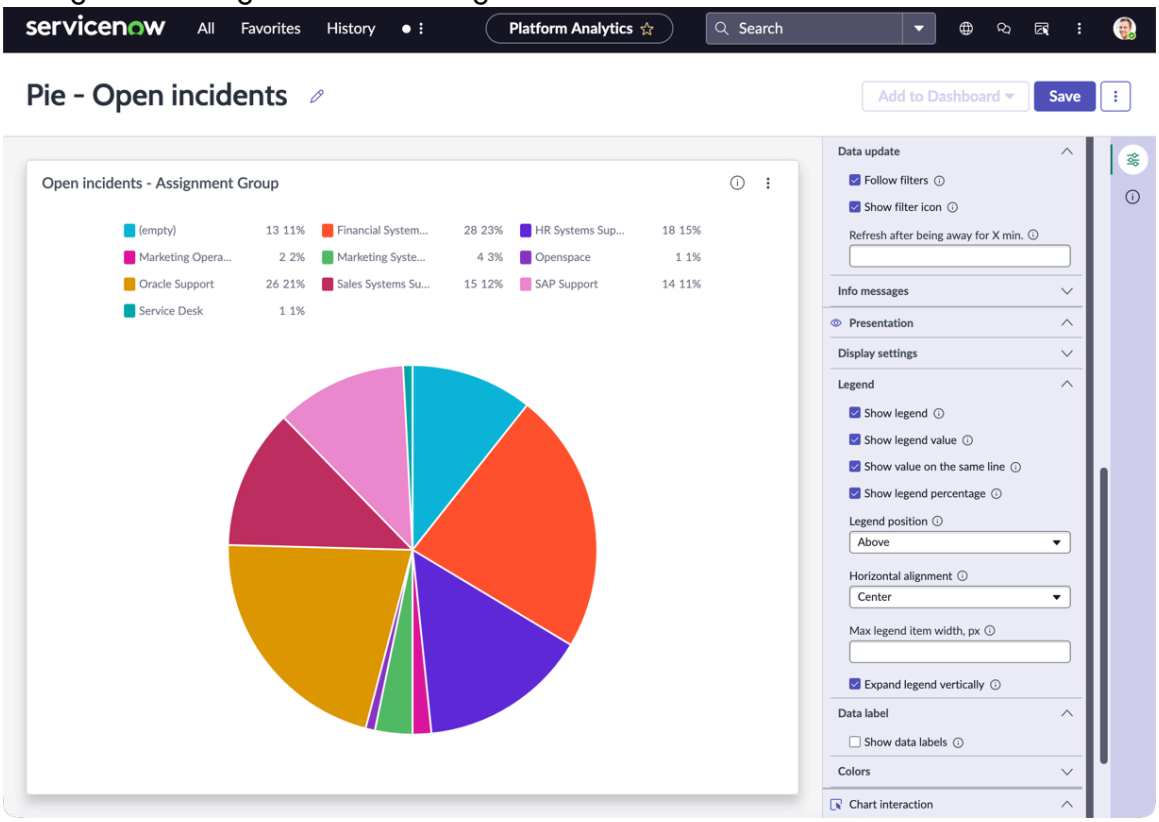
d. Select **Show legend percentage** to provide more information about the value.

e. Play with where to place the legend above of the visualization.
You can choose to place the legend above, below, or to the right or left of the visualization.

f. Select the Center **Horizontal alignment**.
Horizontal alignment is not available if you place the legend to the right or left of the visualization. Start and End move the legend to the left or right of the visualization. (Start and End are right and left for languages that read from right to left.)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

g. Change the Max legend item width to give those values more or less room.



9. Clear **Show legend** and select **Show data labels**.

a. Choose the **Data label type**.
You can choose Value to show the number next to the label, Percent to show the percentage the value represents, or Value and percent to show both.

b. Change the Max label size to 50.
The labels wrap to additional lines. The Truncation type doesn't make a difference, because the labels are wrapped.

c. Clear the **Wrap labels** option.
When you change the Truncation type, you can see that End replaces the ends of the longer labels with three dots. Select Start and the three dots replace the first part of the longer labels. And the same happens when you select middle.

10. Choose the **Default** color type for the visualization.

- **Default** applies the colors associated with your UX theme.
- **Color palette** uses hues of the same color, for example Blue Light to Dark.
- **Fixed element** specifies the same color for each element, such as hardware incidents. All data visualizations that use fixed element colors show the same element in the same color.

Result

You have created a pie visualization grouped on one value. You have also configured the visualization's labeling, legend, and colors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Donut visualization example

The donut visualization uses a hollow circular shape to show the proportion or percentage of different categories or groups. The semi-donut visualization does the same job as the donut using a semicircle instead of a full circle.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

Use this visualization type when you want to compare subcategories or additional data set in a simple and easy to understand format.

Procedure

1. Follow the first steps to Create a pie or donut data visualization:

   a. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.

   b. Select **Create data visualization**.

   c. Select the Donut or Semi-donut visualization type.
   In this example, you create a donut visualization, but the concepts are the same.

2. For the moment, we can skip the header and border section and move to the data source.

   a. Select **Add data source**.

   b. Choose the Incident [incident] table.

   c. Because this visualization shows open incidents, let's add the Incidents.Open condition in the Filters section.
   With this filter selected, the visualization only shows the number of active incidents.

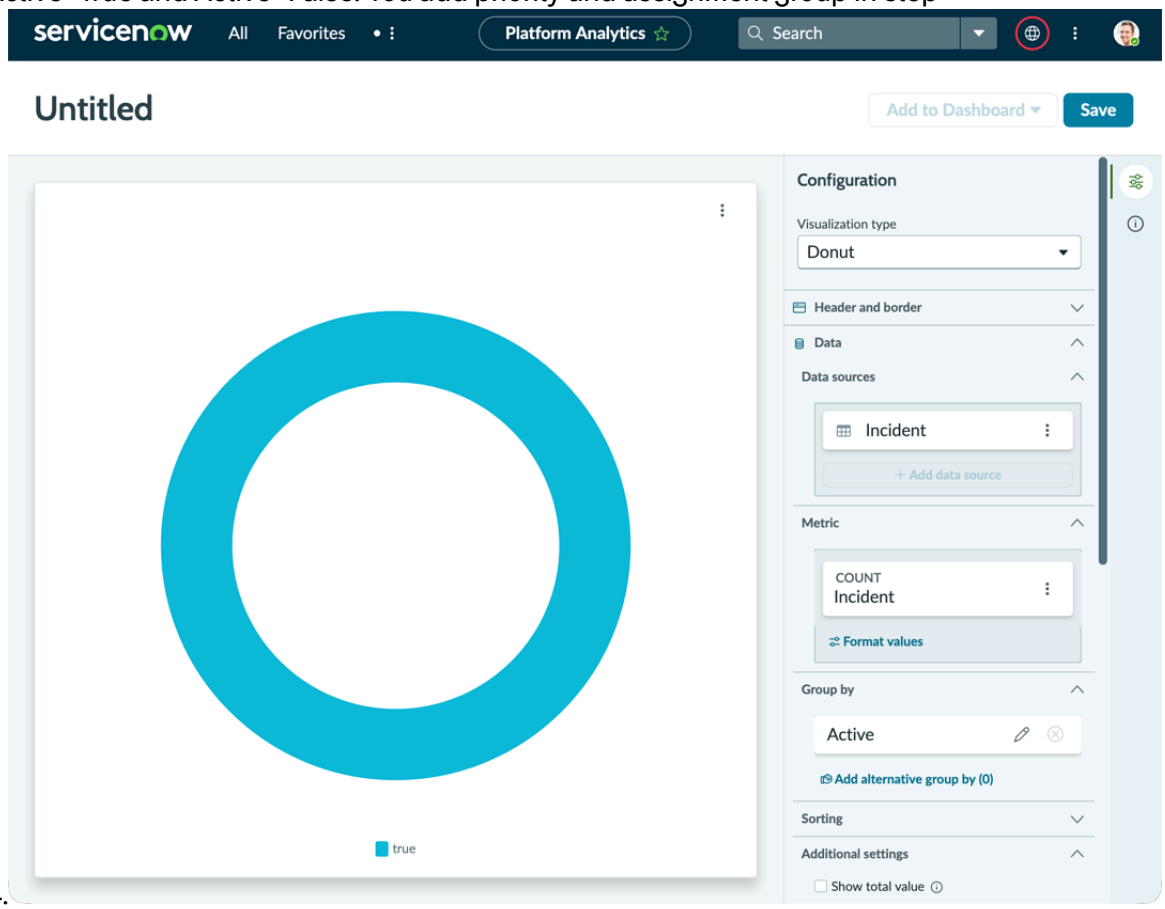
   d. **Optional:** Select **Run** to preview the records that the visualization will be based on.

   e. Select **Add this source**.

   A pie visualization with the current value of the selected data appears in the Visualization Designer. Because the only information you've given is that the visualization represents active incidents, you see only two possible wedges for

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active=True and Active=False. You add priority and assignment group in step 4.



3. Now that you can see the visualization, let's add some context for the user.

   a. Expand the Header and border section.

   b. Select **Show header** and provide the visualization title `Open incidents - Priority`. When **Show header** is selected, you can add a title and a description. The chart title isn't necessarily the same as the visualization name. The visualization name identifies it in the Visualization Designer and in a list. The chart title appears within the visualization.

   c. Enter a description of the visualization: `Open incidents of all priorities`. While the description and title fields aren't required, this information makes the visualization easier to understand on a dashboard and easier to identify in a list.

   d. Select **Save** and give the report the title `Donut - Open incidents`.

4. Skip the Metric section.

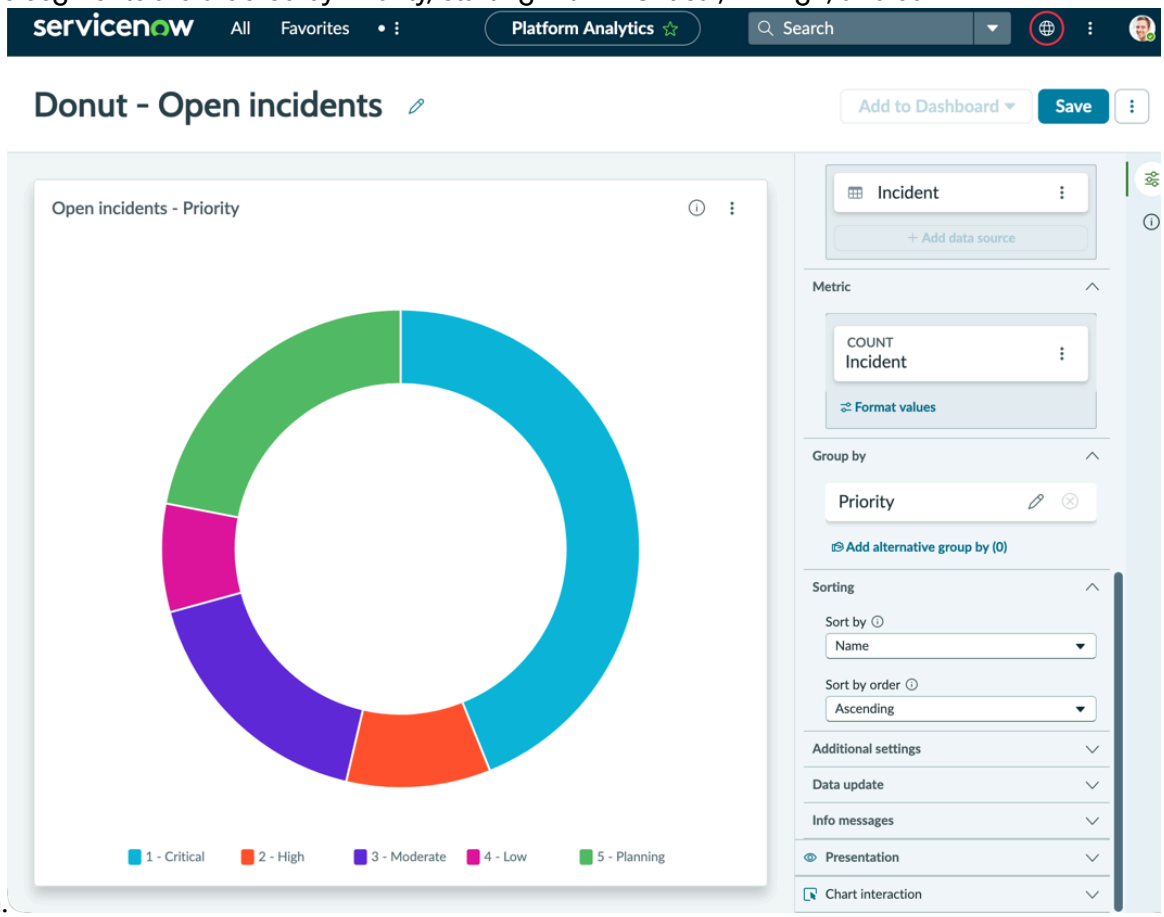
5. Add a Group by to differentiate the information in the visualization.
   Under Group by, select **Priority** and then select **Apply**.

6. Under Sorting, choose the field to sort by and the order of the sorting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Choose to sort by `Name`.

b. Choose `Ascending` for the sort order.
The segments are ordered by Priority, starting with 1 - Critical, 2 - High, and so on.



7. Under Data update, configure how the audience interacts with the visualization.

a. Select **Follow filters**.
This option enables the visualization to follow interactive filters on the dashboards it's placed on that are based on the same table.

b. Select **Show filter icon** to show the number of filters applied to the visualization.
For example, if dashboard filters limit the value of the visualization, the icon indicates that you're seeing the number of open incidents that match the filters. You can then check to see which filters are in effect.

c. Select **Enable drilldown** to let viewers navigate to relevant information by selecting a data point in the chart.
Some visualizations only drill down to the list of associated data. Table data is generally restricted by access control lists (ACLs) and viewers may not see all of the associated records.

This control mirrors **Allow chart interaction**. Under Chart Interaction, you can also select the destination of drilling down.

8. In the Presentation section, choose how to show what the sections of the donut describe.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Show Legend** gives examples of the color coding for each value in the visualization. You can choose whether to show the legend, where to place it and how much to show. Ideal placement depends on the size of its container on a dashboard. If you have more horizontal space, place the legend to the on one side or the other. If you have more vertical space, place it above or below.
- **Show data labels** adds the label and value information next to the segments of the visualization.

a. Select **Show legend** to enable legend options.

b. Select **Show legend value**.
This option adds the number associated with the metric. In this case, 4 is added to the high priority incidents because that is how many high priority incidents there are.

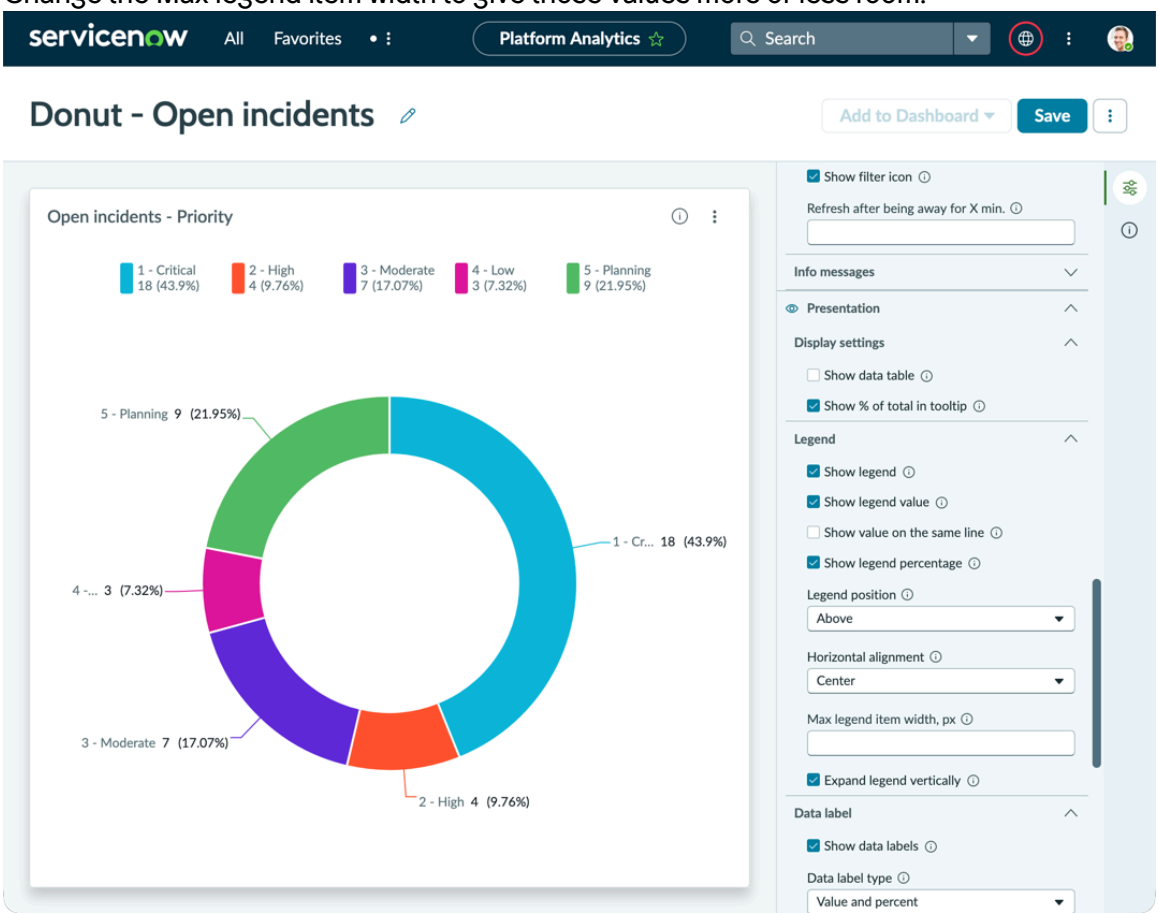
c. Select **Show value on the same line** to keep the value with the assignment group name.

d. Select **Show legend percentage** to provide more information about the value.

e. Play with where to place the legend above of the visualization.
You can choose to place the legend above, below, or to the right or left of the visualization.

f. Select the Center **Horizontal alignment**.
Horizontal alignment is not available if you place the legend to the right or left of the visualization. Start and End move the legend to the left or right of the visualization. (Start and End are right and left for languages that read from right to left.)

g. Change the Max legend item width to give those values more or less room.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Clear **Show legend** and select **Show data labels**.

   a. Choose the **Data label type**.
   You can choose Value to show the number next to the label, Percent to show the percentage the value represents, or Value and percent to show both.

   b. Change the Max label size to 50.
   The labels wrap to additional lines. The Truncation type doesn't make a difference, because the labels are wrapped.

   c. Clear the **Wrap labels** option.
   When you change the Truncation type, you can see that End replaces the ends of the longer labels with three dots. Select Start and the three dots replace the first part of the longer labels. And the same happens when you select middle.

10. Choose the **Default** color type for the visualization.
    - **Default** applies the colors associated with your UX theme.
    - **Color palette** uses hues of the same color, for example Blue Light to Dark.
    - **Fixed element** specifies the same color for each element, such as hardware incidents. All data visualizations that use fixed element colors show the same element in the same color.

Result
You have created a donut visualization grouped on one value. You have also configured the visualization's labeling, legend, and colors.

What to do next
Create a semi-donut visualization.

- Select the More actions button (⋮) and choose **Duplicate**.
- Name the new visualization `Semi-donut - Open incidents` and select **Duplicate**.
- Change the Visualization type to Semi-donut and select **Save**.

The semi-donut has all the same settings as the donut, but is a half circle instead of a full circle.

Create a Pareto bar data visualization

Use a Pareto bar visualization to Identify the most important dimension in a large set of dimensions. Pareto bar visualization columns show data in descending order. A line shows the cumulative percentage.

Before you begin
Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task
For information about the use of a Pareto bar visualization in a dashboard, see the Developer Site. This site gives information about Pareto bar data visualization components in the UI Builder, and some configuration options may differ from the Visualization Designer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select **Create data visualization**.
3. Select the Pareto bar visualization ( ) visualization type.
4. Configure the **Header and border**. Header and border options are the same for all data sources.

Header and border fields	Description
Show header	The visualization header, including title and icons.
Show header separator	Option to display a line separating the header from the rest of the component.
Chart title	Title of the visualization.
Description	A short overview about the visualization that the end user sees. Descriptions help users find the visualization.
Wrap title	Option to wrap long titles onto a second line. If false, displays an ellipsis to truncate long titles.
Wrap labels	Select to wrap long elements labels on the axis.
Max label size, px	Specify the maximum label size for element names on the axis. Default=100 px.
Truncation type	Specify where to truncate long labels with an ellipsis. Options are Beginning, Middle, and End.
Show border	Option to display a line around the component.
Bare	Option to remove padding around data visualization to provide more compact positioning on the page. Only available when **Show border** is turned off.
Show refresh option	Option to show or hide the refresh option from data visualizations. If cache is enabled on a dashboard, the Refresh option is always hidden.
Show export options	Option to show or hide the visualization's export types.
Header background color	Specify the color behind the title of the visualization.
Title color	Specify the text color of the title. The default title color is black, but you can choose a color that contrasts better with the header

© 2026 ServiceNow, Inc. All rights reserved.

Header and border fields	Description
	background. Only available when **Header background color** is selected.

5. Choose a data source.
   For general descriptions of the data sources, see Data sources for data visualizations.

   - Table (available in the base system). When you select a table, you can filter it by custom or preconfigured conditions. Custom conditions can include questions or Service Catalog variables.

     Configured report sources appear in the **Predefined conditions** list. For more information, see Report sources.

     To help you create a custom filter, there is a preview list of records that would be included in the visualization. You can change which fields are shown as columns and the width of columns in the list actions.

     
   - Indicator (available in the base system). You can filter the indicator scores by breakdowns and elements.

     Note: Benchmark indicators are not supported.

     
     Note:

     You might have a multiple select (is one of) or dynamic (is (dynamic)) operator on the breakdown element filter. These operators require the indicator and breakdown to support them. For more information about the configurations that support these operators, see "Is one of" and "Is (Dynamic)" operators on breakdown conditions in data visualizations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Usage Insights (available with the User Experience PAR Integration application, to users with a required role). Choose one of up to three KPIs included with this application, depending on the visualization type. For more information, see User Experience Analytics data sources for data visualizations.

Note: You can choose multiple data sources for this visualization. However, all data sources must be of the same type: table, indicator, or Usage Insights. For more information, see Multiple data sources.

6. Select the options for your data source.
   - If your visualization represents table data, go to Table data options for Pareto bar visualizations.
   - If your visualization represents indicator data, go to Indicator data options for pareto bar visualizations.
   - If your visualization represents Usage Insights data, go to Usage Insights for Pareto bar visualizations.
7. Under **Presentation**, provide display and color information.

   Under **Display settings**, you can show the data table. This table shows graph and visualization data for easier screen reader access. You can also select whether hovering on a data value opens a tooltip with all the data values or only the details of the selected data value.

X-axis options

Field [Property]	Description
Hide axis	Hides both the bar metric Y-axis and the pareto Y-axis.
Axis style	Style of the X axis. ○ Clean `clean`: Adds a straight line to the X axis. ○ No tick lines `noTicks`: Option to remove all marks from the X axis. ○ Standard `default`: Adds a line and tick marks to the X axis. **Note:** Only available when **Show grid** is true for vertical bar visualizations.
Axis title (for X axis)	Title to display on the horizontal axis of the visualization.
Wrap labels	Wraps long labels in the horizontal axis.
Max label size, px	Maximum label size for the horizontal axis, in pixels.

Y-axis options

Field [Property]	Description
Hide axis	Hides both the bar metric Y-axis and the pareto Y-axis.
Axis title (for Y axis)	Only affects the bar axis and not the Pareto axis.
Show grid	Adds grid lines to the visualization. This option applies only to the Y axis.
Axis style	Style of the Y axis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field [Property]	Description
	○ Clean `clean`: Adds a straight line to the Y axis. ○ No tick lines `noTicks`: Option to remove all marks from the Y axis. ○ Standard `default`: Adds a line and tick marks to the Y axis. **Note:** Only available when **Show grid** is true for vertical bar visualizations.

Legend options

Field	Description
Show legend	Option to display the legend.
Legend position	Legend location relative to the visualization: Above, Below, Right, or Left

Data label options

Field	Description
Show data labels	Option to display the score for each data point.
Data label position	Location of data labels: at the top, middle, or bottom of the bars. **Note:** Only available when **Show data labels** is true.

Color options

Field	Description
Set color type	Type of color scheme to apply to the component. Options include: ○ Default: A color or set of colors that come from the UX Theme that is applied to the instance. For more information, see Working with themes in Next Experience. ○ Color palette: List of color palettes to select from predefined system palettes in the Chart Color Scheme [pa_chart_color_schemes] table. For grouped or stacked data, the colors apply in order from highest value to lowest. For multiple data sources, palette colors apply in the order of data sources. For example, the first color of a palette applies to the first data source, and the second palette color applies to the second source. All visualizations that use the same color palette show the same colors, regardless of what data they display. ○ Fixed element color: Use a specific color from the Chart Colors table [sys_report_chart_color] for each element. All data visualizations that use fixed element colors show the same element, such as critical incidents in the Global scope, in the same color. This option is available only for Table data sources and only if no more than one data source or metric is added, and a Group by is defined.

8. Under **Chart interaction**, set what if anything happens when a viewer clicks a chart or a chart segment on the visualization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Allow chart interaction	Enable an event to occur when a user clicks in a visualization or one of its segments.
Action	Choose the event that occurs when a user clicks in a visualization or one of its segments. Choices depend on the visualization type and data source. Applies only when **Allow chart interaction** is on. For more information, see Chart interactions in a data visualization. ○ **Go to data view** opens a list view, KPI Details page, or Usage Insights overview page relevant to the associated segment or visualization. For table data, a system property determines whether a Core UI list or a Platform Analytics list opens. For more information, see Data views for different data sources. ○ **Go to URL** opens the specified URL, which can be on the instance or external. You have the option of specifying a page name to appear in the tooltip, for those visualizations with tooltips. ○ **Drill down to chart** (Visualization Designer only) Opens a different data visualization that is filtered by the selected data. You can add a drill-down visualization for each metric on the parent visualization. **Note:** The last level of drill down in the Platform Analytics experience is always a Core UI list. Records do not open in Workspace embedded lists. **Drill down to chart** supports only table data sources.

9. Select **Save**.
   Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations** to return to the Data Visualization list.

What to do next

- Add a visualization to a dashboard from the Visualization Designer
- Share a data visualization in the Visualization Designer
- Bookmark a visualization in the Visualization Designer

Table data options for Pareto bar visualizations

When you select a table data source for a Pareto bar visualization, the following Data configuration options are available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Data	
Data source	You have selected a Table data source in Create a horizontal or vertical bar data visualization. **Note:** For pareto visualizations, only one data source can be defined at any given time.
Metric	
Label	Label of the metric. By default it is the same as the name of the data source. **Note:** Only one metric can be defined for a Pareto bar visualization at any given time.
Select an aggregation	Computational method for aggregating data. The default is **Count**, which displays the number of records selected. **Note:** If you select **Count Distinct**, only unique records are counted. For example, you want to generate a report with a distinct number of users who have one or more of the roles in a given list of roles. Users with more than one role would be counted twice unless you use **Count Distinct**.
Field	Field to apply the metric to, for **Average**, **Sum**, or **Count Distinct** aggregations. You may further be able to aggregate on fields from extended tables. The data is shown in a format that matches the field type. For example, if you select an integer field, such as the **Priority** field, the data is expressed as a number. If you select a duration field, such as **Business duration** on the Incident table, the aggregated data is expressed in days, hours, and minutes. If function fields were created in Report Designer for the table, they are available in the dropdown list. For more information, see Report on function fields.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Group by	
Field for [table]	The field to group by. For example, in a visualization of incident data grouped by **Assignment group**, all incidents that belong to Software, Service Desk, and Network are placed in separate groups. If the table contains variables or question fields, you have the option to group by one of them at the end of the list of fields. Only one **Group by** can be defined in the Pareto chart. The

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Alternative Group By can be defined for a Pareto visualization. For vertical bar, horizontal bar, and pivot reports with multiple data sources: If you group the first source by a choice field, you can group the second source by any applicable choice field. • It is not possible to group or stack data by the **Tags** field, or by certain field types, such as MEDIUMTEXT. • If you want to group by a field with continuous values, such as date or integer, the values are automatically grouped according to any report ranges that are defined for the data. For more information, see Report ranges.
Max number of groups	Select the maximum number of groups to display. Groups in excess of this number, determined by sorting, are aggregated into the Others group. You can show that aggregate with the **Show others** option. By default, you cannot show more than 50 groups. If you have the admin role, you can change this limit in the *par_viz.table_data.max_groups* system property. Data for the Max number of groups is evaluated across all periods in the time series to ensure consistent group membership across all dates in the visualization.
Show others	If **Max number of groups** is set and this option is turned on, an aggregate of the groups beyond the maximum number is displayed as the Others group.
Hide elements with values of 0	When toggled on, elements with a value of NULL or 0, such as rows or data points, are not displayed. This control is not available when the metric is COUNT.
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the visualization may be grouped by. The viewer of the visualization can then select which of these items to group the data by. The viewer toggles the visibility of the selector in the visualization's More actions menu. In the additional items dialog, you can set whether this selector is visible by default by toggling **Selector visible by default**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If you select a value in **Group by**, that is the default group-by value. You do not have to select a **Group by** value to specify alternative group-by values. In this case, no default group-by value is used. For more information about setting alternative group-bys for multiple metrics, see Options for time series data visualizations with multiple metrics. For more information about the viewer experience selecting from alternative group-by values, see Select a group-by value in a data visualization as a viewer. **Important:** • Only up to three metrics on one visualization support alternative group-by. • Alternative group-by does not support data binding on the data source
Date range	
Apply date range	When turned on, this option allows date filters on the dashboard or UIB page to apply to this visualization. The date range can also be configured in the visualization, but date filters override visualization settings.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Indicator data options for pareto bar visualizations

When you select an indicator data source for a Pareto bar visualization, the following Data configuration options are available.

Field	Description
Data	
Data source	You have selected an Indicator or Usage Insights data source in Create a horizontal or vertical bar data visualization. **Note:** Only one data source can be defined pareto at any given time.
Metric	
Label	Label of the metric. By default it is the same as the name of the data source. **Note:** Only one metric can be defined for a Pareto bar visualization at any given time.
Time aggregation	Time aggregation to apply to the metric, such as 7-day running SUM or By-month AVG. Default is the same as the indicator period. For more information, see Applying time series aggregations.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Group by	
Breakdown	List of breakdowns to choose from for grouping indicator scores. **Important:** • Scripted breakdowns are not supported in dashboard filters. • Only two levels of breakdown are supported in total, including data visualization and dashboard filters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the visualization may be grouped by. The viewer of the visualization can then select which of these items to group the data by. The viewer toggles the visibility of the selector in the visualization's More actions menu. In the additional items dialog, you can set whether this selector is visible by default by toggling **Selector visible by default**. If you select a value in **Group by**, that is the default group-by value. You do not have to select a **Group by** value to specify alternative group-by values. In this case, no default group-by value is used. For more information about setting alternative group-bys for multiple metrics, see Options for time series data visualizations with multiple metrics. For more information about the viewer experience selecting from alternative group-by values, see Select a group-by value in a data visualization as a viewer. **Important:** • Only up to three metrics on one visualization support alternative group-by. • Alternative group-by does not support data binding on the data source
Date range	
Apply date range	When turned on, this option allows date filters on the dashboard or UIB page to apply to this visualization. The date range can also be configured in the visualization, but date filters override visualization settings.
Show data for selected period as	Available when **Apply date range** is selected. The indicator aggregation logic for how scores from the selected period are shown, such as Latest score, Sum, or Average.
Set absolute period	Option to set absolute start and end date. Available when **Apply date range** is selected.
Period start	Start date for the absolute period. This property applies only when **Set absolute period** is true.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Period end	End date for the absolute period. This property applies only when **Set absolute period** is true. Select **Use current date for period end** to automatically update the end date to the current date. (Not available if the start date is in the future.)
Number of periods	Number of date periods to display. This property applies only when **Set absolute period** is true.
Period	Time interval for each date period. • Days `D` • Months `M` • Years `Y` This property applies only when **Set absolute period** is false.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Heading	Header text of the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Usage Insights for Pareto bar visualizations

When you select a Usage Insights data source for a Pareto bar visualization the following Data configuration options are available.

Important: Pareto visualizations are only suitable for Events data, not Users or Sessions. Only Events have a value to group by.

Field	Description
Data	
Data source	You have selected a Usage Insights data source in Create a horizontal or vertical bar data visualization. For sessions, you can configure the metric to reflect the number of sessions, average session duration, average pages per session, or average sessions per user. **Note:** Only one data source can be defined for pareto visualizations at any given time.
Metric	
Label	Label of the metric. By default it is the same as the name of the data source. **Note:** Only one metric can be defined for a Pareto bar visualization at any given time.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Group by	
Event property	Properties of the Usage Insights data source. **Note:** Available only for Events and Sessions metrics, in which case it is mandatory.
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the visualization may be grouped by. The viewer of the visualization can then select which of these items to group the data by. The viewer toggles the visibility of the selector in the visualization's More actions menu. In the additional items dialog, you can set whether this selector is visible by default by toggling **Selector visible by default**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If you select a value in **Group by**, that is the default group-by value. You do not have to select a **Group by** value to specify alternative group-by values. In this case, no default group-by value is used. For more information about setting alternative group-bys for multiple metrics, see Options for time series data visualizations with multiple metrics. For more information about the viewer experience selecting from alternative group-by values, see Select a group-by value in a data visualization as a viewer. **Important:** • Only up to three metrics on one visualization support alternative group-by. • Alternative group-by does not support data binding on the data source
Date range	
Show data for selected period as	Available when **Apply date range** is selected. The indicator aggregation logic for how scores from the selected period are shown, such as Latest score, Sum, or Average.
Set absolute period	Option to set absolute start and end date. Available when **Apply date range** is selected.
Period start	Start date for the absolute period. This property applies only when **Set absolute period** is true.
Period end	End date for the absolute period. This property applies only when **Set absolute period** is true. Select **Use current date for period end** to automatically update the end date to the current date. (Not available if the start date is in the future.)
Period	Time interval for each date period. • Days `D` • Months `M` • Years `Y`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This property applies only when **Set absolute period** is false.
Number of periods	Number of date periods to display. This property applies only when **Set absolute period** is true.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Create a pivot table data visualization in the Visualization Designer

Create a pivot table visualization to summarize large data sets by breaking them down by multiple dimensions in a single table. Cells show each row and column value combination and can also show subtotals.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

For information about the use of a Pivot visualization in a dashboard, see the Developer Site. This site gives information about Pivot data visualization components in the UI Builder, and some configuration options may differ from the Visualization Designer.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select **Create data visualization**.
3. Select the Pivot Table ( ) visualization type.
4. Configure the **Header and border**. Header and border options are the same for all data sources.

Header and border fields	Description
Show header	The visualization header, including title and icons.
Show header separator	Option to display a line separating the header from the rest of the component.
Chart title	Title of the visualization.
Description	A short overview about the visualization that the end user sees. Descriptions help users find the visualization.
Wrap title	Option to wrap long titles onto a second line. If false, displays an ellipsis to truncate long titles.
Wrap labels	Select to wrap long elements labels on the axis.
Max label size, px	Specify the maximum label size for element names on the axis. Default=100 px.
Truncation type	Specify where to truncate long labels with an ellipsis. Options are Beginning, Middle, and End.
Show border	Option to display a line around the component.
Bare	Option to remove padding around data visualization to provide more compact positioning on the page. Only available when **Show border** is turned off.
Show refresh option	Option to show or hide the refresh option from data visualizations. If cache is enabled on a dashboard, the Refresh option is always hidden.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header and border fields	Description
Show export options	Option to show or hide the visualization's export types.
Header background color	Specify the color behind the title of the visualization.
Title color	Specify the text color of the title. The default title color is black, but you can choose a color that contrasts better with the header background. Only available when **Header background color** is selected.

5. Choose a data source.
   For general descriptions of the data sources, see Data sources for data visualizations.

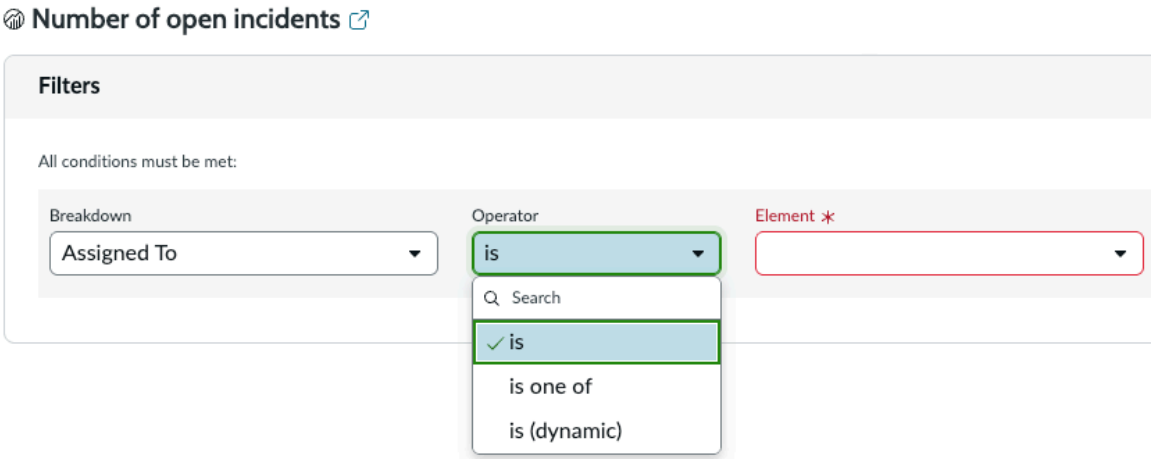
   - Table (available in the base system). When you select a table, you can filter it by custom or preconfigured conditions. Custom conditions can include questions or Service Catalog variables.

     Configured report sources appear in the **Predefined conditions** list. For more information, see Report sources.

     To help you create a custom filter, there is a preview list of records that would be included in the visualization. You can change which fields are shown as columns and the width of columns in the list actions.

     
   - Indicator (available in the base system). You can filter the indicator scores by breakdowns and elements.

     Note: Benchmark indicators are not supported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

You might have a multiple select (is one of) or dynamic (is (dynamic)) operator on the breakdown element filter. These operators require the indicator and breakdown to support them. For more information about the configurations that support these operators, see "Is one of" and "Is (Dynamic)" operators on breakdown conditions in data visualizations.

- Usage Insights (available with the User Experience PAR Integration application, to users with a required role). Choose one of up to three KPIs included with this application, depending on the visualization type. For more information, see User Experience Analytics data sources for data visualizations.

Note: You can choose multiple data sources for this visualization. However, all data sources must be of the same type: table, indicator, or Usage Insights. For more information, see Multiple data sources.

6. Select the options for your data source.
   - If your visualization represents table data, go to Table data options for pivot table visualizations.
   - If your visualization represents indicator data, go to Indicator data options for pivot table data visualizations.
   - If your visualization represents Usage Insights data, go to Usage Insights data options for pivot table data visualizations.
7. Under **Presentation**, provide display and color information.

Field	Description
Display settings	
Freeze row header	Allows users to keep the header visible while scrolling to another area in the visualization.
Freeze row footer	Allows users to keep the footer visible while scrolling to another area in the visualization.
Freeze first column	Keeps the first column visible while scrolling.
Show alternative row colors	Toggles a background color for alternative rows to make reading the visualization easier.
Show alternative column colors	Toggles a background color for alternative columns to make reading the visualization easier.
Display row lines	Displays border lines to separate rows.
Display column lines	Displays border lines to separate columns.
Table size settings	
Truncate first column [truncateFirstColumn]	When true, limits the width of the first column. First column contents beyond this width are truncated. First column headers are not

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	truncated. Specify this width limit in **First Column max width, in px**.
First Column max width, in px	The maximum width of the first column, beyond which its contents are truncated. This maximum width cannot be less than the width of the first column header, which is never truncated. Values lower than the header width are ignored. Only takes effect when **Truncate first column** is active. Default value is 200px.
Wrap column headers	Breaks header text into lines matching content width, with a minimum limit of 100px. Does not apply to first column. You cannot both wrap and truncate column headers.
Truncate column headers	Truncates header text into lines matching content width, with a minimum limit of 100px. Does not apply to first column. You cannot both wrap and truncate column headers.
Colors	
Set color type	○ Default: A color or set of colors that come from the UX Theme that is applied to the instance. For more information, see Working with themes in Next Experience. ○ Single color/Colors per metric: Select a single color in the **Set value color** field. Interacting with that field opens a selector where you can choose the color from either a set of icons or from a list. You can also search for a color. Entering a search value has the selector show you a list of colors filtered by that search value. If the visualization has more than one metric, you see the Colors per metric option instead. This option lets you select a single color for each metric. Alternatively, you can add a rule to define a dynamic color. For more information, see Create coloring rules for data visualizations.

8. Under **Chart interaction**, set what if anything happens when a viewer clicks a chart or a chart segment on the visualization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Allow chart interaction	Enable an event to occur when a user clicks in a visualization or one of its segments.
Action	Choose the event that occurs when a user clicks in a visualization or one of its segments. Choices depend on the visualization type and data source. Applies only when **Allow chart interaction** is on. For more information, see Chart interactions in a data visualization. ○ **Go to data view** opens a list view, KPI Details page, or Usage Insights overview page relevant to the associated segment or visualization. For table data, a system property determines whether a Core UI list or a Platform Analytics list opens. For more information, see Data views for different data sources. ○ **Go to URL** opens the specified URL, which can be on the instance or external. You have the option of specifying a page name to appear in the tooltip, for those visualizations with tooltips. ○ **Drill down to chart** (Visualization Designer only) Opens a different data visualization that is filtered by the selected data. You can add a drill-down visualization for each metric on the parent visualization. **Note:** The last level of drill down in the Platform Analytics experience is always a Core UI list. Records do not open in Workspace embedded lists. **Drill down to chart** supports only table data sources.

9. Select **Save**.
   Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations** to return to the Data Visualization list.

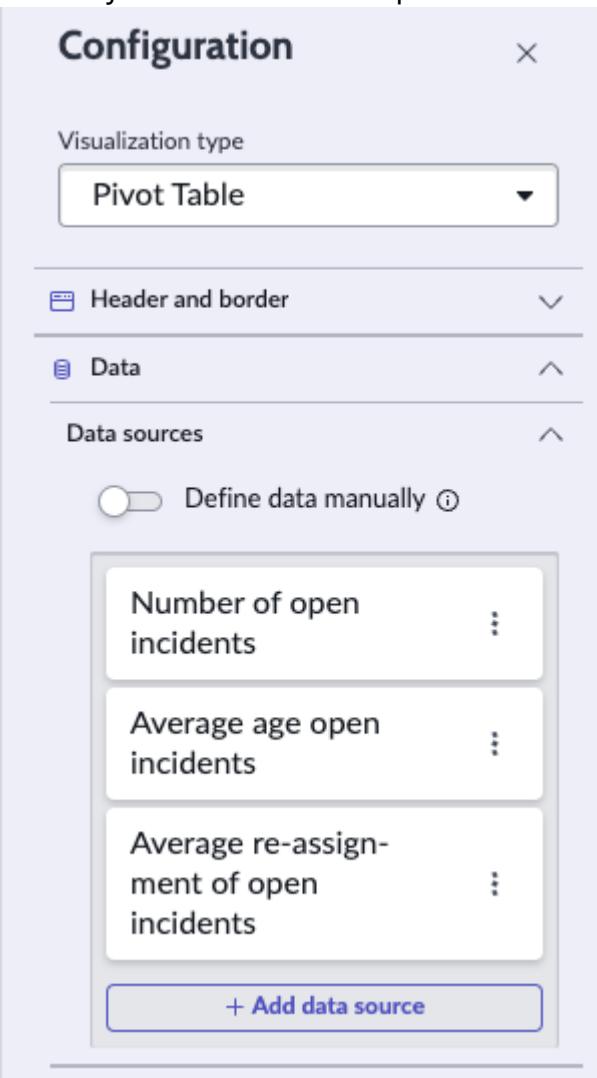
Example: Pivot table with multiple data sources

Consider a case where you want to present the following information, split up for each assignment group:

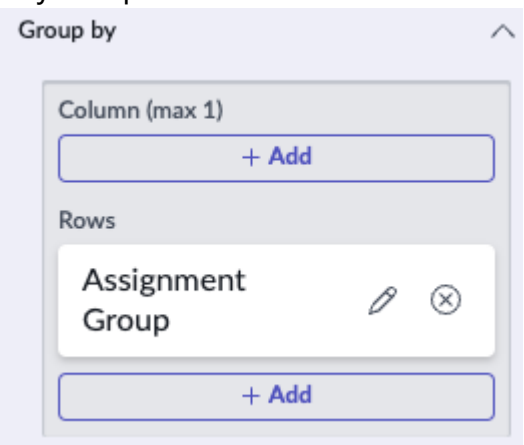
- Number of assigned open incidents
- The average age of the assigned open incidents
- The average number of times an incident was reassigned

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can present this information in a single pivot table. Each set of information is going to come from a different data source. You have to find either three tables or three Performance Analytics indicators with this information. You cannot mix and match different types of data sources! Fortunately, you find three appropriate indicators already defined in your instance. You select them as your data sources for a pivot table.



You want to see these indicator scores broken down by assignment group. Therefore, you select Assignment Group under Group By. Your three data sources are going to show as three columns, so you skip the **Column** field and select Assignment Group as a row.



Now you are done. Save the data visualization and use it in a dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Incidents analysis

Assignment Group ▲	Open incidents	Avg age of open incidents	Avg reassignment count
Financial Systems Support	29	91 days	1.34
HR Systems Support	18	91 days	1.28
Marketing Operations	2	90 days	0.50
Marketing Systems Support	4	91 days	1.00
Openspace	1	1539 days	
Total	**149**	**204 days**	**1.19**

What to do next

- Add a visualization to a dashboard from the Visualization Designer
- Share a data visualization in the Visualization Designer
- Bookmark a visualization in the Visualization Designer

Table data options for pivot table visualizations

When you select a table data source for a pivot table visualization, the following Data configuration options are available.

Field	Description
Data	
Data source	You have selected a Table data source in Create a pivot table data visualization in the Visualization Designer.
Metric	
Label	Label of the metric. By default it is the same as the name of the data source.
Select an aggregation	Computational method for aggregating data. The default is **Count**, which displays the number of records selected. **Note:** If you select **Count Distinct**, only unique records are counted. For example, you want to generate a report with a distinct number of users who have one or more of the roles in a given list of roles. Users with more than one role would be counted twice unless you use **Count Distinct**.
Field	Field to apply the metric to, for **Average**, **Sum**, or **Count Distinct** aggregations. You may

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	further be able to aggregate on fields from extended tables. The data is shown in a format that matches the field type. For example, if you select an integer field, such as the **Priority** field, the data is expressed as a number. If you select a duration field, such as **Business duration** on the Incident table, the aggregated data is expressed in days, hours, and minutes. If function fields were created in Report Designer for the table, they are available in the dropdown list. For more information, see Report on function fields.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Group by	
Select columns	The field whose values are each represented in a vertical column.
Max number of groups	Select the maximum number of groups to display. Groups in excess of this number, determined by sorting, are aggregated into the Others group. You can show that aggregate with the **Show others** option. By default, you cannot show more than 50 groups. If you have the admin role, you can change this limit in the *par_viz.table_data.max_groups* system property. Data for the Max number of groups is evaluated across all periods in the time series to ensure consistent group membership across all dates in the visualization.
Show others	If **Max number of groups** is set and this option is turned on, an aggregate of the groups beyond the maximum number is displayed as the Others group.
Rows	Hierarchy of table fields with values displayed horizontally.
Field for <table>	The field to group by. For example, in a visualization of incident data grouped by **Assignment group**, all incidents that belong to Software, Service Desk, and Network are placed in separate groups. If the table contains variables or question fields, you have the option to group by one of them at the end of the list of fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • It is not possible to group or stack data by the **Tags** field, or by certain field types, such as MEDIUMTEXT. • If you want to group by a field with continuous values, such as date or integer, the values are automatically grouped according to any report ranges that are defined for the data. For more information, see Report ranges.
Show row total	Option to show a final column with the total of each row
Show column total	Option to show a final row with the total of each column
Show parent row totals	When you have a hierarchy of more than one field in the rows, this option shows the sub total of fields higher up the hierarchy.
Sorting	
Sort by	Sorting options of the main and alternative groups set in **Group by**. Options include: • Name: Sorts the values alphabetically by field or element name. • Value: Sorts the values numerically or by count. • Element order: If you are grouping by records on the Choice [sys_choice] table, either directly or through a breakdown, this option sorts the groups according to the value of the Sequence field. • Group bucket: Sorts the elements by bucket group, when applicable. Only available for indicator data sources and when the breakdown used for the **Group by** is based on a bucket group. • Report range: Sorts the table field values by range. Only available for table data sources and when the table field used for the **Group by** has a report range associated with it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • The choices of what to sort by are based on the main, default **Group by**, if one is defined. This sorting applies to any alternative group-bys if possible. If the sorting criterion selected for the main group-by cannot apply to an alternative group-by (such as sorting by Element order when the alternative group-by is not on the Choice table), sorting for that group-by defaults to Value. • If no main **Group by** has been set, but alternative group-bys are defined, you can sort only by Name or Value. • Sorting is not available for Pareto bar visualizations. Pareto charts are always sorted by value in descending order.
Sort by order	Ascending or descending.
Additional settings	
Show 0 when no data is available	When toggled on, shows empty (NULL) values as zero (0). Default is true.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Info messages

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Indicator data options for pivot table data visualizations

When you select an indicator data source for a pivot table visualization, the following Data configuration options are available.

Field	Description
Data	
Data source	You have selected an Indicator data source in Create a pivot table data visualization in the Visualization Designer.
Metric	
Label	Label of the metric. By default it is the same as the name of the data source.
Time aggregation	Time aggregation to apply to the metric, such as 7-day running SUM or By-month AVG. Default is the same as the indicator period. For more information, see Applying time series aggregations.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Group by	
Breakdown	List of breakdowns to choose from for grouping indicator scores. **Important:** • Scripted breakdowns are not supported in dashboard filters. • Only two levels of breakdown are supported in total, including data visualization and dashboard filters.
Max number of groups	The maximum number of breakdown elements to display in columns. This property does not apply to rows.
Sorting	
Sort by	Sorting options of the main and alternative groups set in **Group by**. Options include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• Name: Sorts the values alphabetically by field or element name. • Value: Sorts the values numerically or by count. • Element order: If you are grouping by records on the Choice [sys_choice] table, either directly or through a breakdown, this option sorts the groups according to the value of the Sequence field. • Group bucket: Sorts the elements by bucket group, when applicable. Only available for indicator data sources and when the breakdown used for the **Group by** is based on a bucket group. • Report range: Sorts the table field values by range. Only available for table data sources and when the table field used for the **Group by** has a report range associated with it. **Note:** • The choices of what to sort by are based on the main, default **Group by**, if one is defined. This sorting applies to any alternative group-bys if possible. If the sorting criterion selected for the main group-by cannot apply to an alternative group-by (such as sorting by Element order when the alternative group-by is not on the Choice table), sorting for that group-by defaults to Value. • If no main **Group by** has been set, but alternative group-bys are defined, you can sort only by Name or Value. • Sorting is not available for Pareto bar visualizations. Pareto charts are always sorted by value in descending order.
Sort by order	Ascending or descending.
Additional settings	
Show 0 when no data is available	When toggled on, shows empty (NULL) values as zero (0). Default is true.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.

Field	Description
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Usage Insights data options for pivot table data visualizations

When you select a Usage Insights data source for a pivot table visualization, the following Data configuration options are available.

Important: Pivot table visualizations are only suitable for Events data, not Users or Sessions. Only Events have a value to group by.

Field	Description
Data	
Data source	You have selected a Usage Insights data source in Create a pivot table data visualization in the Visualization Designer.
Metric	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Metric	Label of the metric. By default it is the same as the name of the data source: Events or Sessions. For sessions, you can configure the metric to reflect the number of sessions, average session duration, average pages per session, or average sessions per user.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Group by	
Columns	Properties of the Usage Insights data source. **Note:** Available only for Events and Sessions metrics, in which case it is mandatory.
Rows	Hierarchy of table fields with values displayed horizontally.
Event property	Choice of properties of the data source to select for a column or row.
Show row total	Show the total value of elements in each row.
Show column total	Show the total value of elements at the bottom of each column.
Show parent row totals	For a hierarchy of rows, show the total of all child rows per column, depending on metric aggregation.
Additional settings	
Show 0 when no data is available	When toggled on, shows empty (NULL) values as zero (0). Default is true.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Pivot visualization example

Pivot tables show multiple dimensions or variables of a data set. This visualization displays separate cells for each row and column value combination, as well as a column subtotal for each first-level row. Aggregate information is presented in the upper left.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

Use this visualization type to show multiple variables in a single visualization. It can be useful for showing the relationship between different variables. In this example, you look at closed incidents grouped by assignment group, priority, and location.

Procedure

1. Follow the first steps of Create a pivot table data visualization in the Visualization Designer:
   a. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
   b. Select **Create data visualization**.
   c. From the Multidimensional charts, select the Pivot Table visualization type.
2. For the moment, skip the header and border section and move to the data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Add data source**.

b. Choose the Incident [incident] table.

c. Because this visualization shows completed incidents, let's add the Incidents.Closed condition in the Filters section.
With this filter selected, the visualization only shows the non-active incidents.

d. **Optional:** Select **Run** to preview the records that the visualization will be based on.

e. Select **Add this source**.

A pivot data visualization with the current value of the selected data appears in the Visualization Designer. Because the only information you've given is that the visualization represents closed incidents, you see only a single row. You add columns and rows in the next step.

3. Now that you can see the visualization, let's add some context for the user.

a. Expand the Header and border section.

b. Select **Show header** and provide the chart title `Completed incidents - Priority, Location and Assignment Group`.
When **Show header** is selected, you can add a title and a description. The chart title isn't necessarily the same as the visualization name. The visualization name identifies it in the Visualization Designer and in a list. The chart title appears within the visualization.

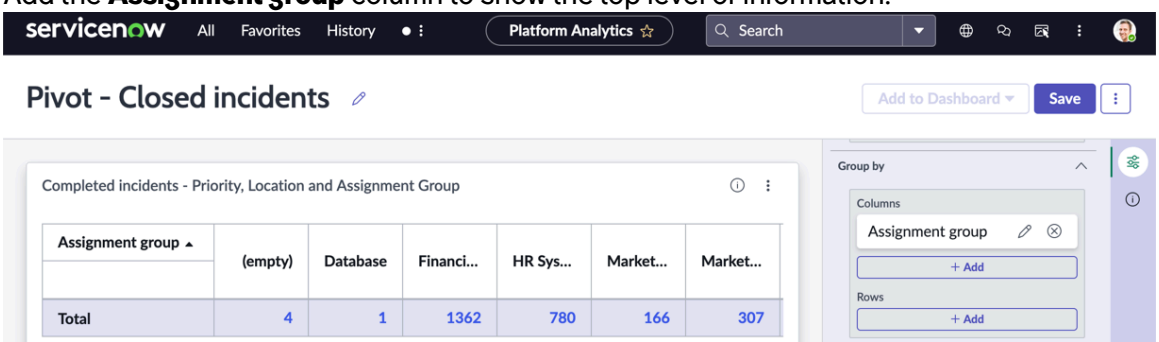
c. Enter a description of the visualization: `Closed incidents of all assignment groups grouped by priority and location`.
While the description and title fields aren't required, this information makes the visualization easier to understand on a dashboard and easier to identify in a list.

d. Select **Save** and give the report the title `Pivot - Closed incidents`.

4. Skip the Metric section.

5. Under Group by, add one column and multiple rows to show the data from multiple perspectives.

a. Add the **Assignment group** column to show the top level of information.

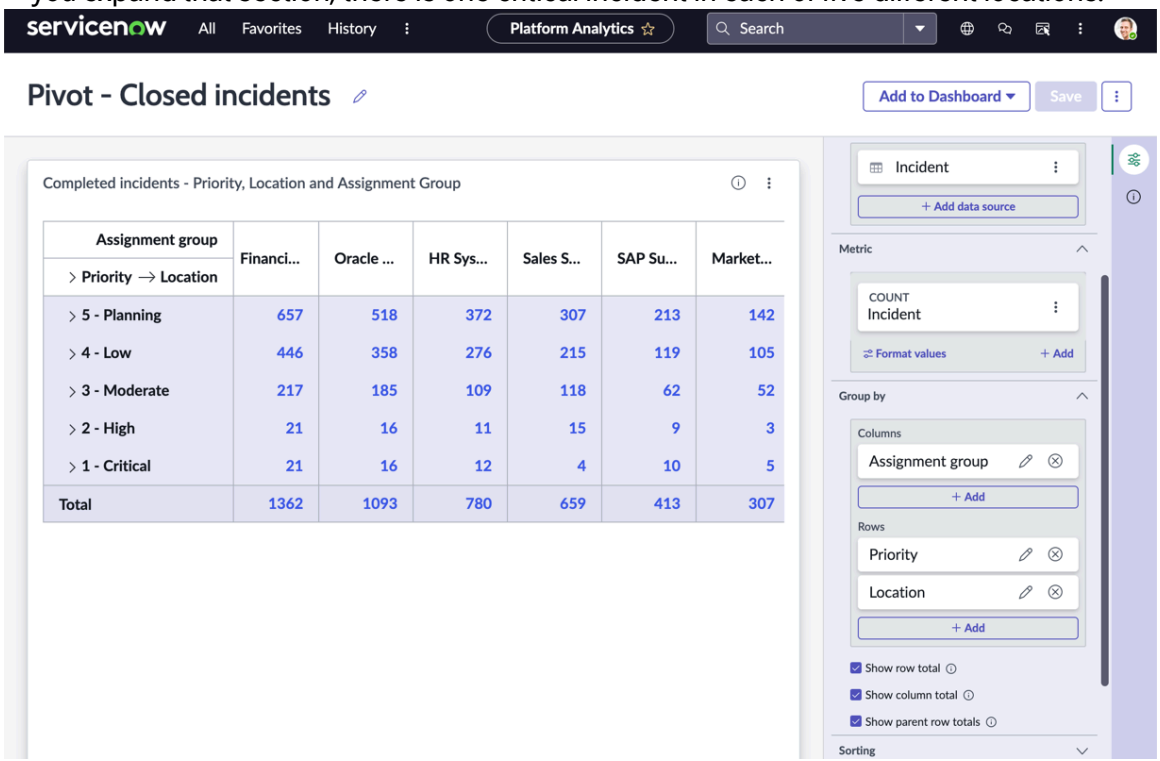


b. Add two rows: **Priority** and **Location**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Show all totals.

- **Show row total** provides the total count for each row in a new column.
- **Show column total** provides the total for each column in a new row.
- **Show parent row totals** shows the totals in each top level row of the elements in its column. For example, there are five Critical Marketing Systems Support incidents. When you expand that section, there is one critical incident in each of five different locations.

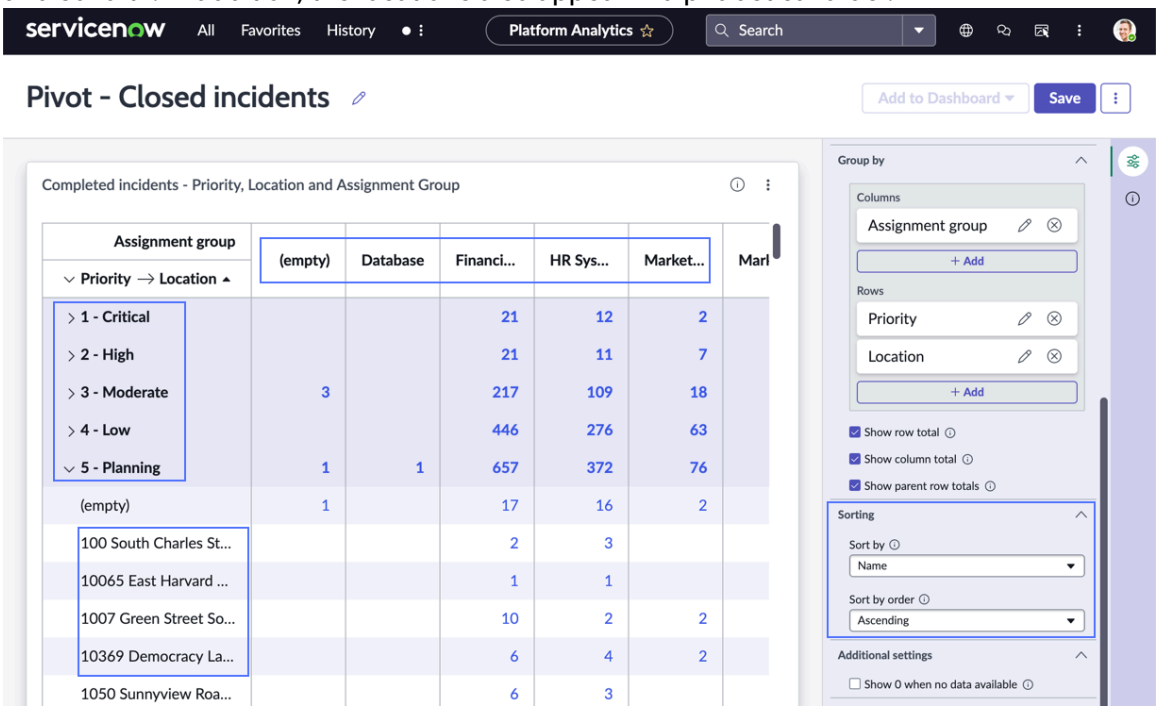


6. Under Sorting, choose the field to sort by and the order of the sorting.

a. Choose to sort by `Name`.
The priority names each start with a number so they appear in the order 1 - Critical, 2 - High, 3 - Moderate, and so forth.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Choose `Ascending` for the sort order.
The bars are ordered with 1 - Critical at the top followed by 2 - High, 3 - Moderate, and so forth. In addition, the locations also appear in alphabetical order.



7. Under Data update, configure how the audience interacts with the visualization.

a. Select **Follow filters**.
This option enables the visualization to follow interactive filters on the dashboards it's placed on that are based on the same table.

b. Select **Show filter icon** to show the number of filters applied to the visualization.
For example, if dashboard filters limit the value of the visualization, the icon indicates that you're seeing the number of open incidents that match the filters. You can then check to see which filters are in effect.

c. Select **Enable drilldown** to let viewers navigate to relevant information by selecting a data point in the chart.
Some visualizations only drill down to the list of associated data. Table data is generally restricted by access control lists (ACLs) and viewers may not see all of the associated records.

This control mirrors **Allow chart interaction**. Under Chart Interaction, you can also select the destination of drilling down.

8. Play with the display settings.
The settings in this section enable you to make the table easier to read with frozen rows and columns, lines and shading for rows and columns, and expanding or contracting the table when it's first viewed.

9. Play with the color settings.
From Set color type, choose **Single color** to enable setting background colors and configuring color rules.

10. Configure a color rule for the visualization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example deals with closed incidents, but in the case of open incidents, you want to define a dynamic color rule that changes the score's color based on its value.

a. Under Color Rules, select **+ Add rule**.

b. For the first color rule, choose the **Operator** `lower than`, enter the **Value** 6, and choose the color `Green`, and select **Apply**.

The value is up to the specified number but not including it.

Retain the order 100.

c. To indicate a value that requires more attention, create a second rule with the **Operator** `between`, the values 5 and 25, the color and icon color `Warning Orange`, and the order 50.

d. To show values that require the highest attention, create a third rule with the **Operator** `greater than`, the value 25, the color and icon color Red, and the order 25.

You have created three rules to show whether the value is in line with what you want to see.

Note: Color rules only apply to the individual values, not to the total columns and rows which retain the specified color and background color.

Create time series data visualizations

Show changes in data over time. Use different time series visualizations to emphasize different aspects of the data, such as trends or individual values.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

A time series is an ordered sequence of metrics taken continuously over time. The following business cases are some of the uses of a time series:

- Identifying trends, patterns, and outliers in data.
- Identifying turning points, such as whether a change in policy led to a change in indicator scores.
- Evaluating the relationships between data sources.

When you are selecting a visualization for a time series, consider whether you want to emphasize the trend in the data or specific changes in the data. Also consider whether you want to show one data source or compare several related data sources.

For information about the use of a Time series visualization in a dashboard, see the Developer Site. This site gives information about Time series data visualization components in the UI Builder, and some configuration options may differ from the Visualization Designer.

For an example of creating a time series visualization, see Time series data visualization example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select **Create data visualization**.
3. Configure the **Header and border**. Header and border options are the same for all data sources.

Header and border fields	Description
Show header	The visualization header, including title and icons.
Show header separator	Option to display a line separating the header from the rest of the component.
Chart title	Title of the visualization.
Description	A short overview about the visualization that the end user sees. Descriptions help users find the visualization.
Wrap title	Option to wrap long titles onto a second line. If false, displays an ellipsis to truncate long titles.
Wrap labels	Select to wrap long elements labels on the axis.
Max label size, px	Specify the maximum label size for element names on the axis. Default=100 px.
Truncation type	Specify where to truncate long labels with an ellipsis. Options are Beginning, Middle, and End.
Show border	Option to display a line around the component.
Bare	Option to remove padding around data visualization to provide more compact positioning on the page. Only available when **Show border** is turned off.
Show refresh option	Option to show or hide the refresh option from data visualizations. If cache is enabled on a dashboard, the Refresh option is always hidden.
Show export options	Option to show or hide the visualization's export types.
Header background color	Specify the color behind the title of the visualization.
Title color	Specify the text color of the title. The default title color is black, but you can choose a color that contrasts better with the header background. Only available when **Header background color** is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Choose a data source.
   For general descriptions of the data sources, see Data sources for data visualizations.

   - Table (available in the base system). When you select a table, you can filter it by custom or preconfigured conditions. Custom conditions can include questions or Service Catalog variables.

     Configured report sources appear in the **Predefined conditions** list. For more information, see Report sources.

     To help you create a custom filter, there is a preview list of records that would be included in the visualization. You can change which fields are shown as columns and the width of columns in the list actions.

     
   - Indicator (available in the base system). You can filter the indicator scores by breakdowns and elements.

     Note: Benchmark indicators are not supported.

     
     Note:

     You might have a multiple select (is one of) or dynamic (is (dynamic)) operator on the breakdown element filter. These operators require the indicator and breakdown to support them. For more information about the configurations that support these operators, see "Is one of" and "Is (Dynamic)" operators on breakdown conditions in data visualizations.

   - MetricBase (available if MetricBase is enabled). When you select a MetricBase data source, you have the option of constructing a custom filter for it using conditions and related list conditions, as with Table data sources.
   - Usage Insights (available with the User Experience PAR Integration application, to users with a required role). Choose one of up to three KPIs included with this application, depending on the visualization type. For more information, see User Experience Analytics data sources for data visualizations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can select multiple data sources for this visualization, but they must be of the same type: table, indicator, Usage Insights, or MetricBase. For more information, see Multiple data sources.

5. Select the options for your data source.
   - If your visualization represents table data, go to Table data options for time series data visualizations.
   - If your visualization represents indicator data, go to Indicator data options for time series data visualizations.
   - If your visualization represents Usage Insights data, go to Usage Insights data options for time series data visualizations.
   - If your visualization represents MetricBase data, go to MetricBase data options for time series data visualizations.
6. Under **Presentation**, provide display and color information.

Field	Description
Display settings: Each visualization type, such as Area and Column, has a different set of display settings. See Display settings for different time series data visualizations.	
Y axis	
Hide axis	Option to hide the primary axis.
Primary axis title	Title to display on the vertical axis of the visualization. This property applies only when **Hide primary axis** is false. If there is more than one Y-axis, you have additional axis titles, representing the properties yAxis1Title, yAxis2Title, etc. Add a Y-axis scale for a metric in the **More options** menu for the metric.
Axis range - from	Starting point for the values on the primary axis.
Axis range - to	End point for the values on the primary axis.
Show grid	Shows a grid of fine lines perpendicular to the primary axis, to help align values against that axis.
Axis style	Style of the primary axis. ○ Clean `clean`: Adds a straight line to the primary axis. ○ No tick lines `noTicks`: Option to remove all marks from the primary axis. ○ Standard `default`: Adds a line and tick marks to the primary axis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
X axis	
X axis title	Title to display on the horizontal axis of the visualization.
Show grid	When enabled, grid lines appear on the visualization.
Legend	
Show legend	Option to display the legend. Activated automatically at 400% zoom.
Show legend value	Option to display the value corresponding to the area of the chart you hover on. The value displays as a tooltip and in the chart legend.
Legend position	Legend location relative to the chart: Above, Below, Right, or Left
Horizontal alignment	Horizontal alignment of elements in the legend: Start, Center, or End
Max legend item width, px	Number of pixels after which the item in the legend is truncated.
Expand legend vertically	When turned on, the legend contents take as much space as needed to fit the legend without scrolling, instead of the maximum 2 lines.
Data label	
Show data labels	Option to display the score for each data point.
Colors	
Set color type	Type of color scheme to apply to the component. Options include: ○ Default: A color or set of colors that come from the UX Theme that is applied to the instance. For more information, see Working with themes in Next Experience. ○ Color palette: List of color palettes to select from predefined system palettes in the Chart Color Scheme [pa_chart_color_schemes] table. For grouped or stacked data, the colors apply

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	in order from highest value to lowest. For multiple data sources, palette colors apply in the order of data sources. For example, the first color of a palette applies to the first data source, and the second palette color applies to the second source. All visualizations that use the same color palette show the same colors, regardless of what data they display. ○ Fixed element color: Use a specific color from the Chart Colors table [sys_report_chart_color] for each element. All data visualizations that use fixed element colors show the same element, such as critical incidents in the Global scope, in the same color. This option is available only for Table data sources and only if no more than one data source or metric is added, and a Group by is defined. **Note:** Single color is only available when no **Group by** is selected.

7. Under **Chart interaction**, set what if anything happens when a viewer clicks a chart or a chart segment on the visualization.

Field	Description
Allow chart interaction	Enable an event to occur when a user clicks in a visualization or one of its segments.
Action	Choose the event that occurs when a user clicks in a visualization or one of its segments. Choices depend on the visualization type and data source. Applies only when **Allow chart interaction** is on. For more information, see Chart interactions in a data visualization. ○ **Go to data view** opens a list view, KPI Details page, or Usage Insights overview page relevant to the associated segment or visualization. For table data, a system property determines whether a Core UI list or a Platform Analytics list opens. For more information, see Data views for different data sources. ○ **Go to URL** opens the specified URL, which can be on the instance or external. You have the option of specifying a page

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	name to appear in the tooltip, for those visualizations with tooltips. ○ **Drill down to chart** (Visualization Designer only) Opens a different data visualization that is filtered by the selected data. You can add a drill-down visualization for each metric on the parent visualization. **Note:** The last level of drill down in the Platform Analytics experience is always a Core UI list. Records do not open in Workspace embedded lists. **Drill down to chart** supports only table data sources.

8. Select **Save**.
   Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations** to return to the Data Visualization list.

What to do next

- Add a visualization to a dashboard from the Visualization Designer
- Share a data visualization in the Visualization Designer
- Bookmark a visualization in the Visualization Designer

Use cases for different time series visualization types

Time series visualizations can emphasize the trend in the data or specific changes in the data. They can show one data source or compare several related data sources.

Time series visualization types

Visualization	Description and use case
Visualizing trends in the scores of an indicator	
Line	Shows how one or more values change over time by connecting a series of data points with straight lines. Use a line visualization to emphasize the trend in the data. Consider line visualizations to be the default choice for displaying a time series. If you are unsure of which visualization to use, use a line.
Spline	Shows how one or more values change over time by connecting a series of data points with a fitted curve that emphasizes the trend over individual data points. Spline visualizations let you take a limited set of known data points and approximate intervening values.
Scatter	Shows unconnected points for values in the Y-axis against time in the X-axis. Usually the trend line is also shown. Use with a spread of data that cannot be usefully connected with a line.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Time series visualization types (continued)

Visualization	Description and use case
Visualizing trends in the scores of an indicator	
Comparing scores in a data source	
Column	Shows changes in data over time by displaying values as proportional vertical columns. Use either to visualize changes in one data source or to compare data sources. To compare data sources with a column visualization, either add data sources to the visualization, or place several column visualizations next to each other in a dashboard.
Step	Emphasizes changes in a data source between discreet points in time. Use to show small incremental changes, especially when a line visualization smudges the data.
Comparing scores or trends between data sources	
Area	Resembles a line visualization, but the area between the axis and line is emphasized with colors. Use with multiple data sources to highlight the relative contribution that each data source makes to the whole.

Table data options for time series data visualizations

The following Data configuration options are available for all time series type visualizations of table data.

Field	Description
Data	
Data source	You have selected a Table data source in Create time series data visualizations.
Metric If there is more than one metric, you can change the time series chart type for that metric by clicking the Change chart type icon. Also, if there is more than one metric, you can use the More options list to select a main metric and to add a Y-axis for each metric. Lastly, you can set dashboard filters to apply only to specific metrics. For more information, see Options for time series data visualizations with multiple metrics.	
Label	Label of the metric. By default it is the same as the name of the data source.
Select an aggregation	Computational method for aggregating data. The default is **Count**, which displays the number of records selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If you select **Count Distinct**, only unique records are counted. For example, you want to generate a report with a distinct number of users who have one or more of the roles in a given list of roles. Users with more than one role would be counted twice unless you use **Count Distinct**.
Field	Field to apply the metric to, for **Average**, **Sum**, or **Count Distinct** aggregations. You may further be able to aggregate on fields from extended tables. The data is shown in a format that matches the field type. For example, if you select an integer field, such as the **Priority** field, the data is expressed as a number. If you select a duration field, such as **Business duration** on the Incident table, the aggregated data is expressed in days, hours, and minutes. If function fields were created in Report Designer for the table, they are available in the dropdown list. For more information, see Report on function fields.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Group by	
Field for [table]	The field to group by. For example, in a visualization of incident data grouped by **Assignment group**, all incidents that belong to Software, Service Desk, and Network are placed in separate groups. If the table contains variables or question fields, you have the option to group by one of them at the end of the list of fields. **Note:** • It is not possible to group or stack data by the **Tags** field, or by certain field types, such as MEDIUMTEXT. • If you want to group by a field with continuous values, such as date or integer, the values are automatically grouped according to any report ranges that are defined for the data. For more information, see Report ranges.
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the visualization may be grouped by. The viewer of the visualization can then select which of these items to group the data by. The viewer toggles the visibility of the selector in the visualization's More actions menu. In the additional items dialog, you can set whether this selector is visible by default by toggling **Selector visible by default**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If you select a value in **Group by**, that is the default group-by value. You do not have to select a **Group by** value to specify alternative group-by values. In this case, no default group-by value is used. For more information about setting alternative group-bys for multiple metrics, see Options for time series data visualizations with multiple metrics. For more information about the viewer experience selecting from alternative group-by values, see Select a group-by value in a data visualization as a viewer. **Important:** • Only up to three metrics on one visualization support alternative group-by. • Alternative group-by does not support data binding on the data source
Sorting	
Sort by	Sorting options of the main and alternative groups set in **Group by**. Options include: • Name: Sorts the values alphabetically by field or element name. • Value: Sorts the values numerically or by count. • Element order: If you are grouping by records on the Choice [sys_choice] table, either directly or through a breakdown, this option sorts the groups according to the value of the Sequence field. • Group bucket: Sorts the elements by bucket group, when applicable. Only available for indicator data sources and when the breakdown used for the **Group by** is based on a bucket group. • Report range: Sorts the table field values by range. Only available for table data sources and when the table field used for the **Group by** has a report range associated with it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • The choices of what to sort by are based on the main, default **Group by**, if one is defined. This sorting applies to any alternative group-bys if possible. If the sorting criterion selected for the main group-by cannot apply to an alternative group-by (such as sorting by Element order when the alternative group-by is not on the Choice table), sorting for that group-by defaults to Value. • If no main **Group by** has been set, but alternative group-bys are defined, you can sort only by Name or Value. • Sorting is not available for Pareto bar visualizations. Pareto charts are always sorted by value in descending order.
Sort by order	Ascending or descending. The sort by order for all elements in a time series visualization based on table data is based on the entire data set. For example, a column visualization that shows incidents per month grouped by priority, the order of priority for all months is computed across all data points. If there are multiple group bys added and if all group by fields support the selected sorting option, the selected sorting option applies to all. If some group by fields don't support the selected sorting, they default to Name. If a date filter is applied, the data is sorted by the most recent period, even if that period is hidden.
Trend by	
Aggregation period	The period by which values are aggregated to calculate the trend. Options come from the standard calendar and any business calendars that are defined on the instance, such as the Gregorian. Select **Auto** to have the application infer the aggregation level based on the selected date range. Automatic aggregation respects business calendars and shift schedules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Interval in minutes [trendByMinuteInterval]	Number of minutes in each aggregation period. This property applies only when **Aggregation period** is **Minute**.
Date field for [table]	The date field on the table to aggregate by. You can only select fields of the following data types: • Date • Date/Time • Due Date • Precise Time
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Follow filter per metric	If the visualization shows multiple metrics, toggle filter following on and off for each metric. Default: All metrics follow filters if Follow filters is on. For more information, see Following filters per metric.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Indicator data options for time series data visualizations

The following Data configuration options are available for all time series type visualizations of indicator scores.

Field	Description
Data source	You have selected an Indicator data source in Create time series data visualizations.
Metric If there is more than one metric, you can change the time series chart type for that metric by clicking the Change chart type icon. Also, if there is more than one metric, you can use the More options list to select a main metric and to add a Y-axis for each metric. Lastly, you can set dashboard filters to apply only to specific metrics. For more information, see Options for time series data visualizations with multiple metrics.	
Label	Label of the metric. By default it is the same as the name of the data source.
Time aggregation	Time aggregation to apply to the metric, such as 7-day running SUM or By-month AVG. Default is the same as the indicator period. For more information, see Applying time series aggregations.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Group by	
Breakdown	List of breakdowns to choose from for grouping indicator scores. **Important:** • Scripted breakdowns are not supported in dashboard filters. • Only two levels of breakdown are supported in total, including data visualization and dashboard filters.
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the visualization may be grouped by. The viewer of the visualization can then select which of these items to group the data by. The viewer toggles the visibility of the selector in the visualization's More actions menu. In the additional items dialog, you can set whether this selector is visible by default by toggling **Selector visible by default**. If you select a value in **Group by**, that is the default group-by value. You do not have to select a **Group by** value to specify alternative

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	group-by values. In this case, no default group-by value is used. For more information about setting alternative group-bys for multiple metrics, see Options for time series data visualizations with multiple metrics. For more information about the viewer experience selecting from alternative group-by values, see Select a group-by value in a data visualization as a viewer. **Important:** • Only up to three metrics on one visualization support alternative group-by. • Alternative group-by does not support data binding on the data source
Sorting	
Sort by	Sorting options of the main and alternative groups set in **Group by**. Options include: • Name: Sorts the values alphabetically by field or element name. • Value: Sorts the values numerically or by count. • Element order: If you are grouping by records on the Choice [sys_choice] table, either directly or through a breakdown, this option sorts the groups according to the value of the Sequence field. • Group bucket: Sorts the elements by bucket group, when applicable. Only available for indicator data sources and when the breakdown used for the **Group by** is based on a bucket group. • Report range: Sorts the table field values by range. Only available for table data sources and when the table field used for the **Group by** has a report range associated with it.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: • The choices of what to sort by are based on the main, default **Group by**, if one is defined. This sorting applies to any alternative group-bys if possible. If the sorting criterion selected for the main group-by cannot apply to an alternative group-by (such as sorting by Element order when the alternative group-by is not on the Choice table), sorting for that group-by defaults to Value. • If no main **Group by** has been set, but alternative group-bys are defined, you can sort only by Name or Value. • Sorting is not available for Pareto bar visualizations. Pareto charts are always sorted by value in descending order.
Sort by order	Ascending or descending. The sort by order for all elements in a time series visualization is based on the most recent element. For example, a column visualization that shows incidents per month grouped by priority, the order of priority for all months reflects that of the most recent month. If some group by fields don't support the selected sorting, they default to sorting by group bucket for date/time fields such as Age. For all other fields, they default to element order. If a date filter is applied, the data is sorted by the most recent completed period.
Date range	
Show maximum range	Option to show the maximum range of available dates.
Set absolute period	Option to set absolute start and end date. Available when **Apply date range** is selected.
Period start	Start date for the absolute period. This property applies only when **Set absolute period** is true.
Period end	End date for the absolute period. This property applies only when **Set absolute period** is true.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Select **Use current date for period end** to automatically update the end date to the current date. (Not available if the start date is in the future.)
Number of periods	Number of date periods to display. This property applies only when **Set absolute period** is true.
Period	Time interval for each date period. • Days `D` • Months `M` • Years `Y` This property applies only when **Set absolute period** is false.
Allow change date range	When turned on, the viewer has a date range selector control with a set of predefined options.
Additional settings	
Show target	If it is defined for the indicator, displays the global target value.
Show forecast	Option to display forecast data in the chart based on current trend data. **Note:** If there is not enough historical data to generate a forecast, no forecast or error is displayed.
Configure forecast	Opens a dialog for configuring forecasting on this data visualization. A forecast configuration on the data visualization overrides any configuration set on the data source, such as an indicator. This override applies only to the specific data visualization. This option is available only when Show forecast is turned on. For more information, see Configure a forecast in a time series data visualization.
Show forecast range	Option to display the 95% confidence interval of the forecast. Available only when Show forecast is turned on.
Show trend	Option to display the direction that the indicator is moving, or how values have changed over time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Show confidence band	Option to display the bandwidth between which indicator scores are moving.
Show threshold	Option to display an active threshold set for the selected indicator, such as an all-time high or low. Thresholds appear only if they have been defined for the selected indicator.
Show comment	Option to display comments added to data points.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Follow filter per metric	If the visualization shows multiple metrics, toggle filter following on and off for each metric. Default: All metrics follow filters if Follow filters is on. For more information, see Following filters per metric.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Show filter as separate series	When toggled on, if there is a filter applying multiple elements, these elements are shown as separate lines in the chart. The filter can be a component added to a dashboard or UIB page, or it can be an "is one of" filter condition on the data visualization itself. This feature supports only one breakdown at a time. Other breakdown filters have no effect on the chart. Filter precedence works as follows: • The first "is one of" filter condition on the data visualization overrides all other filter conditions and all single/multiple select filter components. • If there are no "is one of" filter conditions, the first multiple select filter that has a selection made overrides all other single/multiple select filters and all filter conditions. • A different multiple select filter can take effect if the first one is cleared. Default: off. A single aggregate line is shown for all elements. Requires the latest Data Visualization application from the ServiceNow Store.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Available only when no **Group by** is defined.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace, includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Usage Insights data options for time series data visualizations

The following Data configuration options are available for all time series type visualizations of Usage Insights data.

Note: If you add a Platform Analytics data visualization with Usage Insights (UXA) data to an inline dashboard, the default drilldown for that data visualization is to open the corresponding UXA analytics page. This feature provides a quick and efficient way to drill down and explore specific user behavior from your Platform Analytics dashboard.

Field	Description
Data source	You have selected a Usage Insights data source in Create time series data visualizations.
Metric If there is more than one metric, you can change the time series chart type for that metric by clicking the Change chart type icon. Also, if there is more than one metric, you can use the More options list to select a main metric and to add a Y-axis for each metric. Lastly, you can set

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
dashboard filters to apply only to specific metrics. For more information, see Options for time series data visualizations with multiple metrics.	
Metric	
Metric	Label of the metric. By default it is the same as the name of the data source: Events or Sessions. For sessions, you can configure the metric to reflect the number of sessions, average session duration, average pages per session, or average sessions per user.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Use custom formatting	Option to use custom formatting on the component.
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands. **Note:** Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.

Field	Description
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
Group by	
Event property [eventPropertyValue]	List of properties to choose from for Usage Insights Event sources that have properties. **Note:** Only applies to Events metrics.
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the visualization may be grouped by. The viewer of the visualization can then select which of these items to group the data by. The viewer toggles the visibility of the selector in the visualization's More actions menu. In the additional items dialog, you can set whether this selector is visible by default by toggling **Selector visible by default**. If you select a value in **Group by**, that is the default group-by value. You do not have to select a **Group by** value to specify alternative group-by values. In this case, no default group-by value is used. For more information about setting alternative group-bys for multiple metrics, see Options for time series data visualizations with multiple metrics. For more information about the viewer experience selecting from alternative group-by values, see Select a group-by value in a data visualization as a viewer. **Important:** • Only up to three metrics on one visualization support alternative group-by. • Alternative group-by does not support data binding on the data source
Trend by	
Aggregation period [trendByFrequency]	The period by which values are aggregated to calculate the trend. Options come from the standard calendar and any business calendars that are defined on the instance, such as the Gregorian. Select **Auto** to have the application infer the aggregation level based on the selected date range. Automatic

Field	Description
	aggregation respects business calendars and shift schedules.
Date range	
Show maximum range	Option to show the maximum range of available dates.
Set absolute period	Option to set absolute start and end date. Available when **Apply date range** is selected.
Period start	Start date for the absolute period. This property applies only when **Set absolute period** is true.
Period end	End date for the absolute period. This property applies only when **Set absolute period** is true. Select **Use current date for period end** to automatically update the end date to the current date. (Not available if the start date is in the future.)
Number of periods	Number of date periods to display. This property applies only when **Set absolute period** is true.
Period	Time interval for each date period. • Days `D` • Months `M` • Years `Y` This property applies only when **Set absolute period** is false.
Allow change date range	When turned on, the viewer has a date range selector control with a set of predefined options.
Show range picker by default	When turned on, the date range selector is shown to the viewer without the viewer needing to open it. When off, the viewer has to open the date range selector in the More options menu. Default: off (false)

Field	Description
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

MetricBase data options for time series data visualizations

The following data options are available for all time series type visualizations of MetricBase data.

Field	Description
Data source	You have selected a MetricBase data source in Create time series data visualizations.
Metric If there is more than one metric, you can change the time series chart type for that metric by clicking the Change chart type icon. Also, if there is more than one metric, you can use the More options list to select a main metric and to add a Y-axis for each metric. Lastly, you can set dashboard filters to apply only to specific metrics. For more information, see Options for time series data visualizations with multiple metrics.	
Label	Label of the metric. By default it is the same as the name of the data source.
Metric	Metrics determined in your MetricBase database.
Transform	Option to apply a transform to the data. For example, you can select **Envelope** to show the minimum and maximum (envelope) value within the dataset. For more information, see MetricBase transforms.
Dynamic period based on time range	When enabled, the aggregation period is set according to the time range. Time range < 4 hours: minute aggregation. Time range 4 hours - 3 days: hourly aggregation. Time range > 3 days: daily aggregation. Applies only when the Transform is Resample.
Label	Label to apply to the transform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This property only applies when when **Transform** is Label.
Model	Prediction model to use to transform the data. If a model does not already exist, you can create one. To learn more, see Detect anomalies in MetricBase data using predictive models. This property applies only when **Transform** is Predict.
Count	Specified number of values to show in the metric dataset. This property applies only when **Transform** is Top or Bottom.
Summand	Specified value to add to the data points in the dataset. This property applies only when **Transform** is Add.
Subtrahend	Specified value to subtract from the data points in the dataset. This property applies only when **Transform** is Subtract.
Factor	Value to multiply the data points in the dataset by. This property applies only when **Transform** is Multiply.
Divisor	Value to divide the data points in the dataset by. This property applies only when **Transform** is Divide.
Duration	Specified duration of new data points used to calculate an outcome. This property applies only when **Transform** is Interpolate.
Fractions	Percentiles of the underlying data to create a new dataset. This property applies only when **Transform** is Fractiles.
Function	Aggregation function used to calculate a new dataset.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This property applies only when **Transform** is Resample, Filter, or Partition.
Period	New time period to apply to the dataset. This property applies only when **Transform** is Resample.
Window	Sliding time window of the given duration to create the new dataset. This property applies only when **Transform** is Filter or Partition.
Base	A timestamp to align the partition window. This property applies only when **Transform** is Partition.
Format values	Select to open the **Formatting values** dialog. For more information, see Value formatting in reports.
Formatting values	
Formatting	Select default, number, or duration format
--Number format	
Decimal precision	Number of decimals to show in the metric. This field is available only when the **Use custom formatting** option is activated.
Rounding	Type of rounding to use to reach the number of decimals in the **Decimal precision** field. Options include: • Up `UP` • Down `DOWN` • Ceiling `CEILING` • Floor `FLOOR` • Half up `HALF_UP` • Half down `HALF_DOWN` • Half even `HALF_EVEN` **Note:** Only available when **Use custom formatting** is true.
Use the thousands group separator	Option to use a comma to separate groups of thousands.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Only available when **Use custom formatting** is true.
Enable abbreviation	Option to use an alphabetical abbreviation. For example, M to represent million. **Note:** Only available when **Use custom formatting** is true.
Example	Example of the final value to show in the component. **Note:** Only available when **Use custom formatting** is true
--Duration format	
Unit format	Option to abbreviate the time unit or use full words
Maximum duration unit	Largest time unit in display
Minimum duration unit	Smallest time unit in display
Hide seconds when duration is greater than one minute	When Seconds are the minimum duration unit, toggling this on hides the second after the duration exceeds one minute.
Show original value in tooltip	Pointing to a displayed metric value shows the default formatted value in a tooltip.
Example	An example metric value as formatted
Group by	
Group by	The field on the MetricBase data source to group by. For example, for a visualization of the Monitorable Item data source, you can group by Created by, Name, Primary, Tags, Type, or Updated by.
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the visualization may be grouped by. The viewer of the visualization can then select which of these items to group the data by. The viewer toggles the visibility of the selector in the visualization's More actions menu. In the additional items dialog, you can set whether

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	this selector is visible by default by toggling **Selector visible by default**. If you select a value in **Group by**, that is the default group-by value. You do not have to select a **Group by** value to specify alternative group-by values. In this case, no default group-by value is used. For more information about setting alternative group-bys for multiple metrics, see Options for time series data visualizations with multiple metrics. For more information about the viewer experience selecting from alternative group-by values, see Select a group-by value in a data visualization as a viewer. **Important:** • Only up to three metrics on one visualization support alternative group-by. • Alternative group-by does not support data binding on the data source
Date range	
Set absolute period	Option to set absolute start and end date. Available when **Apply date range** is selected.
Number of periods	Number of date periods to display. This property applies only when **Set absolute period** is true.
Period	Time interval for each date period. • Days `D` • Months `M` • Years `Y` This property applies only when **Set absolute period** is false.
Date format	Defines the date format for the X axis. • Default `default` • Date `date` • Month `month`
Allow change date range	When turned on, the viewer has a date range selector control with a set of predefined options.

Field	Description
Show range picker by default	When turned on, the date range selector is shown to the viewer without the viewer needing to open it. When off, the viewer has to open the date range selector in the More options menu. Default: off (false)
Additional settings	
Show forecast	Option to display forecast data in the chart based on current trend data. Requires licensed Performance Analytics. **Note:** If there is not enough historical data to generate a forecast, no forecast or error is displayed.
Configure forecast	Opens a dialog for configuring forecasting on this data visualization. A forecast configuration on the data visualization overrides any configuration set on the data source, such as an indicator. This override applies only to the specific data visualization. This option is available only when Show forecast is turned on. For more information, see Configure a forecast in a time series data visualization.
Show forecast range	Option to display the 95% confidence interval of the forecast. Available only when Show forecast is turned on.
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Follow filter per metric	If the visualization shows multiple metrics, toggle filter following on and off for each metric. Default: All metrics follow filters if Follow filters is on. For more information, see Following filters per metric.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Refresh after being away for X min.	Triggered when you navigate away from the dashboard that contains the data visualization to another page in the same workspace,

Field	Description
	includingPlatform Analytics experience. Sets how many minutes you will be on another page before the visualization automatically refreshes when you navigate back. Do not confuse this property with the **Scheduled repetition** setting on inline dashboards. This latter property refreshes the entire dashboard, and applies only while that dashboard is open.
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

Display settings for different time series data visualizations

Each time series visualization type has a different set of display settings.

Area visualization display settings

Field	Description
Line stroke width	Sets the line stroke width for the items on the chart in pixels.
Disable tooltip	Option to remove tooltips on hover. Default: false
Show only one data point in tooltip	When turned on, the tooltip shows only the data point being hovered over. When turned off, the tooltip shows all data points. Default: Off, except when zoom is 400%, which automatically turns it on.
Show data table	Shows a table with chart and graph data for easier screen reader access. Data includes the percentage of the total for each value, when appropriate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Show markers	Display a symbol at each data point on the chart to simplify identifying specific values. Available for line, spline, area, and step charts.
Show 0 when no data available	Choose whether to show 0 when there is no value in the selected dataset or for the configuration.
Show % of total in tooltip	Enable to show the percentage each data point contributes to the total alongside absolute values in the tooltip.
Show continuous line	Available when **Show 0 when no data available** is not selected. When selected and there is no data for a specific time, there is no gap in the chart and it shows continuous line.

Scatter visualization display settings

Field	Description
Disable tooltip	Option to remove tooltips on hover. Default: false
Show only one data point in tooltip	When turned on, the tooltip shows only the data point being hovered over. When turned off, the tooltip shows all data points. Default: Off, except when zoom is 400%, which automatically turns it on.
Show data table	Shows a table with chart and graph data for easier screen reader access. Data includes the percentage of the total for each value, when appropriate.
Show 0 when no data available	Choose whether to show 0 when there is no value in the selected dataset or for the configuration.
Show % of total in tooltip	Enable to show the percentage each data point contributes to the total alongside absolute values in the tooltip.

Column visualization display settings

Field	Description
Chart variation	Select whether to display the group-by values in stacked columns or side-by-side.
Disable tooltip	Option to remove tooltips on hover.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Default: false
Show only one data point in tooltip	When turned on, the tooltip shows only the data point being hovered over. When turned off, the tooltip shows all data points. Default: Off, except when zoom is 400%, which automatically turns it on.
Show data table	Shows a table with chart and graph data for easier screen reader access. Data includes the percentage of the total for each value, when appropriate.
Show % of total in tooltip	Enable to show the percentage each data point contributes to the total alongside absolute values in the tooltip.

Spline, line, and step visualization display settings

Field	Description
Line stroke width	Sets the line stroke width for the items on the chart in pixels.
Disable tooltip	Option to remove tooltips on hover. Default: false
Show only one data point in tooltip	When turned on, the tooltip shows only the data point being hovered over. When turned off, the tooltip shows all data points. Default: Off, except when zoom is 400%, which automatically turns it on.
Show data table	Shows a table with chart and graph data for easier screen reader access. Data includes the percentage of the total for each value, when appropriate.
Show markers	Display a symbol at each data point on the chart to simplify identifying specific values. Available for line, spline, area, and step charts.
Show % of total in tooltip	Enable to show the percentage each data point contributes to the total alongside absolute values in the tooltip.
Show continuous line	When selected and there is no data for a specific time, there is no gap in the chart and it shows continuous line.

Configure a forecast in a time series data visualization

If a time series visualization is configured to show forecasts, you can configure the forecasts for that visualization.

Before you begin

This procedure assumes you have created a time series visualization for a non-table data source and you want to configure forecasting for that visualization.

Note: Support is not provided for the Hour of day or Day of week aggregations on table data.

Role required: Any role that can create a time series visualization. For non-indicator data sources, a subscription to Performance Analytics is also required.

About this task

When you configure forecasting on a data visualization, you override any forecast configuration set on the data source, such as an indicator. The override applies only to the specific data visualization.

Procedure

1. Open the configuration panel of the time series visualization.
2. In **Additional settings**, activate **Show forecast**.
   Table data sources do not support forecasting.
3. Select **Configure forecast**.
   The **Configure forecast** pane opens.
4. Complete the following fields:

Field	Description
Forecast method	The statistical method the system uses to forecast values for this indicator. The default value is Auto, meaning that the system chooses a method that best fits the data. For more information, see Forecast methods and Automatic selection of forecast methods.
Period length	The number of data points needed to establish a pattern in the time series. If you select **Use default**, the period length depends on the frequency of the data source. For example, the period length for a time series with a daily frequency is 7 data points by default. For more information, see Default forecast period lengths.
Number of periods to look ahead	Number of data periods in the future to forecast scores for.
Forecast range lower limit	The lowest meaningful value of a forecast score. If a score lower than this value is forecast, this value is displayed instead.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Forecast range upper limit	The highest meaningful value of a forecast score. If a score higher than this value is forecast, this value is displayed instead.

5. Select which data to base the forecast on.

Option	Description
Visualization date range	All data within the date range of the visualization
Previous periods	The number of data periods before the present to base forecasts on. These data periods are the same length as the ones in **Period length**. If you select Previous periods, also specify the number of periods in the **Number of periods to consider** field.
Specific starting date	All scores collected after a start date. If you select Specific starting date, also specify the **Start date**.

Warning: If there are insufficient data points to generate a forecast, nothing is shown, neither the forecast nor a message.

Performance Analytics scores forecasts

Forecast methods

Forecasting uses standard statistical methods. You can select a method or let the system choose one automatically.

Method	Description
Linear	Generates a linear regression forecast based on the historical scores, using constant and trend as explanatory variables.
Seasonal	Generates a linear regression forecast based on the historical scores, using seasonal dummies as explanatory variables. A 'season' for this analysis is one period.
Seasonal Trend	As Seasonal, but includes a trend as an explanatory variable.
Seasonal Trend Loess (STL)	Generates a seasonal forecast based on a best-fit function. This method fits a trend, a season, and a random noise process to the data using an exponentially weighted moving average approach. The forecast is based on the full data set, with more weight given to more recent observations A 'season' for this analysis is one period.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Method	Description
Random Forest (RF)	Creates a combination of decision trees where the predictions produced by these trees are averaged to get a single prediction. The randomness comes from each tree being built from a random subset of the available data and inputs. For more information about the random forest method, see this Medium article.
Autoregressive (AR)	The autoregressive (AR) model forecasts future values of an indicator by using a linear combination of a trend, seasonal dummies, and past values. Like the Random Forest (RF) model, the AR model checks for the best number of lags. However, the AR model relates current to past values linearly, whereas the RF model is non-linear.

Automatic selection of forecast methods

If you are a statistics expert, you can select a forecast method manually. By default, the instance chooses the best method for you automatically, based on the fit of the method.

To determine the best fitting forecast method, the instance generates forecasts using each forecast method with your historical data. The instance then compares those forecasts with the latest data based on how far ahead you want to forecast. The instance performs this evaluation each time it displays the forecast. Therefore, collecting additional scores or changing the forecast period can alter which forecast method is used.

Consider a time series visualization of a Performance Analytics indicator with a daily frequency. You configure forecasting on the visualization to use a period length of 7 days and to base forecasts on the previous two periods. The instance applies each forecasting method to your historical data that is older than two weeks. Then the instance compares those forecasts against the latest two weeks of data. The forecast that most closely fits the latest two weeks of data is then recalculated using the entire data set. The visualization shows the results of this final calculation.

Default forecast period lengths

Forecast periods have a default length that depends on the frequency of the data sources. Not all data sources have the same frequencies.

Default period lengths common to all data sources

Score frequency	Number of data points per period	Total period length
Daily	7	1 Week
Weekly	13	1 Quarter
Bi-weekly	6	1 Quarter
Four Weekly	13	1 Year
Monthly	12	1 Year
Bi-monthly	6	1 Year
Quarterly	4	1 Year
Fiscal Quarterly	4	1 Year
Half Yearly	2	1 Year
Yearly	4	4 Years

Score frequency	Number of data points per period	Total period length
Fiscal Yearly	4	4 Years

Default period lengths unique to MetricBase

Score frequency	Number of data points per period	Total period length
Minutely	100	Dynamic, controlled by data source depending on query

Options for time series data visualizations with multiple metrics

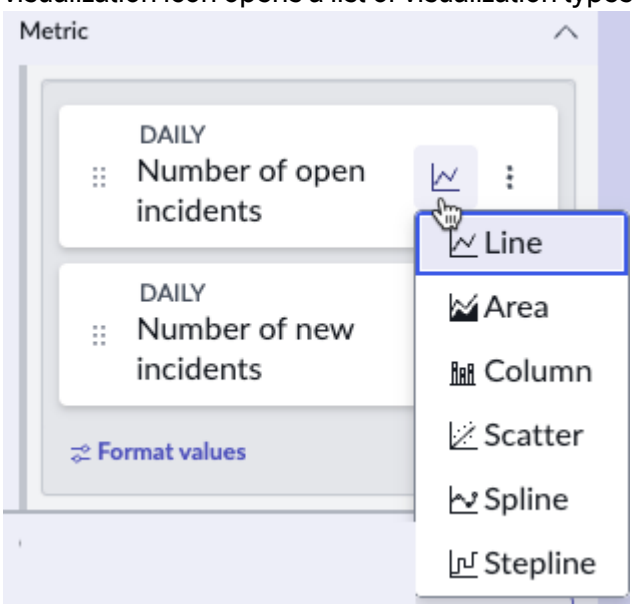
If you are showing multiple metrics in a time series data visualization, you can set the group by, visualization type, and Y-axis scale for each metric. You can also have filters on a dashboard apply only to specific metrics.

Note: Additional data sources must use the same unit as the first metric. Otherwise, only the first metric is used in the visualization.

https://player.vimeo.com/video/1002743383?badge=0&autopause=0&player_id=0&app_id=58479

Separate visualization for each metric

When you have a data visualization with more than one data source, you have a separate metric for each data source. In time series data visualizations, you can select a separate visualization type for each metric, to make the visualization easier to read. In each Metric tile, selecting the visualization icon opens a list of visualization types to choose from.



Multiple Y-axes

In some time series, the difference between the range of values of metrics makes it difficult to read the metrics when they share the same Y-axis scale. In this case, you can have separate Y-axis scales for the metric. Add a Y-axis for a metric by selecting the More options icon in the metric tile. Be sparing with this function, however, because having too many Y-axis scales also makes the visualization difficult to read. Also, be sure to give a short but clear label for each Y-axis if you have more than one.

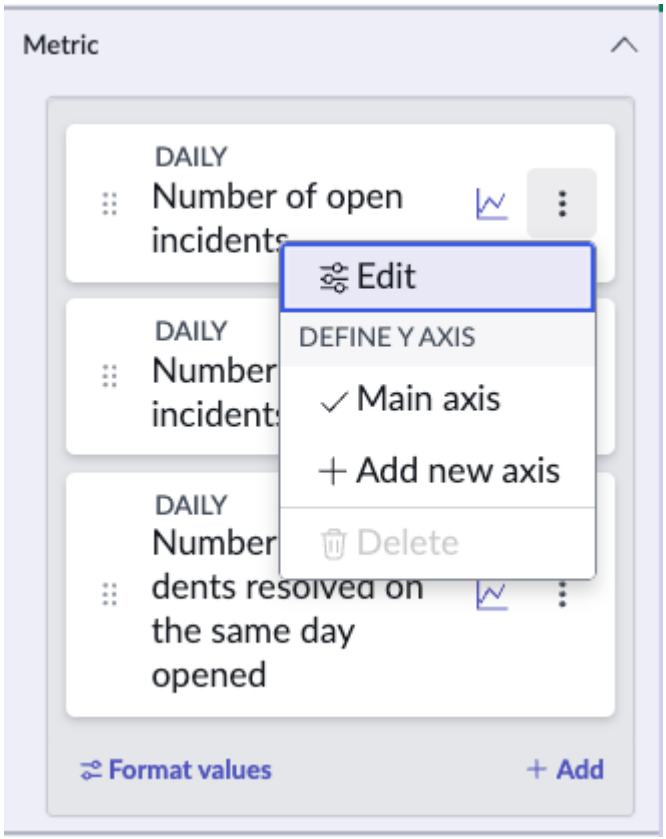
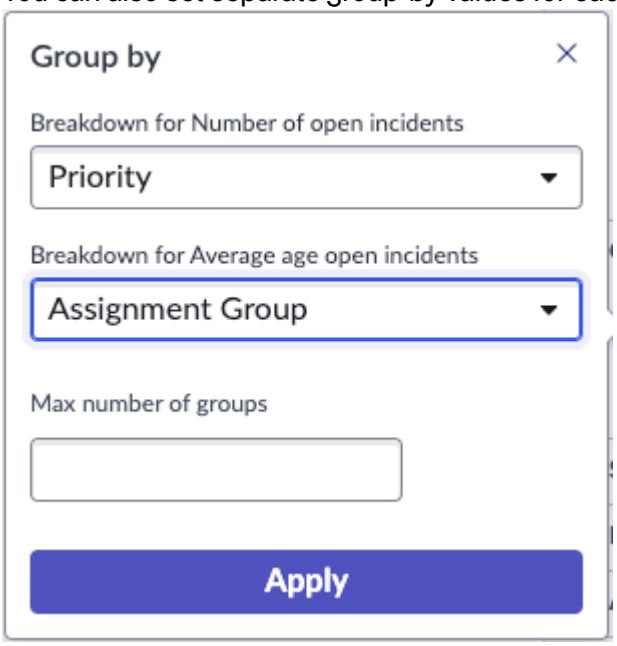
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Group by per metric

You can also set separate group-by values for each metric.



If you have no more than three metrics, you can also set alternative group-bys. You can select any field or breakdown that can apply to any of your metrics. The dialog where you select the alternative group-bys says how many of your selections apply to each metric. In runtime, the viewer can select a group-by for each metric, but only from the choices that can apply to that metric.

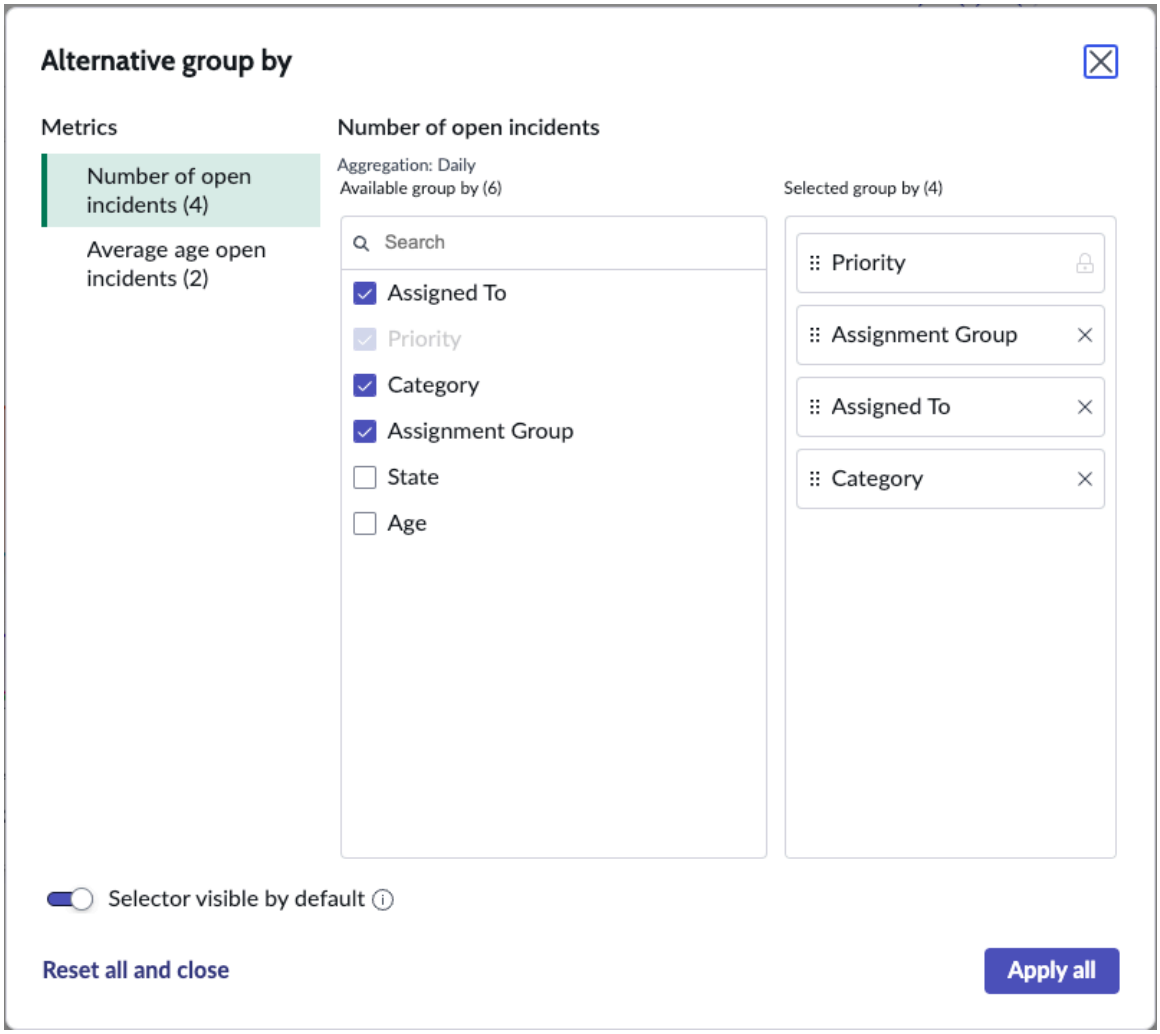
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Follow filters per metric

If **Follow filters** is activated on a time series or bar visualization that shows multiple metrics, the configuration panel shows an expandable item called **Follow filters per metric**. Expand this item to toggle filter following on or off for each metric.

For example, consider a bar visualization that shows the Number of open problems and the Average age of open problems. You can configure this visualization so that the Number of open problems follows any applicable filters on a dashboard, but the Average age of problems does not.

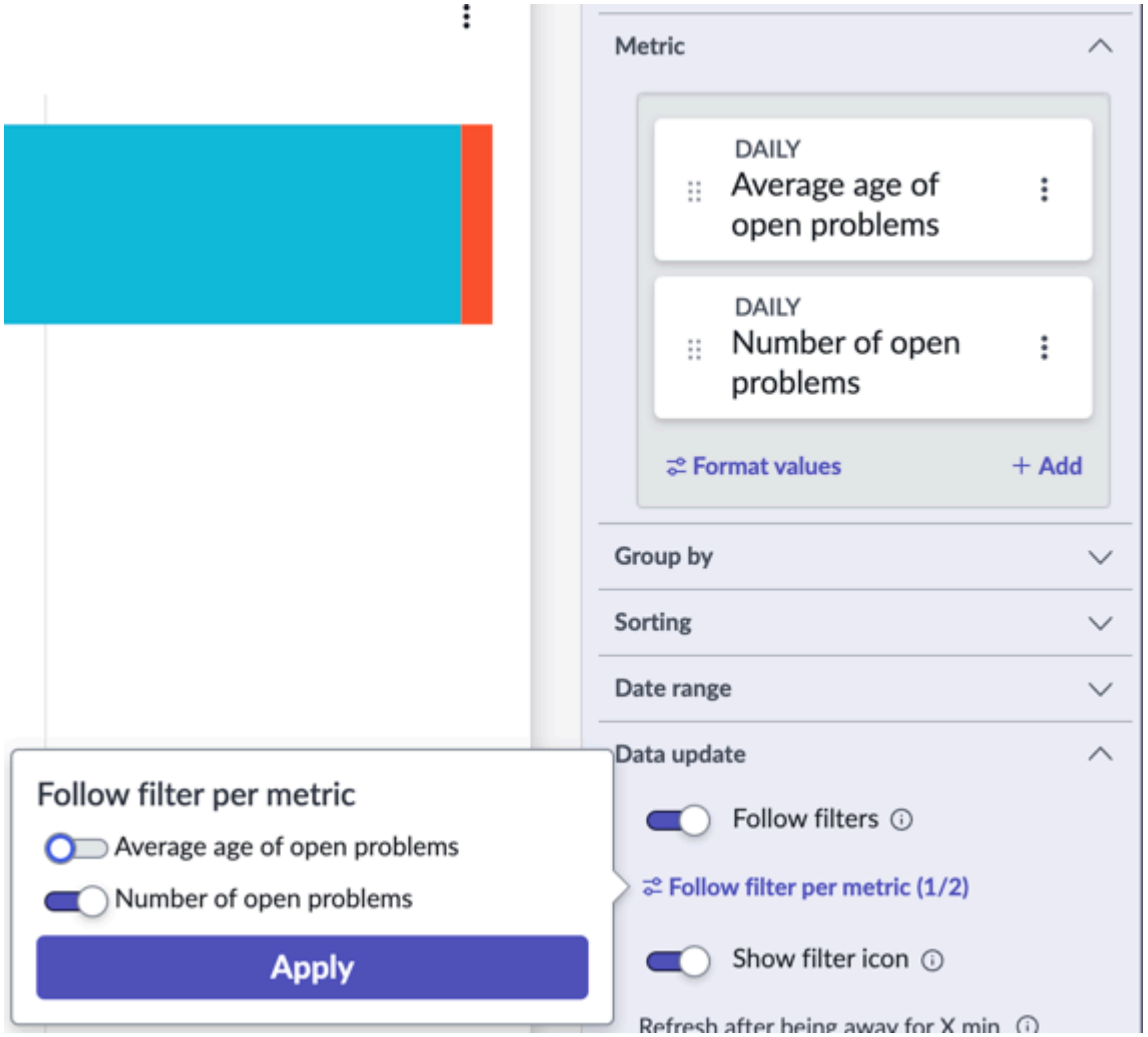
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

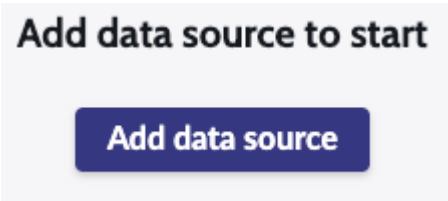


Time series data visualization example

Time series visualizations show the changes in data over time. This example starts with a single indicator data source and adds more complexity.

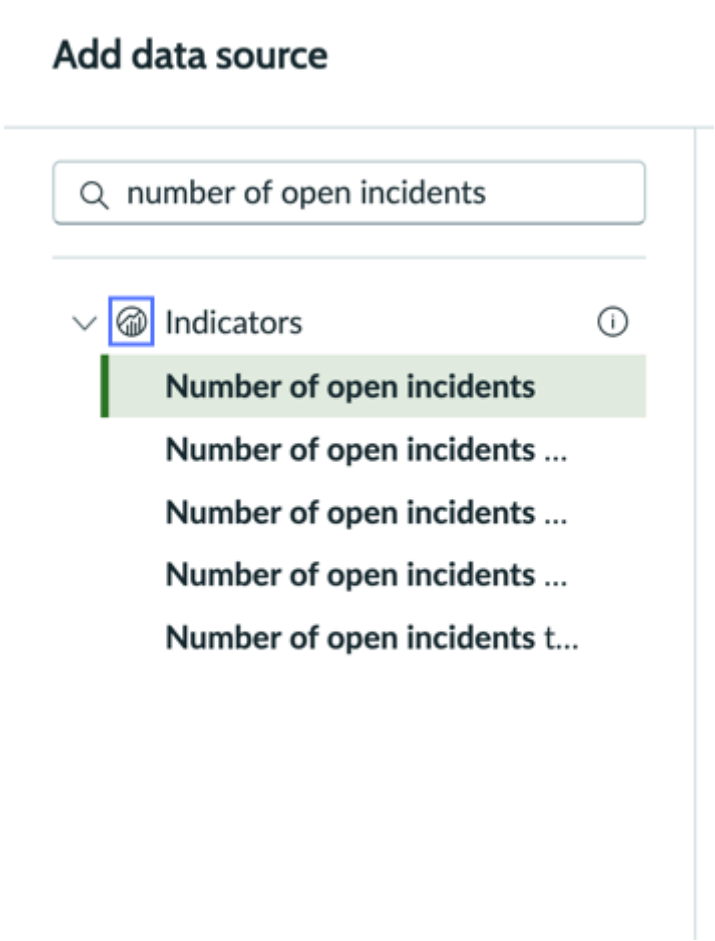
In this example you start wanting to show the change in the number of open incidents over time. Then you want to show the trend, and then the number of open incidents broken down by priority. Finally you want to compare the number of open incidents against the number of new incidents.

1. First you search for **Data Visualizations** in the Unified Navigation and select **Create data visualization**
2. In the empty new data visualization, you select **Add data source**.

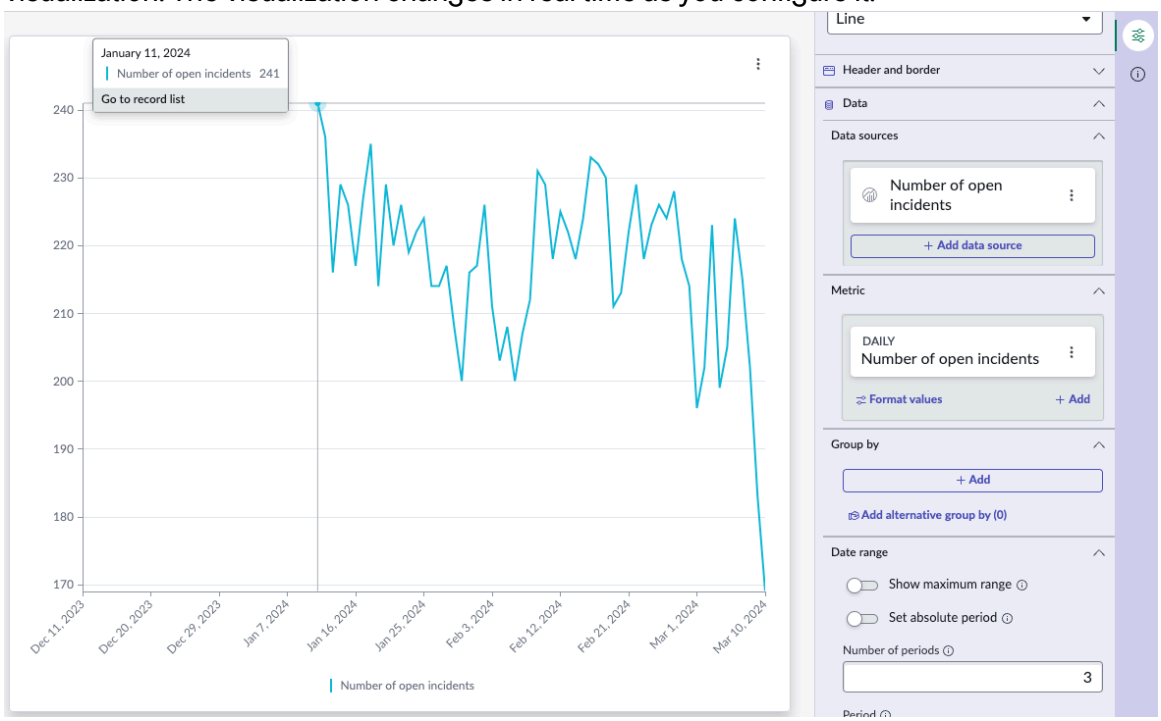


3. You want to use the indicator Number of open incidents. Fortunately, this indicator has been used before and is listed under the Suggested data sources, saving you the trouble of searching for it. You can tell that Number of open incidents is an indicator data source because of the little column-and-trend icon next to it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

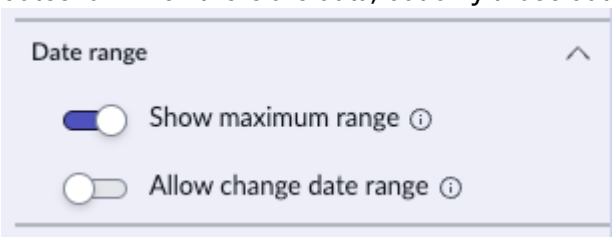


4. You return to the visualization and see that the Line type has been selected by default. Line is the most common type of time series, and a time series is the usual visualization for an indicator. You also have an open Configuration panel for this data visualization, next to the line visualization. The visualization changes in real time as you configure it.

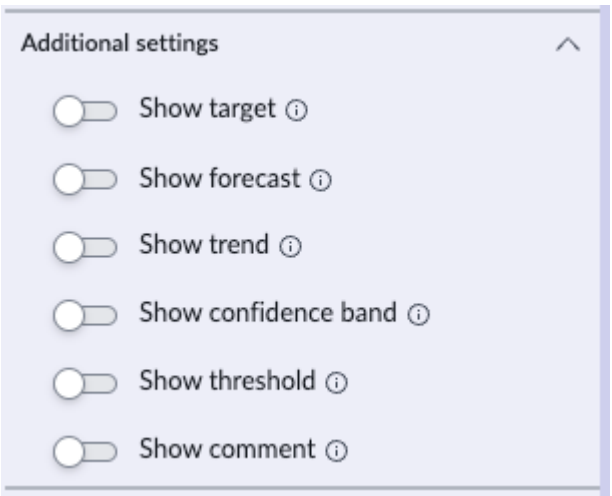


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. The data presentation doesn't look so great, because you only created the indicator on January 11. Fortunately, the Configuration panel has a Date range section where you can trim the dates that are shown. In this case, you select **Show maximum range**, and it shows all the dates for which there are data, but only those dates.

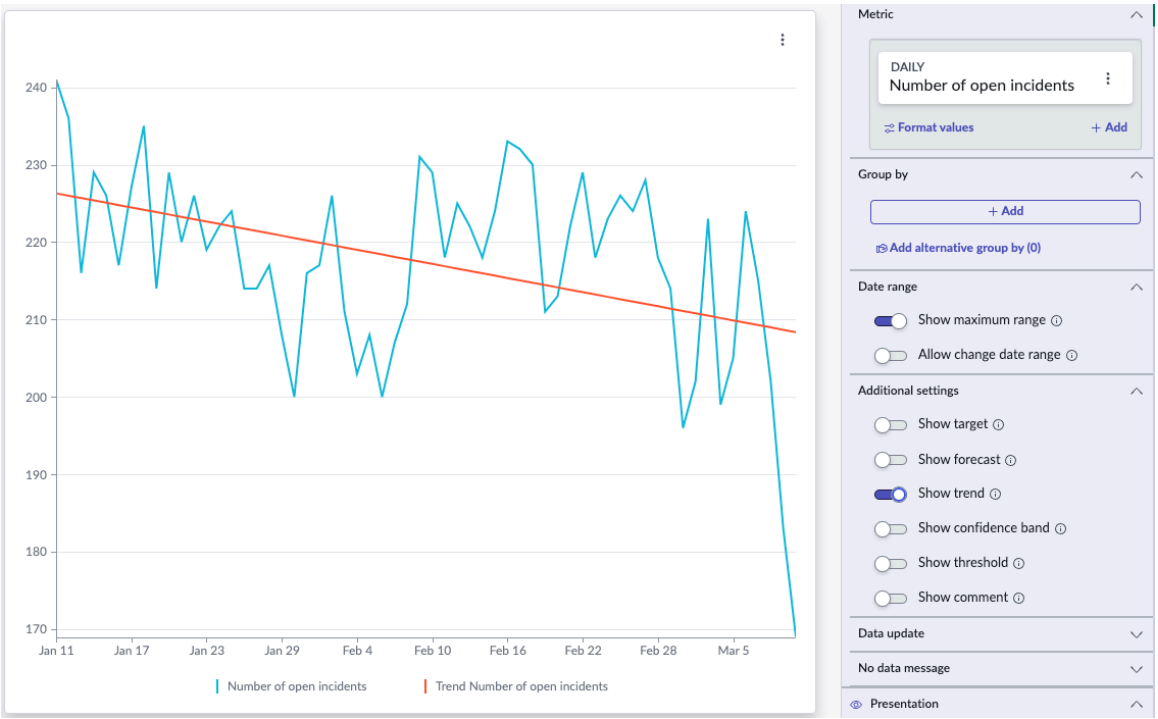


6. You would also like to see what more information you can give about this data, so you expand the **Additional settings** section. For indicators, these settings are the same as the KPI Details chart options. For more information, see Chart options in KPI Details under the KPI Details documentation. If you have the necessary roles, you can set targets and thresholds for an indicator in KPI Details.

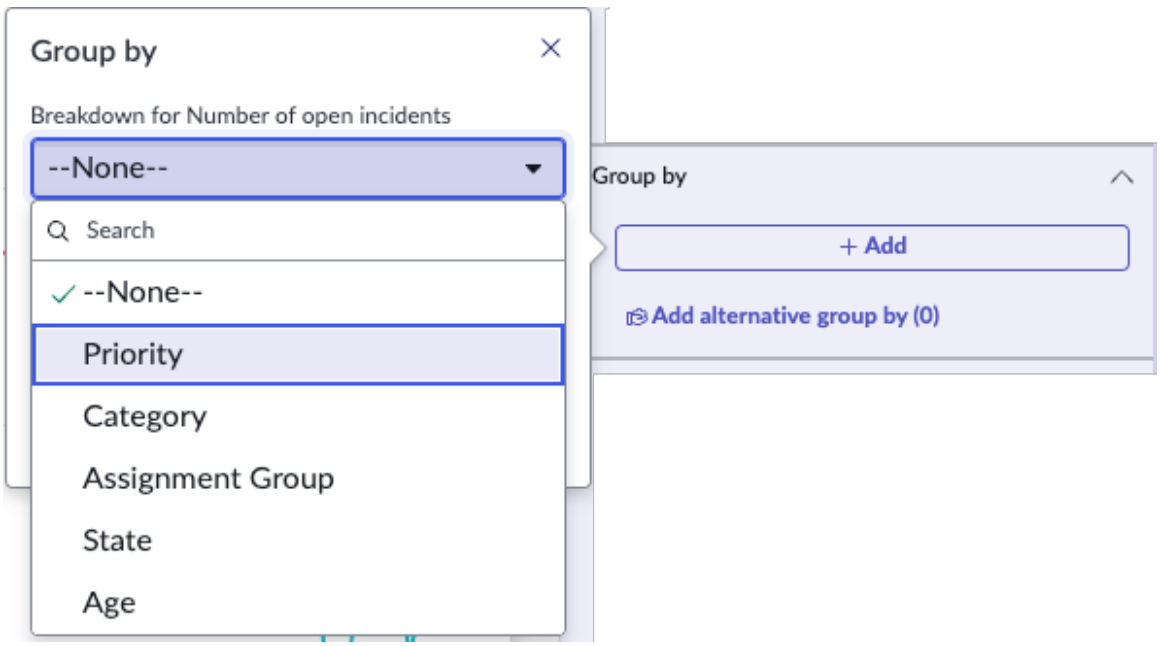


7. You decide to show the data trend, to give the viewer an idea of where the indicators were heading before the Christmas break.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



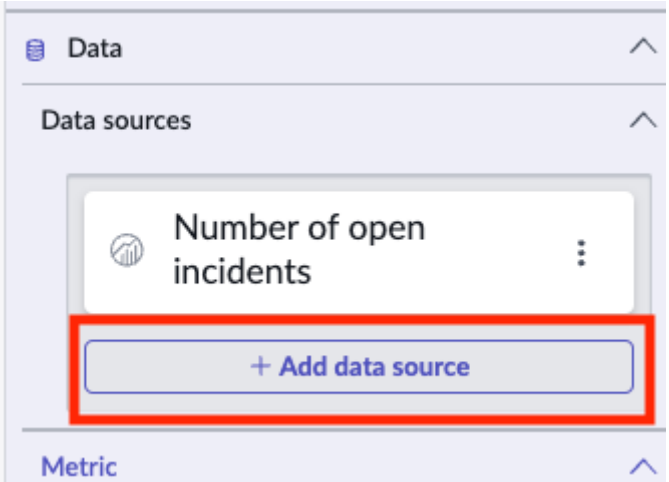
8. Now you have a new task, which is to duplicate this data visualization but split up the number of incidents into groups according to their priority. You group data on a time series visualization in the **Group by** section of the Configuration panel. So you expand that section and discover that there is already a Priority breakdown for the Number of open incidents indicator. You select that breakdown.



9. You get a separate line for every **Group by** value. Here you see that you can no longer show the trend. If you expand the **Additional settings** section in the Configuration panel again, you see that no extra information besides the forecast can be shown now that you have set a **Group by** value.

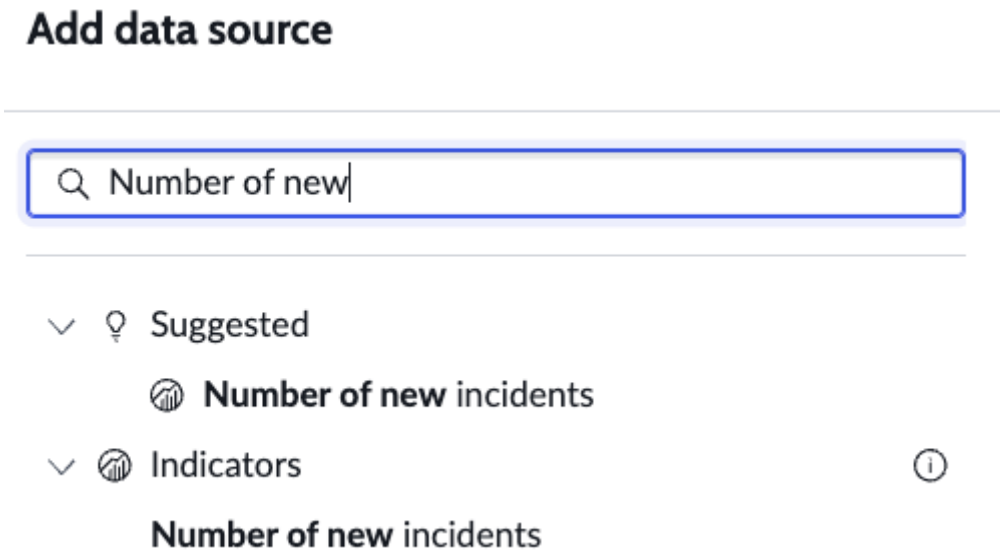
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Now you have an additional requirement, which is to display the Number of new incidents indicator in the same visualization, for comparison. To show this indicator, you expand the **Data** section in the Configuration panel and select **+ Add data source** under Data sources.

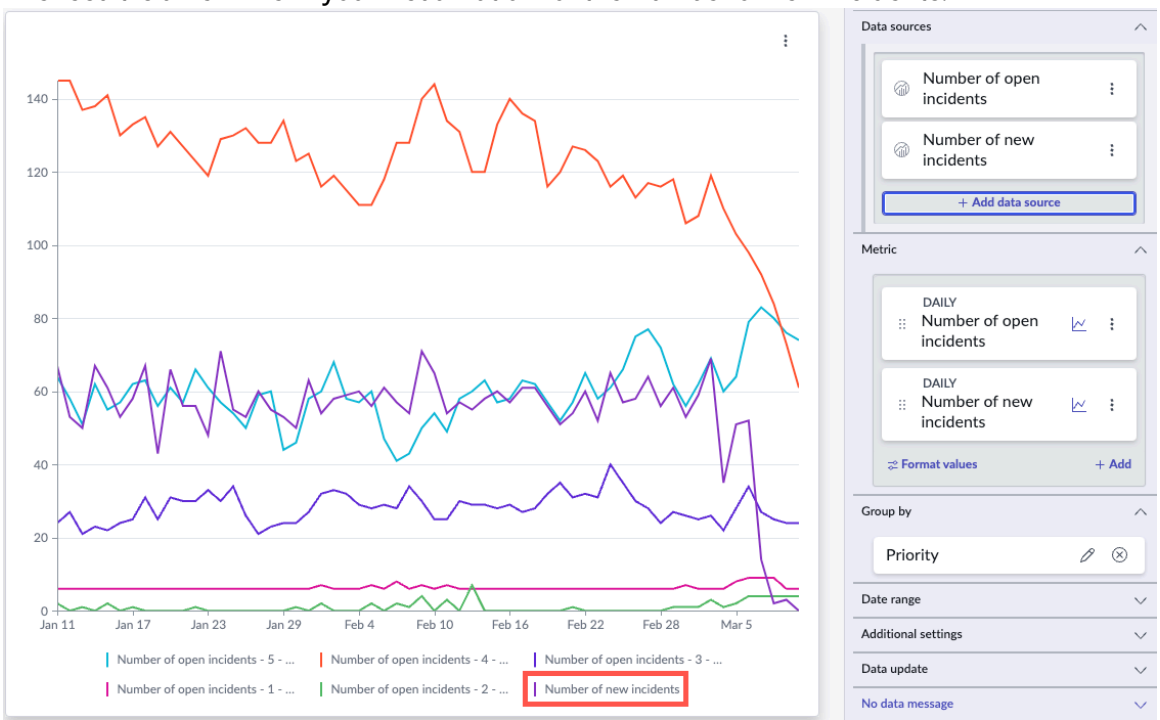


11. Then you search for the Number of new incidents indicator and add it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

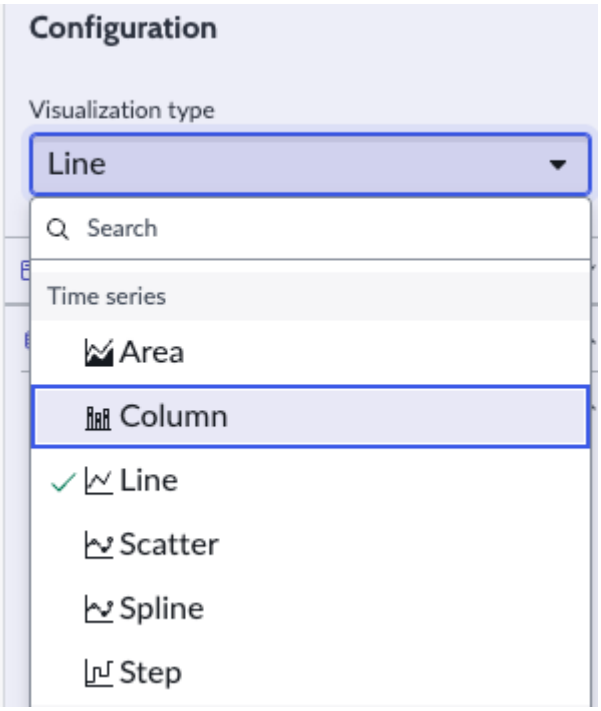


The result is a new line in your visualization for the Number of new incidents.

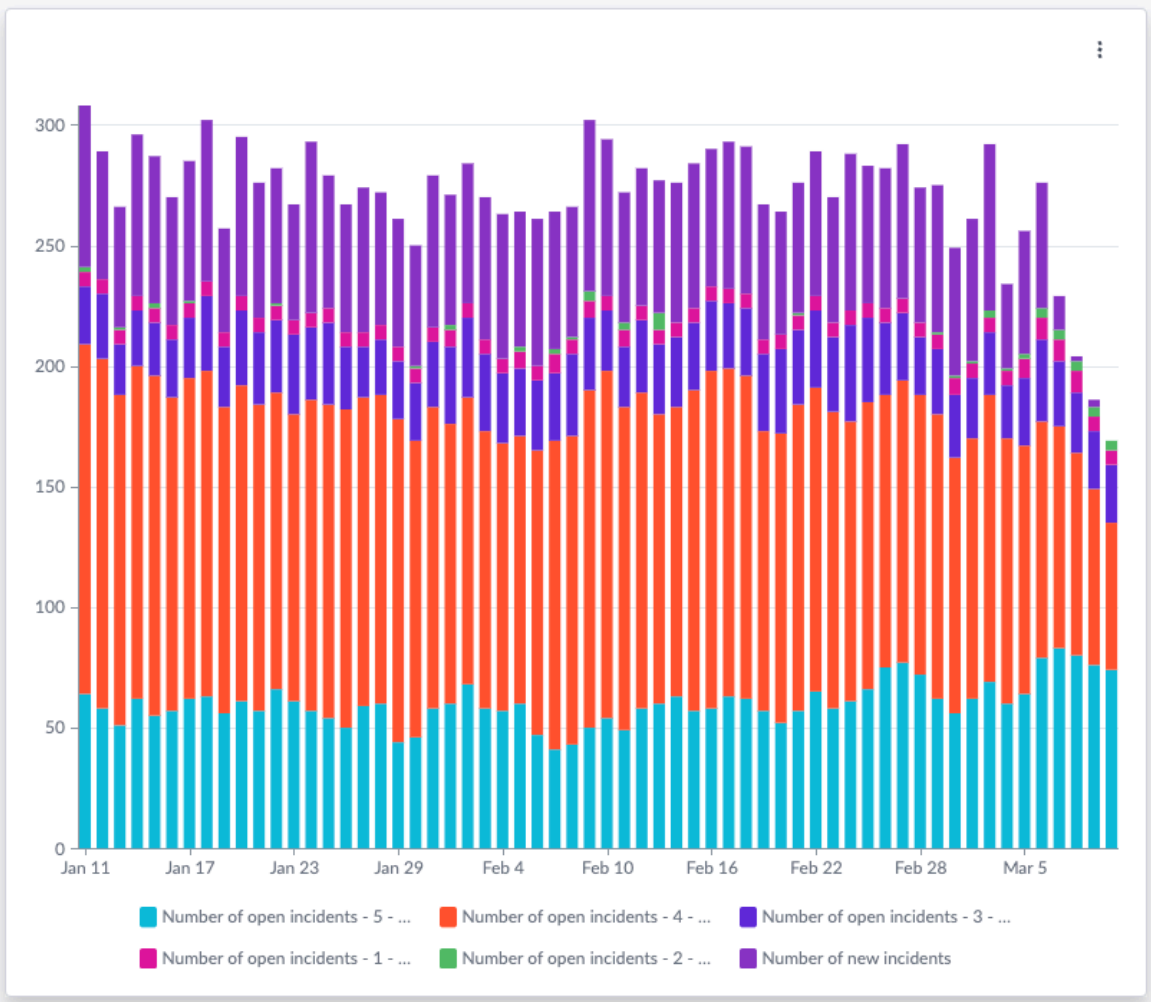


12. You find this difficult to read and aren't sure that this is the best visualization to use. After reading Use cases for different time series visualization types, you decide to change the visualization to a column display.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

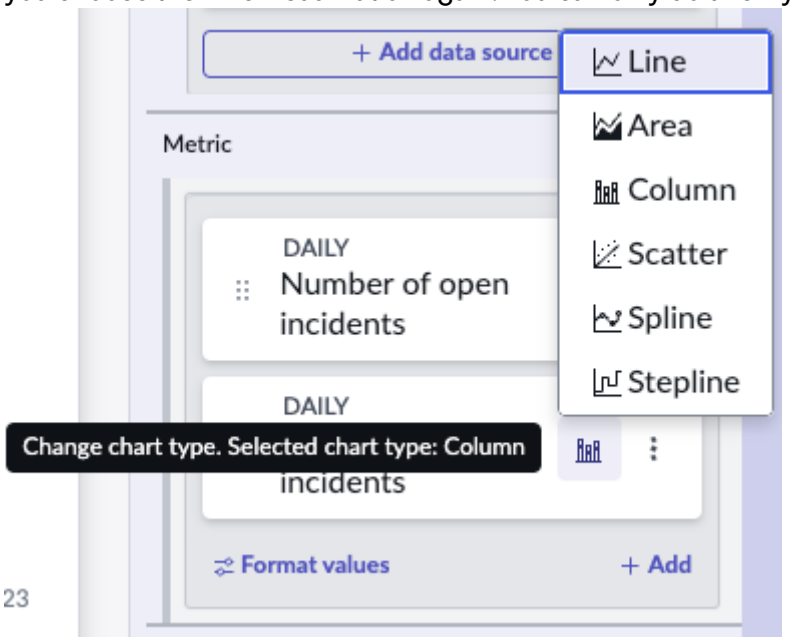


13. This is certainly an improvement, but you think you could do better still.

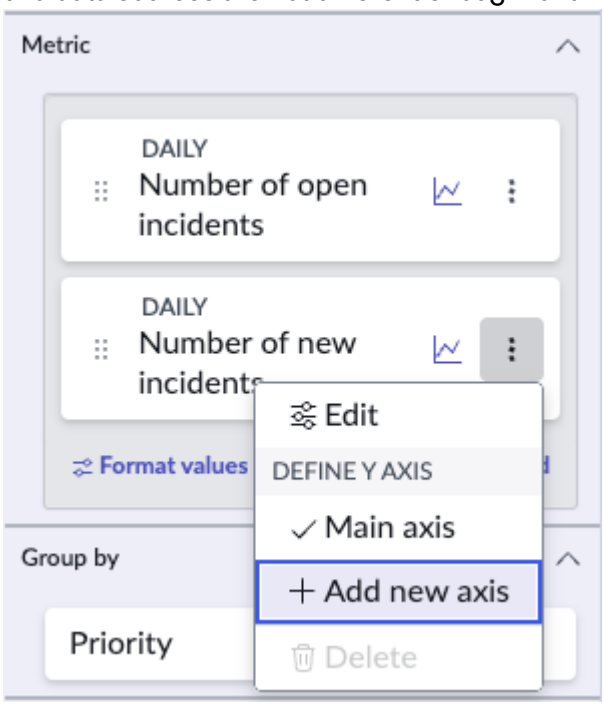


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

14. Fortunately, you can set different visualization types for different metrics. You go to the Metrics tiles and expand the menu under the visualization type icon for Number of new incidents. Here you choose the Line visualization again. You can only do this if you have more than one metric.

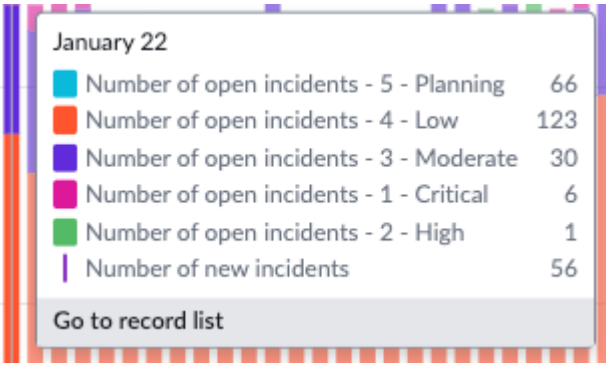


15. You also have the option to set different Y-axes for Number of open incidents and Number of new incidents, through the More options menu on each Metric tile. However, the scales for the two data sources are not different enough for this to help.



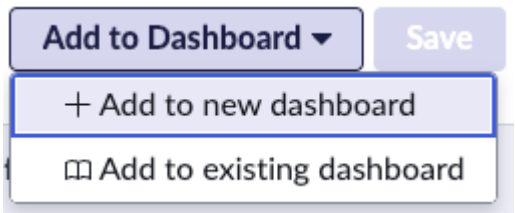
16. The visualization is still a little busy, but a viewer can point their cursor to a column and see the breakdown of scores for that date.

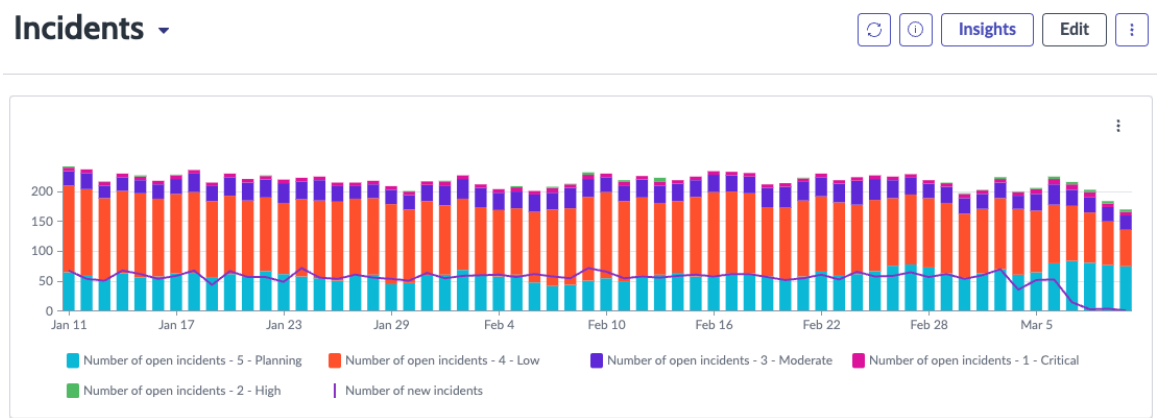
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



17. The last thing you do is to make the legends more readable. Right now the entries are truncated before a viewer could see what each priority actually is. So you try expanding the legend item width to 300px.

18. That's it! You save the visualization, which is ready for you to add to dashboards. If you have the right roles, you can save the visualization in the Data Visualizations library for other dashboard designers to use.





Create a calendar report data visualization

Create calendar report visualizations to show and highlight date-driven events.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

For information about the use of the Calendar report visualizations on dashboards, see the Developer Site. This site gives information about Calendar report components in the UI Builder, and some configuration options may differ from the Visualization Designer.

About this task

The calendar visualization is used to show activity over the course of a longer span of time than most data visualizations. Use them when you want to condense date-specific information into a small space.

Note: Calendar visualizations that are migrated from Core UI require a start time in the **Start date** field and an end time in the **End date** field. These fields are not required in Core UI, but are required in Platform Analytics experience.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select **Create data visualization**.
3. Select the Calendar Report ( ) visualization type.
4. **Optional:** In the configuration panel, configure the **Component header**.

Field	Description
Component title	A title for the calendar report visualization that reflects the information being shared.
Use large font size	Defines the styles used to render the calendar title. When true, the non-bold Title-tertiary font is used. Otherwise, the bold Header-secondary font is used. (Optional) Default: false
Component description	Description you enter for the component. This field has a limit of 250 characters.
Show description	Adds an information icon ( ) to the visualization. This icon opens the component description in a popup.

5. In the **Data** section, specify the source table, predefined condition, date range, and filter options.

Data fields	Description
Table	Select the table or database view to report calendar events from. Default value: task

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data fields	Description
Predefined conditions	Predefined conditions from the Report Source [sys_report_source] table for filtering event records.
Edit filter table	Conditions for filtering event records. This filter is applied when the end user views the calendar. Users can filter further if a filter component is added to the page. **Note:** This property adds a filter condition in addition to the table and predefined conditions, if any are applied.
Start date field	Field from the record to display as the starting event. You must select a date field. Default value: Opened
End date field	Field to report on as the ending event. You must select a date field. Default value: Closed [closed_at]
Event display fields	One or more fields you select to appear on all calendar events. Default value: number,short_description

6. In the **Additional Settings** section you have some miscellaneous options.

Data fields	Description
Follow filters	When enabled, the visualization follows all filters in the same dashboard tab or on the whole dashboard.
Show filter overview	Shows a filter icon that opens a filter panel. This panel shows the configuration filters, such as "Active is true" and any filters followed on the dashboard. Does not show predefined conditions.
Default view	The calendar view format to apply as the default. Choose from: ○ Day ○ Week ○ Work Week ○ Month Default value: Month

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select **Save**.
   Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations** to return to the Data Visualization list.

What to do next

- Add a visualization to a dashboard from the Visualization Designer
- Share a data visualization in the Visualization Designer
- Bookmark a visualization in the Visualization Designer

Create a list visualization in the Visualization Designer

Create a list of table records that can be drilled down to from chart interactions. List visualizations display table data in columns. By default, the columns match the default list view of the table.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

Warning: If you want to modify the selection of columns, first save the List visualization. Otherwise, the default columns are removed from the List. Ignore this warning if you do not want to keep any of the default columns. If you do not have the latest Platform Analytics bundle installed, you must add the default columns manually instead of just saving the visualization.

In the Zurich release, this List replaces the simple list visualization. Upon migration, all simple lists are migrated to the new List.

Note:

- You can include Spotlight information in a list visualization. Configure the list to display information from the Spotlight [spotlight] table. For more information, see Spotlights on Platform Analytics dashboards. For general information about the Spotlight feature, see Ranking records with Spotlight.
- It is not possible to configure auto refresh on the List visualization. To refresh a List visualization on a dashboard, select the More Options icon and choose **Refresh**.
- The option to show the total number of records is not available in the new List visualization.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select **Create data visualization**.
3. Select the List ( ) visualization type from the category labeled **Other**.
4. Select **Add data source**.
   You can only select Table data sources, such as the Incident [incident] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The list appears, populated with a default selection of columns depending on the default view of the selected table. You can change the columns in the Columns and rows section. Save the List before changing the column selection.

5. Configure the **Header and border**. Header and border options are the same for all data sources.

Header and border fields	Description
Show header	The visualization header, including title and icons.
Show header separator	Option to display a line separating the header from the rest of the component.
Chart title	Title of the visualization.
Description	A short overview about the visualization that the end user sees. Descriptions help users find the visualization.
Wrap title	Option to wrap long titles onto a second line. If false, displays an ellipsis to truncate long titles.
Show border	Option to display a line around the component.
Bare	Option to remove padding around data visualization to provide more compact positioning on the page. Only available when **Show border** is turned off.
Header background color	Specify the color behind the title of the visualization.
Title color	Specify the text color. The default title color is black, but you can choose a color that contrasts better with the header background.

6. Configure the data fields.

Data fields	Description
Group by	
Group by (optional)	The field to group by. For example, in a visualization of incident data grouped by **Assignment group**, all incidents that belong to Software, Service Desk, and Network are placed in separate groups. If the table contains variables or question fields, you have the option to group by one of them at the end of the list of fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data fields	Description
	Note: ○ It is not possible to group or stack data by the **Tags** field, or by certain field types, such as MEDIUMTEXT. ○ If you want to group by a field with continuous values, such as date or integer, the values are automatically grouped according to any report ranges that are defined for the data. For more information, see Report ranges.
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the visualization may be grouped by. The viewer of the visualization can then select which of these items to group the data by. The viewer toggles the visibility of the selector in the visualization's More actions menu. In the additional items dialog, you can set whether this selector is visible by default by toggling **Selector visible by default**. If you select a value in **Group by**, that is the default group-by value. You do not have to select a **Group by** value to specify alternative group-by values. In this case, no default group-by value is used. For more information about the viewer experience selecting from alternative group-by values, see Select a group-by value in a data visualization as a viewer. **Important:** ○ Only up to three metrics on one visualization support alternative group-by. ○ Alternative group-by does not support data binding on the data source
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data fields	Description
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.
Alignment	The alignment of the illustration and text in the message.

7. Configure the presentation fields.

Presentation fields	Description
Columns and rows	
Columns	Select the columns from the table that you want to display in the visualization. **Note:** The List shows some columns by default after you select the data source. These columns are not included as selected columns in the configuration panel. If you're working on a new List visualization and have the latest Platform Analytics bundle installed, save the visualization to mark these columns as selected. Otherwise, manually select any default columns that you want to keep. Any columns that are not marked as selected are removed when you apply your changes to the columns.
Maximum rows	Specify the maximum number of rows to show. When there are more rows in the visualization, it will be divided into pages (if **Allow list pagination** is selected in display settings).
Number of displayed columns	For a view with too many columns, you can set the maximum number that are displayed.
Maximum characters	Specify the number of characters to show in a cell before it is truncated.
Show option to personalize columns	Enable the ability to add, remove, and change the order of columns in the list at runtime.
Disable dotwalk	Disable the dotwalk capability in personalized lists. Available only if Show option to personalize columns is selected.
Show option to drag and drop columns	Enable users to reorder the columns at runtime.
Show option to group records	Enable users to group the list by column entries at runtime.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Presentation fields	Description
Show column resizing	Enable users to resize column widths at runtime.
Show column filtering	Enable users to apply filters from column headings at runtime.
Show column sorting	Enable users to sort the column values in ascending or descending order at runtime.
Display settings	
Show inline editing	Allows users to edit values in the list by double-clicking them. Security restrictions including ACLs apply. **Note:** Users cannot edit fields of the journal_input type. These fields include the following: ○ Work Notes ○ Additional Comments ○ Approval Comments ○ Change request notes ○ Problem Notes
Show links	Select to show all links in the list. When cleared, reference fields and links render as plain text.
Wrap cell content	Enable multiple lines of text per cell across the table. Text may still be truncated, based on the value of the **Maximum characters** option.
Show 'view all' footer	Enables the user to view all the rows in the visualization, not just the maximum number specified.
Allow list pagination	Enables the list to be divided across multiple pages. When cleared, list pagination is hidden.

Create a list visualization with variable columns

You can create a list visualization with variables columns based on a data source or table that has variables associated with it. For example, if an item has a variable called **Storage**, you can create a list report that has a column for the values in this variable.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

In the Zurich release, this List replaces the simple list visualization. Upon migration, all simple lists are migrated to the new List.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- It is not possible to configure auto refresh on the List visualization. To refresh a List visualization on a dashboard, select the More Options icon and choose **Refresh**.
- The option to show the total number of records is not available in the new List visualization.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select **Create data visualization**.
3. Select the List ( ) visualization type from the category labeled **Other**.

   The application shows a preliminary version of the report. To view the updated report at any time, select **Run**.
4. Select **Add data source**.
5. Select a report source that has variables associated with it.
   There are two kinds of report sources. For list reports with variables, the report source is usually the service catalog table.

Report source	Description
Data source	A table with filters applied to provide a single source of information for all users. **Note:** If you select a data source used by existing reports, a notification will display prompting you to view them.
Table	The raw data from a table with no filters applied.

6. In the Presentation section, select **+Add**and select the arrow next to **Variables** at the bottom of the available fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Depending on system configuration, you can add fields from tables that extend the selected

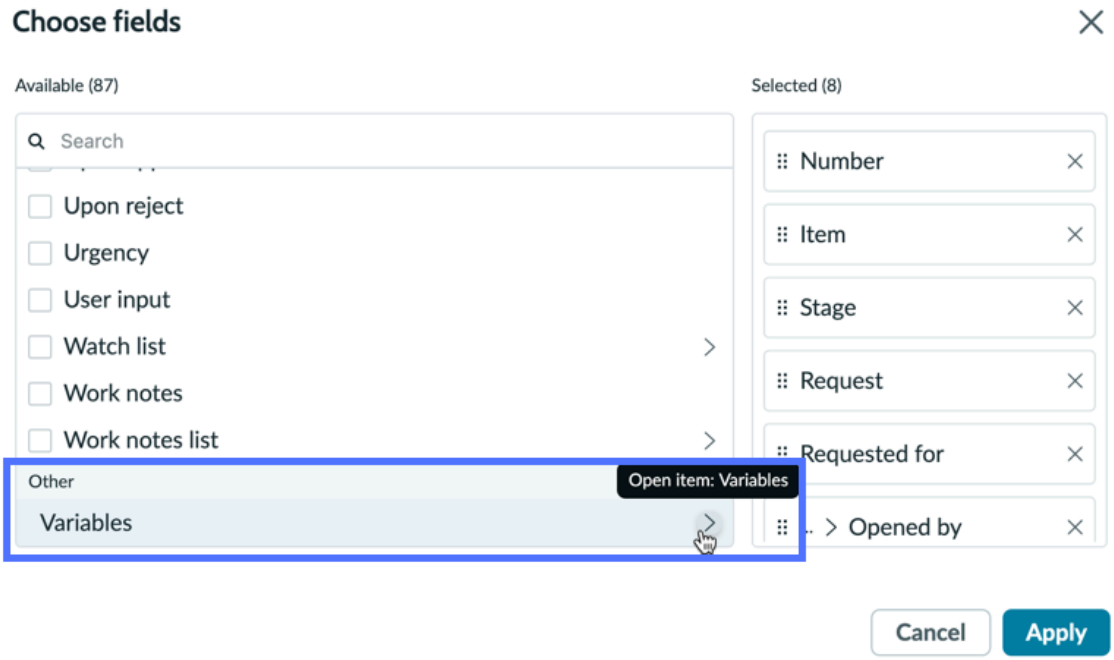


table.

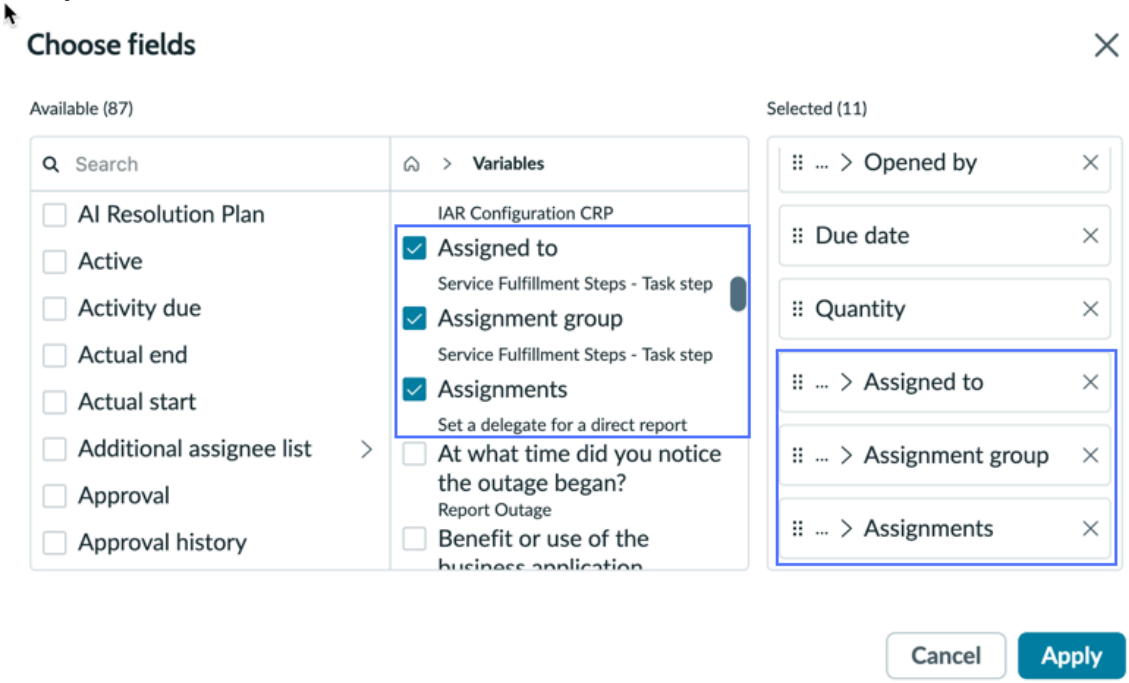
7. In the Variables column select the boxes next to the variables you want to add to the visualization.
   The variables you check are added to the list of selected



columns.

8. Select **Apply**.
9. Configure the rest of the visualization. **Header and border** options are the same for all data sources.

Header and border fields	Description
Show header	The visualization header, including title and icons.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header and border fields	Description
Show header separator	Option to display a line separating the header from the rest of the component.
Chart title	Title of the visualization.
Title alignment	Choose Start to align the title with the start of line, End to align it with the end of the line, or Center for center alignment.
Description	A short overview about the visualization that the end user sees. Descriptions help users find the visualization.
Wrap title	Option to wrap long titles onto a second line. If false, displays an ellipsis to truncate long titles.
Line of truncation	Specify where to truncate long labels with an ellipsis. Options are 1, 2, and 3.
Show border	Option to display a line around the component.
Bare	Option to remove padding around data visualization to provide more compact positioning on the page. Only available when **Show border** is turned off.
Header background color	Specify the color behind the title of the visualization.
Title color	Specify the text color. The default title color is black, but you can choose a color that contrasts better with the header background.
Group by	
Group by (optional)	The field to group by. For example, in a visualization of incident data grouped by **Assignment group**, all incidents that belong to Software, Service Desk, and Network are placed in separate groups. If the table contains variables or question fields, you have the option to group by one of them at the end of the list of fields. **Note:** ○ It is not possible to group or stack data by the **Tags** field, or by certain field types, such as MEDIUMTEXT. ○ If you want to group by a field with continuous values, such as date or integer, the values are automatically grouped according to any report ranges that are defined for the data. For more information, see Report ranges.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header and border fields	Description
Add alternative group by	This selection opens a dialog in which you select additional items that the data in the visualization may be grouped by. The viewer of the visualization can then select which of these items to group the data by. The viewer toggles the visibility of the selector in the visualization's More actions menu. In the additional items dialog, you can set whether this selector is visible by default by toggling **Selector visible by default**. If you select a value in **Group by**, that is the default group-by value. You do not have to select a **Group by** value to specify alternative group-by values. In this case, no default group-by value is used. For more information about the viewer experience selecting from alternative group-by values, see Select a group-by value in a data visualization as a viewer. **Important:** ○ Only up to three metrics on one visualization support alternative group-by. ○ Alternative group-by does not support data binding on the data source
Data update	
Follow filters	Follow filters set for a page. When enabled, the visualization displays on a workspace with the filters set by the page. Toggle off to disable a visualization from accepting any filter input.
Show filter icon	Option to show the filter icon and the number of filters impacting the visualization. If a filter is not selected to apply to a visualization, the icon does not show. Toggle off to hide the filter icon and number of filters applied.
Info messages	
Set custom message when no data	Option to configure a custom message that displays when no data is returned.
Illustration	An illustration to include in the message.
Heading	Header text of the message that describes why no data was returned.
Heading level	Header text size for the message that describes why no data was returned.
Content	Secondary text of the message that provides additional detail.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header and border fields	Description
Alignment	The alignment of the illustration and text in the message.
Presentation	
Columns and rows	
Columns	Select the columns from the table that you want to display in the visualization
Maximum rows	Specify the maximum number of rows to show. When there are more rows in the visualization, it will be divided into pages (if **Allow list pagination** is selected in display settings).
Number of displayed columns	For a view with too many columns, you can set the maximum number that are displayed.
Maximum characters	Specify the number of characters to show in a cell before it is truncated.
Show option to personalize columns	Enable the ability to add, remove, and change the order of columns in the list at runtime.
Disable dotwalk	Disable the dotwalk capability in personalized lists. Available only if Show option to personalize columns is selected.
Show option to drag-and-drop columns	Enable users to reorder the columns at runtime.
Show option to group records	Enable users to group the list by column entries at runtime.
Show column resizing	Enable users to resize column widths at runtime.
Show column filtering	Enable users to apply filters from column headings at runtime.
Show column sorting	Enable users to sort the column values in ascending or descending order at runtime.
Display settings	
Show inline editing	Allows users to edit values in the list by double-clicking them. Security restrictions including ACLs apply. **Note:** Users cannot edit fields of the journal_input type. These fields include the following: ○ Work Notes ○ Additional Comments ○ Approval Comments ○ Change request notes ○ Problem Notes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header and border fields	Description
Show links	Select to show all links in the list. When cleared, reference fields and links render as plain text.
Wrap cell content	Enable multiple lines of text per cell across the table. Text may still be truncated, based on the value of the **Maximum characters** option.
Show 'view all' footer	Enables the user to view all the rows in the visualization, not just the maximum number specified.
Allow list pagination	Enables the list to be divided across multiple pages. When cleared, list pagination is hidden.

10. Select **Save**.

Create an Indicator Scorecard

The Indicator Scorecard component enables users to visualize and compare data between multiple Performance Analytics indicators. It highlights the information regarding the last score collected, the change from the previous data point, the trend over time, and the value of the target to achieve.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

For information about the use of an Indicator Scorecard in a dashboard, see the Developer Site. This site gives information about Indicator scorecard components in the UI Builder, and some configuration options may differ from the Visualization Designer.

Note: You aren't able to sort by previous scores in UI Builder.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select **Create data visualization**.
3. Select the Indicator Scorecard ( ) visualization type.
4. **Optional:** Configure the **Header and border**.

Header and border fields	Description
Show header	The visualization header, including title and icons.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header and border fields	Description
(Optional) Show large font size	(Optional) Renders the header title in a large font
Chart title	Title of the visualization.
Description	A short overview about the visualization that the end user sees. Descriptions help users find the visualization.
Show border	Option to display a line around the component.
Header background color	Background color for the header. Applies only to this visualization's header. For accessibility, verify contrast between the header background and title text using the color picker's contrast ratio checker. Themes aren't supported with custom colors.
Title background color	Background color for the chart title, aligned with your dashboard theme, branding, or design preferences. The selected color applies only to the title of this visualization. For accessibility, verify sufficient contrast between the header background and title text using the contrast ratio checker in the color picker. Themes are not supported when a custom color is selected.

5. Configure the filtering and sorting capabilities of the Indicator Scorecard.

Field	Description
Scorecard Type	List to select from scorecard types. Options include: ○ **List**: Shows the list of indicators and metrics as columns. ○ **Pivot**: Shows indicators as rows and breakdown as columns or vice versa.
Show Header	Toggle to show or hide header.
Title	Component title.
Description	Component description displayed in the info icon during runtime.
Source definition	Select how to set which indicators to show. Options include: ○ **Condition based**: Allows you to set a condition to determine which indicators to display. ○ **Manually selected**: Allows you to manually add indicators through the **Add data source** pane. You can select a breakdown and element to filter the indicator for each indicator you manually select.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If you select only one indicator, you can set **Show only breakdowns** to show the elements of that indicator without the indicator score. ○ **Indicator group**: Sets an indicator group as the source.
Filter	Encoded query string for filtering which indicators to show. To create a filter statically, use the condition builder that is provided. **Note:** Only available if **Source definition** is Condition based.
Indicator group	Filter the table based on an indicator group from the list. **Note:** Only available if **Source definition** is Indicator group.
Breakdown	Select the breakdowns that you want to display. You can drag breakdown tiles to reorder them.
Follow breakdown relation	Turn on to apply breakdown relations if any are defined for the selected breakdown. After turning this option on, select the breakdown relation from a list that opens. When you add this indicator scorecard to a dashboard, also add a filter with the breakdown source as its filter source. Set the filter to filter indicators with this breakdown. For more information, see Navigating breakdown elements with breakdown relations. The latest version of the Data Visualizations application from the ServiceNow® Store is required.
Max number of groups	The maximum number of elements to show for a breakdown. If you do not select the elements to show in **Filter elements**, the elements that are shown depend on the breakdown source and the value of **Sort direction**. For example, consider the Assignment Group breakdown, which uses the Name field from the Group [sys_group] table. With the default value of 5, the **Max number of groups** field shows either the first 5 or last 5 group names alphabetically. The order depends on the sort direction. To control which elements appear, select them in the **Filter elements** field. Default: 5
Filter elements	Select the elements to show for the relevant breakdown. If you don't select any elements, all elements up to the max number of groups are shown.
Show breakdowns as columns	When true, breakdown elements are shown as columns on the pivot table. When false, breakdown elements are shown as rows. Supports only one breakdown and applies only to Pivot scorecards. Default: false
Show only breakdowns	If set to true, hides indicator total and shows only breakdown elements and the metrics selected. Available only on List scorecards when Source Definition is **Manually Selected** and only one indicator is selected. Default: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Allow change breakdown	When true, the viewer can change the breakdown that is displayed. Available only when **Show only breakdowns** is true. Default: false
Breakdown visibility selector	When true, the breakdown selector is visible to viewers of the scorecard. When false, the breakdown selector has to be opened from the More options menu. Only available when **Allow change breakdown** is true. Default: false
Metrics	Select analytics to show in the indicator list. You can drag and drop metrics tiles to reorder them. Default: lastScore, changeAndChangePercent, target, trend
Time series aggregation	Time series aggregation to apply to all Indicators selected. To learn more about time series aggregations, see Applying time series aggregations.
Sort by	The column to sort the indicators by. Values: Name, Latest Score, Target, Change, changePercent, indicator_group **Note:** You cannot sort by previous scores. Default: Name
Sort Direction	The sorting direction for the indicators and/or breakdown elements. The effect on breakdown elements varies depending on the breakdown source. For example, breakdown elements from the Choice [sys_choice] table are sorted according to the value of the Sequence field. By contrast, breakdown elements from Group [sys_group] are sorted alphabetically according to the Name field. Values: Ascending (Asc) or Descending (Desc) Default: Asc
Additional settings	
Follow filters	Turn on to have filters set on the dashboard apply to the Indicator Scorecard. Default: true
Show filter icon	Show the filter icon and the number of dashboard filters impacting the visualization. If a filter isn't selected to apply to a visualization, the icon doesn't show. Toggle off to hide the filter icon and number of filters applied. Default: true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Enable drilldown	Redirects user to underlying data when they select a data point. Toggle off to prevent this interaction. Default: true
Show filter element	Option to show the applied filter elements next to the indicator name. If a filter cannot apply to a visualization, the element(s) do not show. Toggle off to hide the filter elements and show only the indicator name. Default: true
Show bookmark	Toggle to show or hide a column of bookmarks. When on, users can bookmark indicators and breakdowns for themselves. Default: true
Show indicator info	Toggle to show or hide the indicator information icon. When shown, indicator information includes information about the last collection date, frequency of collection, and direction. Default: true
Show bookmarked items only	Toggle on to show only bookmarked indicators or breakdown elements. Default: false
Display settings	
Max elements per page	The page size as determined by the maximum number of indicators or breakdown elements that the page can show. The increments are 10, 20, 50, and 100 indicators/elements. Default: 10
Target color scheme	Select a target color scheme. By default, the value defined in the **Default indicator target color scheme** property on the Performance Analytics Properties page is applied.
Show alternate row colors	Alternates colors of rows.
Show row lines	Adds dividers between rows.
Show column lines	Adds dividers between columns.
Chart interaction	
Allow chart interaction	Enable navigation to the KPI Details page of an indicator when that indicator's name is selected.
Action	Only the **Go to data view** interaction is available. This action opens the indicator in KPI Details.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Save**.
   Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations** to return to the Data Visualization list.

What to do next

- Add a visualization to a dashboard from the Visualization Designer
- Share a data visualization in the Visualization Designer
- Bookmark a visualization in the Visualization Designer

Create a data visualization from a list

You can create a Platform Analytics vertical bar or pie data visualization from inside a Core UI list. If you have a data visualization role, you can save, share, export, or duplicate the visualization.

Before you begin

Role required: You need a role that gives access to the list. To save, share, export, or duplicate the visualization, you need itil, viz_creator, or a role that contains viz_creator, such as any of the reporting roles.

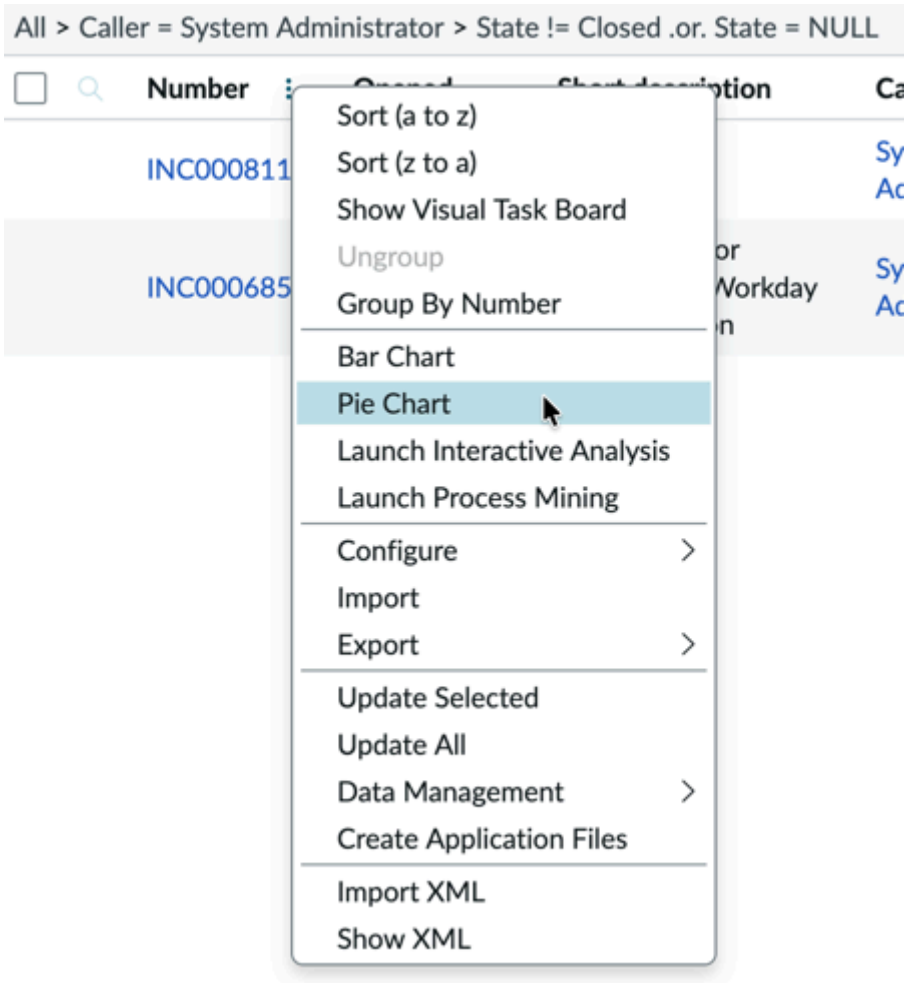
About this task

If you are on a new instance or an instance that has fully migrated to Platform Analytics, follow this procedure. Otherwise, you create a Core UI pie or bar report, instead. In this case, see Run a report from a list.

Procedure

1. Navigate to the list.
2. Right-click the header of the column that contains the values you want to be displayed as the bars or slices in the visualization.
3. Select **Pie Chart** or **Bar Chart**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The data visualization is generated and opened in the Visualization Designer.

Common data visualization tasks

See how to edit, share, duplicate, and delete Platform Analytics data visualizations, along with other common tasks. Most tasks are launched from the same menu.

Edit a data visualization in an inline dashboard

You can create and edit a data visualization from within the inline dashboard editor. Not all the options are the same as in the Visualization Designer. You can move between the inline editor and the Visualization Designer.

You can add a data visualization to a dashboard through the **Add new element** menu, as described in Edit in-line Platform Analytics dashboard elements. You can edit a visualization in the dashboard by putting the dashboard in edit mode and selecting the visualization. However, some of the behavior may differ:

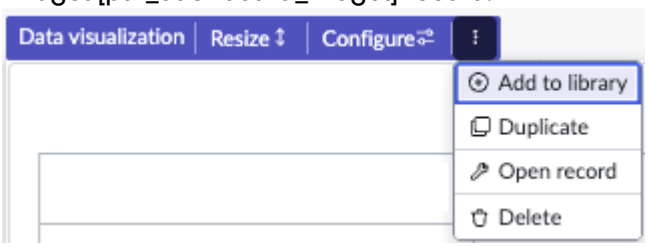
- If the visualization is in the library and you own it, you need the itil, report_user, or viz_creator role to edit it. When you save your edit, you have the option to save the visualization in the library, which affects all dashboards that show the visualization, or to save a local copy only for the dashboard.
- If the visualization is in the library and you do not own it, you need the viz_admin or admin role to edit it. When you save your edit, you have the option to save the visualization in the library, which affects all dashboards that show the visualization, or to save a local copy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the visualization is in the library and you don't have the necessary roles to edit it, you can "unlink" the visualization by creating a local copy, which you can edit. For more information, see Edit a copy of a shared dashboard element.
- Some options may differ between the inline editor and the Visualization Designer. For example, in the chart interactions, you configure a data visualization to drill down to another visualization only in the Visualization Designer.

Important: You cannot place Core UI reports or Performance Analytics widgets on a Platform Analytics dashboard. Add data visualizations instead.

The **Actions** menu on the visualization itself provides options for changing the editor. You can also select to **Resize**, **Configure**, **Duplicate** , or **Delete** the visualization from the dashboard. If you have the viz_admin role or higher, you can also view the visualization's PAR Dashboard Widget [par_dashboard_widget] record.



Note: If you save a Platform Analytics dashboard with appsee data, a single click on that dashboard automatically redirects you to the corresponding UXA dashboard. This provides a quick and efficient way to drill down and explore specific user behavior from your appsee analytics.

Other topics

Add a dashboard data visualization to the library

To make a data visualization on a dashboard reusable, or to be able to edit it in the Visualization Designer, add it to the data visualization library.

Before you begin

Role required: itil, report_user, viz_creator, or higher, and the right to edit the dashboard

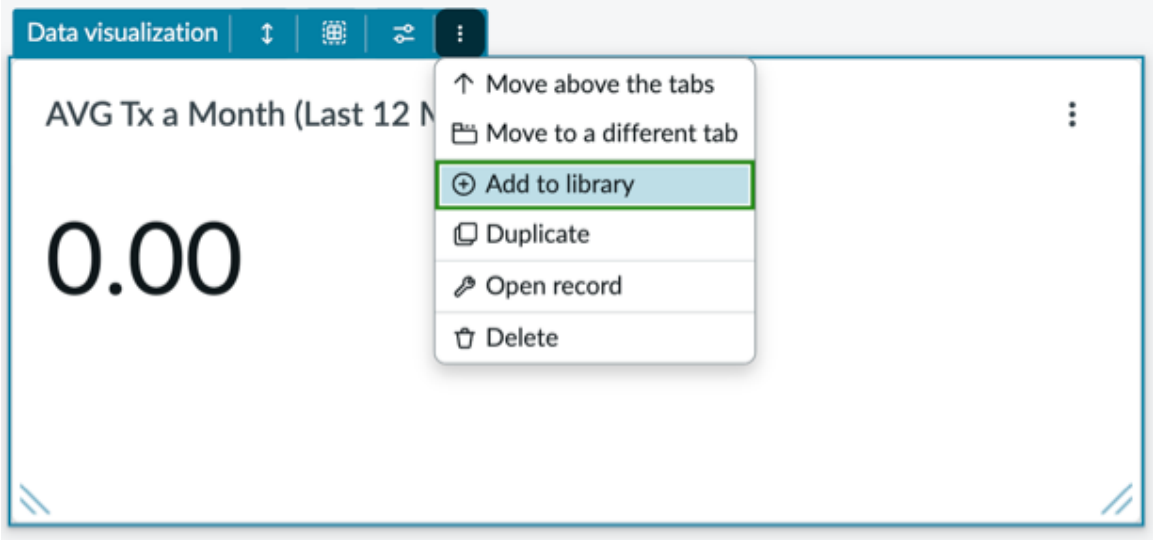
About this task

You may want to add a data visualization that exists only as a local copy on an in-line dashboard to the data visualization library. You may want to do this to make the data visualization available to add to other dashboards. You may also want to be able to edit the data visualization in the Visualization Designer, as described in Open a visualization in the Visualization Designer from a dashboard.

Procedure

1. Open the relevant dashboard for editing.
2. Locate or create the relevant data visualization.
   See Creating data visualizations.
3. Expand the data visualization context menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Add to library**.
5. Provide a name and description for the data visualization.
6. Select **Add to library**

What to do next

The data visualization now exists in the data visualization library. You can edit it as described in Open a visualization in the Visualization Designer from a dashboard.

Open a visualization in the Visualization Designer from a dashboard

From the dashboard editor, open a data visualization in the Visualization Designer. You have a different set of options.

Before you begin

The data visualization must exist in the data visualization library.

Role required: itil, report_user, viz_creator, or higher, if you own the data visualization. viz_admin or higher for any data visualization. You also need the right to edit the dashboard.

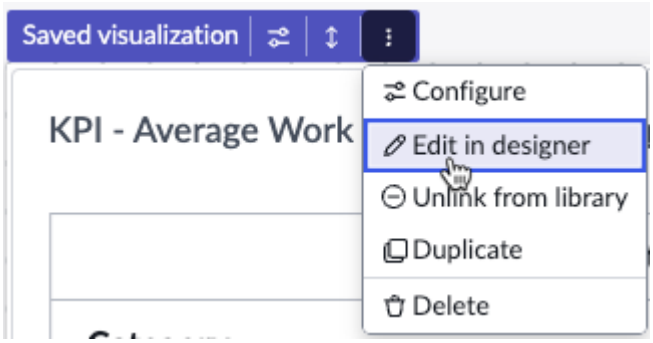
About this task

While working in the dashboard editor, you may find that you want to reconfigure a data visualization in a way that is only possible in the Visualization Designer, not in the dashboard editor. For example, you might want to configure the **Drill down to chart** interaction. The **Actions** menu on the data visualization lets you open the visualization in the Visualization Designer in one step, without lots of navigating.

Procedure

1. Navigate to **Platform Analytics** > **Dashboards** and open your dashboard.
2. Select **Edit** to put the dashboard in edit mode.
3. Add the data visualization if it is not already there.
   For more information, see Edit in-line Platform Analytics dashboard elements.
4. On the data visualization, expand the **Actions** menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Select **Edit in designer**.

What to do next

Proceed to edit the data visualization as described in Edit a data visualization in the Visualization Designer.

Edit a data visualization in the Visualization Designer

After you create a data visualization, you can return to it and edit the data visualization's appearance and other aspects.

Before you begin

Role required: You can edit any data visualization you own unless it is a shared visualization, in the library. If the data visualization is in the library and you own it, you need the itil, report_user, or viz_creator role to edit it. You can edit any data visualization with the viz_admin role or higher.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select the visualization that you want to edit.
3. In the Visualization Designer, select the Configuration icon ( ) to edit header, data, and presentation options.
4. Select the information icon ( ) to edit name, description, certification, and requester information.

Data visualization details

The Details pane gives you an overview of key information about the data visualization that you are currently editing.

Select the **Details** icon in the Visualization designer to see the details of the visualization you are editing. You can see the following information:

Field	Description
Name	The name should be meaningful. If you have editing rights, you can change the name here.
Description	The description should be information that helps other users understand the nature and purpose of the visualization. If you have editing rights, you can change the description here.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Mark as certified	If you have a role that lets you certify a data visualization for use in your organization, certify or decertify the visualization here. For more information, see Certify a data visualization in the Visualization Designer.
Requested by	If a user on the instance requested that you create or edit this visualization, you can name the person here. The user is considered a responsible user. The data visualization is shared with them, with editing rights.
Created by, Last updated by	The users who created and last updated this visualization
Usage	
n dashboards	If the visualization is used on any dashboards, the number of dashboards displays here. The **View your dashboards** link opens a simple list of those dashboards that you created or were shared with you and that contain this data visualization. The number of dashboards listed can be smaller than the total number of dashboards that contain the visualization.
Shared with	Icons for every user who the visualization is shared with. Point to an icon to view the user's full name and the sharing details. For more information, see Share a data visualization in the Visualization Designer.

Certify a data visualization in the Visualization Designer

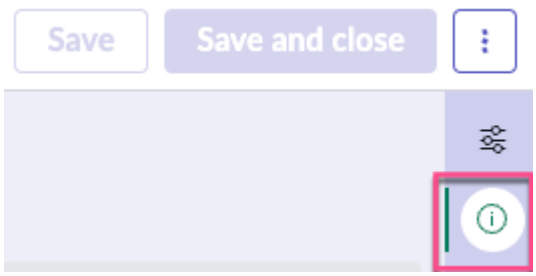
Certify a data visualization to indicate that it is company-approved for reuse.

Before you begin

Role required: admin, viz_admin

Procedure

1. Navigate to **Workspaces** > **Platform Analytics Workspace**, or the workspace that has the Analytics Center ( ) page and the dashboard you want to certify.
2. On the **Data visualizations** tab, select the dashboard you want to certify.
3. Select the information button ( ) to open the Details panel.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the toggle labeled **Mark as certified**.
5. Select **Save**.

Result

The Certified badge appears next to the visualization's name in the Visualization Designer.

On the Data Visualizations tab, the visualization is listed under Certified data visualizations. The visualization is also marked True in the Certified column. This column may not be visible. Select the Edit columns icon ( ) to add it.

Add a visualization to a dashboard from the Visualization Designer

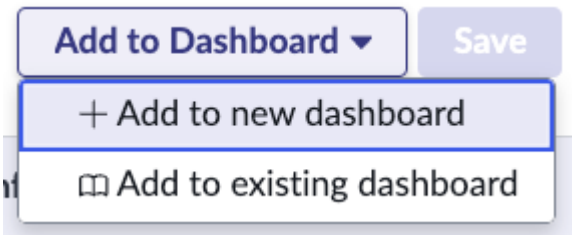
Add a visualization from the Visualization Designer to a new dashboard or to an existing dashboard.

Before you begin

Role required: You must have a role that allows access to the data in the visualization. You must own the visualization, or it must be shared with you. You must have the right to edit the dashboard in which you want to add the visualization.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**.
2. Create a data visualization, or open a data visualization that you want to add to a dashboard.
3. Expand **Add to Dashboard** and choose from the following options.



Option	Result
Add to new dashboard	A new, untitled dashboard opens in the inline dashboard editor. The data visualization is already on this dashboard. Complete the dashboard, adding any more desired elements and naming it. For more information, see Create a dashboard with the in-line editor.
Add to existing dashboard	The Select dashboard dialog box opens. To open a list of dashboards in which you can add the data visualization, click or begin entering in the **Select dashboard** field. Only dashboards that you can edit are available. Technical dashboards are not available. When you have made your choice, select **Add to dashboard**. The dashboard opens in the in line editor for further editing. The visualization is the last element in the dashboard. **Tip:** If you don't see your data visualization, refresh the browser page.

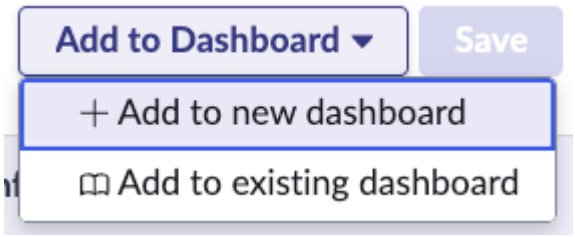
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Adding a visualization to an existing dashboard

You have just completed creating the data visualization Open incidents - Priority. You want to add it to the dashboard Incidents Overview, which you have the right to edit.

1. First, you save your last changes to the visualization.

2. After you save, the **Add to dashboard** options are available.



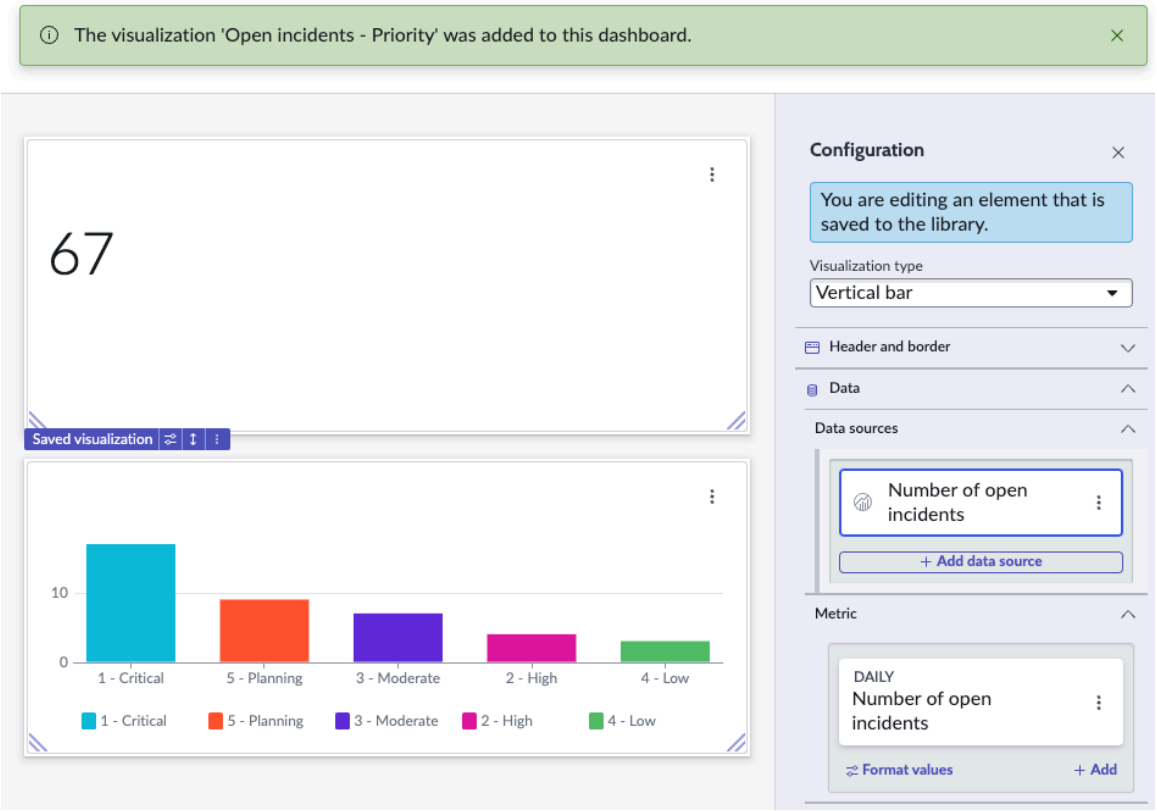
3. Because you already have a dashboard in mind, you select **Add to existing dashboard**. A dialog box opens.

4. You enter `Inc` into the **Select dashboard** field, and you see the Incidents Overview dashboard listed.

5. You select the Incidents Overview dashboard and then select **Add to dashboard.**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. The Incidents Overview dashboard opens in the inline editor. After you refresh the browser page, you see the Open Incidents - Priority data visualization added to the end.



Duplicate a visualization in the Visualization Designer

Duplicate a visualization so that you can use aspects of the source in a copy of the visualization.

Before you begin
Role required: viz_creator

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**
2. Select the visualization that you want to duplicate.
3. From the More actions menu (⋮), select **Duplicate**.
4. Give the duplicate a unique name and select **Duplicate**.

Result
The visualization is copied with the new name and the suffix **- Copy**. All other aspects of the visualization remain the same.

Important: The new copy of the visualization is automatically saved.

Duplicate a visualization on an inline dashboard

Duplicate a visualization so that you can use aspects of the source in a copy of the visualization while on the dashboard it sits on.

Before you begin
Role required: viz_creator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Dashboards**
2. Select the dashboard with the visualization that you want to duplicate.
3. Select **Edit**.
4. From the Actions menu ( ) on the visualization, select **Duplicate**.
   A copy of the visualization is added to dashboard.
5. Select the copy of the visualization to open its Configuration panel.
6. Give the copy of the visualization a unique chart title to distinguish it from the original on the dashboard.
7. Select **Save** to save the changes to the dashboard.
8. **Optional:** From the Actions menu ( ) on the visualization, select **Add to Library** to make the copy available to other users.
   When you add the visualization to the library, you must give it a name and, optionally, a description. Other users see the name and description in the list of visualizations in the library.

Result

The visualization is copied with the new information.

Important: The new copy of the visualization is automatically saved.

Share a data visualization in the Visualization Designer

Share a visualization to provide view or edit permissions to users, groups, or roles. A user can access a shared visualization in any workspace on the original instance.

Before you begin

Important: The right to share a dashboard or data visualization includes the right to add, edit, and delete sharing rights for any user, group, or role on that dashboard or data visualization. A user cannot use this ability to give themselves or others edit rights if they were not originally given edit rights.

Role required: You can share any data visualization that you created. When you share a data visualization, you can pass along the rights to share that visualization further. You also decide whether to share with editing rights or only viewing rights. If a data visualization has been shared with you with sharing and editing rights, you can also pass along editing rights.

Users with the admin and viz_admin roles can share all data visualizations. Only users with the admin and viz_admin roles can share data visualizations with roles.

Sharing a visualization with a user, group, or role adds that visualization to the **Shared with me** tab in the Data Visualizations overview. Any user with a role can list and view any visualization at the table level. Report_view access control lists (ACLs) still apply no matter how the user gets to the visualization, however changes to ACLs can break data visualizations that are used in UI Builder.

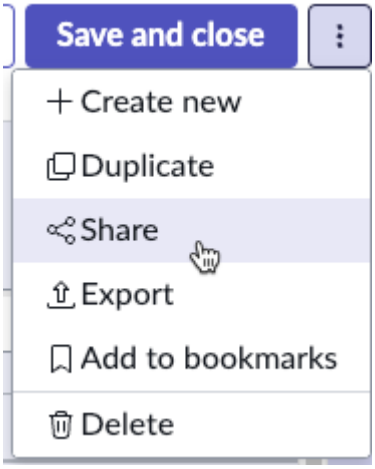
Edit rights granted by sharing a data visualization do not apply to that visualization when placed on a dashboard, but only in the Visualization Designer.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or to a workspace with a visualization that you own.
2. Locate and open the visualization that you want to share.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Expand the More actions menu and select **Share**.



4. Enter the names of one or more users, groups, or roles you want to share the data visualization with.

Note:

- It is not possible to share data visualizations with inactive users.
- Only users with the admin or viz_admin role see the option to share visualizations with roles.

5. To allow the people that you share the data visualization with also to share that data visualization, select **Allow recipients to share**.
When you add a user, group, or role as a viewer, they can only share the visualization as a viewer. When you add a user, group, or role as an editor, they can share the dashboard as a viewer or as an editor.
6. Select one of the following options.

Option	Description
Add as viewer	Grant only viewing rights to the users, groups, or roles you share the visualization with. The recipients cannot edit it.
Add as editor	Grant editing rights to the users, groups, or roles you share the visualization with.

7. Select **Confirm**.

Manage data visualization access

You can change the access rights of persons with whom the data visualization is shared.

Before you begin

Important: The right to share a dashboard or data visualization includes the right to add, edit, and delete sharing rights for any user, group, or role on that dashboard or data visualization. A user cannot use this ability to give themselves or others edit rights if they were not originally given edit rights.

Role required: You can change the access rights to any data visualization that you created, regardless of your role. Users with the admin and viz_admin roles can change the access rights

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

to all data visualizations. Only users with the admin and viz_admin roles can change role-related access rights to data visualizations. Any user can view a data visualization by default.

Procedure

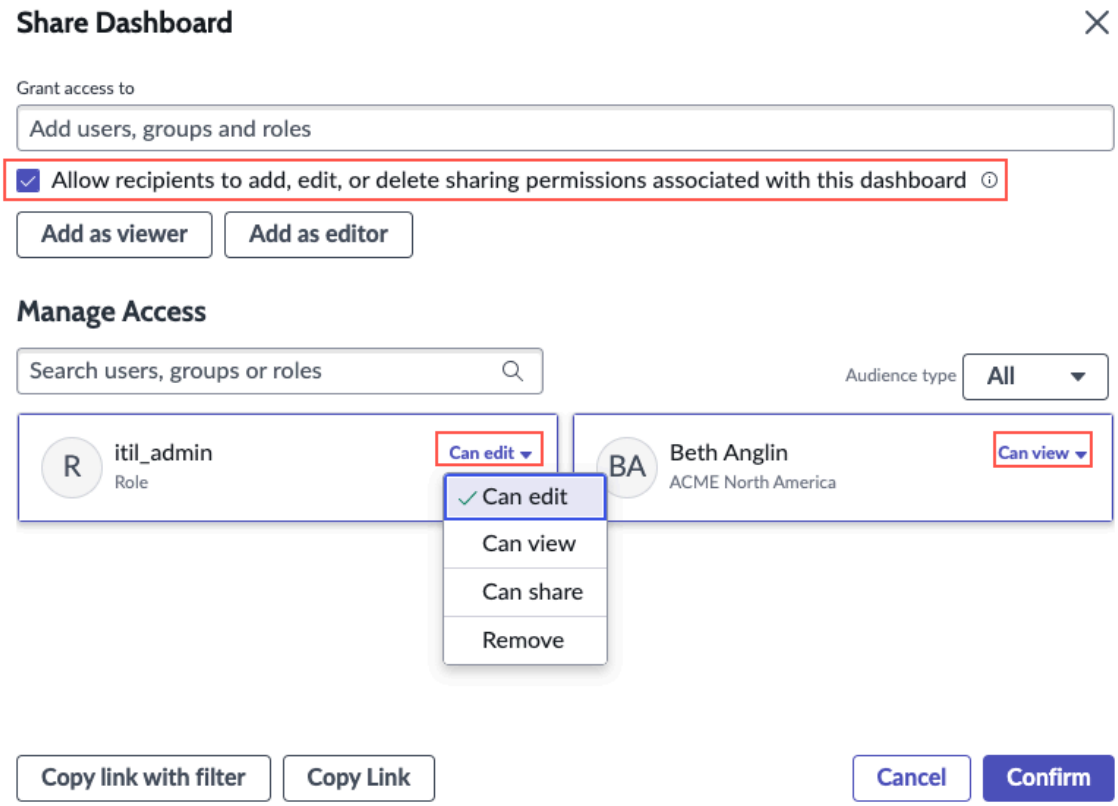
1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or to a workspace that has a component based on the Analytics Center template ( ) and the data visualizations you want to share.
2. Open the **Data visualizations** tab and select the data visualization whose access you want to manage.
3. Expand the More actions menu and select **Share**.

   Under Manage Access, you see a tile for every user, group, or role that the data visualization is shared with.

4. **Optional:** Filter the user tiles.
   a. In **Audience type**, limit the tiles that appear to show only users, only groups, or only roles.
   b. Enter a partial name of a user, group, or role in the search field.
5. When you locate the desired tile, expand the list of rights and select the rights to grant.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can grant editing rights or only viewing rights. You can give or take away the right to share the data visualization. Lastly, you can remove the user, no longer sharing the data visualization with



them.

Export a data visualization from the Visualization Designer

Export individual data visualizations to various formats and sizes. Download the exports or share them over email.

Before you begin

Role required: You can export any visualization that you created or that was shared with you. Users with the admin or viz_admin role can export any data visualizations.

About this task

Not all visualizations support all output types. Some export options shown in the UI for a visualization may not be valid. Consult the following table.

Supported export formats for different data visualization

	Supported data visualization export formats
Calendar reports, Indicator scorecards, Pivot tables, Geomap	None
Lists	PDF, Microsoft Excel (.xls or .xlsx), Embedded LIST, CSV
Other data visualizations	PowerPoint, PDF, PNG, JPEG, Embedded PNG
Non-data visualization dashboard elements, like Headings	Not applicable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

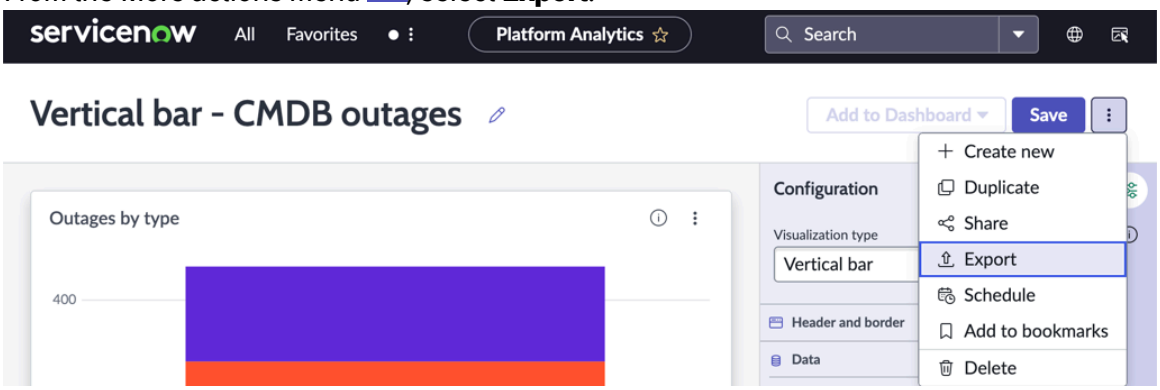
Data visualizations exported to PowerPoint include the title and the description if this information is provided in the source visualization.

Note:

If you have any Now Assist applications installed, you can probably export a dashboard conversationally through the Now Assist panel. See Export dashboards and data visualizations from the Now Assist panel.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select the visualization that you want to export.
3. From the More actions menu , select **Export**.



4. In the File to export section, configure the following information.

Field	Description
File type	Export data visualizations in one of their supported formats. (See Supported export formats for different data visualization.) Select **Embedded PNG** or **Embedded LIST** to embed the exported file in the email body instead of sending it as an attached file or ZIP. You can edit the email around the image.
Page format	For PDF, PNG, Embedded PNG, and JPEG, select Letter, A4, or A3 to correspond to the paper dimensions of the printed visualization. You cannot set the page format when exporting a List.
Orientation	Choose Portrait or Landscape. Not available when exporting to Microsoft PowerPoint, Microsoft Excel, or CSV formats.

5. Under **Delivery**, select **Download file** or **Send file via email**.
   - When you choose to download the file, a **Download** button is available after the export is complete. The file, named `<visualization-name>.<filetype>`, is downloaded to your default local destination.
   - When you send the file by email, you can select users and groups on your instance or any allowed email address. Security constraints may restrict who you can email. You also must specify a subject, and you can add a message. When you are done, select **Export**.

Note: To send email to persons who are not on your instance, make sure outbound email is configured. See Outbound Email Configuration in the Developer Site.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Schedule the export of data visualizations or dashboards

Automate the export and mailing of data visualizations. Help colleagues build presentations, share information with external users, or track data over time.

Before you begin

Role required:

- par_scheduler, or any role that contains it, to create or edit the scheduled export of any dashboard or visualization that you can access.
- sn_par_sche_export.par_scheduler_admin to delete the scheduled export of a dashboard or data visualization.
- viz_admin to create, update, or delete the scheduled export of any data visualization on the instance
- dashboard_admin to create, update, or delete the scheduled export of any dashboard on the instance.

To view the list of scheduled exports, navigate to **All** > **Platform Analytics** > **Library** > **Scheduled Export**. This list contains all scheduled exports including Core UI dashboards and reports and Platform Analytics experience dashboards and data visualizations.

About this task

You can export multiple dashboards and data visualizations together in one scheduled email. Supported export formats depend on what you are exporting and whether you are exporting it as part of a dashboard or as a standalone data visualization.

Supported export formats

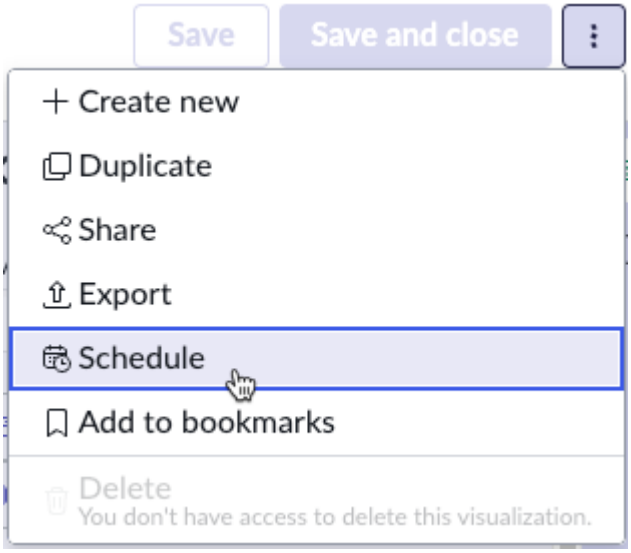
Data visualization or dashboard element	Supported dashboard export formats	Supported data visualization export formats
Calendar reports, Indicator scorecards, Pivot tables, Geomap	None	None
Lists	PDF	PDF, Microsoft Excel (.xls or .xlsx), Embedded LIST, CSV
Other data visualizations	PowerPoint, PDF	PowerPoint, PDF, PNG, JPEG, Embedded PNG
Non-data visualization dashboard elements, like Headings	None	Not applicable

Note: This topic is available in both the Dashboard and the Data Visualization documentation.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** and select **Data Visualizations** or **Dashboards**.
2. Select an item that you want to export on a regular schedule.
   Check the list of supported export formats under **About this task**.
3. From the More actions menu ( ), select **Schedule**.
   You cannot be in Edit mode.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



All the options appear for exporting the dashboard or data visualization. If you do not want to export this object, select **Change**.

4. Select the file type.
5. If you are exporting a dashboard or data visualization to PDF, or a data visualization to a graphic file, select the page format and orientation.
   Scheduled exports of List data visualizations to PDF do not have options for page format or orientation. If you need a PDF with a particular format or orientation, consider putting the List on a dashboard and scheduling the export of that dashboard, instead.
6. If you are exporting a dashboard to Power Point, do the following steps:

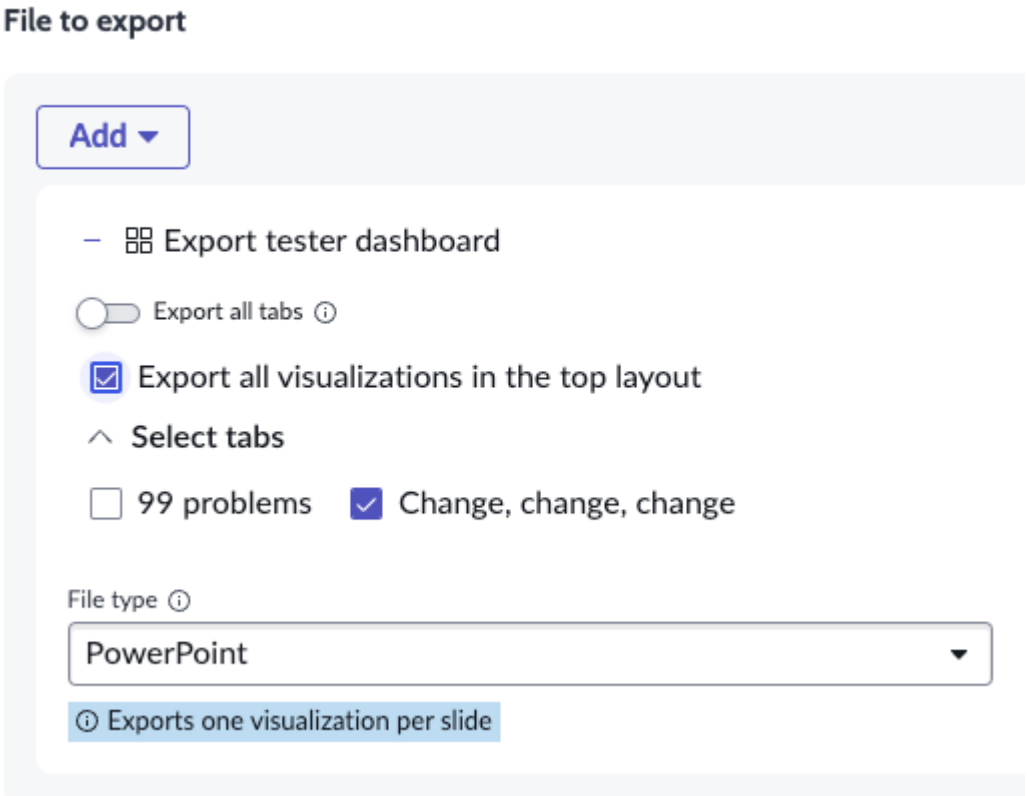
   a. Select whether to export all tabs or only specific tabs.

   b. If you select to export only specific tabs, select which tabs to export and whether to include the top layout contents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example

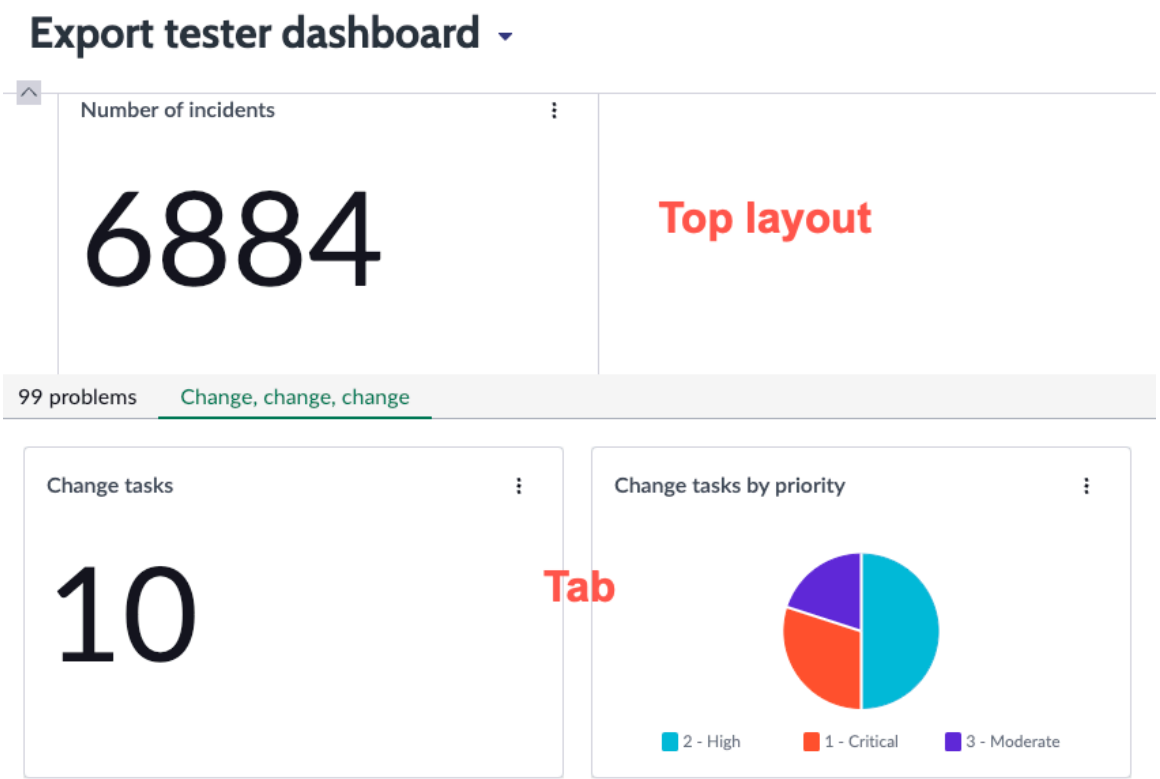
Configuring the export of dashboard tabs



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, if you do not turn on **Export all tabs**, you have to select the tabs to export. If you select a tab and turn on **Export all visualizations in the top layout**, you export that tab and any visualizations placed above the tabs.

The visualizations that are exported



7. To add more dashboards or data visualizations to the export, do the following steps:
   a. Expand the **Add** menu.
   b. Select **Dashboard** or **Data visualization**.
   c. Choose one or more dashboards or visualizations to export.
   d. Configure the export criteria for each added dashboard or visualization as in Steps 4-6. You can add both dashboards and data visualizations to a single export.
8. To send non-embedded exports as ZIP files, turn on **Send as ZIP files**.
9. In the Email schedule section, specify when and how often to send the email.

Field	Description
Active	Turn on to enable delivery of scheduled export emails.
Reoccurrence	Select how often to send the export email.
Day, Time, other calendar fields	Specify when to send the email. Your options depend on how often you chose to send the email in **Reoccurrence**. Time fields are in HH:MM:SS format.
Omit if no records	Turn on to prevent the distribution of empty emails.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Use conditions	Turn on to specify a scripted condition for generating the report.
Condition	A conditional script that determines if a scheduled job should run. The last expression of the script should evaluate to a Boolean (true/false) value. This text box appears only if you select **Use conditions**. For more information about scripts on the ServiceNow AI Platform®, see Scripts. **Warning:** Conditional scripts for scheduled emails are executed in the sandbox. Therefore, function definitions are not allowed. Some API calls and keywords are also not allowed. For more information, see Script sandbox property.

10. In the Email details section, specify the recipients and the email subject.
    You can enter users and groups on your instance or any permitted internal or external email addresses. Security constraints may restrict who you can send the report to. You can also add a message. To send email to persons who are not on your instance, you need to have outbound email configured. See Outbound Email Configuration.
11. Select **Save** to save the schedule.

Delete a visualization in the Visualization Designer

You can delete a data visualization that is no longer useful.

Before you begin

Inform any users who can view the visualization that you're deleting it. No validation is executed to check if the visualization is used in a dashboard.

Role required: You can delete any data visualization that you created. If you have the admin or viz_admin role, you can delete any data visualization.

Procedure

1. Navigate to **Platform Analytics** > **Library** > **Data visualizations**.
2. Open the data visualization that you want to delete.
3. From the More actions menu (⋮), select **Delete**.
4. Confirm the deletion.
   You cannot undo this action.

Bookmark a visualization in the Visualization Designer

Bookmark a visualization so that you can find it easily in the Data Visualizations library.

Before you begin

Role required: None. Anyone who can access a data visualization can bookmark it for themselves.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select the visualization that you want to bookmark.
3. From the More actions menu (⋮), select **Add to bookmarks**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
On the **Data Visualizations** tab, the selected visualization appears in the Bookmarked list.

What to do next
To remove a bookmark, choose the bookmarked visualization and select **Remove bookmark** from the More actions menu ( ).

View data visualizations

A dashboard viewer has several ways to affect what a data visualization shows in runtime.

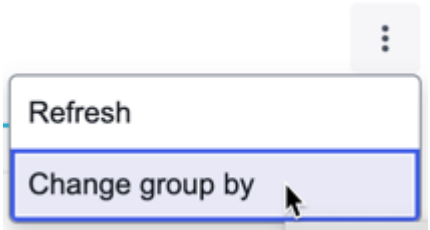
Select a group-by value in a data visualization as a viewer

A viewer of a data visualization can select the value for grouping the data in the visualization.

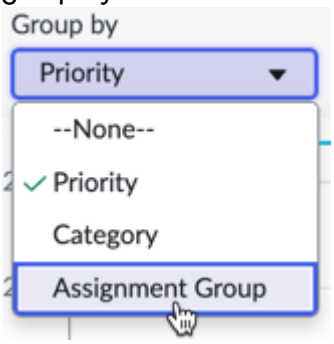
If a data visualization is configured with alternative group-by values, a viewer can pick which value to apply. No editing rights are required. On a visualization that shows Service Catalog data, the options can include Service Catalog variables, as described in Service catalog variables in data visualizations.

Note: Instructions for configuring alternative group by are included in the data options topics for the relevant data visualizations.

Toggle the visibility of the selector for group-by values by selecting **Change group by** in the data visualization's More actions menu. An editor of the visualization can set whether the selector is visible or hidden by default.

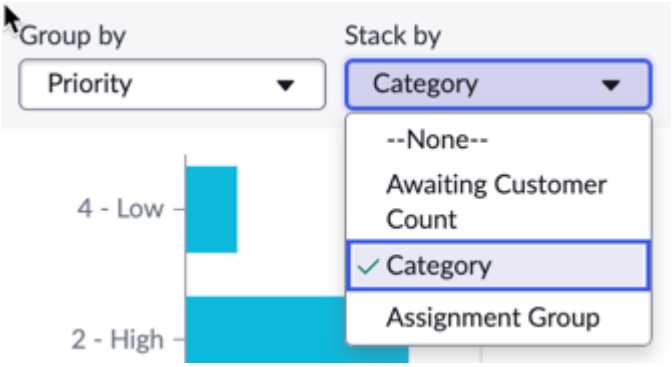


All data visualizations that support group by also let viewers select the group-by value, except for pivot tables. For all such data visualizations except bar visualizations, you have only a single group-by value to select.



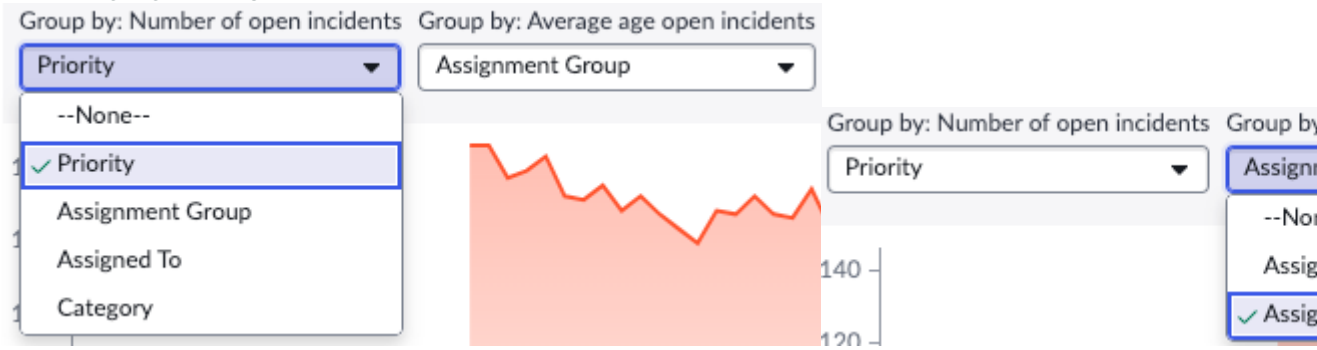
If you are viewing a bar visualization, you can choose a stack-by value as well as a group-by value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



In a time series visualization that shows more than one metric, you might have the option of selecting a group-by for each metric. You are given only valid choices.

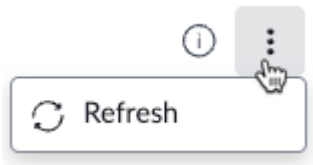
Selecting a group-by value for each metric in a time series



Refresh a data visualization as a viewer

A viewer of a data visualization can refresh that data visualization without refreshing the page or having editing rights.

Anyone viewing a data visualization can refresh that visualization through the visualization's More actions menu.



Download a data visualization from a dashboard

As a viewer, download individual data visualizations from a dashboard or the Visualization Designer. Output formats differ between Lists and other data visualizations. The available output formats are CSV, Excel, PNG and JPEG.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Important:

- The options to export data visualizations other than List to CSV or Excel are available only if you install the Data Visualizations Bundle version 6.2 or later from the ServiceNow® Store.
- Indicator scorecards and calendar reports cannot be downloaded from the visualization.
- Pivot tables and single score data visualizations can only be downloaded as CSV or Excel (.xls) files.
- Boxplots can only be downloaded as JPEG or PNG files.
- List visualizations support several export formats but not graphic files.

Role required: Anyone viewing a data visualization can export that visualization from a dashboard or the Visualization Designer through the visualization's **More actions** menu.

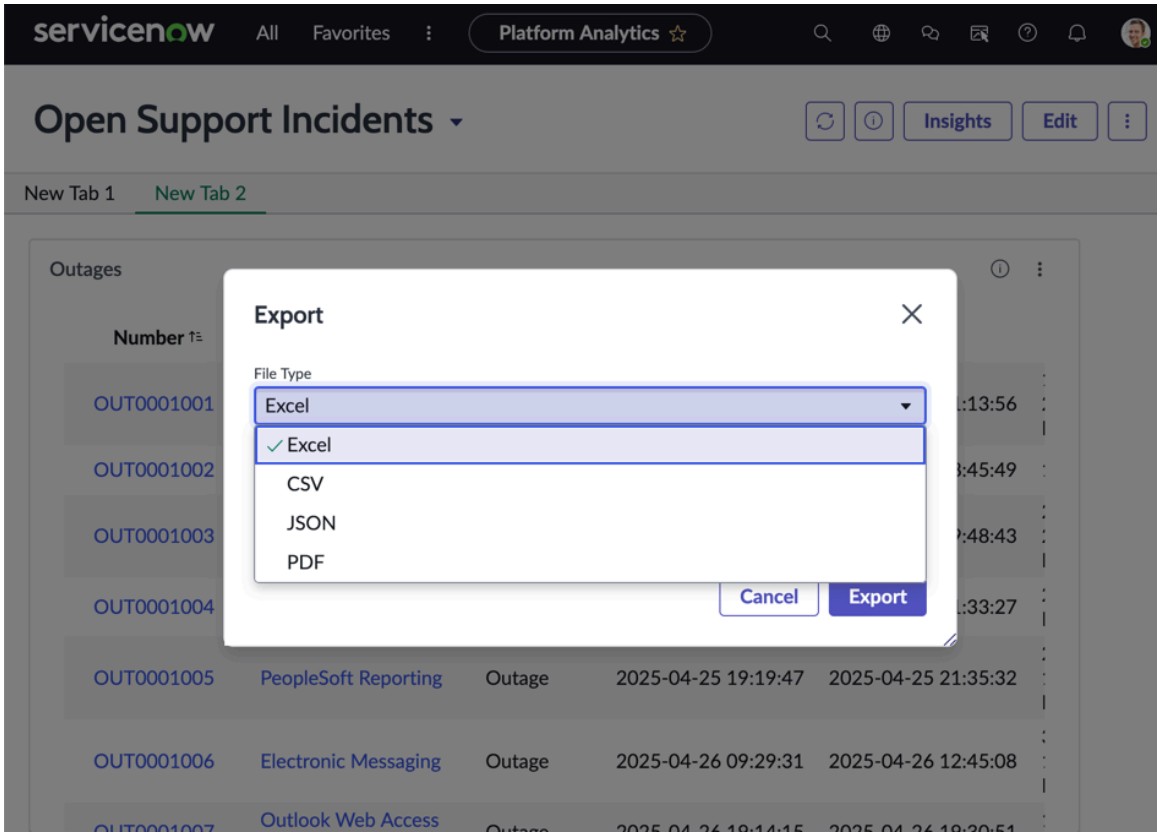
Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Dashboards**.
2. Open the desired dashboard.
3. Select the More options 3-dot menu in the visualization you want to export.
4. For supported data visualizations other than Lists, select the export format:
5. For lists, follow these steps on the visualization's More options 3-dot menu:

   a. Select **Export**.

   b. Select the desired file type from the Export list.
      - Excel
      - CSV
      - JSON
      - PDF

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Select the delivery type.
All file types support download and email. PDF also supports an Accessible PDF format.

d. If you chose to email the file, specify the email address.

Result
The file is saved to the download folder of your browser, unless you are emailing a list.

Configure data visualizations

Learn about advanced configuration options in depth. While most configuration options are discussed only in the context of creating a data visualization of a given type, these options are more complex and have characteristics shared across all visualization types.

Selecting data sources for data visualizations

The key purpose of a data visualization is to show data. Thus, one of the most important steps in creating a data visualization is to select the source of the data to show.

Note: This documentation focuses on data visualizations in the Visualization Designer or the inline dashboard editor. The information also applies in the UI Builder, but in the latter environment you have more options, such as custom and JSON data sources.

The data source is one of the first two things you select for a data visualization, either just before or just after the visualization type.

Warning: If you select data sources and then change the visualization type to one that does not support those data sources, the unsupported sources are cleared. If you later switch back to a visualization type that supports the original selection, you do not restore your original selection. You then have to reselect sources manually.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select a table data source for a data visualization

Select a table whose records you wish to display. Filter by predefined or custom conditions. Preview a list of records.

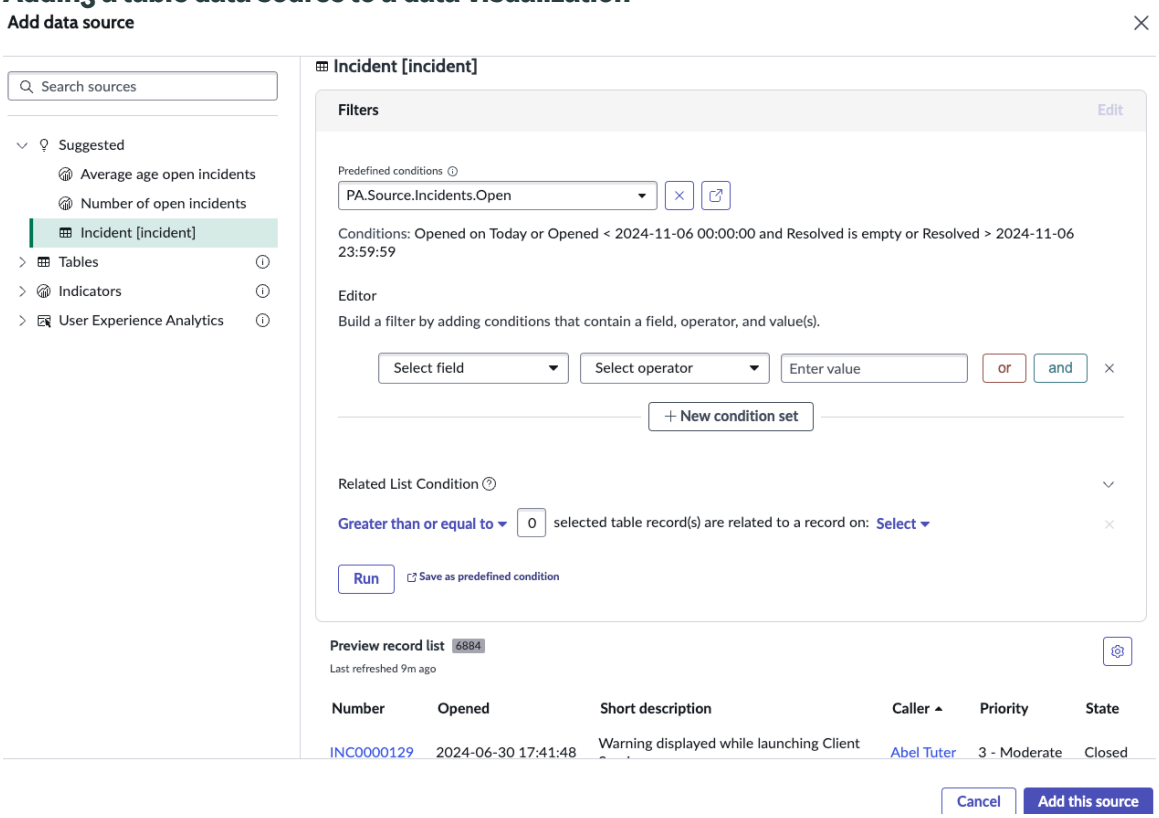
Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

This procedure assumes you are in the process of creating or editing a data visualization and need more information about selecting the data source. It also assumes you are working in either the Visualization Designer or the inline dashboard editor. More options are available in the UI Builder.

Adding a table data source to a data visualization



Procedure

1. Start to create a new data visualization, or open an existing visualization for editing. For more information, see Creating data visualizations.
2. Choose one of the following:
   - If you have not yet selected the visualization type, select **Add data source** from the main panel.
   - If you have selected the visualization type, select **Add data source** from the Data sources section of the configuration panel.
3. To select a table data source, choose one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enter the table name or the first few letters of the name in the **Search sources** field.
- Locate the table in the **Suggested** list. Tables are indicated by a table icon.
- Expand the **Tables** list and navigate down to the desired table.

When you select a table, the filters and preview list become available.

4. **Optional:** Select a predefined filter.
   Predefined filters are defined on the Report Sources [sys_report_source] table. For more information, see Report sources.
5. **Optional:** Select **+Add custom conditions** and build a filter in the ServiceNow AI Platform Condition builder.
   For more information, see Condition builder.
6. With **+Add custom conditions** open, add a relationship with a field in another table by expanding **Related list condition**.
   For information about building a related list condition, see Add related list conditions.
7. Run your filter query or save it as a predefined condition on the Report Sources table.
8. Examine the filtered list of records in the Preview records list.
   You can reorder, sort, or resize the list in the column header row. You can choose which columns to show or restore the original widths in the list actions.
9. Select **Cancel** or **Add this source**.
   You return to the data visualization editor. In the configuration panel, you can add Group by fields and set other data properties, depending on the visualization type.

Select an indicator data source for a data visualization

Select a Performance Analytics indicator (KPI) to display in your data visualization. You can filter the indicator scores by breakdowns.

Before you begin

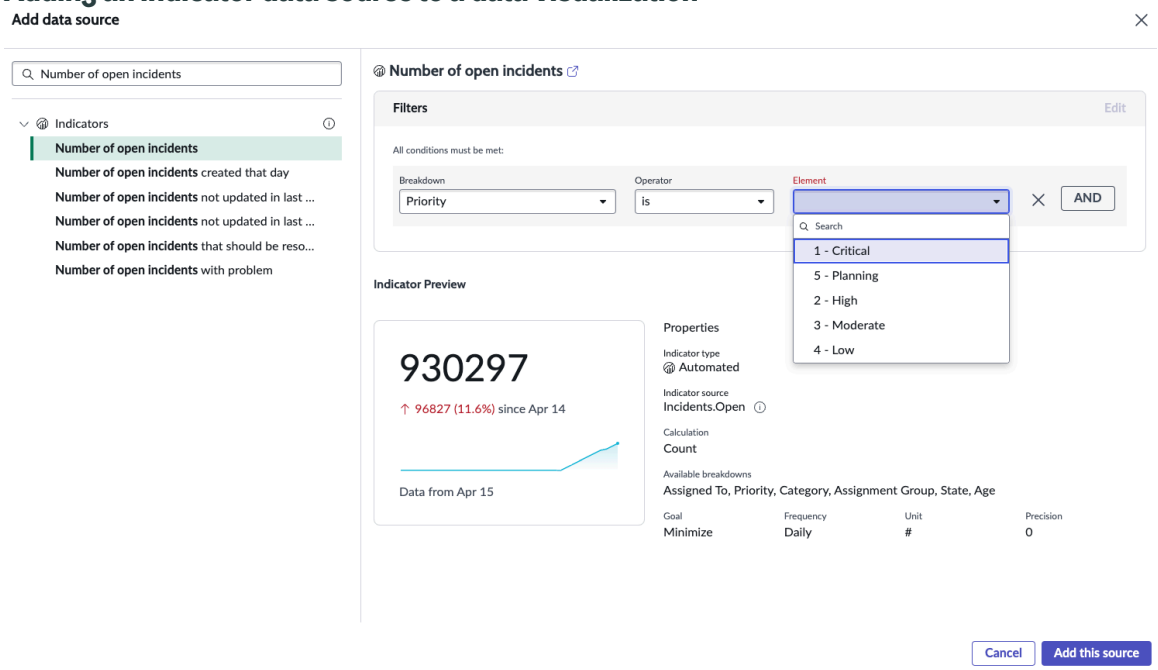
Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

About this task

This procedure assumes you are in the process of creating or editing a data visualization and need more information about selecting the data source. It also assumes you are working in either the Visualization Designer or the inline dashboard editor. More options are available in the UI Builder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Adding an indicator data source to a data visualization



Procedure

1. Start to create a new data visualization, or open an existing visualization for editing.
   For more information, see Creating data visualizations.
2. Choose one of the following:
   - If you have not yet selected the visualization type, select **Add data source** from the main panel.
   - If you have selected the visualization type, select **Add data source** from the Data sources section of the configuration panel.
3. To select an indicator data source, choose one of the following:
   - Enter the indicator name or the first few letters of the name in the **Search sources** field.
   - Locate the indicator in the **Suggested** list. Indicators are marked by an indicator icon.
   - Expand the **Indicators** list and navigate down to the desired indicator.

   When you select an indicator, the breakdown selector and the preview list become available.
4. **Optional:** Select one or more breakdowns, each with an operator and one or more elements. The number of breakdowns and elements may be limited. For more information, see Indicator breakdowns.
5. Review the indicator properties and the score.
6. Select **Cancel** or **Add this source**.
   You return to the data visualization editor. In the configuration panel, you can add Group by fields and set other data properties, depending on the visualization type.

User Experience Analytics data sources for data visualizations

You can show metrics related to Usage Insights in a data visualization component. The available metrics depend on the visualization type.

Note: Users require the admin, analytics_admin, or analytics_viewer role to add Usage Insights data sources to a visualization.

The Usage Insights application, available in the ServiceNow® Store, provides several data sources.

Events

This data source tracks the events that are triggered on the application. When you select Events as the data source on a visualization, you also must select the application and the event. Apart from this, you can also select the event conditions and specify the event property. For example, you can filter the events based on Country, Manager, Department, Role, etc. In a Bar or Pie/Donut visualization, use the **Group by** field to select an event property. You can then view the number of occurrences and the values distribution of that single event property.

Note: The default maximum number of custom filters you can save for user experience analytics application is 500. You can modify the number of custom filters in the uxa.query_builder.max_num_of_user_filter property.

Pages

This data source tracks page views or usage metrics for a specific page on the application. When you select Pages as the data source on a visualization, you must also select the application and the page. Apart from this, you can add custom conditions to filter data for more accurate analysis.

- Page Views
- Average View Duration
- Average Load Time

Sessions

This data source tracks the number of sessions triggered on an application.

When you select this data source on a visualization, you also must select the application and the category. For Single Score visualizations only, you can select a condition as the category. You can add or edit conditions in the condition builder.

- All Sessions: Represents the number of all sessions created on the application.
- New Sessions: Represents the number of sessions that were created in the most recent time period.
- Returning Users: Users who have created more than one session.
- Short sessions: Number of sessions shorter than 20 seconds.
- Long sessions: Number of sessions longer than 300 seconds.
- Custom: You define this category by creating at least one condition.

Users

The number of active unique users using the application. When you select this data source on a visualization, you must also select the application and the category of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

user. For Single Score visualizations only, you can select a condition as the category. You can add or edit conditions in the condition builder.

- All Users: Represents the number of all users in the application.
- New Users: Represents the number of users who have performed their first session.
- Never Returned Users: Users who have created only one session.
- Multi Device Users: Users who have created a session with more than one device.
- Custom: You define this category by creating at least one condition.

Important: You must specify the date range for all Usage Insights data sources on all visualization types.

The following data visualizations do not support Usage Insights data sources:

- Calendar
- Geomap
- Heatmap
- Pivot table
- Simple List
- Indicator Scorecard

Time series and score data visualizations support all Usage Insights data sources.

User Experience Analytics data sources

Metric	Supported visualization type	Group by	Response
Events	• Scores (Single score, dial, gauge) • Time series • Bars, including Pareto • Pies and donuts • Pivot tables	Bars, Pivot tables, and Pies/donuts: Supported by the event's property Other visualization types: Not supported	Time series: Number of events in the date range Scores: Number of occurrences of the event Bars, Pie/Donut, Pivot: Breakdown of event in date range by property
Sessions	• Time series • Scores • Pies and donuts • Bars	Supports Group by and Stack by	Time series: Number of sessions in the date range Scores: Number of created sessions. Responses can also be filtered by conditions.

User Experience Analytics data sources (continued)

Metric	Supported visualization type	Group by	Response
Users	• Time series • Scores • Pies and donuts • Bars	Supports Group by and Stack by	Time series: Number of active or new users in the date range Scores: Number of active or new users. Responses can also be filtered by conditions.
Pages	• Time series • Scores	Not supported	Time series: Number of active or new users in the date range Scores: Number of active or new users. Responses can also be filtered by conditions.

Multiple data sources

Some visualization types support multiple data sources, while others do not. If your data visualization supports multiple data sources, the data sources must all be of the same type: all tables, all indicators, or all another type.

Multiple data source support by visualization type

Visualization type	Multiple data source support
All time series (line, column, spline, area, and others)	Supported
All scores (single score, dial, gauge)	Not supported
All bars (horizontal, vertical, Pareto)	Supported
Heatmap	Not supported
Pies and donuts	Not supported
Pivot table	Supported
Bubble	Supported
Boxplot	Not supported
Calendar report	Not supported
Geomap	Not supported
Indicator scorecard	Not supported
Analytics list	Not supported

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Warning: If you select multiple data sources for a visualization and then change the visualization type to one that does not support multiple data sources, you keep only the first data source. Switching back to a visualization type that supports multiple data sources does not restore the previously selected data sources.

Example data visualization based on multiple data sources

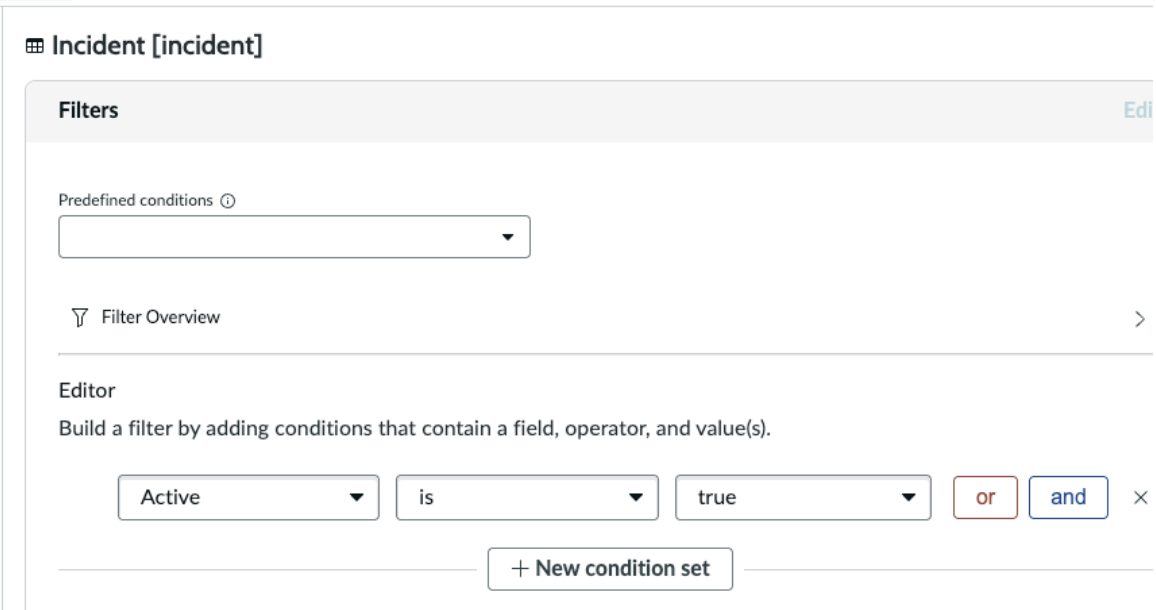
Here's a simple example of a report based on the Indicator and Problem tables.

Before you begin

Role required: Anyone with access to data can create a visualization of that data on any dashboard that they can edit. Users with the itil, report_user, admin, or viz_creator role can create a visualization in the Visualization Designer. When you create a visualization in the Visualization Designer, it is saved to the Library. For more information on access, see Report_view access control and Platform Analytics roles.

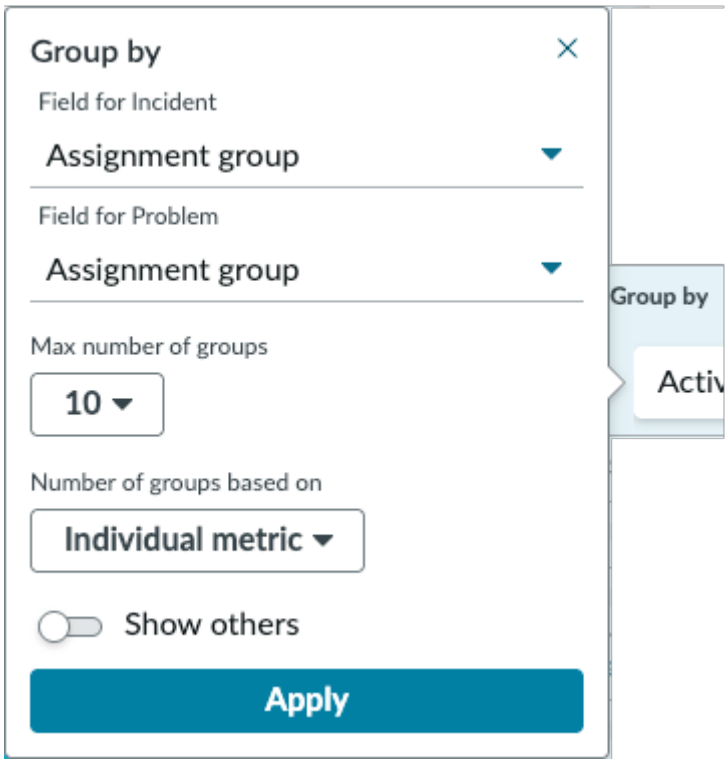
Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**.
2. Select **New**.
3. For the purposes of this example, create a Vertical bar visualization.
   For more information, see Create a horizontal or vertical bar data visualization.
4. Under Data sources, select **+ Add data source**.
5. Add the Incident [incident] table as a data source, with the custom condition `Active is true`.



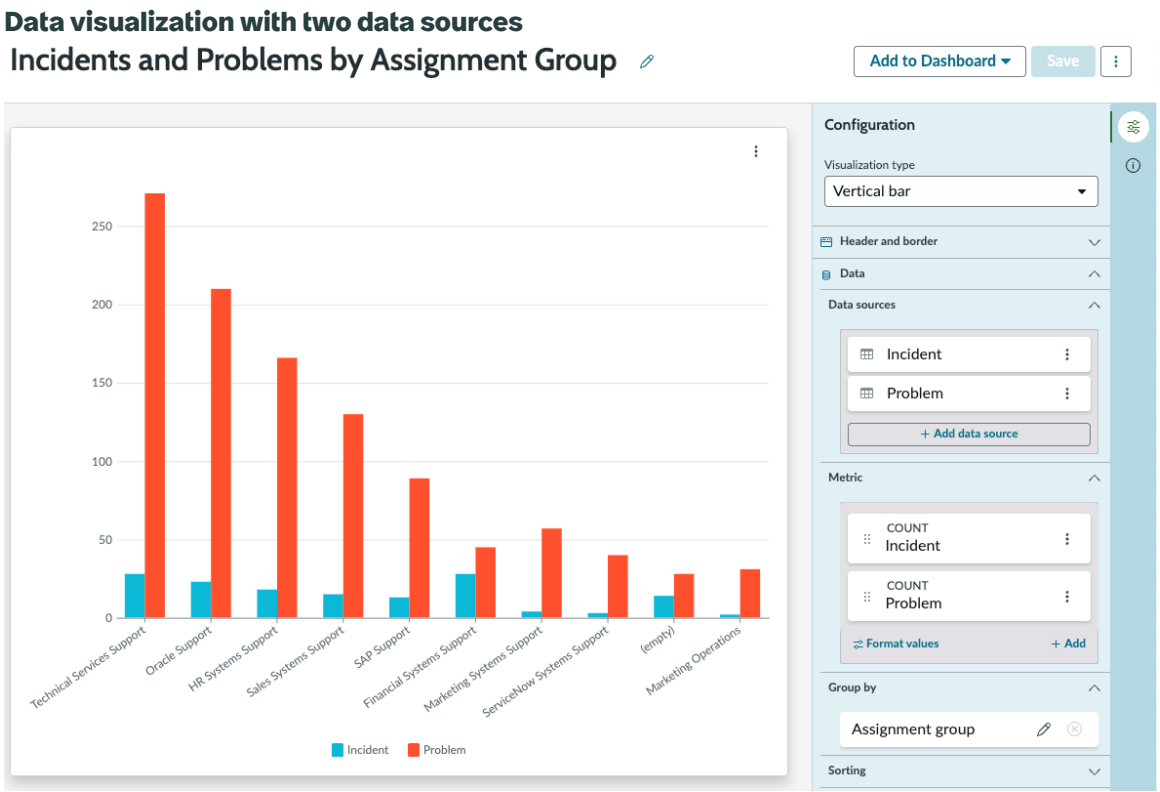
6. Select **+ Add data source** again and add the Problem [problem] table, also with the condition `Active is true`.
   Data sources for a visualization must all be of the same type. Here they are tables.
7. Group both data sources by Assignment Group.
   The second source is grouped automatically by the same field as the first source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. **Optional:** To make the visualization easier to read, under **Chart variation**, select `Side-by-side`.
9. Select Save and name the visualization `Incidents and Problems by Assignment Group`.

Result



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure a data visualization to follow filters or not

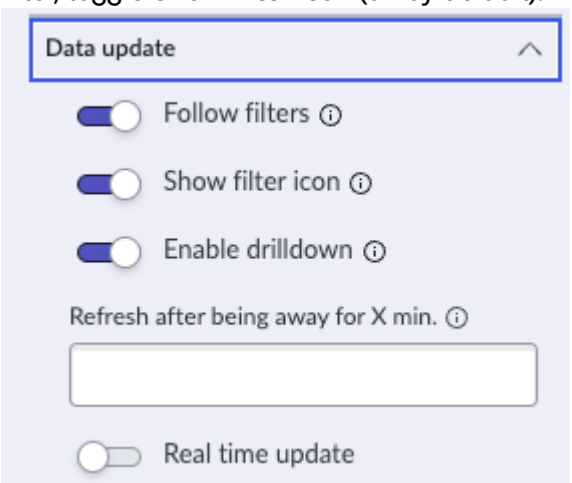
Data visualizations follow filters by default. A data visualization follows filters in the same dashboard tab as itself or above the tabs. Data visualizations either follow all such tabs that target their data sources, or none.

Before you begin

Role required: You can edit any data visualization you own unless it is a shared visualization, in the library. If the data visualization is in the library and you own it, you need the itil, report_user, or viz_creator role to edit it. You can edit any data visualization with the viz_admin role or higher.

Procedure

1. Locate the data visualization either in its dashboard or in the Library.
2. Open the visualization for editing.
   - If in the data visualization library, select the visualization to open it.
   - If in a dashboard, select **Edit** on the dashboard, focus on the desired data visualization, and select **Configure** in the visualization header menu.
3. In the Data update section, select or deselect **Follow filters**.
4. To show or not show a filter icon ( ) on the data visualization when it follows an interactive filter, toggle **Show filter icon** (on by default).



Control data source availability by role

Limit by role the data sources for which users can create data visualizations.

Before you begin

Role required: admin

About this task

By default, all roles can create data visualizations for all data sources. You can instead limit the available data sources by an allow list. When you create a Visualization Data Sources Visibility [sys_viz_data_source_role] record for a data source, only users with at least one of the roles that you specify can create a data visualization for that data source. Any visualizations that they created before you created the allow list still exist. However, the user who created the visualization will no longer be able to edit that visualization unless they have one of the roles from the allow list.

Important: Create only one Visualization Data Sources Visibility record for a data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a new record on the Visualization Data Sources Visibility [sys_viz_data_source_role] table.
   For example, you can navigate to the list view of the table and select **New**.
2. In the **Viz data source** field, select the data source whose use you want to limit.
   Your choices include any custom data sources that you have created in the Viz Framework Data Sources [sys_viz_data_source] table.
3. Select the **Edit user roles** icon ( ) next to Roles.
4. In the **Available** field, highlight those roles that should be able to create data visualizations for this data source.
   Only users with the roles you add will have access to the data source. You can reopen this record and add or delete roles later. Users with deleted roles will see a message that they don't have access to the data source when they try to edit a visualization based on it.
5. Select the right arrow > button to add the highlighted roles to the record.
6. Select **Done**.
7. Select **Submit**.

Example: Impact of limiting data source by role

Abel Tuter is a top business analyst. Abel has the pa_power_user role and can create indicators. Alissa Mountjoy is a technical expert who schedules data collection jobs for indicators, but is not a business analyst and does not create indicators. Alissa has the pa_data_collector role. By default, both Abel and Alissa can create data visualizations based on an indicator.

Abel creates a time series data visualization on the Number of Open Incidents indicator. Abel shares this visualization with Alissa, also granting editing rights.

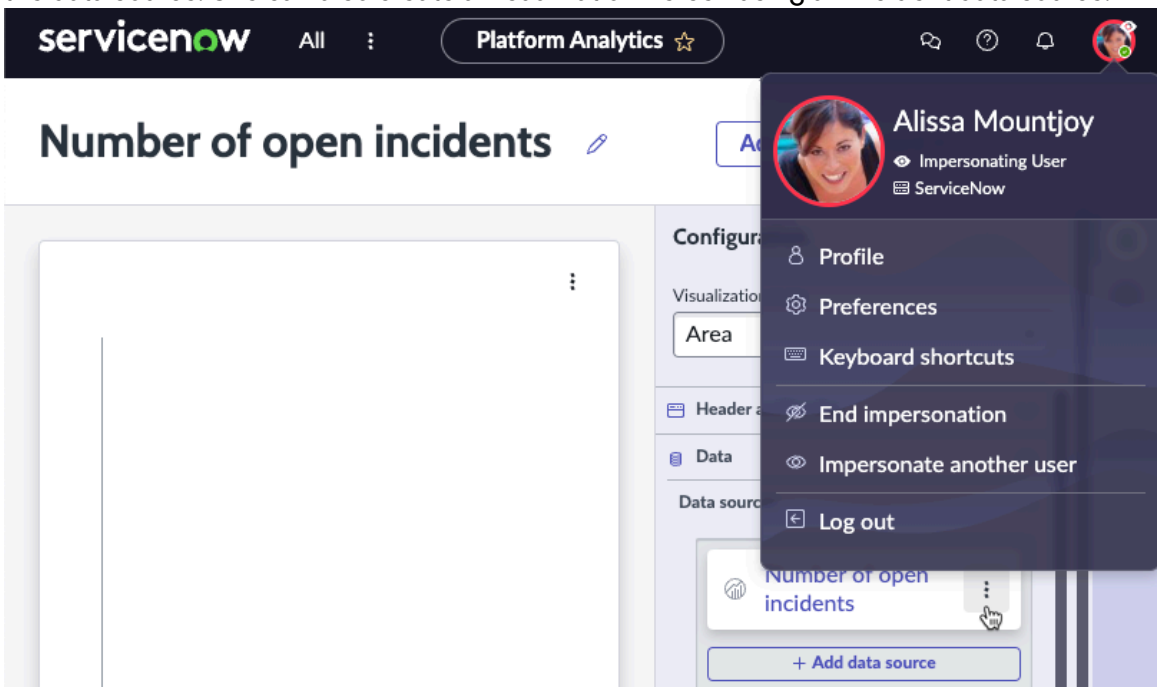
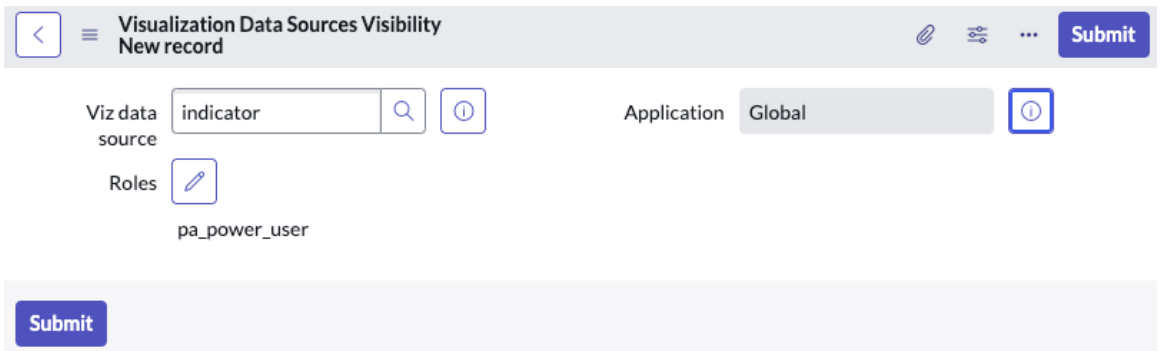
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alissa can open this visualization in edit mode, accessing the configuration panel. She can edit the data source. She can also create a visualization herself using an incident data source.

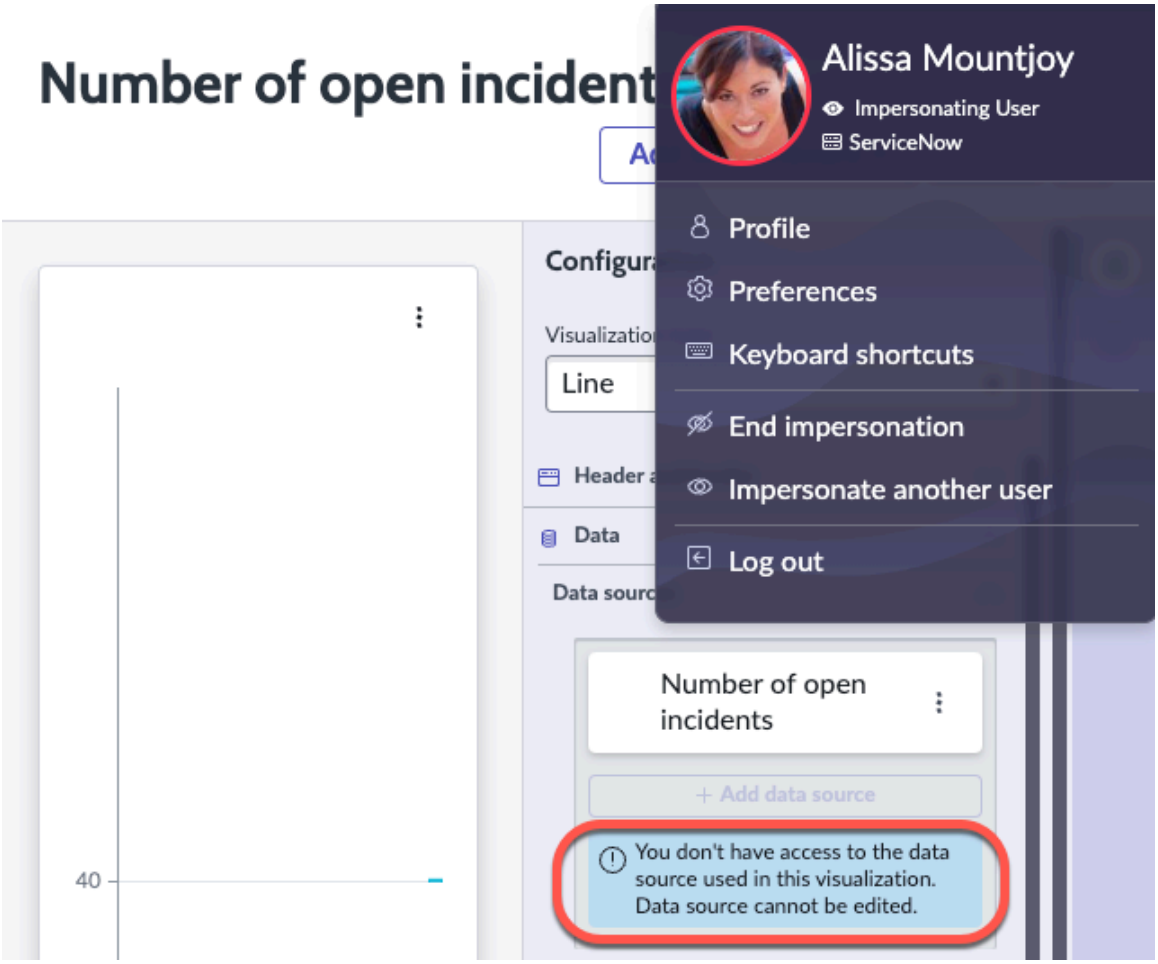


As a system administrator, you decide that only business experts with the pa_power_user role should be able to create data visualizations based on indicators.



Alissa still has editing rights to the data visualization, but can no longer edit the data source. Neither can Alissa create a data visualization with an incident data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Related topics

Data sources for data visualizations

Dot-walking from reference fields in a data visualization

Dot-walking provides access to fields on extended, or related, tables, enabling you to create data visualizations on fields from those tables.

You can access references on extended tables from the Metric, Group by/Stack by, column/row, or Trend by fields in the Configuration panel, or when you add custom conditions when you choose the data source. The Sorting option also enables you to configure the sort order of applicable reference fields on extended tables. Tables that reference other tables are denoted with an arrow (▶) icon.

Dot-walking references a field by building a chain of field names separated by dots (periods). For instance, *incident.assigned_to.company* references the company of the user assigned to an incident. The recommended limit for chain length is three levels.

Note: Dot-walking applies only to visualizations of table data sources.

Related topics

Dot-walking examples

Dot walk fields in Visualization Designer

Learn how to dot walk table fields in a data visualization of table data. See how to start from a parent table, such as Task, and dot walk to include data from extended tables, such as Indicator and Problem.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

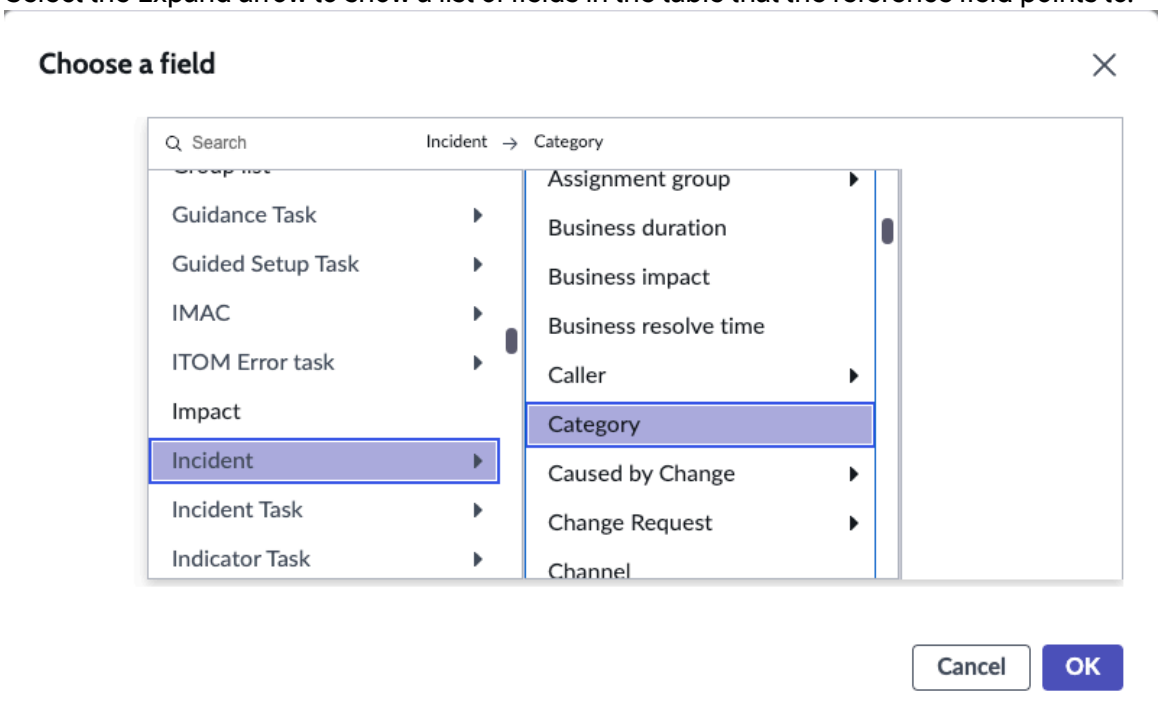
Role required: itil, report_user, report_group, report_global, report_admin, or admin.

About this task

Note: If you cannot dot-walk from any of your fields, check with a ServiceNow AI Platform administrator whether the system UI property *glide.ui.list.allow_extended_fields* is enabled on your instance.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**, or open an in-line dashboard and select **Edit**.
2. Select **Create data visualization**.
3. Create any of the data visualizations listed under Creating data visualizations, selecting a table data source.
4. Open one of the following sections of the configuration tab, depending on the visualization type:
   - The condition builder that opens with **+ Add custom conditions** on the data source.
   - Metric
   - Group by
   - Trend by
   - Columns
5. Edit or add an item in the section
   For a metric, select an aggregation other than Count.
6. Under Field, navigate to the desired reference field.
   Reference fields have an Expand arrow ▶.
7. Select the Expand arrow to show a list of fields in the table that the reference field points to.



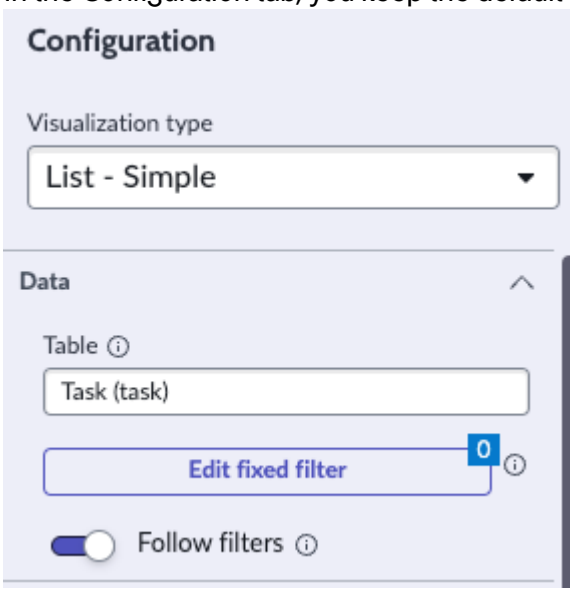
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Select a field, or continue to dot walk across reference fields until you find the desired field.
9. Select **OK** or **Apply**.

Example: Dot-walking to two tables that extend Task [task]

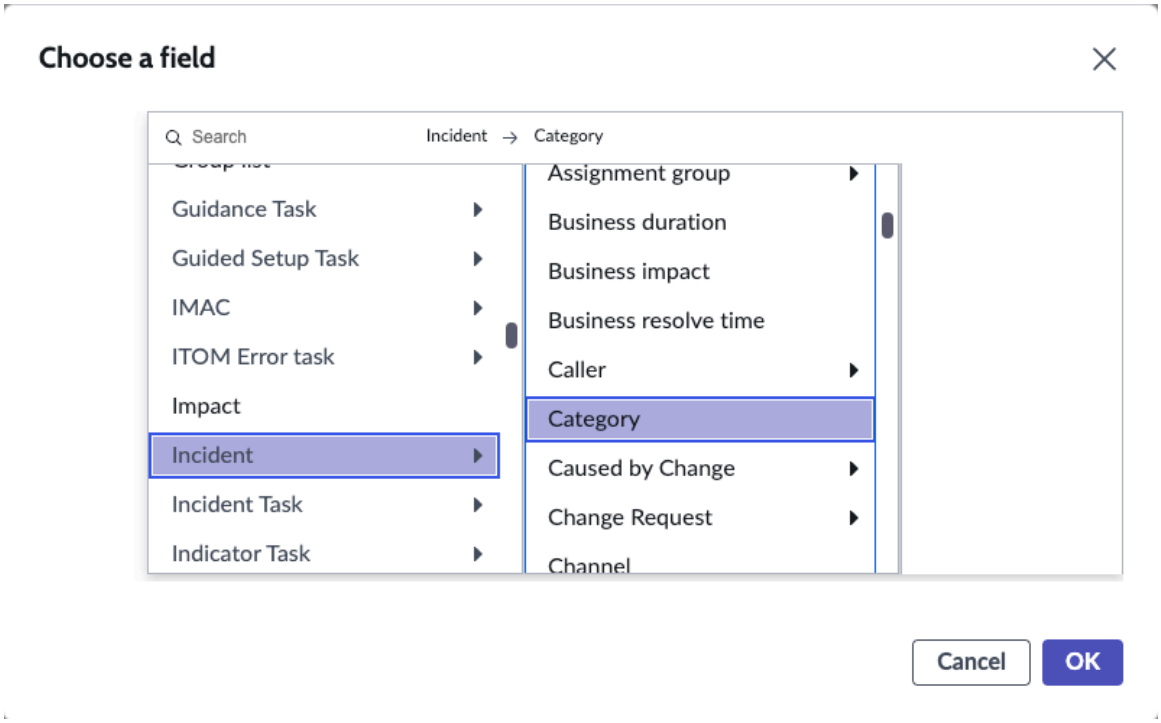
In this example, you create a simple list of data from the Task table and include fields from the Indicator [indicator] and Problem [problem] tables, which extend Task.

1. You navigate to the Data Visualizations list in the Platform Analytics library and select **New**.
2. In the **Visualization type** field, you select Simple list ( ).
3. In the Configuration tab, you keep the default Task [task] table.



4. In the Columns field, you select **+Add** and scroll down to Incident.
5. Next to Incident, you see an Expand arrow that indicates you can dot-walk. So you click that arrow, and scroll down through the fields on the Incident table until you reach the Category field, which you select.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. You repeat this process to add the Problem.Related incident field.
7. Add the Number, State, Assigned to, and Short Description fields, and move them into the order you want.
8. To see only relevant entries, you add the following filters:
   - Active is true AND
   - Category [Incident] is not Null OR
   - Related Incidents [Problem] is not empty
9. You save the visualization and title it `Active Incidents and Problems`.

The final visualization shows either Incident.Category values, Problem.Related Incidents values, or both.

Active Incidents and Problems data visualization showing Incident.Category content

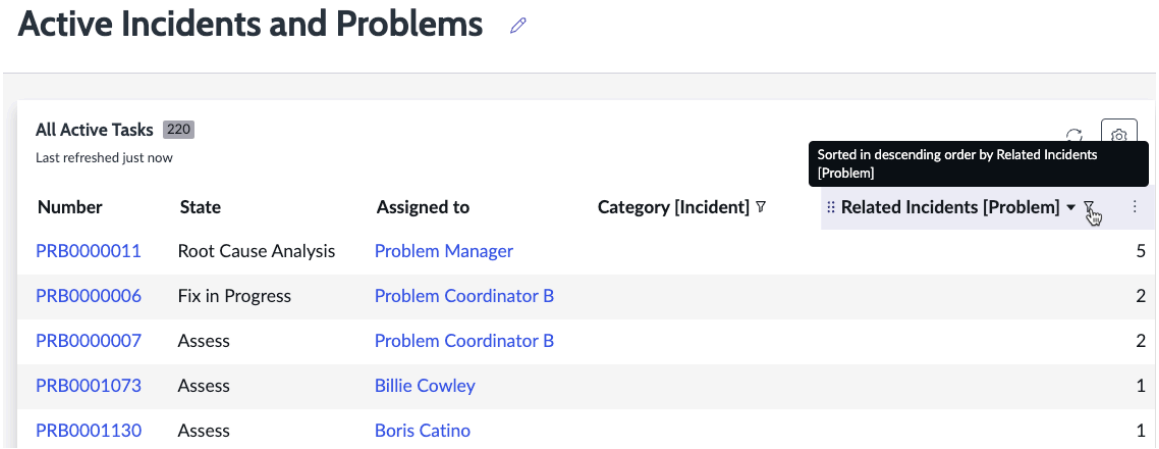
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active Incidents and Problems data visualization showing Related incident.Problem content



Value formatting in data visualizations

In most data visualizations, you can configure how numerical values look when you publish the report.

Types of value formatting

Unit format

Show the format of time fields as d/h/m/s or day/hour/minute/second.

Maximum/Minimum duration unit

Select the largest or smallest unit to be shown: Day, Hour, Minute, or Second.

Hide seconds when unit is greater than one minute

Removes seconds display when a duration value is greater than one minute. Only available if you choose **Second** as the minimum duration unit.

Decimal precision

Number of decimal places to show, from zero to four decimal places.

Note: Decimal precision is not supported on currency fields.

Rounding

For values greater than one minute, simplifies a number by rounding, while keeping it close to its value. See the next section, Rounding options.

Use the thousands group separator

Separate a value of thousands or higher with a comma or period.

Enable abbreviation

Show a value of thousands or higher with a single character.

Note: Abbreviation for Currency, Price, or FX Currency values is not supported.

Hide value in tooltip

Do not show the unrounded, unabbreviated value in the tooltip.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rounding options

For values greater than one minute, rounding options simplify a number, but keep it close to its value. Select from these rounding options:

- Up - to the next larger whole number if positive and to the next smaller whole number if negative. Example: For original values of:
  - 1.1 returns a value of 2
  - 1.6 returns a value of 2
  - -1.6 returns a value of -2
- Down - to the next smaller whole number if positive and to the next larger whole number if negative. Example: For original values of:
  - 1.1 returns a value of 1
  - 1.6 returns a value of 1
  - -1.6 returns a value of -1
- Ceiling - to the next larger whole number, toward the positive. Example: For original values of:
  - 1.1 returns a value of 2
  - 1.6 returns a value of 2
  - -1.6 returns a value of -1
- Floor - to the next smaller whole number, toward the negative. Example: For original values of:
  - 1.1 returns a value of 1
  - 1.6 returns a value of 1
  - -1.6 returns a value of -2
- Half up - to the nearest neighboring whole number. If both neighbors are equidistant, rounds to the next larger whole number. Example: For original values of:
  - 1.1 returns a value of 1
  - 1.6 returns a value of 2
  - 2.5 returns a value of 3
- Half down - to the nearest neighboring whole number. If both neighbors are equidistant, rounds to the next smaller whole number. Example: For original values of:
  - 1.1 returns a value of 1
  - 1.6 returns a value of 2
  - 2.5 returns a value of 2
- Half even - to the nearest whole number. If both neighbors are equidistant, rounds to the closest even number. Example: For original values of:
  - 1.1 returns a value of 1
  - 1.6 returns a value of 2
  - -2.5 returns a value of -2

Summary of rounding options:

© 2026 ServiceNow, Inc. All rights reserved.

Result of rounding input to one digit with the given rounding mode

Input number	Up	Down	Ceiling	Floor	Half up	Half down	Half even
5.5	6	5	6	5	6	5	6
2.5	3	2	3	2	3	2	2
1.6	2	1	2	1	2	2	2
1.1	2	1	2	1	1	1	1
1.0	1	1	1	1	1	1	1
-1.0	-1	-1	-1	-1	-1	-1	-1
-1.1	-2	-1	-1	-2	-1	-1	-1
-1.6	-2	-1	-1	-2	-2	-2	-2
-2.5	-3	-2	-2	-3	-3	-2	-2
-5.5	-6	-5	-5	-6	-6	-5	-6

Chart interactions in a data visualization

You can set what occurs when a user interacts with a visualization, such as by selecting a bar column. Possibilities include navigating to a URL, opening another data visualization, and filtering all visualizations on the dashboard by the selected value.

https://player.vimeo.com/video/1003324543?badge=0&autopause=0&player_id=0&app_id=58479

The configuration panel of a data visualization includes a section labeled Chart interaction. In this section, you set what is called "on-click behavior." This term refers to what happens when a user interacts with a segment of the visualization that represents a value. Examples include selecting a point on a time series or a segment of a pie or donut. You can also disable chart interactions for the visualization.

Important: You cannot configure chart interactions for data visualizations on technical dashboards or other UI Builder pages. You can only enable and configure custom on-click events. Turn on-click events on or off with the **Enable drilldowns** toggle, then configure handlers for them. For information about configuring on-click events from data visualizations on a technical dashboard, see Add a drilldown event to a data visualization on a technical dashboard.

The following actions are available for a chart interaction:

Go to data view

Opens a view of the data appropriate to the data type. For information about the views for each data source, see Data views for different data sources.

Note: Go to data view is the default interaction for all supported data sources.

Go to URL

Opens the URL you specify. This URL can be on the instance or external to it. Where relevant, you can specify the name of the page that is opened in a tooltip. Go to URL is the default interaction for Usage Insights data sources.

Apply as filter

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filters all applicable data visualizations on the dashboard by the value of the selected segment. Does not apply when the Group by field is a time duration. Available only for Horizontal and Vertical Bar and Pie/Donut visualizations, and only for table and indicator data sources. Not available on UI Builder. For more information, see Make a data visualization act as a filter.

Drill down to chart

Opens a different data visualization that is filtered by the selected data. You can add a drill-down visualization for each metric on the parent visualization. You configure this new drill-down visualization seamlessly as part of the process of configuring the chart interaction.

Note: Drill down to chart has the following limitations:

- You cannot configure Drill down to chart in the inline dashboard editor, only in the Visualization Designer.
- Drill down to chart is available only for table data sources.
- You cannot set drill down to chart from the Calendar, Geomap, Indicator scorecard, or List visualizations. However, you can drill down from supported visualizations to any visualization that can display table data.

Different visualization interactions support different data sources and data visualization types. The following table shows the matrix of support.

Interaction support

Action	Supported data visualizations	Supported data sources
Go to data view	All	All that the visualization supports
Go to URL	All except Geomap and Indicator Scorecard	All that the visualization supports
Apply as filter (Available only in inline dashboard editor)	• Horizontal and Vertical Bar • Pie and Donut	Table and indicator
Drill down to chart (Available only in Visualization Designer)	All except Calendar, Indicator scorecard, List, and Geomap	Table

Configure visualization interactions

Select what happens when a viewer interacts with a section of a data visualization that you are editing.

Before you begin

Role required: You can configure this option on any visualization you create, but the person viewing the data visualization must have the right to see the underlying data.

About this task

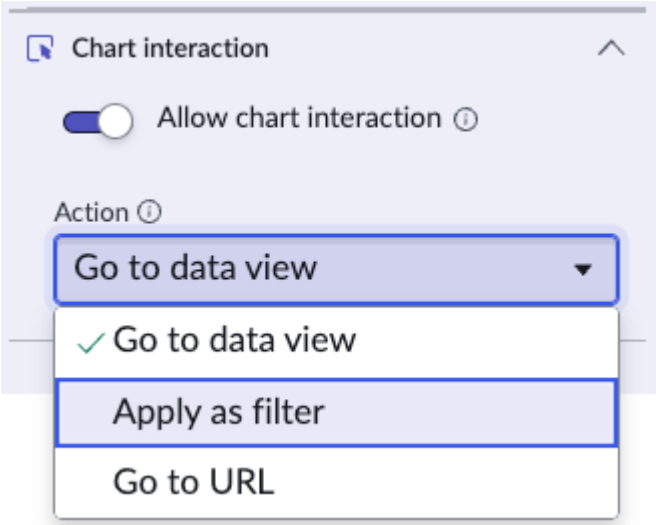
You can configure chart interactions only in the Visualization Designer or the inline dashboard editor, not in UI Builder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations**.
2. Select or create the visualization you want to configure.
3. Under Chart interaction, enable on **Allow chart interaction**.
4. Under Action, select from the available chart interactions.
   The possible interactions are:
   - Go to data view
   - Go to URL
   - Drill down to chart (available from within the Visualization Designer): Lets you add multiple layers of visualizations to drill down to from each metric in the visualization.
   - Apply as filter (available only when editing within a dashboard)

   The interactions are described in Chart interactions in a data visualization.

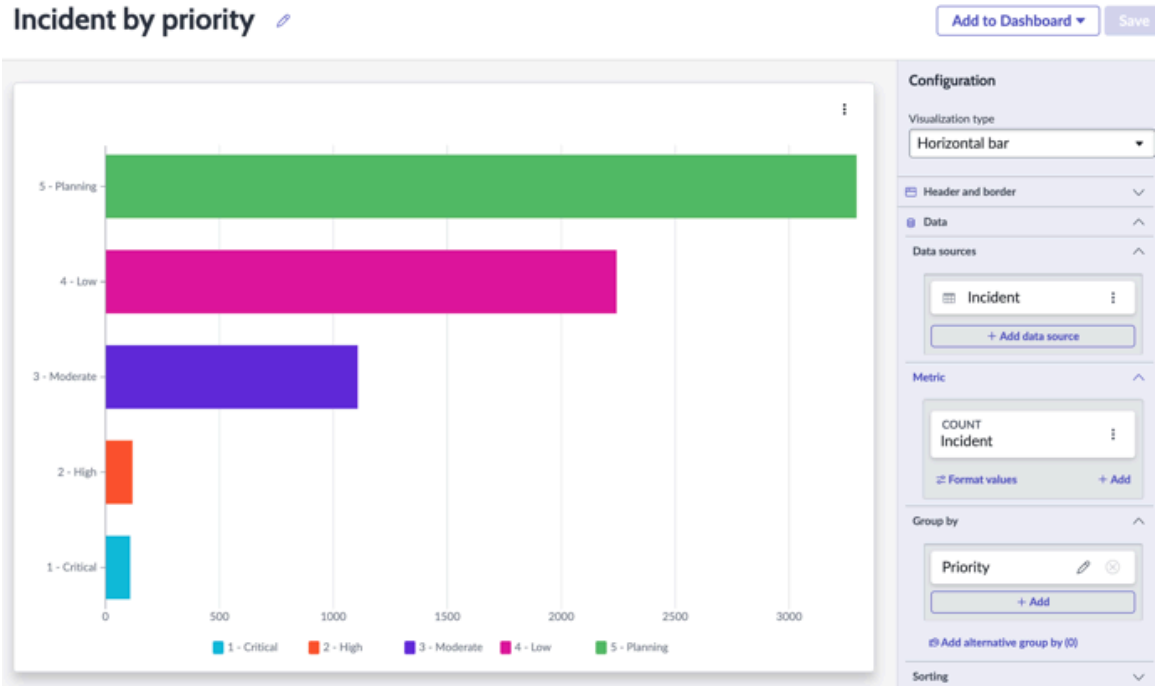


5. Select **Save**.

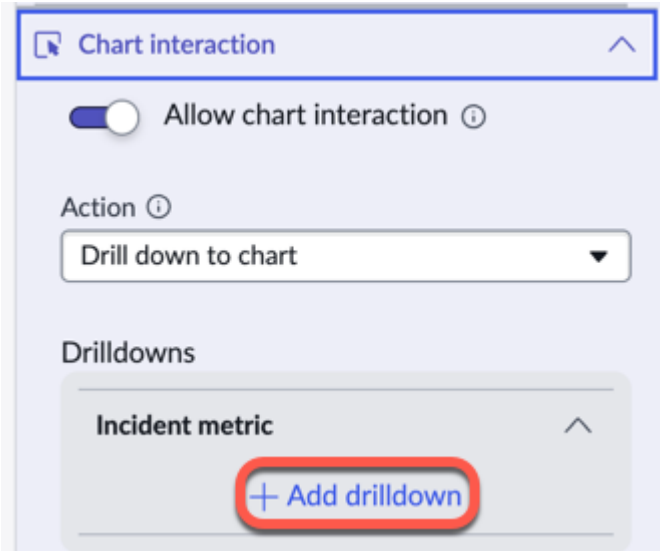
Example: Drill down to chart

Consider a horizontal bar data visualization of the number of incidents on the Incident table grouped by Priority. You decide that users should drill down from a value on this visualization to a single-score visualization showing the total number of incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

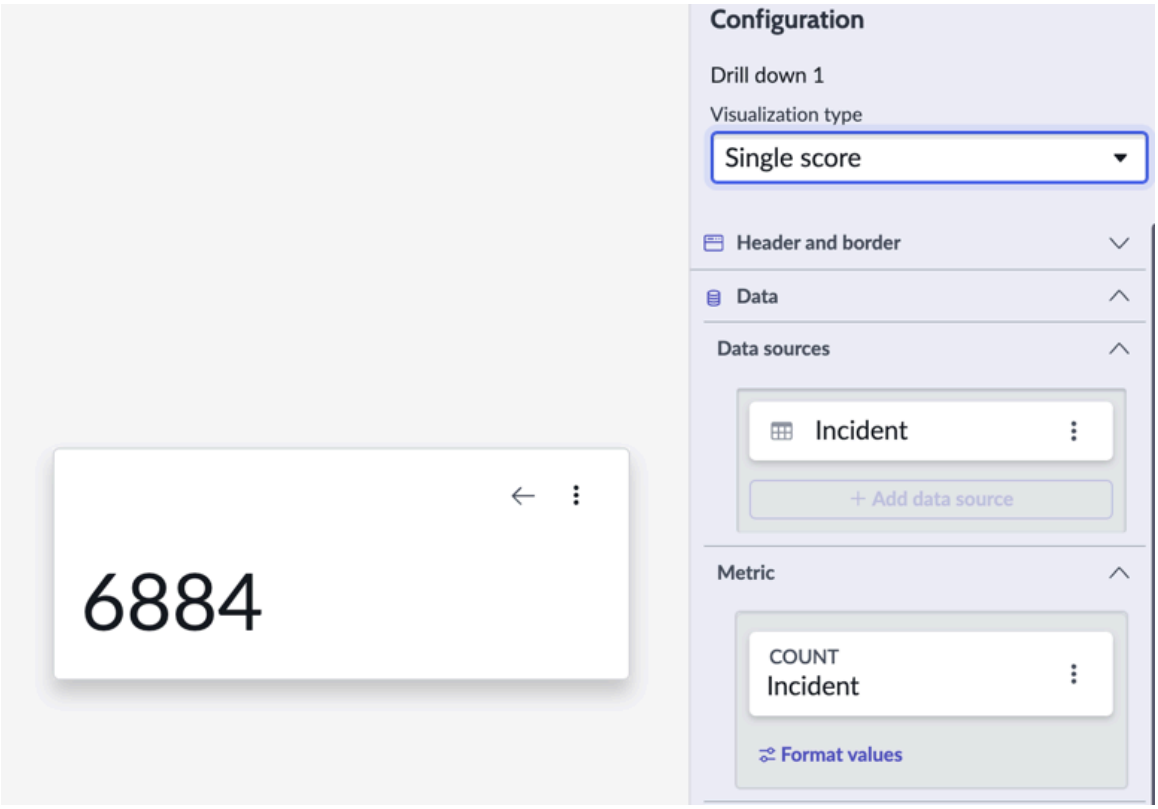


1. You navigate to the Chart interaction section of the configuration panel. Here you select **Drill down to chart** as the action. You can add a drilldown chart to any of the metrics in the visualization. As the Incident metric is the only one on the visualization, this metric is your only choice.

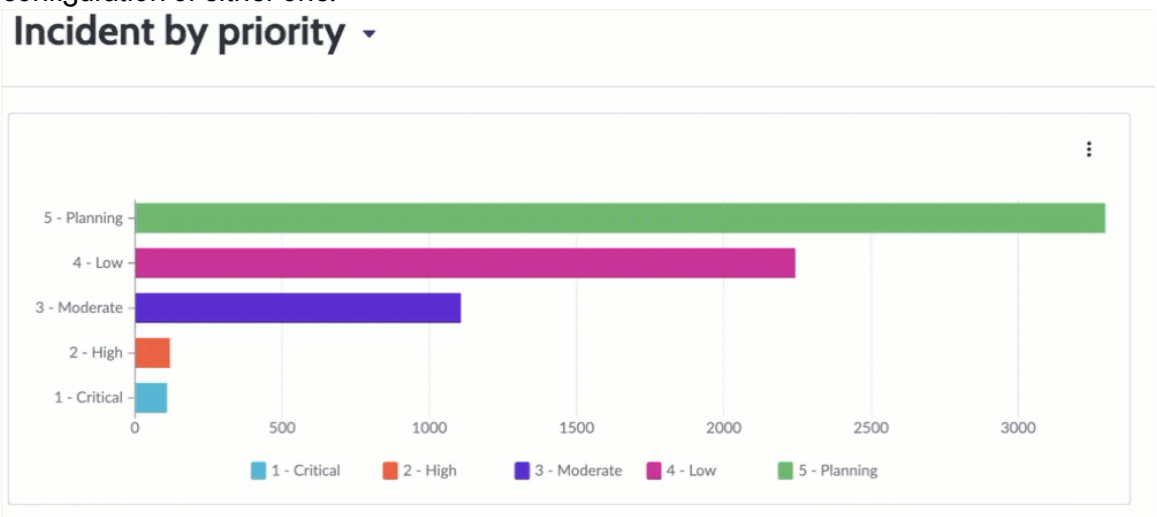


2. You select **+ Add drilldown** for the Incident metric. A configuration panel for a new visualization called Drill down 1 opens.
3. You configure the visualization to show a single score representing the number of incident records on the Incident table and save the visualization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. You could add another visualization to drill down to from the single score visualization that you created, but you don't think this is necessary.
5. Now, when a viewer interacts with this visualization on a dashboard, they can drill down from the bar visualization to the single score and navigate back up. Similarly, you or another editor of the visualization can move between the parent and child visualizations to edit the configuration of either one.



Data views for different data sources

When the chart interaction for a data visualization is set to Go to data, interacting with a data value on the visualization opens different pages depending on the data source.

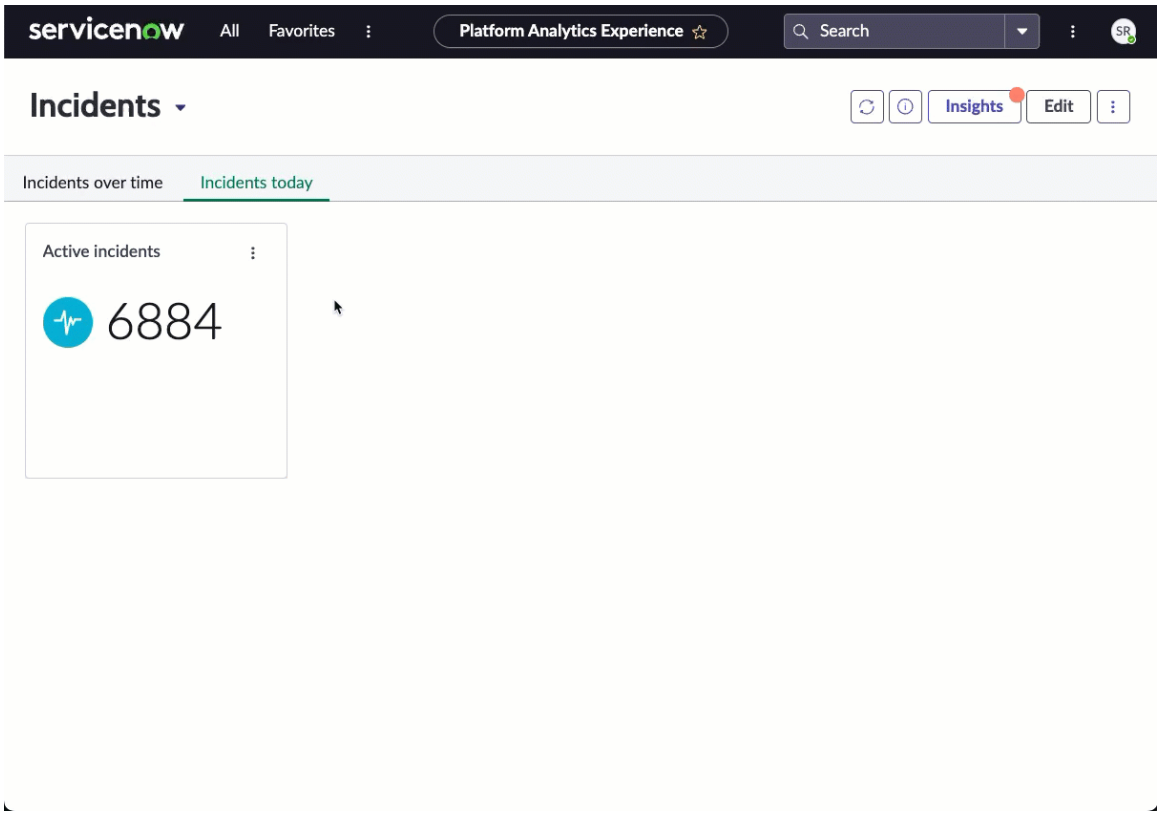
Note: For an overview of the data sources that are available for data visualizations, see Data sources for data visualizations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table data visualizations

Go to data chart interactions from table data visualizations open an associated list of table records. When the system property *com.glide.par.pae.drilldown_to_core_ui* is true, the list is a Core UI list. When it is false, the list is a Platform Analytics list. If you are drilling down from a List, you open a table record either in Core UI or in Platform Analytics, again depending on *com.glide.par.pae.drilldown_to_core_ui*. For more information, see Data Visualization properties.

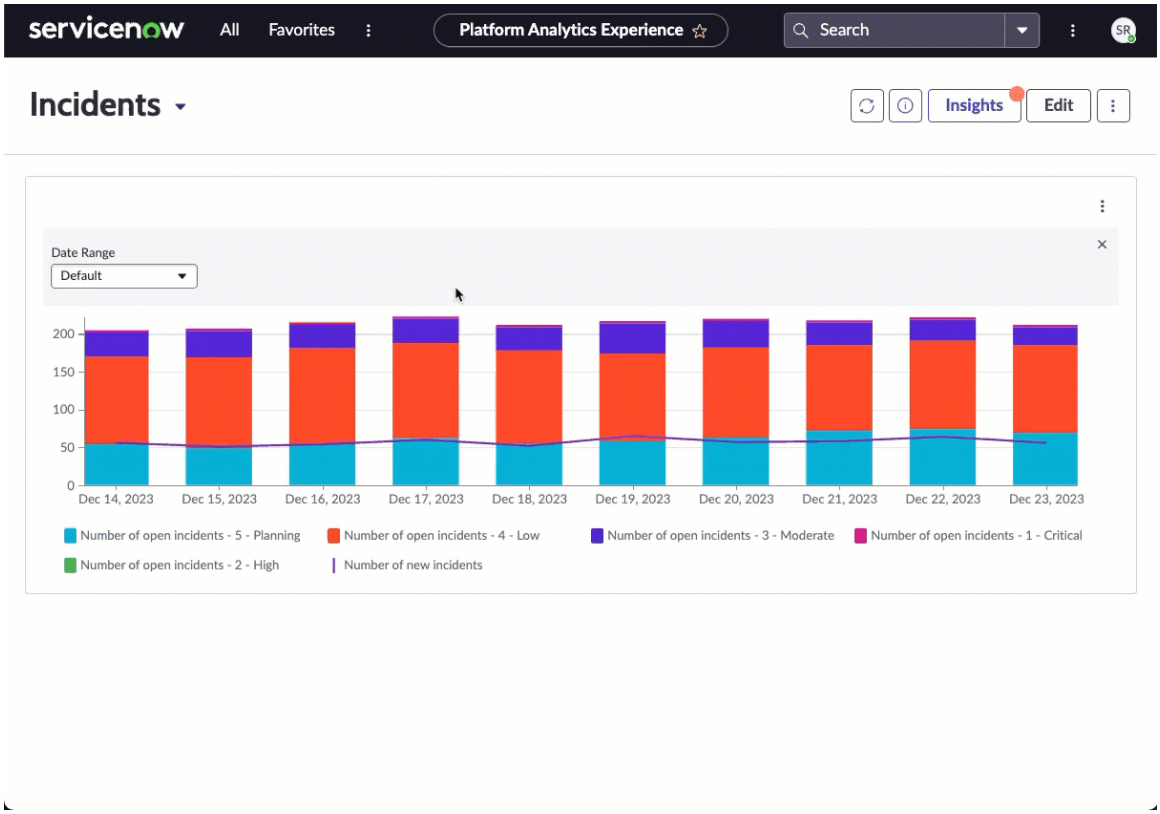
Note: This system property does not apply to data visualizations in technical dashboards or other UIB pages, which use manually configured event handlers instead of chart interactions.



Indicator visualizations

Go to data chart interactions from indicator visualizations open the associated KPI Details page. For more information, see KPI Details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Usage Insights visualizations

Go to data chart interactions from Usage Insights visualizations opens an overview page for the individual application in the visualization. The overview opens on the Data Foundations view that matches the data visualization: event, session, user, or page data. For more information, see Navigating the Usage Insights application.

Health Log Analytics visualizations

Go to data chart interactions from Health Log Analytics data visualizations open the log viewer. For more information, see Health Log Analytics.

Note: You cannot create or edit data visualizations for Health Log Analytics from the Platform Analytics experience, but only from the UI Builder.

MetricBase visualizations

Go to data chart interactions from MetricBase visualizations open the Metrics Explorer. For more information, see MetricBase.

Important: **Go to data** chart interactions for MetricBase require the Metric Explorer for Service Operations (sn_sow_metric_exp) plugin.

Questions in data visualizations

You can group or filter table data in data visualizations by questions. The table must support questions.

Creating data visualizations grouped by questions is helpful to:

- Determine whether questions that customers ask are getting answered.
- Gain more information from customers during the request process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The data source must be a non-service catalog table that has questions associated with it. You can filter or group by questions on a table extended from the Task [task] table, for example the Incident [incident] or Problem [problem] tables, or from the Record Producer table [sc_cat_item_producer].

You can use questions when you create custom conditions to filter the data source. You can also use questions in any Group by or Alternative group by fields that the type of data visualization supports.

Note:

If there is a Record Producer associated with the table, variables defined in that Record Producer are available as Questions in the condition builder for filtering the data source, except for the following question types:

- Label
- Rich text label
- Macro
- Container

You cannot group by Record Producer variables. For more information, see Record Producer.

Use questions in data visualizations

In visualizations of data from the Task [task] hierarchy of tables, you can use questions defined for the table to filter or group the data.

Before you begin

Role required: viz_creator or higher, including itil. To see the data, you need a role permitted by a report_view access control on the data source table

About this task

Use a question as a filter, a group by, or an alternative group by.

Note: Box, and Trendbox visualizations can't use questions as a group by or alternative group by. Single Score, Calendar Report, and Geomap visualizations don't support grouping on any fields. Pivot Table visualizations can group by questions only as columns or rows.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations** and open the visualization to add the question to.
2. Select one of the following options.

Option	Description
Use the question as a filter	Add or edit a data source and select **Add custom conditions**. If any custom conditions have already been defined, select **+ Add**. Then select **Questions** at the bottom of the field list.
Add the question as a group by	Under **Group by**, select **+ Add**. Then select **Questions** at the bottom of the field list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

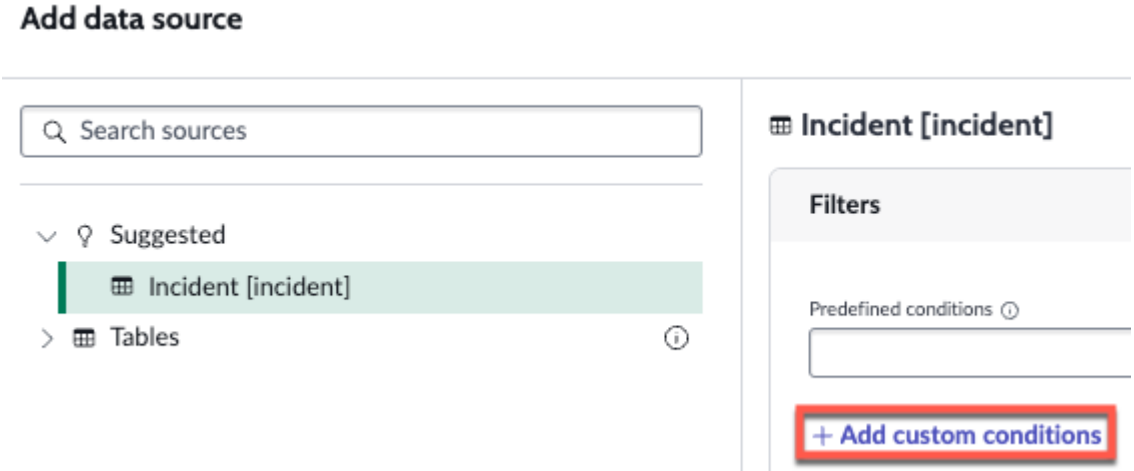
Option	Description
Add the question as an alternative group by	Under **Group by**, select **Add alternative group by**. Then select **Questions**.
Add the question as a column or row in a pivot table	Under **Group by**, select **+Add** for Columns or Rows, then select **Questions** at the bottom of the field list. **Note:** ○ If you create the report with the question as the main Group By, the question behaves as an inner join. ○ If you create the report with a regular field for primary grouping, and a secondary grouping on the question, the question works as an outer join.

The available questions appear. Not all questions that are available as group by values are also available as alternative group by values.

3. Select the question you want.
4. If you are using the question in a custom condition, select the operator and the value.
5. Select **Apply**.

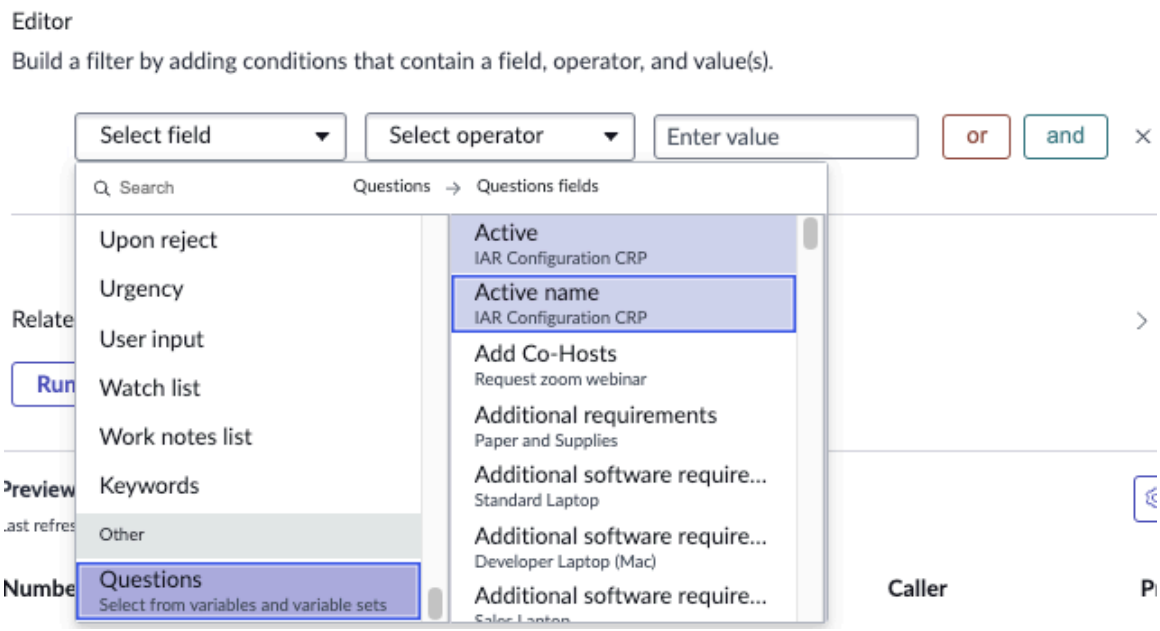
Example: Question as a filter

Here you have opened the Edit data source page for a data visualization. No custom conditions have been defined for this data visualization, so you select **Add custom condition**.



Next, you scroll down the Select field list to question, select that, and select a question.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

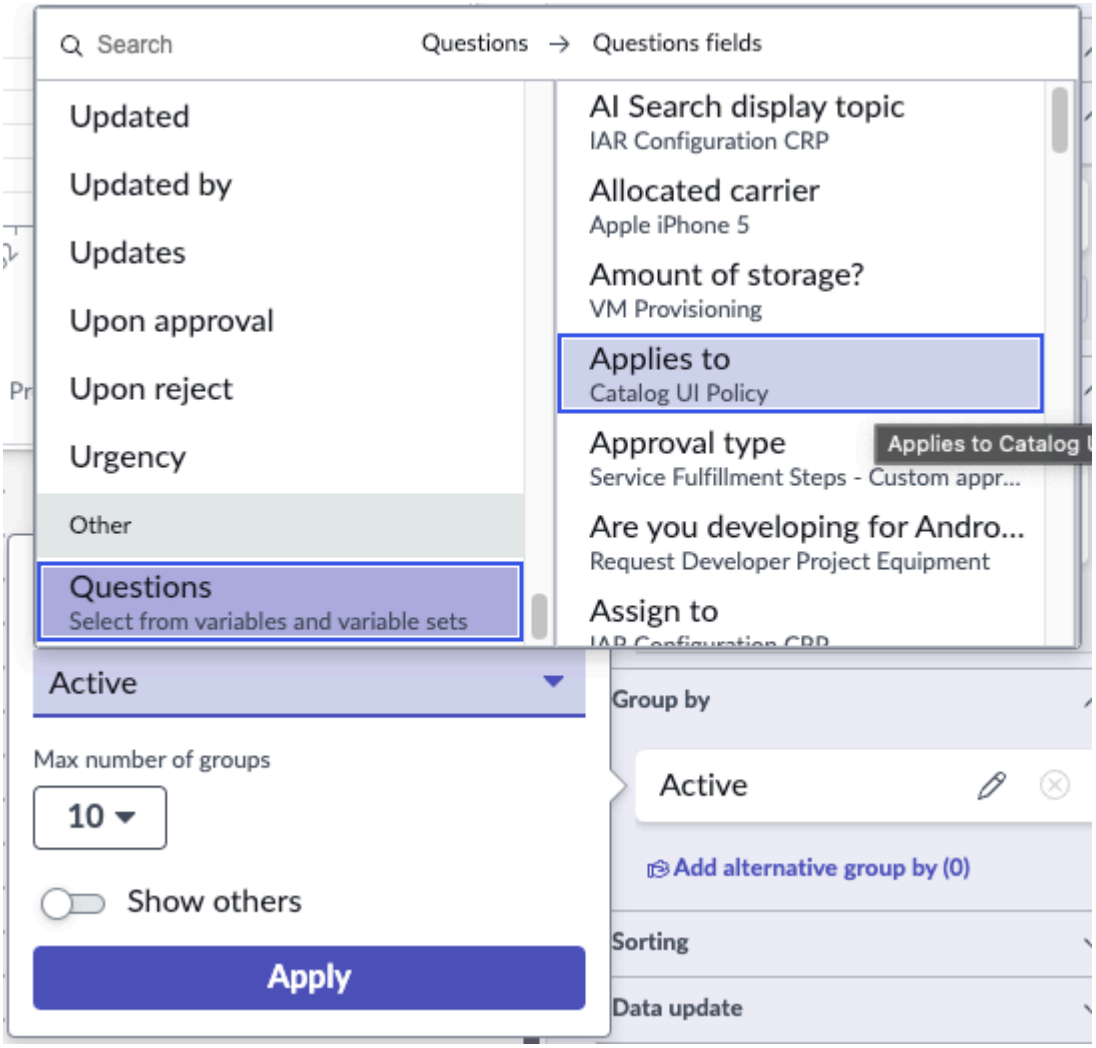


Finally you select the operator and the value, such as Is | A4, and select **Apply**.

Example: Question as a group by

In this case, you have a horizontal bar visualization of data in the Incident table. In the Group by section, you edit the group by. You scroll to the bottom of the list of fields and replace the Active field with questions, and select your question.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you want to add a question as a row or column on a Pivot Table, the experience is almost identical.

Example: Question as an alternative group by

You want a different question as an alternative group by. You select **Add alternative group by** and scroll to **Questions**. Unlike other menus, its position is alphabetical instead of at the bottom. You expand **Questions**, and the list changes to a selection of questions. Not all questions that were available as a group by are available as an alternative group by. Anyway, you select some questions and press **Apply all**.

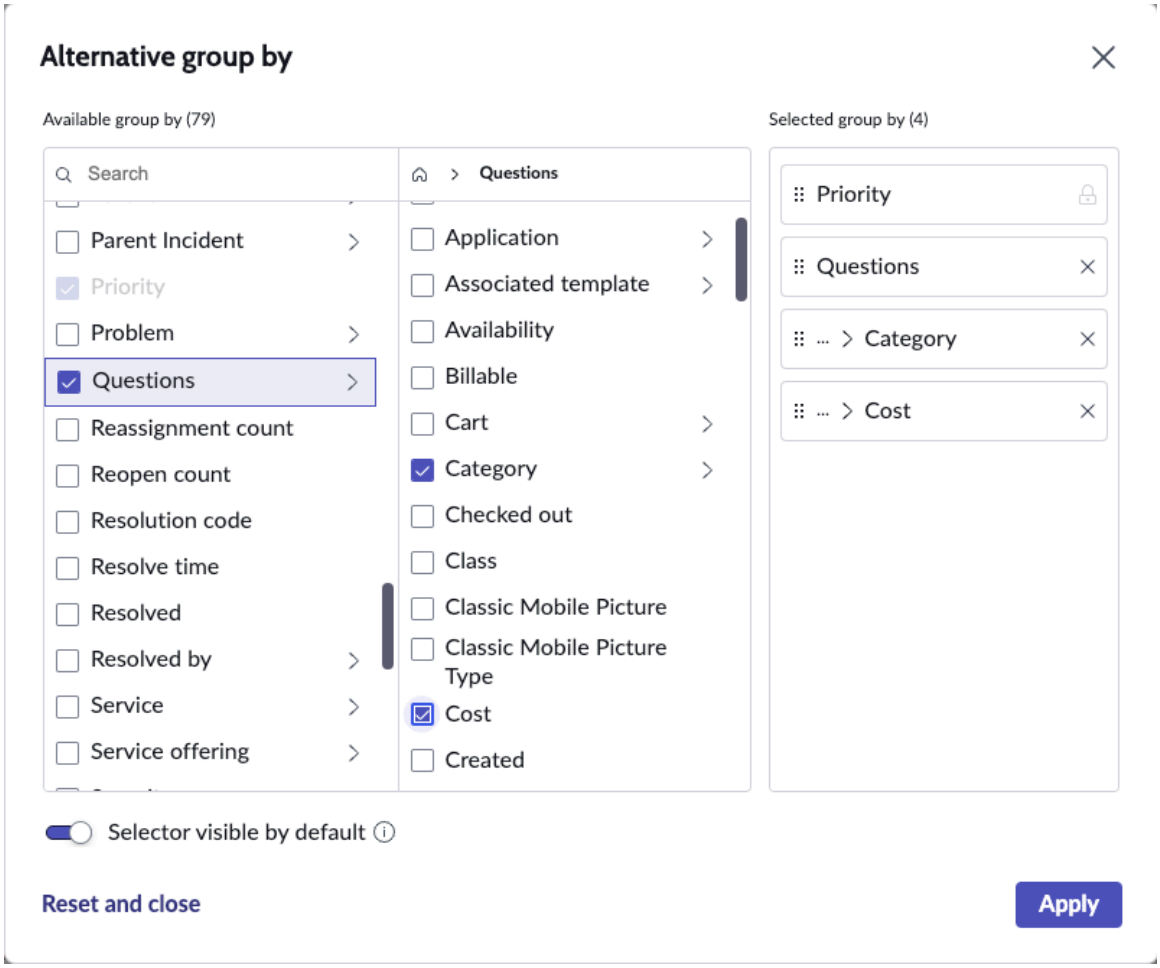
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Service catalog variables in data visualizations

Group or filter data on visualizations by a variable on a selected service catalog item.

Reporting on variables can be helpful in determining if certain catalog items are useful on an instance, for example.

Additionally, you can create filters on the same variable. For example, if a specific mobile phone item has a storage variable, you can create a report that only shows those phones with 32 GB of storage.

Use service catalog variables in data visualizations

In data visualizations based on service catalog data, stack and group by variables, use variables as columns in lists, and as columns and rows in multilevel pivot tables.

Before you begin

Role required: viz_creator or higher, including itil. To see the data, you need a role permitted by a report_view access control on the data source table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Users with a role other than viz_admin can use service catalog variables if as admin you add their role to the access control lists (ACLs) for the following tables: Options [sc_item_option], Variable Ownership [sc_item_option_mtom], and Variables [item_option_new].
- The data source for the visualization must be based on the Requested Items table [sc_req_item] or the Catalog Task table [sc_task]. Using other types of variables causes an error when generating the data visualization.
- The Oracle Database CLOB field doesn't have the functionality to retrieve the variables data in data visualizations. For a column string field of less than 4000 bytes, you can change the column type to varchar2. To compare the CLOB columns of a smaller size, use the to_char() function. For a larger size CLOB, you must get a substring for comparison using the dbms_lob.substr functions.

About this task

Use a variable as a filter, a group by, or an alternative group by.

Note: Box and Trendbox visualizations can't use service catalog variables as a group by or alternative group by. Single Score, Calendar Report, and Geomap visualizations don't support grouping on any fields. Pivot Table visualizations can group by variables only as columns or rows.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Data Visualizations** and open the visualization to add the variable to.
2. Select one of the following options.

Option	Description
Use the variable as a filter	Add or edit a data source and select **Add cus tom conditions**. If any custom conditions have already been defined, select **+ Add**. Then select **Variables** at the bottom of the field list.
Add the variable as a group by	Under **Group by**, select **+ Add**. Then select **Variables** at the bottom of the field list.
Add the variable as an alternative group by	Under **Group by**, select **Add alternative group by**. Then select **Variables** at the bot tom of the field list. A viewer can choose one of these variables at runtime, as described in Select a group-by value in a data visualization as a viewer.
Add the variable as a column or row in a piv ot table	Under **Group by**, select **+Add** for Columns or Rows, then select **Variables** at the bottom of the field list.

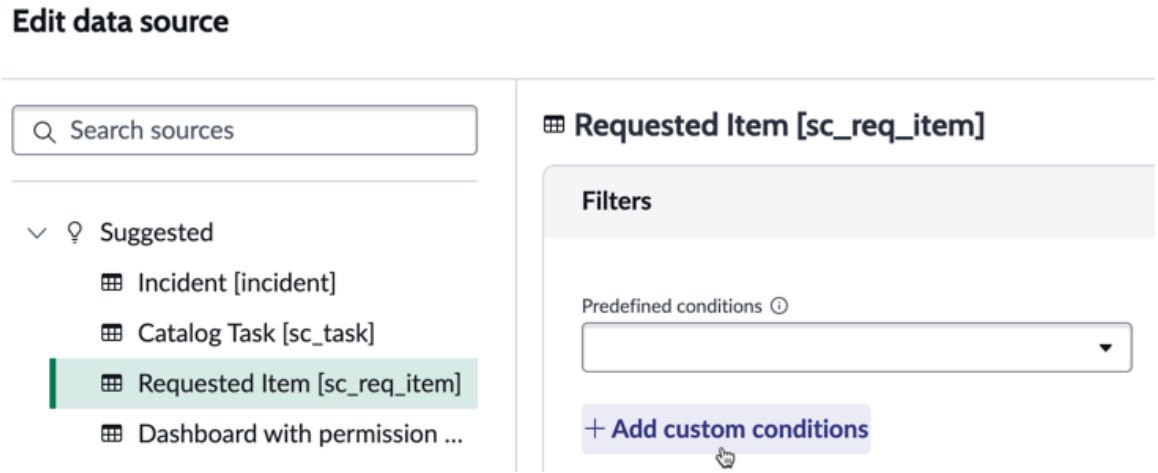
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Note: ○ If you create the report with the vari able as the main Group By, the vari able behaves as an inner join. ○ If you create the report with a regular field for primary grouping, and a sec ondary grouping on the variable, the variable works as an outer join.

3. Scroll to the end of the list of fields and select **Variables**.
   The available variables appear. Not all variables that are available as group by values are also available as alternative group by values.
4. Select the variable you want.
5. If you are using the service catalog variable as a filter, select the operator and the value.
6. Select **Apply**.

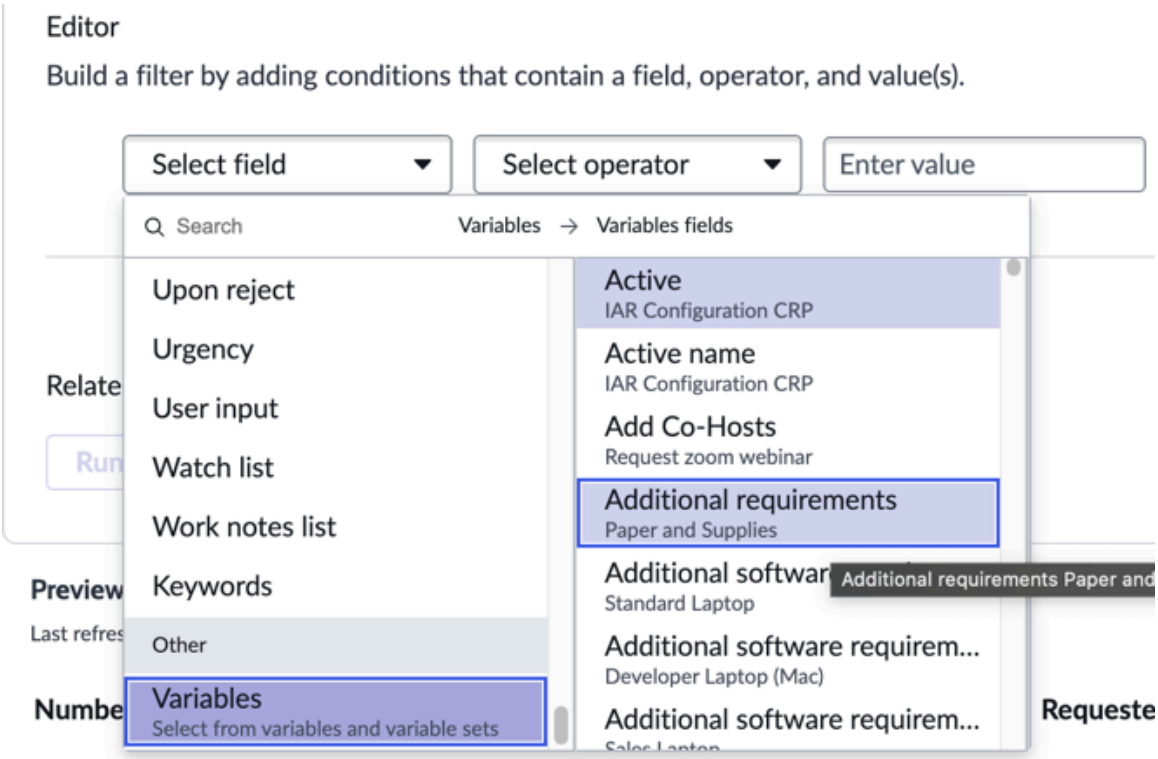
Example: Variable as a filter

Here you have opened the Edit data source page for a data visualization. No custom conditions have been defined for this data visualization, so you select **Add custom condition**.



Next, you scroll down the Select field list to Variable, select that, and select a variable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

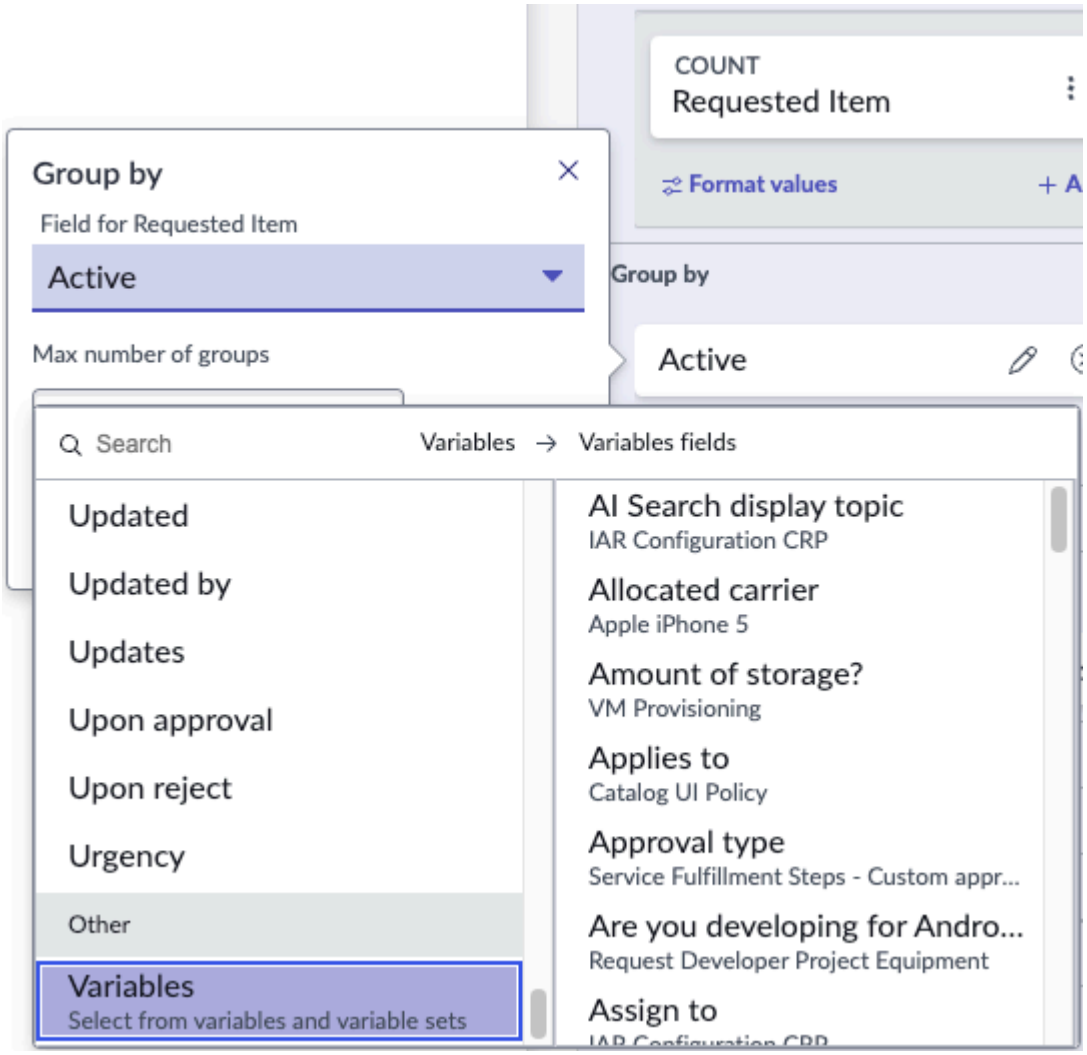


Finally you select the operator and the value, such as Is | A4, and select **Apply**.

Example: Variable as a group by

In this case, you have a horizontal bar visualization of data in the Requested Items table. In the Group by section, you edit the group by. You scroll to the bottom of the list of fields and replace the Active field with Variables, and select your variable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you want to add a service catalog variable as a row or column on a Pivot Table, the experience is almost identical.

Example: Variable as an alternative group by

You want a different service catalog variable as an alternative group by. You select **Add alternative group by** and scroll to the bottom. You expand **Variables**, and the list changes to a selection of variables. Not all variables that were available as a group by are available as an alternative group by. Anyway, you select some variables and press **Apply all**.

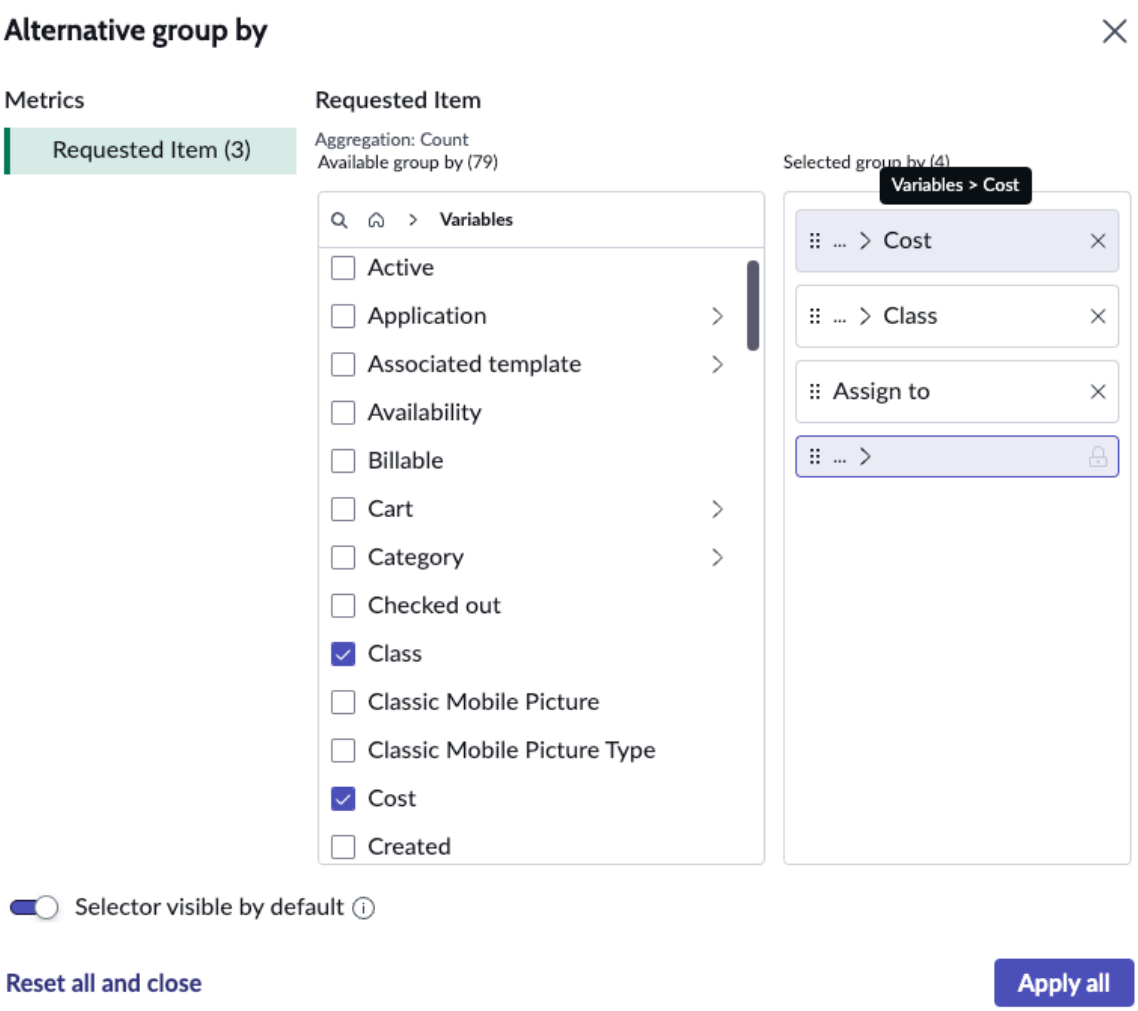
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



System tables in data visualizations

System tables are excluded from data visualizations by default. However, you can exempt system tables from the prohibition. Some system tables are exempt from the restriction by default. Be very careful when creating data visualizations on these system tables.

Prohibited system tables include, but are not limited to:

- Log [`syslog`]
- Transaction Log [`syslog_transaction`]
- Attachment [`sys_attachment`]
- Email [`sys_email`]

If you must report on a system table, you can add it to the *`glide.ui.permitted_tables`* system property. Several system tables are listed in this property by default. Only admin users can create reports on the tables permitted in this property.

Use extreme caution when creating a report or a data visualization on any system table. Consider the Audit [sys_audit] table, which is allowed in reports and data visualizations by default. Typically, this table is the largest table in any instance. It is not unusual for the Audit table, in even a mid-sized instance, to be several gigabytes. In a large installation, this table can be 50GB or more.

When you access a table like Audit programmatically, you know what your query pattern is going to look like, so you can add appropriate data indexes to match your queries. This means that

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

when you bring up, for example, the history of an incident, the database can use an index to efficiently pull back the few dozen rows it needs for that query.

With reports and data visualizations, however, you cannot predict what your query pattern is going to look like. Maybe you want to group by `fieldname` or sort by `oldvalue`. Thus, your queries might not be indexed queries. You can end up asking the database to table scan a multiple gigabyte file, which is bad for these reasons:

- It is slow, so your report or data visualization will take an unacceptably long time to run.
- While the database is scanning your table, your instance will slow down or even become unavailable because other queries cannot get the resources they need.

Colors in data visualizations

Depending on the data visualization, you can select different colors: a fixed color for each Group by element, a predefined color palette, a spectrum spanning high and low values, or a single color.

By default, the data visualization uses the colors that are set in the UX Theme [sys_ux_theme] used by the instance. These colors in turn are defined in the UX theme properties [sys_ux_theme_properties] table. Themes include the following colors:

- A default single color
- A default color palette
- A default spectrum of shades for a color range

You can create a theme and select it either for a specific user or set it as the default theme for an instance. For more information, see Working with themes in Next Experience.

In a specific visualization, you can override the colors set in the UX theme. Set colors in the Colors subsection of the Presentation section in the visualization's configuration panel. The available options are described in the "Create a..." topic for each visualization type.

Selecting a single value color or a color per metric

You can select a single value color for any visualizations except gauge and pie/donut. When you select a single color, you are at first offered the default color. You can choose a color instead in the **Set value color** field. Interacting with that field opens a selector where you can choose a color by color icon or from a list. The list also shows you an icon for each entry. The selector also has a search field. Entering a value into that search field shows you a list of colors filtered by the search term, which can be plain language or part of a hexadecimal code.

If the data visualization shows more than one metric, you can select a single color for each metric.

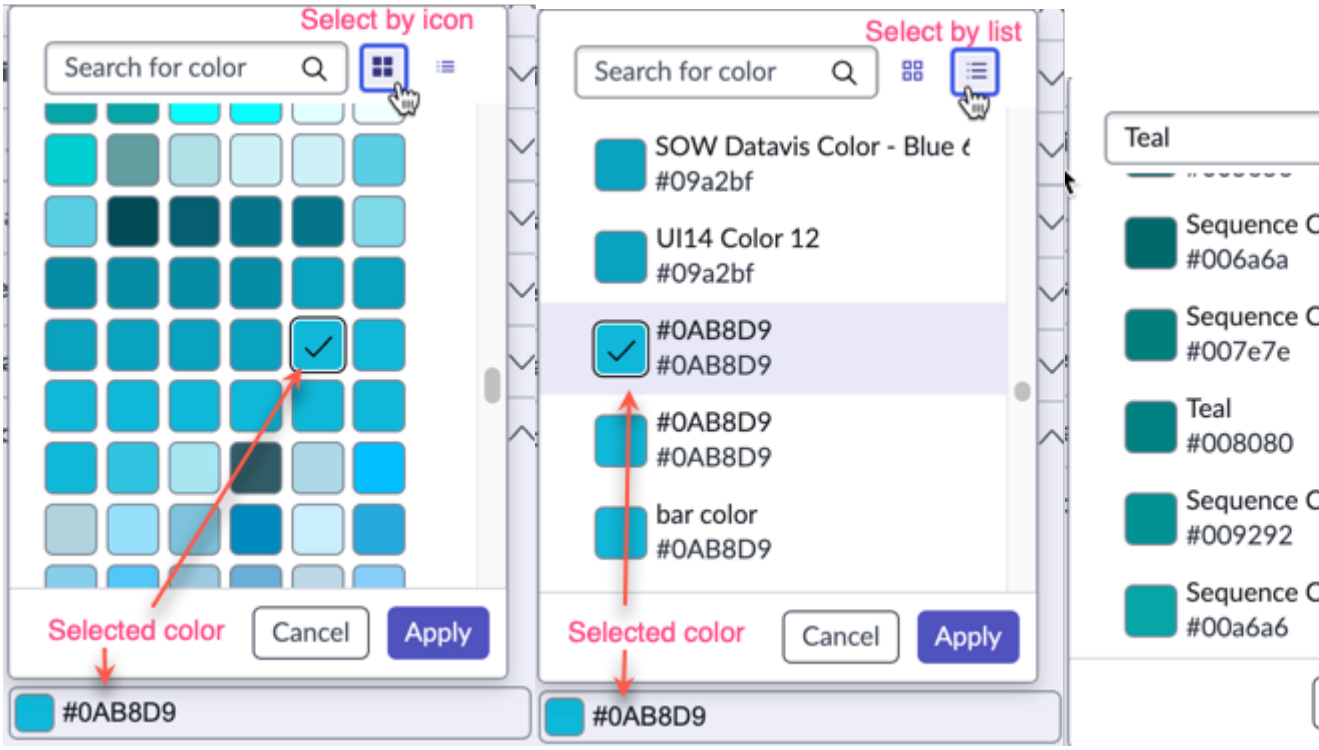
Color selector in icon and list modes



Color rules for pivot table, dial, and single score visualizations

Single score, dial, and pivot table visualizations can use a single color that is set dynamically when the data meets certain conditions. For example, you can create a rule to show the score in green for values under 25. For more information, see Create coloring rules for data visualizations.

Color options for Group by values from table data sources

If you group by a value in a visualization based on a Table data source, you have the following two color range options:

Color palette

A sequence of colors applied to the Group by elements. The colors repeat in order from highest value to lowest. Use color palettes in data visualizations when you want the colors to denote order. Visualizations that use the same palette use the same colors regardless of what data they're showing.

Color palettes are the default coloring pattern in a data visualization where a Group by value is defined. If you don't specify a color palette, the color palette from the UX theme is used.

Non-default color palettes are defined in the Chart color scheme [pa_chart_color_schemes] table. The admin or pa_admin role is required to create a color palette. For more information, see Create a color scheme.

In the following example, you see two data visualizations that show incidents. One visualization shows incidents grouped by Priority, and the other visualization shows incidents grouped by Category. Both visualizations use the Blues dark to light (6) color palette, which uses six shades of blue. Both visualizations show the same colors for the same ranking of values, although the values are different.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Color palette: Blues light to dark

Fixed element colors

Fixed element colors always apply the same color to the same grouping or stacking value. Different grouping and stacking values in different visualizations have different colors. Use fixed element colors if, for example, you always want an element like Priority > 1 - Critical to have the same color.

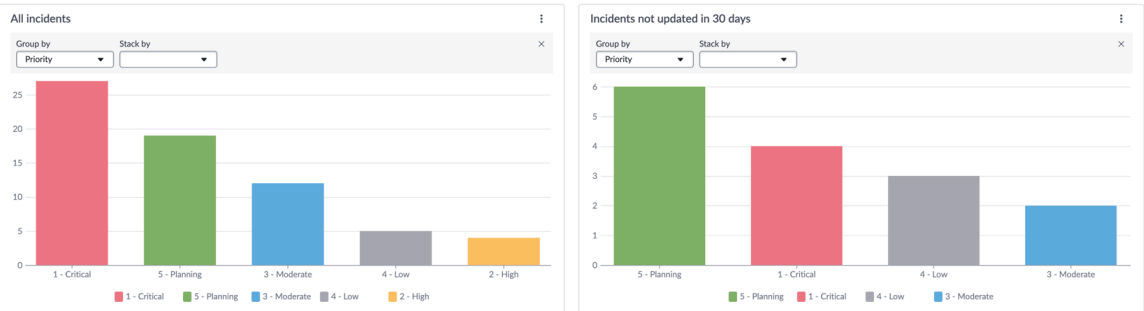
Important:

Fixed element colors are only available for visualizations of Table data sources.

When an element appears for the first time in a data visualization that is using fixed element colors, a color is defined for that element. Thereafter that element has the same color in any data visualization that shows it. The colors are stored for each element in the Chart Colors [sys_report_chart_color] table. To change the color assigned to an element, you need the admin or report_admin role. For more information, see Define colors for data categories.

In the following example, you see two data visualizations that show incidents that are grouped by the same field, Priority. Both visualizations use fixed element colors. The same values of Priority have the same color despite being in a different order.

Fixed element colors: Same elements, different order



In the following example, the data visualizations are grouped by different fields and use fixed element colors. The bars are in different colors, because each element has a unique color.

Create coloring rules for data visualizations

Configure rules for how numerical values are displayed, to easily highlight why a value is important.

Before you begin

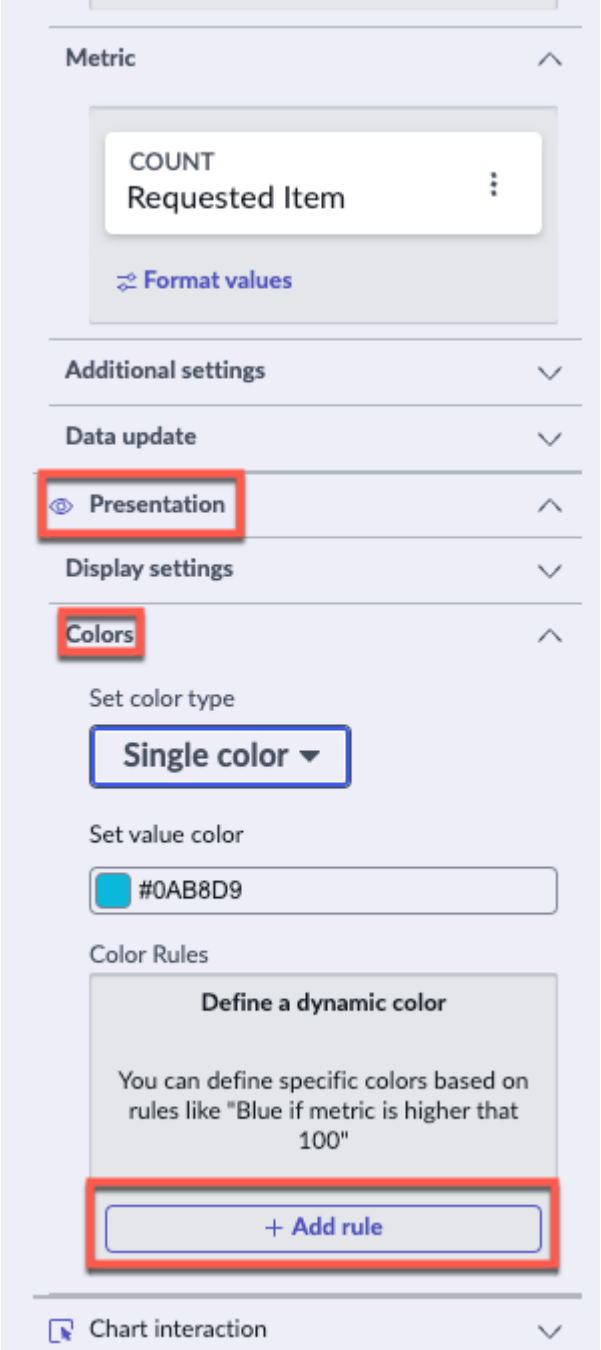
Role required: Any role, and editing rights to the visualization

This task is part of configuring the display settings of some data visualizations.

Procedure

1. Open the data visualization for editing, either in the dashboard in-line editor or the Visualization Designer.
   For more information, see Edit a data visualization in an inline dashboard or Edit a data visualization in the Visualization Designer.
2. In the **Presentation** area of the configuration panel, open the **Colors** section.
3. Choose the **Single Color** type and select **Add rule**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Fill in the fields on the form.

Color Rule fields

Field	Description
Operator	The operator used when evaluating values, such as **greater than** or **between**. For example, to style values of less than 5, select **lower than** and specify a **Value 1** value of 5.
Value 1	The number to evaluate cell values against. When the **Operator** value is **between**, enter the lower value in the **Value 1** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: ○ The color rule is applied to the aggregated values. ○ When creating rules based on a duration value, specify the duration in seconds.
Value 2	The maximum value to match this rule. This field only appears when the **Operator** value is **between**.
Font color	The font color to apply to values that match this rule.
Rule order (Optional)	A numerical value that determines the order in which rules apply. Rules are evaluated from lowest value to highest. For example, you have one rule applies the color blue to the value 7, and a second rule that applies the color red to values between 1 and 10. If you want the 7 to appear blue, the **Rule order** value for the first rule should be higher so that the second rule does not override it. If you do not specify a rule order, coloring rules are applied in the order in which they were created.

5. Select **Apply** to save the rule.
   Create a new rule or return to the Visualization Designer.

Domain separation and data visualizations

Domain separation is supported for data visualizations and relates to the data visualizations themselves and which data is visible. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An Admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Overview of domain separation

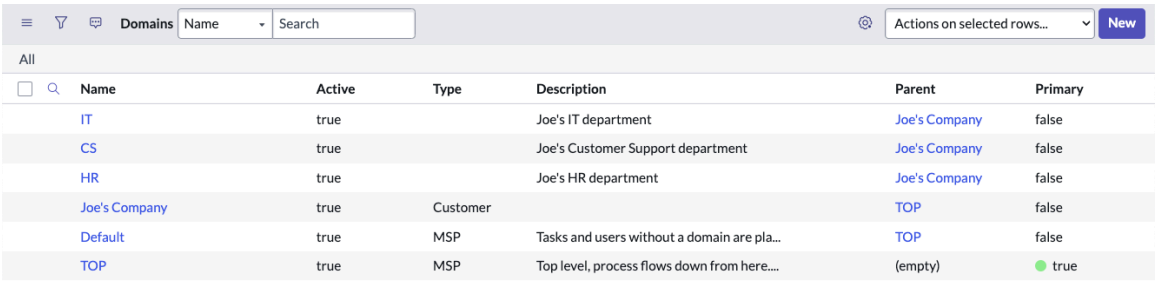
To activate the domain separation plugin, see Request domain separation.

How domain separation works in data visualizations

Separated data includes data visualization designs and data visualization content. A data visualization defined at the global level is visible to users in all child domains.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Data visualizations created in the TOP domain are visible to users in the Joe's Company domain and in the HR, CS, and IT child domains of Joe's Company.
- Data visualizations created in either the IT, CS, or HR child domains aren't visible to users in the other child domains, but they are visible to users in the parent Joe's Company domain.
- Data visualizations created in the parent (Joe's Company) domain are available only to users in that domain, but not to users in the child domains.



Name	Active	Type	Description	Parent	Primary
IT	true		Joe's IT department	Joe's Company	false
CS	true		Joe's Customer Support department	Joe's Company	false
HR	true		Joe's HR department	Joe's Company	false
Joe's Company	true	Customer		TOP	false
Default	true	MSP	Tasks and users without a domain are pla...	TOP	false
TOP	true	MSP	Top level, process flows down from here....	(empty)	true

If you create a data visualization in one domain and copy it to another, the data visualization structure remains the same, but the data visualization data is adjusted for the domain. For example, a data visualization with data from the Incident table where Active=true shows all active incidents to a user in the parent global domain, but only IT incidents to a user in the IT domain.

Data visualization reference

Reference topics provide information on roles, variables, and other information for working with data visualizations.

Data sources for data visualizations

Each workspace data visualization references a specific data source.

Data source	Available in	Description
Table	Base system	A Table data source is a collection of database records that together constitute the current state of your data. The rows of the table correspond to records and the columns correspond to fields. You often choose both table and field, or you group data by fields, when you configure a data visualization. Configured report sources appear in the **Predefined conditions** list when you choose to filter table data.
Indicator	Base system	An indicator, also called a key performance indicator (KPI), is a record of the changes to your table data over a period of time. You use indicators to determine trends and forecast the future. Indicators apply an aggregation and conditions to the data. For example, the indicator Number of open incidents applies the Count aggregation to the Incident table, resulting in a number of incidents. It also applies the conditions that the State of the incidents must not be Closed or Canceled, and the Active field must be True. Indicators often have breakdowns applied. A breakdown is a qualitative property for filtering the indicator scores. For example, for incident data, the priority, category,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data source	Available in	Description
		and assignment group for the incident are all commonly applied breakdowns. For more information, see Performance Analytics indicators.
Usage Insights	Activated by default. However, to include Usage Insights data sources in your visualizations, you need the Usage Insights in PAR Integration application from the ServiceNow® Store.	The ServiceNow® Usage Insights application provides dashboard views for monitoring usage analytics of your web applications as well as Virtual Agent, ServiceNow mobile, and Service Portal applications. Visualize metrics and interactions to better understand the user experience, and create more intuitive journeys for your users. For more general information about Usage Insights, see User Experience Analytics. For more information specific to data visualizations, see User Experience Analytics data sources for data visualizations.
MetricBase	Requires a separate subscription and must be activated by ServiceNow personnel.	The MetricBase application stores time-series data, which is data that is sampled at regular intervals. You can graph the stored data or use it with triggers to execute Flow Designer flows. MetricBase helps developers working with IoT-based applications that monitor or act on large amounts of machine-generated data. For more information, see MetricBase.
Workflow Data Fabric	Base system	Workflow Data Fabric Hub provides a view where you can browse data sources, establish connections, and create data fabric tables that provide access to data from external sources. Workflow Data Fabric tables are found in the same list as other tables when you create a visualization. For more information, see Workflow Data Fabric.
Health Log Analytics	Requires a separate subscription and must be activated by ServiceNow personnel.	The Health Log Analytics application helps prevent IT issues before your users are affected. It helps you identify the root cause of an issue by enabling you to triage related logs and analyze the raw data. For more information, see Health Log Analytics. **Note:** You can create and edit data visualizations for Health Log Analytics only in the UI Builder, not in the Platform Analytics Visualization Designer or in dashboards.

Indicator management and Performance Analytics

Indicator data sources are created and managed through the architecture of the Performance Analytics application. This functionality is now part of Platform Analytics administration.

Long-term users of the ServiceNow AI Platform® may be familiar with Performance Analytics. Performance Analytics is an application for creating indicators, or KPIs. It includes the back end of indicators, breakdowns, indicator and breakdown sources, and scheduled data collection jobs. It also included a Core UI front end of PA Widgets that went on responsive dashboards, and the Analytics Hub for exploring indicators in depth.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In Platform Analytics, the old Performance Analytics front end is replaced. Data Visualizations, which can apply to many data sources, replace both PA Widgets and reports. They can go either on a new type of dashboard or on UIB pages. KPI Details replaces the Analytics Hub.

If you are a new customer, or if you have fully migrated to Platform Analytics, the back end functions of Performance Analytics are grouped under Platform Analytics administration. However, the following material that refers to Performance Analytics continues to apply, at least regarding the back end:

- Training material
- ServiceNow University courses
- ServiceNow Community posts
- Product documentation

If you have upgraded your instance but not yet fully migrated to Platform Analytics, you continue to have Performance Analytics as a navigation area on your instance. Also, administrators who maintain Service Portal pages with Performance Analytics content continue to have access to the Core UI Performance Analytics front end objects on those pages.

Data Visualization roles

There are several roles associated with the Visualization Designer and Visualization Library. Roles limit what users can do with visualizations.

Roles

Any role

Users with any role can create visualizations in dashboards that they have editing rights to. They need access to the data that they wish to display. They can also add visualizations from the library to their dashboards if those visualizations have been shared with them. They can also bookmark or export visualizations that have been shared with them from the Visualization Designer. They can share a visualization with other users and groups if it was shared with them with sharing rights. Specific roles are needed to create or edit visualizations in the Visualization Designer.

viz_creator, itil, report_user

Creates visualizations in the Visualization Designer that are then available throughout the organization in the Data Visualizations library. Cannot delete visualizations that have been shared with them. Can edit visualizations in the library only if they created them or if the visualization was shared with them with editing rights. Can share visualizations only with groups and users.

viz_admin, platform_analytics_admin

Creates visualizations in the Visualization Designer that are then available throughout the organization in the Data Visualizations library. Edits, deletes, shares, exports, and schedules the export of any visualization. Can share visualizations with roles, not only users or groups. Can schedule export and email of any data visualization on the instance.

report_admin, admin

Has the rights of a viz_admin and can also manage all Core UI reports, including reports on the Service Portal.

par_scheduler

Schedules export and email distribution of any visualizations that they can access. Users with this role must also have another role that grants permission to create, edit, and share visualizations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

sn_par_sche_export.par_scheduler_admin

Schedules export and email of any data visualization on the instance.

Data visualization roles

Use case	Required role
Create a data visualization	Anyone with access to data can create a visualization of that data on a dashboard that they own. Users with the viz_creator role can create a visualization in the Visualization Designer. If you create a visualization in the Visualization Designer, it is saved to the library.
Edit a data visualization	You can edit any visualization that you created or that was shared with you with editing rights, if it is not in the library. If it is in the library, you also need the viz_creator role. Edit any visualization on the instance with viz_admin or higher.
Add a visualization from the library to a dashboard	Any role, if the visualization has been shared with you. viz_creator to add any visualization from the library.
Add a visualization that was created in a dashboard to the library	viz_creator or higher and the right to edit the dashboard
Unlink a data visualization on a dashboard from the library, creating a version that is local to that dashboard.	Any role, if you can edit the dashboard containing the visualization
Duplicate a visualization in the Visualization Designer	viz_creator or higher
Share a visualization with users or groups	Any role to share a data visualization that you created or that was shared with you with sharing rights. With the viz_admin role or higher, you can share any data visualization on the instance. When you share a data visualization, you can pass along the rights to share that visualization further. You also decide whether to share with editing rights or only viewing rights. If a data visualization has been shared with you with sharing and editing rights, you can also pass along editing rights.
Share a data visualization with roles	viz_admin or higher
Export a visualization	Any role, if you can view the visualization in the Visualization Designer.
Schedule the export of a data visualization	par_scheduler or higher to schedule the export of a data visualization that you can edit.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data visualization roles (continued)

Use case	Required role
	viz_admin or higher to schedule the export of any data visualization on the instance.
Delete the scheduled export of a data visualization	sn_par_sche_export.par_scheduler_admin (contained in viz_admin)
Delete a visualization	Any role, to delete a data visualization that you created. viz_admin or higher to delete any data visualization on the instance.
Control data source availability by role	admin
Configure visualization interactions	Any role if you have the right to edit the data visualization. The viewer needs the right to view any data they drill down to.
Use service catalog variables in data visualizations	viz_creator or higher
Create coloring rules for data visualizations	Any role if you have the right to edit the data visualization.

Data Visualization properties

Several properties that limit what can be displayed in data visualizations.

These Platform Analytics data visualization properties are available in the System Properties [sys_properties] table.

Note: To open the System Properties table, enter `sys_properties.list.do` in the navigation filter.

Properties for Data visualizations

Property	Description
com.glide.par.pae.drilldown_to_core_ui	Applies only to Platform Analytics experience: When true, **Go to data** chart interactions for visualizations of tables open the Core UI list of table records. Redirections in general that open lists or visualizations open Core UI lists and visualizations. When false, **Go to data** chart interactions for visualizations of tables open the Platform Analytics list of table records. Redirections in general that open lists or charts open Platform Analytics lists and charts. For more information, see Chart interactions in a data visualization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for Data visualizations (continued)

Property	Description
	• Type: true | false (Boolean) • Default value: true • Location: System Property [sys_properties] table
par_vis_config.data_source.can_select_indicator	Specifies roles (comma-separated) which can select indicators as data sources from the Data Visualization configuration panel. If empty, all users can select the indicator sources that they have access to. • Type: string • Default value: empty • Location: System Property [sys_properties] table
par_vis_config.live_refresh_rate_min_value	Specifies the minimum interval in seconds for the Live refresh rate setting in the Data Visualization configuration. If set, a user can still set an empty or 0 value. • Type: integer • Default value: 30 (seconds) • Location: System Property [sys_properties] table
par_viz.table_data.max_data_points	Maximum number of data points for data visualizations based on table sources. • Type: integer • Default value: 10000 • Location: System Property [sys_properties] table
par_viz.table_data.max_groups	Maximum setting recognized for the maxNumberOfGroups property of data visualizations that have a Group by. Applies only to table data. • Type: integer • Default value: 50 • Location: System Property [sys_properties] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data visualization tables

The following tables relate to Platform Analytics data visualizations and can be accessed through scripts.

Table	Description
par_component	Contains all data visualizations in the visualization library and all filters in the filter library. Extends sys_metadata.
par_component_permission	Contains the role, group, and user permissions for all data visualizations and filters in their respective libraries.
par_export	Lists all scheduled dashboard and data visualization exports. Extends sys_metadata.
par_export_job	Stores details of every attempt to export a dashboard or data visualization.
par_export_visualization	Stores the export details of all scheduled data visualization exports. Extends par_export.
par_metadata	Stores the metadata for each data visualization type.
par_notification	Lists email notification definitions of scheduled dashboard and data visualization exports. Extends sys_metadata.
par_notification_email	Stores metadata of scheduled dashboard and data visualization export emails, including subject and message. Extends par_notification.
par_notification_email_recipients	Stores groups and users who receive a notification email with a scheduled dashboard and data visualization export. Contains the non-metadata information for the emails.
par_visualization	Contains all data visualizations in the visualization library. Extends par_component.
par_visualization_permission	Contains the role, group, and user permissions for all data visualizations in the visualization library. Extends par_component_permission.

Filters in Platform Analytics

Filter lists and data visualizations on an inline or technical dashboard. Filter by possible data value, by whether the value is true or false, or by date.

https://player.vimeo.com/video/1107575376?h=196e6f69ab&badge=0&autopause=0&player_id=0&app_id=58479

The preceding video illustrates how to create a filter, in this case a multi-select filter for table data.

You can create a filter for either an inline dashboard or a technical dashboard. Inline dashboards are those dashboards created and populated in the inline dashboard editor. Technical

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

dashboards are populated in the UI Builder and are more flexible but require considerably more expertise. For example, on a technical dashboard, you have to create custom event handlers for filters to apply to lists or data visualizations.

Note: When you enable Usage Insights filters within Platform Analytics dashboards, they operate as global filters. This means their effect is comprehensive, impacting all visualizations across the entire dashboard, not just a single visualization.

Note: The default maximum number of custom filters you can save for user experience analytics application is 500. You can modify the number of custom filters in the uxa.query_builder.max_num_of_user_filter property.

When you edit Core UI filters dashboards migrated in compatibility mode, you do so in the Core UI tools. For more information, see Reporting, dashboards, and Performance Analytics in the Core UI.

Filters on inline dashboards

For inline dashboards, you can either create a filter directly on the dashboard through the inline editor, or you can add a filter to the dashboard from the filter library. In either case, you can add filters to a specific tab or have them apply to the entire dashboard. To take these actions, you only need the right to edit the dashboard.

If you have the analytics_filter_admin role, you can also create a filter for the library through the Filter Designer or copy an existing filter to the library.

The filter applies to those data visualizations and list components that contain a target of the filter.

If you want to put multiple filters on your dashboard, consider adding a filter group. In a filter group, you configure several filters and apply or clear them with one action, making only one call to the database. A filter group may therefore be more efficient than multiple separate filters.

When you create a filter, you first specify the filter type. All further configuration options depend on the selected type.

Important: When using this documentation, first select a topic for creating a filter. After you create a filter and select the filter type, follow the appropriate topic for configuring a filter of that type.

Retaining filter values

On inline dashboards, filters retain their values across logins or page refreshes. However, these values are no longer retained when someone edits the filter configuration. Afterward, the filter reverts to its default values for all users on their next login or page refresh. On technical dashboards and pages created in UI Builder, filters do not retain values across logins or refreshes. For an exception, see Add a dashboard to a Dashboards page.

Filter values can also be retained when you export an inline dashboard. When you export a dashboard to Microsoft PowerPoint, filter values are applied automatically. When you export a dashboard to PDF, you have the option whether or not to retain filter values. Filter values are not retained when you export a technical dashboard. For more information, see Export a Platform Analytics dashboard.

Domain filters

You can filter visualizations by domain on domain-separated instances. Domain filtering uses a different component. For more information, see Create a domain filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create or add a filter on an inline dashboard

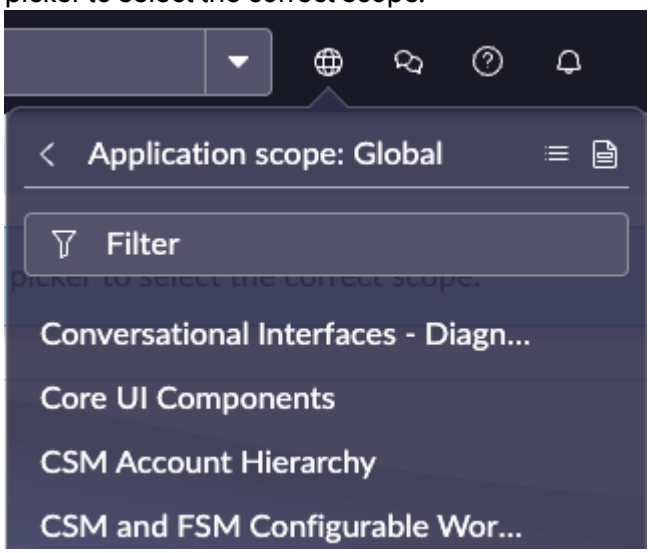
Create a filter or select one from the filter library. When creating a filter, name it, and choose whether to create a single select, multiple select, date, or true/false filter.

Before you begin

Role required: dashboard_admin, or you must be the dashboard owner or have had editing rights shared with you.

Procedure

1. Open **All** > **Platform Analytics** > **Library** > **Dashboards**.
2. Locate the dashboard in the dashboard library and open it for editing, as described in Edit Platform Analytics dashboards.
   If the dashboard is in the inline editor, you see an **Edit** button. If it is a technical dashboard, you see an **Edit in UI Builder** button. In the latter case, go to Create a filter on a technical dashboard in UI Builder.
3. **Optional:** If you are in a different application scope than the dashboard, use the application picker to select the correct scope.



4. Select **Edit** to enter edit mode.
5. Select **Add new element**.
6. Select **Filter** then either a new or a saved filter.
   - Select **New filter** to create a filter from scratch.
   - Select **Saved filter** to reuse a filter from the library.

   When you select **New filter**, the **Configuration** panel opens for the selected filter. When you select **Saved filter**, you can choose an existing filter to add to the dashboard.
7. If you are creating a new filter, select the type of data to filter.

   Other configuration options vary depending on the data type you select. After you select the filter type, follow the instructions on the linked page to continue configuration.

   - Single select: A single value from a set of choices. Single select is the default filter type.
   - Multiple select: More than one value from a set of choices, such as both High and Critical Priority

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Date: A calendar date. You can also set a time. Automatically applies to all indicator data on page or tab.
- True/False: Whether a field value is true or false. Can also be used with indicator breakdowns that are based on a bucket group with only two values. The labels for 'true' and 'false' can be customized. The viewer can select **(empty)** to clear their selection.

8. Choose the **Filter Element**.
   Element options depend on the filter type, but include Pill, Checkboxes, and Typeahead.
9. In the **Filter label** field, type a meaningful name for the filter.
   This name is the name that the user sees.
10. Position the filter.
    If the dashboard has tabs, putting the filter in a tab affects only the visualizations in that tab. If the dashboard has no tabs, or you place the filter above the tabs, it affects all visualizations in the dashboard.

What to do next

Note: Filter values persist across user sessions. When a viewer reopens a dashboard, whatever values they last selected for any filters on the dashboard are preselected. This feature applies only to dashboards created in the inline editor, not technical dashboards.

Create a filter in the Filter Designer

Create a Platform Analytics filter in the Filter Designer and add it to the library for reuse.

Before you begin

Note: Filters that are saved to the filter library are not accessible in the technical editor (UI Builder).

Role required: analytics_filter_admin, admin

Procedure

1. To add a filter to the filter library, navigate to **Platform Analytics** > **Library** > **Filters** and select **New**.
   The Filter Designer opens.
2. Select the type of data to filter.

   Other configuration options vary depending on the data type you select.

   - Single select: A single value from a set of choices. Single select is the default filter type.
   - Multiple select: More than one value from a set of choices, such as both High and Critical Priority
   - Date: A calendar date. You can also set a time. Automatically applies to all indicator data on page or tab.
   - True/False: Whether a field value is true or false. Can also be used with indicator breakdowns that are based on a bucket group with only two values.
3. In the **Filter label** field, type a meaningful name for the filter.
   This name is the name that the user sees.
4. Choose the **Filter Element**.
   Element options depend on the filter type, but include Pill, Checkboxes, and Typeahead.
5. Choose the filter source.
   Options include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables

Select the table to filter.

Indicators

Select the breakdown to use as the filter.

User Experience Analytics

Select the User Experience Analytics property to filter on. For more information, see Filter data in User Experience Analytics.

Result

Upon saving, the filter is saved to the library, where any user can add it to their dashboards.

Create a filter group

Create a set of filters that you can apply simultaneously. When you have multiple filters, applying them all together can be faster than applying them separately.

Before you begin

Role required: dashboard_admin, or any role if you are the dashboard owner or have had editing rights shared with you.

About this task

If you have many filters that apply to many visualizations on a dashboard, it can take a long time to apply all the filters. Each filter whose value you set makes a separate call to the ServiceNow AI Platform. You can speed this process up by organizing filters into groups, where you make a single call to apply multiple filters at once.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Dashboards**.
2. Locate and open or create the dashboard to which you want to add a filter group.
   Technical dashboards are not supported. You can only add a filter group to a dashboard in the inline editor. For more information, see Edit Platform Analytics dashboards.
3. Select **Add new element** and add a Filter Group element.
4. In the **UI Element** section, configure the appearance of the filter group

UI element settings

Option	Description
Show filter group label	Turn on to show the label of the filter group. Default: on
Filter group label	A meaningful name for the filter group, which is visible to the user. Available only when **Show filter group label** is on. Default: Label
Filter group layout	Select Horizontal to show the filters side by side. Select Vertical to show the filters in a column. Default: Horizontal

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Filter spacing	Choose how far apart you want to space the filters. Options: S, M, L Default: S
Show values in pill	Turn on to show the selected filter elements inside the pill for all filters in the group. Default: on
Show border	Turn on to display a line around the filter group. Default: on
Bare	Turn on to remove padding around the filter group to provide more compact positioning. Available only when **Show border** is off. Default: off
Show round corners	Turn on to have the group border and radius match the pill border and radius. Available only when **Show values in pill** is turned off and **Show border** is turned on. Default: off

5. Add filters.
   You can add filters of any type except Domain. The filter configuration is the same as for the Filter component:
   - Configure a Single/Multiple select or cascading filter
   - Configure a True/False filter
   - Configure a Date filter in the inline editor

   When you complete the configuration of each filter, select **Back to group configuration**.
6. Configure any additional settings that you want to change.

Additional settings

Option	Description
Show group apply	Turn on to enable applying all filters in the group together. When disabled, changes to any individual filters in the group apply immediately. Default: on
Show group clear	Turn on to enable clearing all filters in the group together.

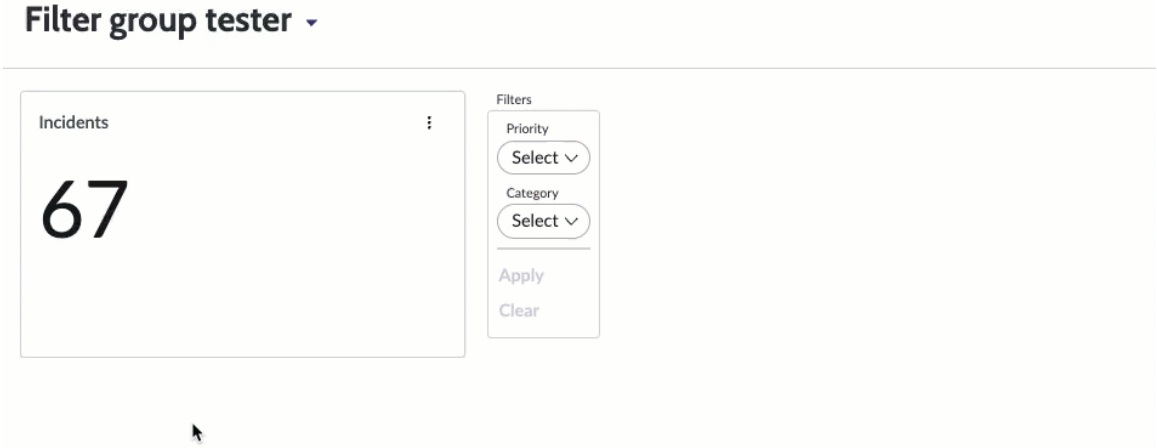
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Default: on
Show group reset	Turn on to enable clearing all filters in the group together. Default: off
Combine clear and reset	Turn on to move Clear and Reset into a More actions ⋮ menu. Available only when **Show group reset** is on.
Show separator	Turn on to show a line between the filters and other content on the dashboard. Default: on
Max filter item width, px	Defines number of pixels allowed for each filter in the group. Text that is wider than this limit wraps to a new line.

Example: Filter group in action

The following example shows a group of two filters being applied to a data visualization. A simple use case is used here for clarity and brevity. In practice, you would use a filter group with multiple visualizations and filters.

Simple filter group



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a filter on a technical dashboard in UI Builder

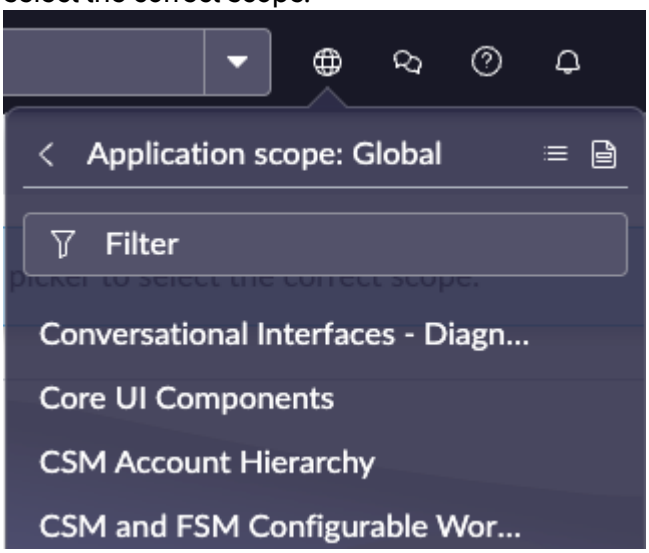
To filter data visualizations and simple lists in a technical dashboard, add a filter component in UI Builder and configure event handlers.

Before you begin

Role required: ui_builder_admin, admin

Procedure

1. Locate the dashboard in the dashboard library and open it for editing, as described in Edit Platform Analytics dashboards.
   If the dashboard is a technical dashboard, you see an **Edit in UI Builder** button. If it is in the inline editor, you see an **Edit** button. In the latter case, go to Create or add a filter on an inline dashboard.
2. If you are in a different application scope than the dashboard, use the application picker to select the correct scope.



3. Select **Edit in UI Builder**.
4. Add layout elements and a filter component as described in Add and configure components.
5. Configure the filter as described in the Filter component reference on the Developer Site . This reference includes a description of each configuration field and general usage information that applies to UI Builder pages in general.

> **Important:** Be certain to configure the event handlers and page scripts to link the filter to the relevant data visualizations or lists.

Make a data visualization act as a filter

You can set a data visualization to act as a filter on a dashboard that contains it. Only table or indicator data can be so filtered.

Before you begin

To use a data visualization as a filter, you have to meet these requirements:

- The visualization can only be of pie/donut or horizontal/vertical bar type.
- The visualization can show only table or indicator data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The visualization must be on a dashboard that was created in the inline editor. You cannot use a visualization as a filter on a technical dashboard or other UI Builder page.
- The visualization cannot have a group by value based on a time duration.

Role required: Any internal role and the right to edit the dashboard with the visualization

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Dashboards**.
2. Find and open the dashboard that contains the data visualization.
3. Select **Edit** to put the dashboard in edit mode.
   If you do not see an Edit button
4. Find the pie/donut or bar visualization that you want to use as a filter on the dashboard.
5. Open the visualization's configuration panel.
6. Locate the Chart Interactions section.
7. Select **Apply as filter**.
8. Save and exit editing mode.

Create a pie or donut data visualization

Create a horizontal or vertical bar data visualization

Configure a Single/Multiple select or cascading filter

Let users filter a dashboard tab on one or more values from a set of choices, such as incident priority. You can have a single or multiple select filter follow another filter in a cascade.

Before you begin

Important: This procedure assumes you've created a filter in the Filter designer or added a filter to your dashboard with the Single select or Multiple select filter type. See Create or add a filter on an inline dashboard, Create a filter in the Filter Designer, or Create a filter group.

Role required: In the inline dashboard editor: dashboard_admin, or you must be the dashboard owner or have had editing rights shared with you.

In the Filter Designer (**Library** > **Filters** > **New**): analytics_filter_admin, admin

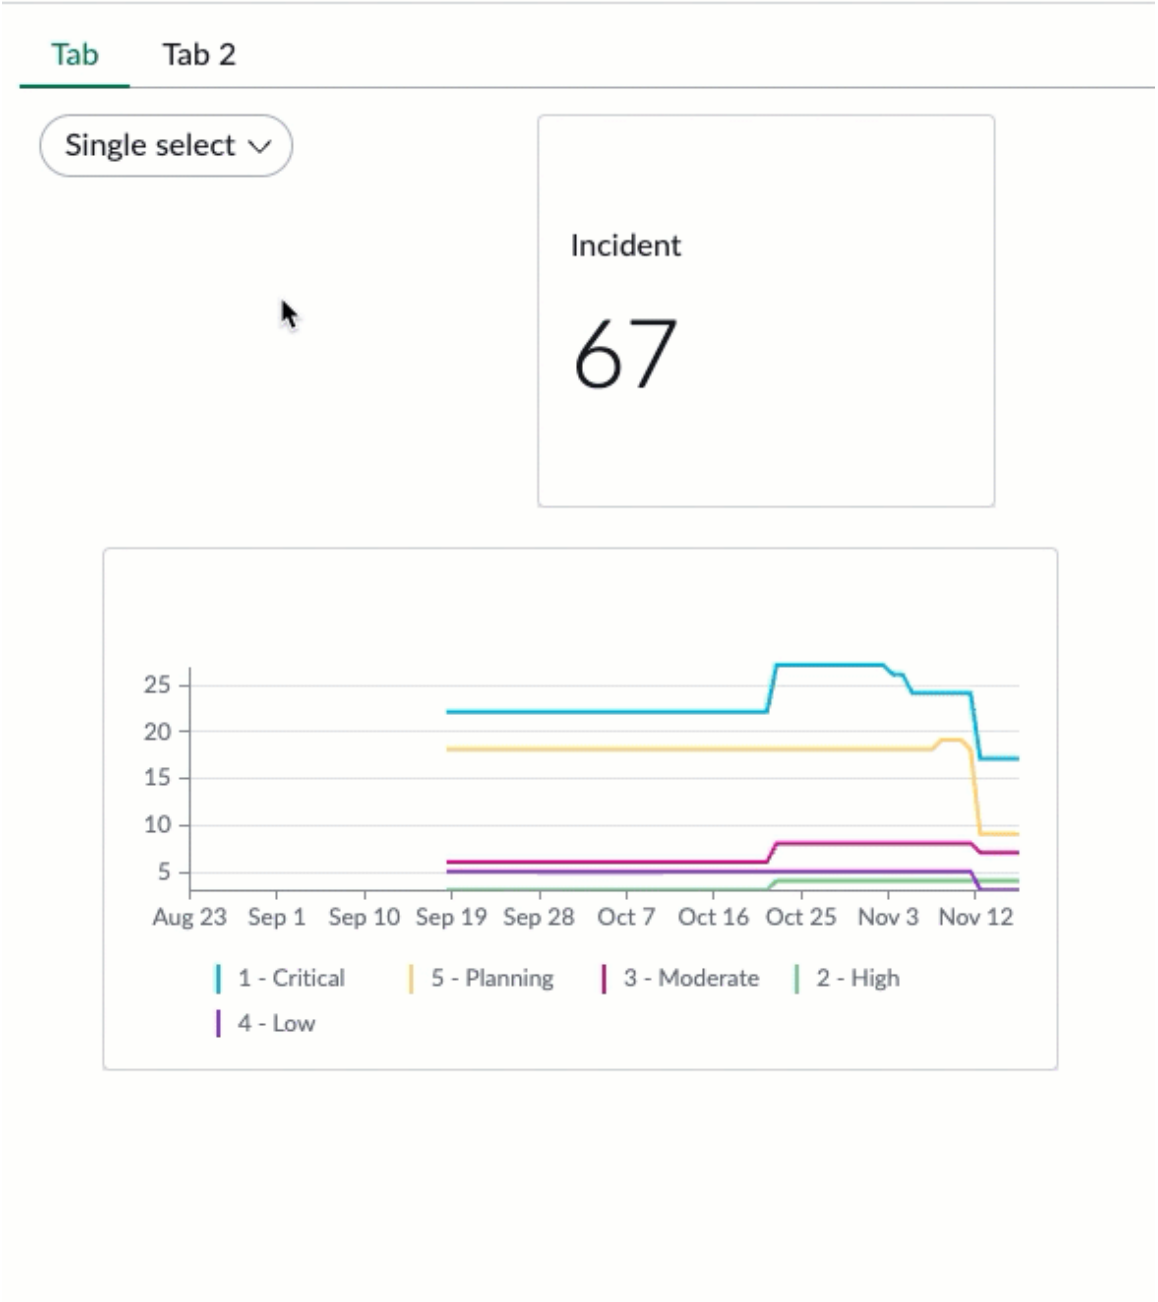
About this task

Filters apply to data visualizations and simple lists. For the filter to apply to a specific data visualization, it must be based on the same table or indicator breakdown as that visualization. For it to apply to a list, it must filter a field in the list.

On a tabbed dashboard, a filter can apply either to the items in a single tab or to the entire dashboard. For the filter to apply to a single tab, add the filter to that tab. For the filter to apply to the entire dashboard, add it above the tabs.

A Single select filter lets users filter items by one value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



A Multiple select filter lets users select multiple values of a field or breakdown.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

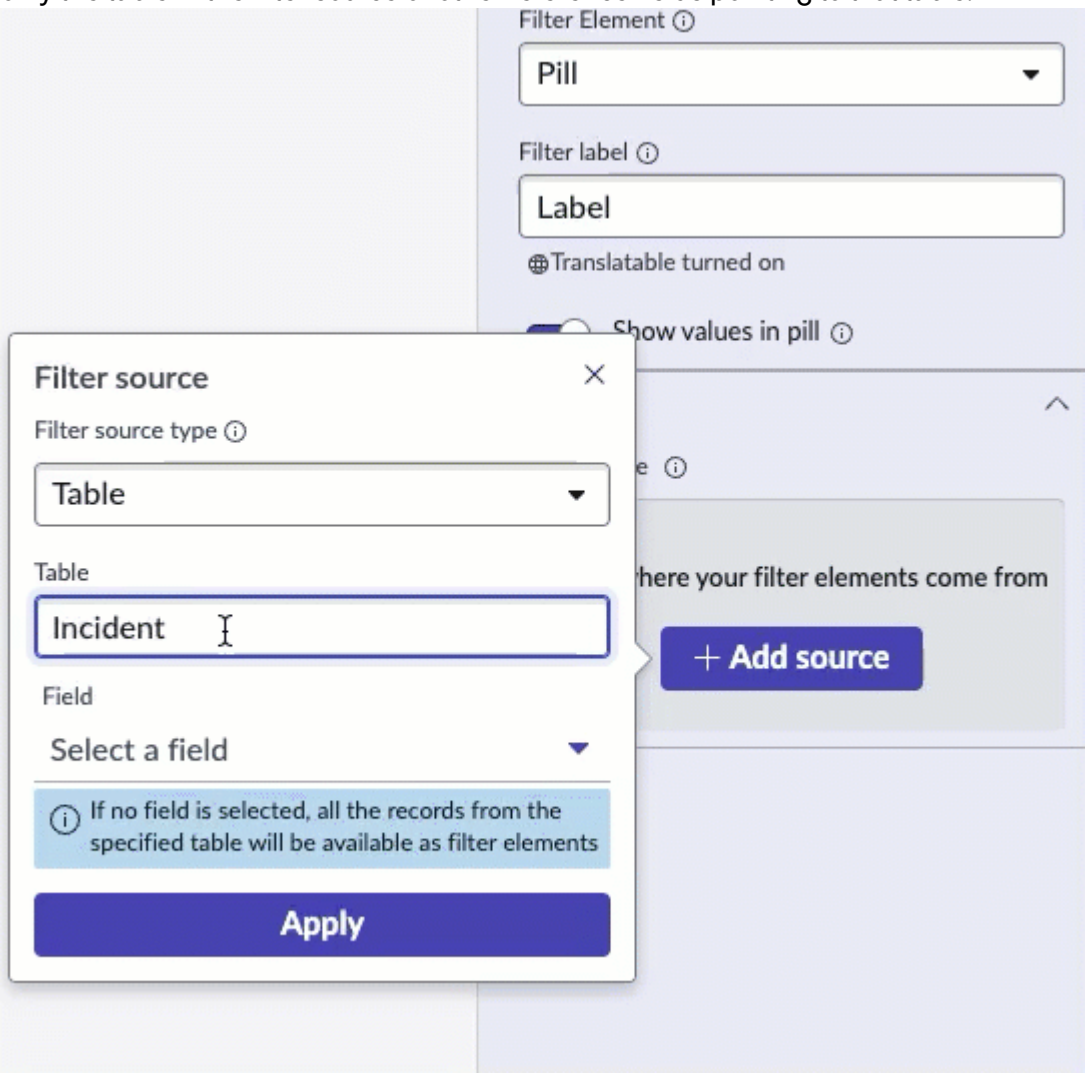
1. Create a filter and select the Single or Multiple Select filter type, as described in Create or add a filter on an inline dashboard or Create a filter in the Filter Designer.
2. In **Filter source type**, select a Table, an Indicator breakdown, or a Usage Insights source. MetricBase and Workflow Data Fabric tables are available under Tables.
3. Specify the filter source, depending on source type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you selected the Table type, select the table and the field.

Note:

- You can select only reference fields and fields that have a Choice list. If the table has only non-reference string and numeric fields, you do not have any fields to select from.
- If you select no field, you can filter only data on that table or in reference fields that point to that table. For example, if you select the Company table as your filter source, you can only filter the Company table or reference fields pointing to Company, such as Incident.Caller.Company or Incident.Location.Company.
- If you select a MetricBase table, don't select a field.
- If you select a field that is a reference field to another table, the filter source resets to refer to that table with no field selected. The data to filter is set automatically to the reference field that you originally selected. As additional data to filter, you can set only the table in the filter source or other reference fields pointing to that table.



- If you selected the Indicator breakdown type, select an indicator breakdown.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

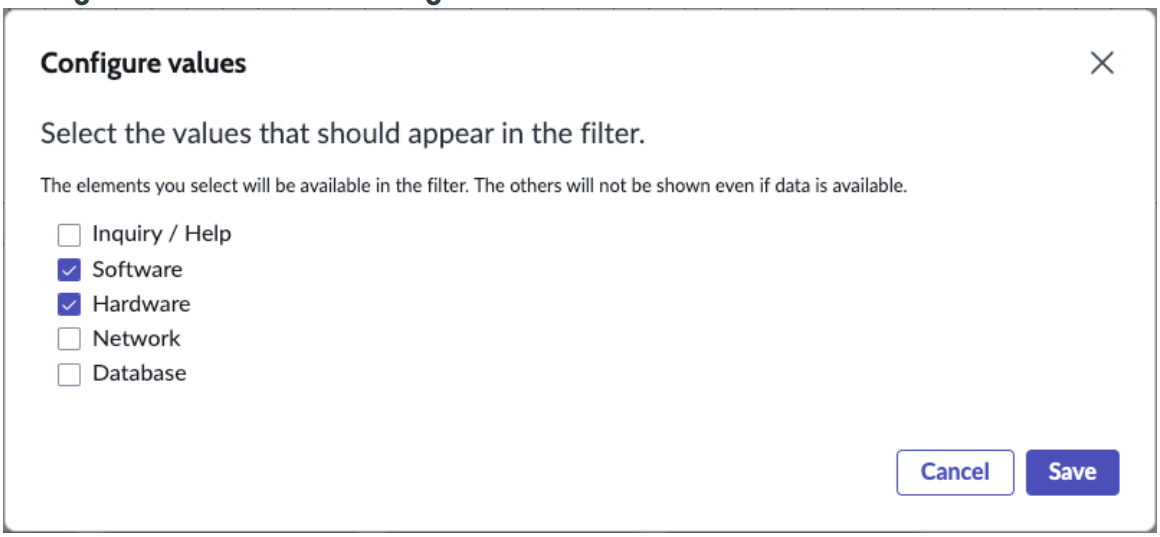
- You can only select a breakdown that is used by at least one indicator.
- Scripted breakdowns on data visualizations are not supported.
- Only two levels of breakdown can be applied to an indicator at the same time. On a dashboard, this could be two filters or one filter and a breakdown specified in the data visualization. However, if data snapshots are enabled on this indicator, this restriction does not apply. For more information, see Data snapshots and multiple breakdowns.

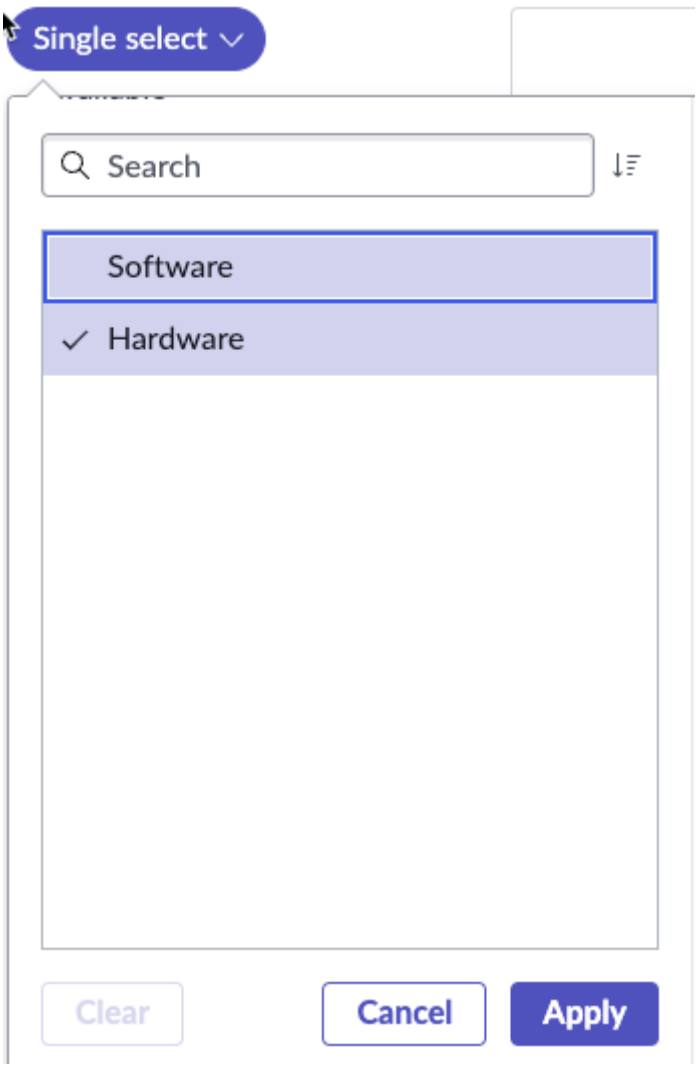
  - If you selected a Usage Insights filter, select a UX Analytics property.

4. **Optional:** To limit the values that the runtime user can choose to filter by, select **Configure values (number)**.
   A list of possible values opens. Clear a value to prevent runtime users from filtering by it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure values list and resulting choices in runtime





Note: If the filter source is a reference to a table, you don't have a list of values to configure. Instead, you can build a condition to set the values in the filter. You can also set a related list condition.

5. **Optional:** Select the default value or values for the filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The dashboard applies these values when a user opens the dashboard.

6. **Optional:** Select the data to filter.
   Some data to filter is chosen automatically depending on the filter source. For example, if you select the Category indicator breakdown from the Incident.Category breakdown source, the filter automatically filters the Category field on the Incident table and any indicators with the Category breakdown. You can edit the automatic data selection or add more data to filter.

   Note: Your selection of filter source can impact which data you can filter. For more information, see Step 3.

7. Under **Other filters to follow**, if the conditions are met, you can select another filter for the current filter to follow in a hierarchy, creating a cascade.

   Note: You can only set **Other filters to follow** when you are configuring filters on a dashboard, not from the filter designer.

   When you set the filter to follow another filter, the choices available in the following filter are limited by the choices made in the followed filter. For more information, see the example Cascading filters for Manager and Assignment Group.

   Conditions:

   - You can follow a filter only if Pill is the UI element for that filter.
   - Only Table and Indicator Breakdown filters support cascading filters.
   - The filter to be followed must filter data on the same table as the filter source of the following filter.

   Note:

   - Some filters have a many-to-many relationship, where values on both filters can match multiple values on the other filter. One such filter can follow another only through a connecting table. Only admins can set up these cascading filters. For more information, see Set a filter to follow another filter in a many-to-many relationship.
   - Two filters can follow each other, but there are additional requirements. For more information, see Conditions for two filters to follow each other.

8. Select the **Sort direction**.
   If you select **Ascending**, the lowest filtered values are shown first. If you select **Descending**, the highest values are shown first. The user can change this value.
9. To let users clear the values they selected for the filter, enable **Allow filter clearance**.
10. **Optional:** Set the maximum number of elements that are loaded initially and at each page refresh.
    The default value is 500.
11. Select **Save**.

Result
The filter is ready to use when you exit editing mode.

Example: Cascading filters for Manager and Assignment Group

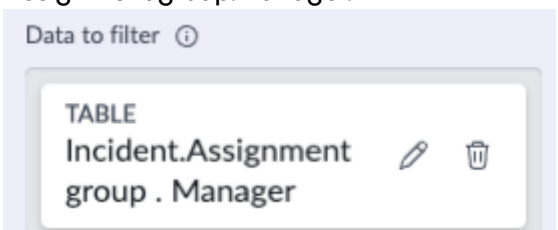
In this example, you want your users to filter incidents by manager or by assignment group. Also, you want to limit the assignment groups that are available in the second filter to those with the manager selected in the first filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. You create data visualizations of incidents, such as a single score data visualization of the number of incidents on the Incident [incident] table.
2. You create a filter to filter incidents by assignment group manager.
   a. First, you create a Single select filter labeled Manager.

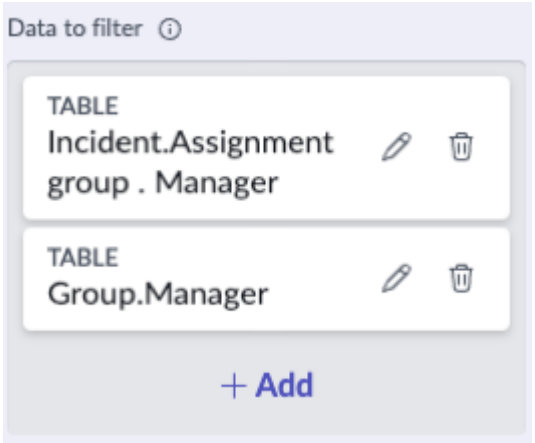
   b. You select the User [sys_user] table as the data source. The Manager field is in that table.

   c. Because you want to apply this filter to a data visualization of Incident table data, you edit the **Data to filter** field to point to the Incident table and the dotwalked reference field Assignment group.Manager.



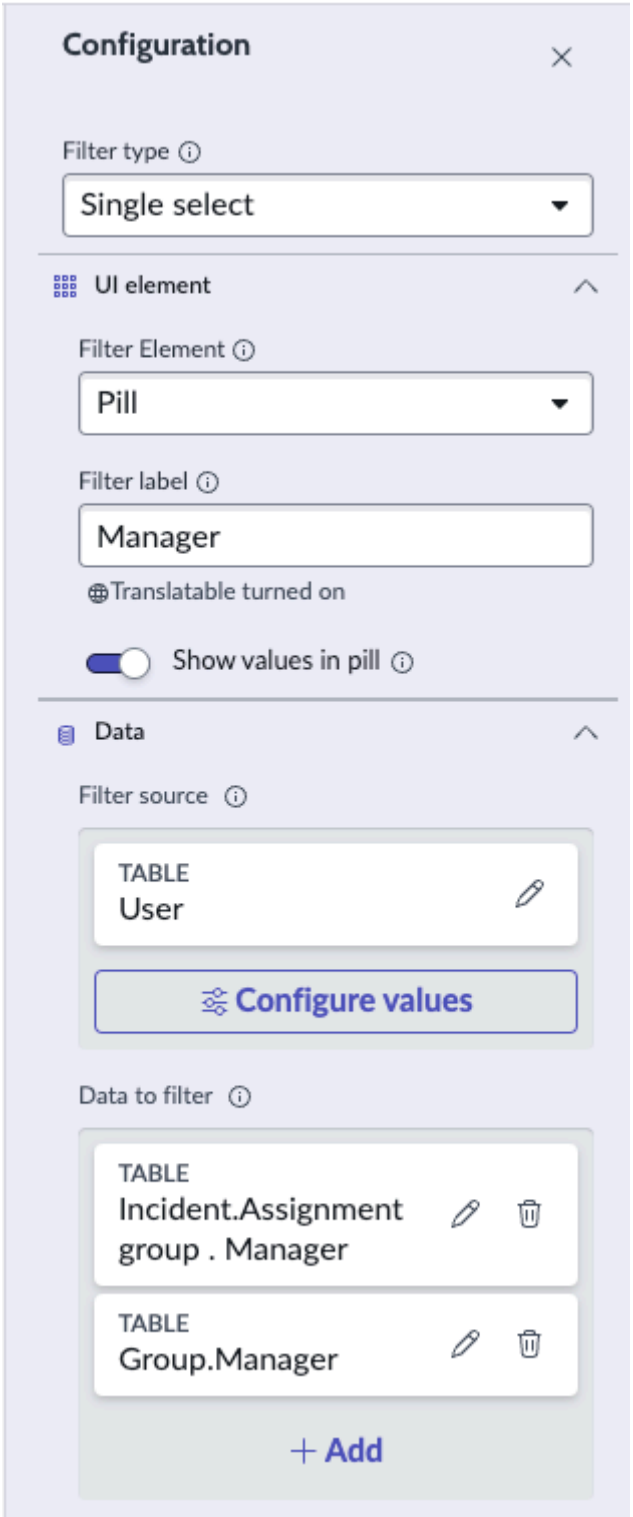
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Still under **Data to filter**, you select **Add+** and add the Manager field on the Group [sys_user_group] table. You will need this field later when you set up a cascading filter.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

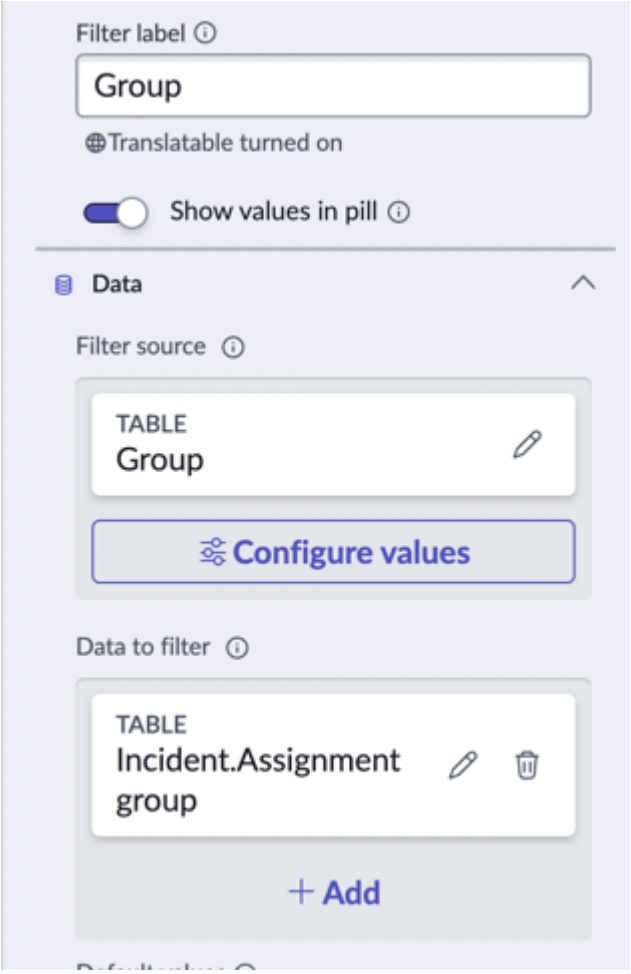
Completed configuration for the Manager filter



3. You create a filter to filter incident data by assignment group.
   a. First, you create a multiple select filter labeled Group.
   b. Then you select the Assignment Group field of the Incident [incident] table as the filter source.

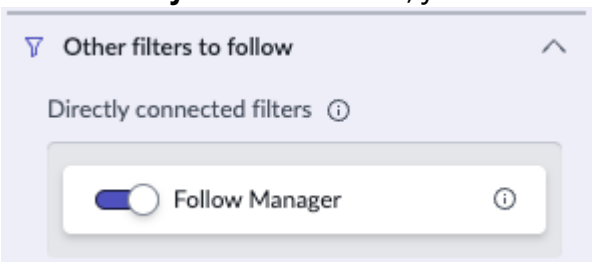
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Because Assignment Group is a reference field that refers to the Group [sys_user_group] table, the filter source resets automatically to the Group table. The data to filter remains Incident.Assignment Group.



4. Scroll down the Group filter's configuration panel to **Follow other filters**.

5. Under **Directly connected filters**, you select **Follow Manager**.

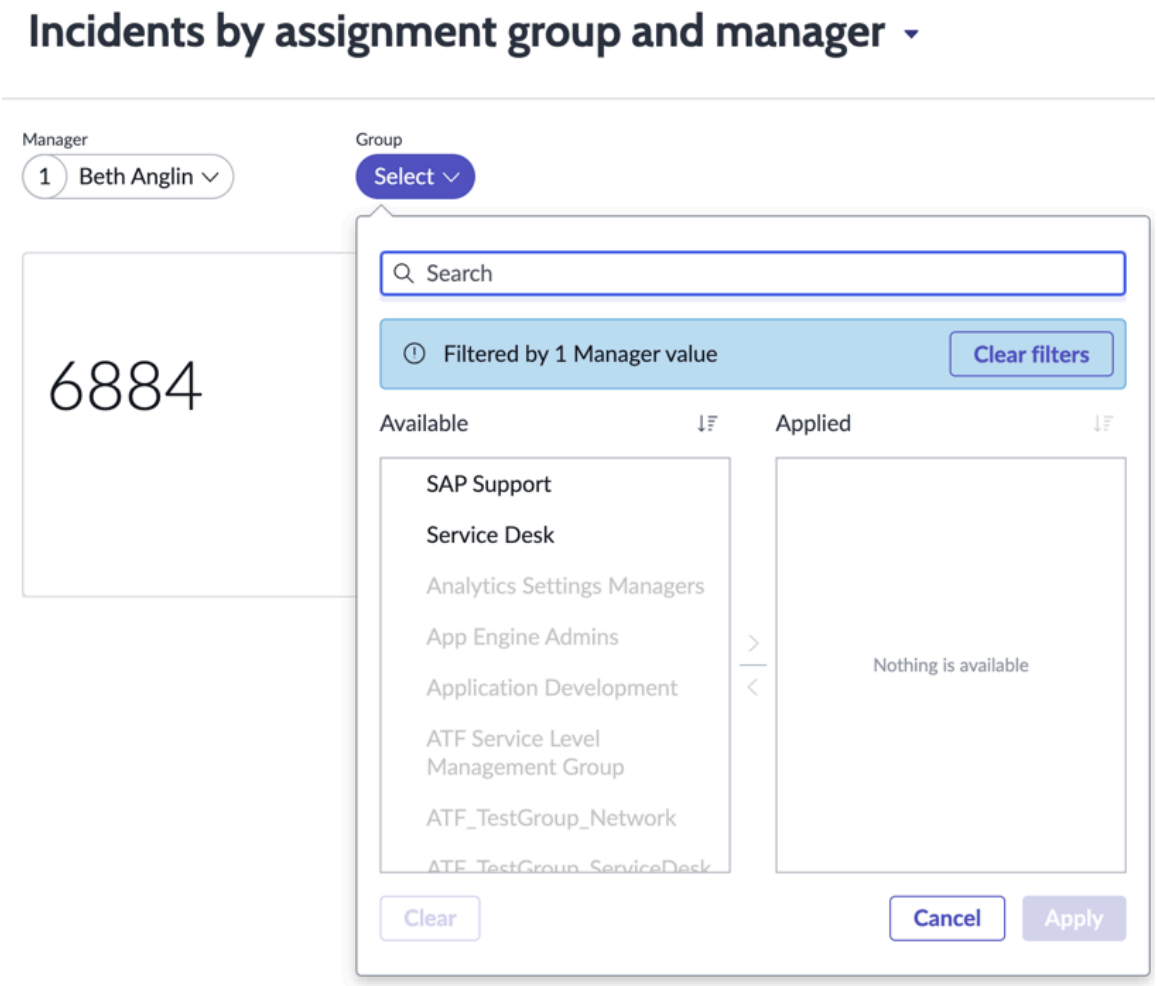


This choice appears because you configured the Manager filter to filter data on the Group table and not only on the Incident table. Remember that to have a cascading filter, the filter that will be followed (in this case Manager) must filter data on the same table as the filter that does the following (in this case Group, on the table sys_user_group).

6. Save and exit editing mode.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Later, a dashboard viewer selects Beth Anglin in the Manager filter. Then, when selecting assignment groups in the Group filter, only those groups with Beth Anglin as the manager are available.



What to do next

If you have the required roles, add the filter to the filter library. You can also reconfigure, delete, or duplicate the filter. For more information, see Edit a Platform Analytics filter on a dashboard.

Related topics

- Applying filters to Process Mining maps
- Edit a Platform Analytics filter on a dashboard
- Configure a data visualization to follow filters or not

Set a filter to follow another filter in a many-to-many relationship

In some cases, values on a pair of filters can refer to multiple values on each other. For one such filter to follow another, it must go through a connecting table.

Before you begin

Role required: admin

About this task

In most cases, a filter follows another filter either in a one-to-one relationship or in a one-to-many relationship. In the latter case, the filter source is a reference field. Anyone who can edit a dashboard can set up one such filter to follow another on that dashboard, in a direct connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

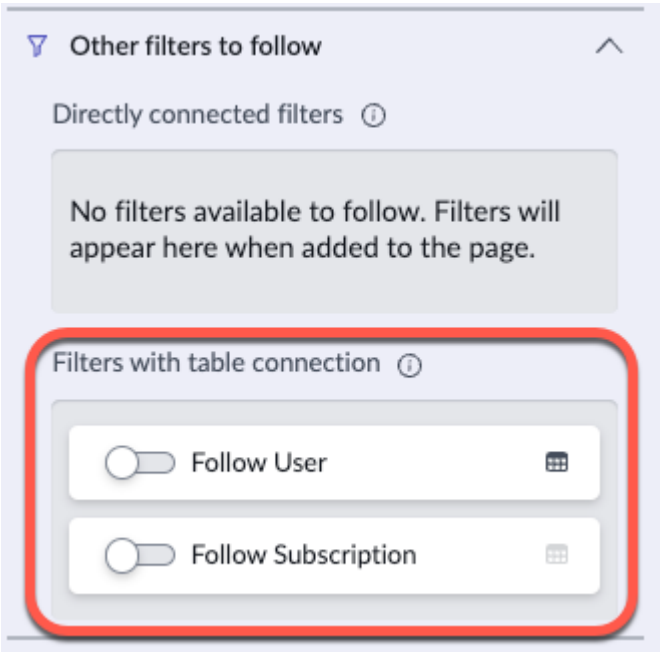
Users with the analytics_filter_admin role can also create such filters in the filter library. For more information, see the example in Configure a Single/Multiple select or cascading filter.

If the values on each filter can refer to multiple values on the other filter (a many-to-many relationship), you have to select a connecting table. This connecting table has a unique record for every possible reference between the two filters. The connecting tables between two tables are defined in the Collection [sys_collection] and Many to Many Definition [sys_m2m] tables. Only administrators can access these tables.

Connection tables come predefined for any relevant tables included in the base system or in Platform Analytics Solutions. However, if you want to use a custom table in a many-to-many relationship, you must define that relationship in the Many to Many Definition table. For more information, see Create a many-to-many table relationship.

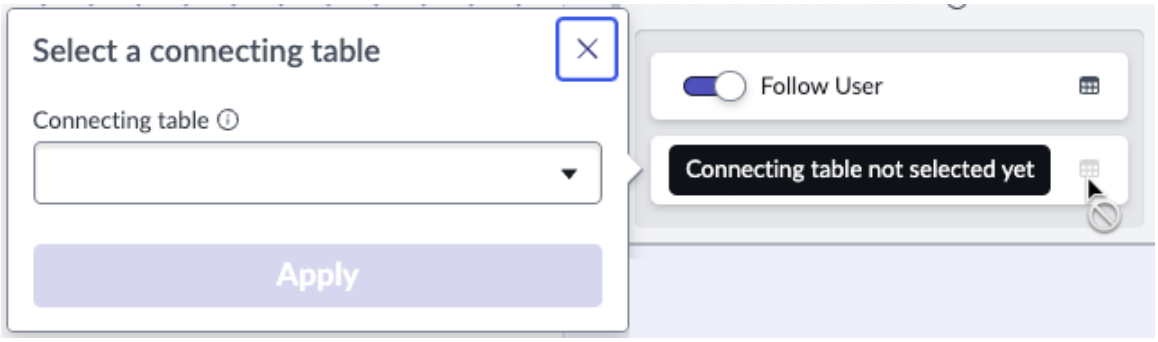
Procedure

1. Add at least two single or multiple select filters to the relevant dashboard.
   For more information about adding filters to a dashboard, see Create or add a filter on an inline dashboard.
2. Put the dashboard in Edit mode.
3. Open the configuration menu for the filter that you want to follow the other filter.
   If the filter can follow any other filters on the dashboard in a many-to-many relationship, these filters are listed under **Filters with table connection** in the **Other filters to follow** section.



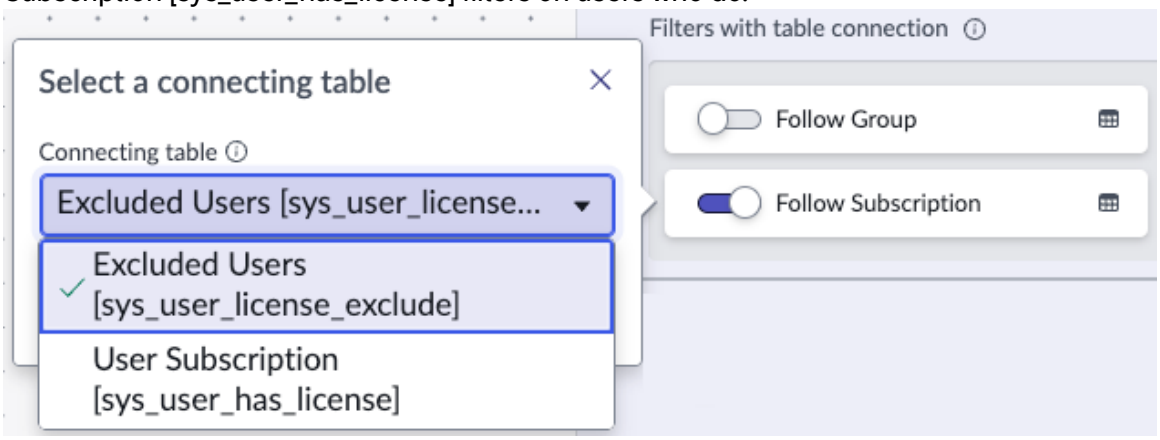
4. Turn following on for the filters that you want this filter to follow.
5. If no connecting table has been selected for that filter, a dialog opens to select the connecting table.
   The Table icon by the toggle is grayed out when no connecting table has been selected yet.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



After you set the connecting table, you can select the table icon to change it.

Example
If you have the choice between more than one connecting table, the names of the connecting tables should suggest which one to select. For example, Excluded Users [sys_user_license_exclude] filters on users who don't have a subscription whereas User Subscription [sys_user_has_license] filters on users who do.



6. Save the dashboard and exit editing mode.

Conditions for two filters to follow each other

It is possible to set up two filters to follow each other mutually. However, several technical limitations apply.

Two Single/Multiple select filters can follow each other through a direct connection, as described in Configure a Single/Multiple select or cascading filter. The conditions described in that topic apply to both filters. For example, both filters must filter data on the other's filter source.

Two Single/Multiple select filters can also filter each other through a many-to-many connection, as described in Set a filter to follow another filter in a many-to-many relationship. Only admins can set up such a connection.

Besides the general conditions for a filter to follow another, the following conditions also apply:

Mixed connection types are invalid

Both filters must follow each other through either a direct connection or a many-to-many connection. One filter cannot follow the other directly and be followed through a many-to-many connection.

Many-to-many connections must use the same connection table

If two filters follow each other through many-to-many connections, both connections must use the same connecting table.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure a True/False filter

Let users filter on true/false fields and breakdown elements. For example, you can enable users to choose only the incidents where the **Active** field is set to **true**.

Before you begin

Important: This procedure assumes you've created a filter in the Filter designer or added a filter to your dashboard with the True/False filter type. For more information, see Create or add a filter on an inline dashboard or Create a filter in the Filter Designer.

Role required: In the dashboard inline editor: dashboard_admin, or you must be the dashboard owner or have had editing rights shared with you.

In the Filter Designer (**Library** > **Filters** > **New**): analytics_filter_admin, admin

About this task

The filter applies to all elements on the same dashboard or the same dashboard tab, depending on filter placement.

Procedure

1. Create a filter and select the True/False filter type, as described in Create or add a filter on an inline dashboard or Create a filter in the Filter Designer.
2. **Optional:** Set custom display labels in place of 'True' and 'False,' such as 'Yes' and 'No.'
3. In **Data to filter**, specify a table field, indicator breakdown, or Usage Insights property to filter. You can add any number of targets to the filter. Select either a table and field or all indicators with a particular breakdown. If you select a table, you can also select to apply the filter to the hierarchy of related tables: Parents, children, siblings, and any database views that contain the table.

   MetricBase and Workflow Data Fabric tables can be filtered, and are listed with the other tables.

   Note:

   - If you select a table, you must select at least one true/false (Boolean) field. You can only select true/false fields.
   - To help you select only true/false indicator breakdowns, your choice is limited to breakdowns based on a bucket [pa_buckets] with only two values. However, the system can't check whether the indicator breakdown is really true/false. You have to determine whether the breakdown is Boolean yourself. Ask your ServiceNow AI Platform administrator for help.
   - An empty (null) value is possible for a field. Therefore, the total number of true and false values can be less than the total number of records or less than an indicator score that counts records. The viewer can also select **(empty)** to clear their selection.

4. **Optional:** Specify a default value of true or false.
   The filter is applied with this value when the dashboard is opened. If you do not specify a default value, the filter value is empty by default.
5. Select the **Sort direction**.
   If you select **Ascending**, the lowest filtered values are shown first. If you select **Descending**, the highest values are shown first. The user can change this value.
6. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The filter is ready to use when you exit editing mode.

What to do next
If you have the required roles, add the filter to the filter library. You can also reconfigure, delete, or duplicate the filter. For more information, see Edit a Platform Analytics filter on a dashboard.

Related topics

Configure a Date filter in the inline editor

Let users select predefined periods or specify custom start and end dates for the data on a dashboard tab.

Before you begin

Important: This procedure assumes you've created a filter in the Filter designer or added a filter to your dashboard with the Date filter type. For instructions, see Create or add a filter on an inline dashboard or Create a filter in the Filter Designer.

Role required: In the dashboard inline editor: dashboard_admin, or you must be the dashboard owner or have had editing rights shared with you.

In the Filter Designer (**Library** > **Filters** > **New**): analytics_filter_admin, admin

About this task
Date filters apply to Score, Time series, Bar, and Pie/Donut visualizations. For indicator data, the **Apply date range** option must be turned on in the visualization's configuration panel (except for time series, where it's implicitly always on). The filter applies to all such visualizations in the same dashboard or dashboard tab as the filter.

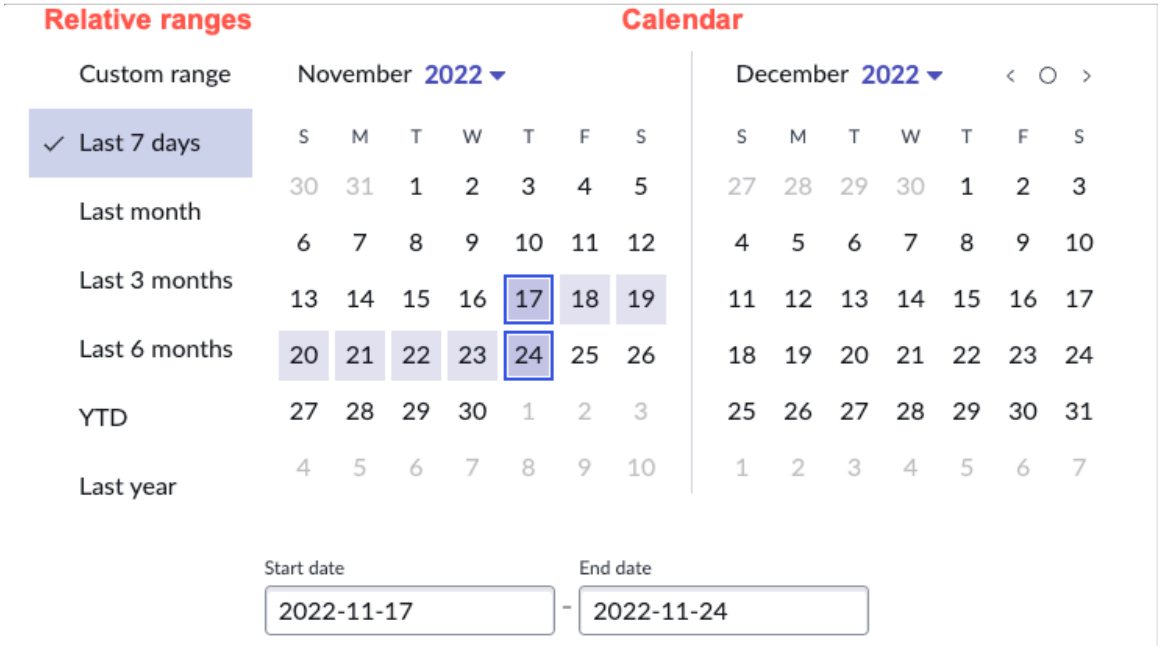
Procedure
1. Create a filter and select the Date filter type, as described in Create or add a filter on an inline dashboard or Create a filter in the Filter Designer.
2. Specify the data to filter.

   The filter is applied automatically to all Performance Analytics indicators and MetricBase KPIs on the tab or in the dashboard.

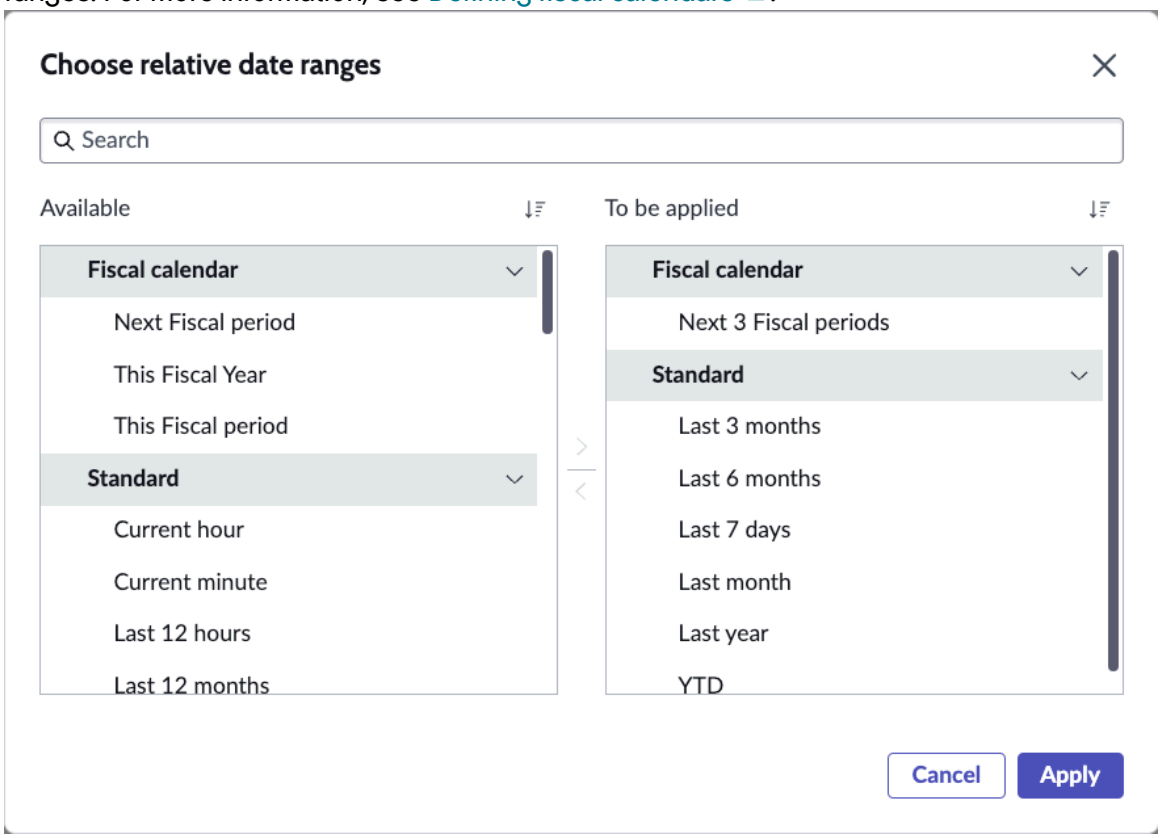
   You can add any number of date fields on tables or Usage Insights date properties to apply the filter to. If you add a table field, you can also choose to apply the filter to the hierarchy of related tables: Parents, children, siblings, and any database views that contain the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In **Date filter view**, select the options that the runtime user has for choosing date ranges:
   - Both calendar and relative ranges, such as seven days or Year To Date (YTD)
   - Calendar only
   - Relative ranges only



4. **Optional:** If you're letting the users select from relative ranges, you can select which relative ranges they can choose from in **Select predefined ranges**.
   If you have Fiscal Calendars installed and configured, you can select from fiscal calendar ranges. For more information, see Defining fiscal calendars.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. To let users filter on the time in hours and minutes instead of only the date, enable **Allow time selection**.
6. **Optional:** In **Default values**, specify a relative range to filter on automatically when the dashboard is opened.
7. To let users clear the values they selected for the filter, enable **Allow filter clearance**.
8. Select **Save**.

Result
The filter is ready to use when you exit editing mode.

What to do next
If you have the required roles, add the filter to the filter library. You can also reconfigure, delete, or duplicate the filter. For more information, see Edit a Platform Analytics filter on a dashboard.

Edit a Platform Analytics filter on a dashboard

Configure a data visualization to follow filters or not

Create a domain filter

Create a domain filter so that you can filter data visualizations on domains in a domain-separated instance. Domain filters enable the user to see data associated with one or more domains.

Before you begin
Domain filters are available on instances with domain separation enabled. Domain filters are not automatically enabled by default. To enable them, install these two plug-ins:

- com.glide.domain.msp_extensions.installer
- com.snc.pa.domain_support

For more information, see Domain separation for service providers. Domain filters are a different component than the Filter component.

Role required: ui_builder_admin or admin.

About this task
Domain filters support both the instance's list of domains and Performance Analytics domain configurations. Filters based on the domain list provide different results than filters based on domain configurations. For more information, see Differences between domain list and domain configuration filters.

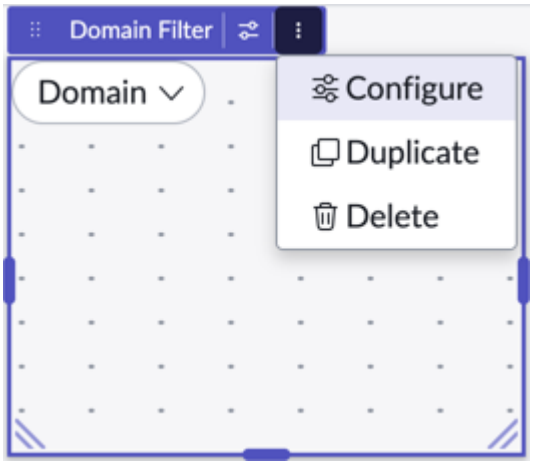
The filter applies to all elements on the same dashboard or the same dashboard tab, depending on filter placement. Filters on dashboard tabs have higher priority than top-level filters.

Procedure
1. Open **All** > **Platform Analytics** > **Library** > **Dashboards**.
2. Locate the dashboard in the dashboard library and open it for editing, as described in Edit Platform Analytics dashboards.

> **Note:** These instructions are for using the inline dashboard editor. If you're editing a technical dashboard in the UI Builder, see the Component reference on the Developer Site.

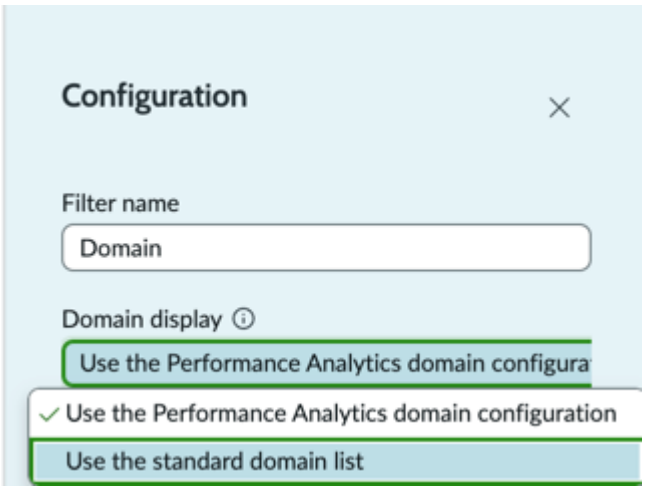
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Create or open the dashboard that you want to add a domain filter to.
   For more information, see Edit Platform Analytics dashboards.
4. Select **Edit**.
5. From the **Add new element** menu, select **Domain filter**.
   The domain filter is added to the dashboard layout in the first available space. This location may be below existing dashboard elements.
6. Select the domain filter's three-dot menu and choose **Configure**.



7. In the **Filter label** field, type a meaningful name for the filter.
   This name is the name that the user sees.
8. To determine what data to display in your filter, configure the domain display and whether to include domain data.

   a. Select the **Domain display**.
   You can filter on either a Performance Analytics domain configuration or a standard domain list.



Options	Description
Use the Performance Analytics domain configuration	Enables users to filter results based on a domain configuration. To learn more about domain configurations, see Grouping domains in Performance Analytics domain configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Options	Description
Use the standard domain list	Enables users to filter results based on the list of domains. The list shows only active domains. Aggregations aren't included.

For a more detailed description of how these properties affect the results of the filter, see Differences between domain list and domain configuration filters.

b. Choose whether to **Include global domain data**.
When selected, the filter includes values from records in the global domain. The global domain usually contains only configuration records.

9. Select **Save**.

Differences between domain list and domain configuration filters

Domain filters based on Performance Analytics domain configurations behave differently than domain filters based on the list of platform domains.

Overview of differences

The results of domain filtering differ based on the presence of child domains and the inclusion of the global domain. If you use domain configurations, results also depend on aggregation.

Platform domain list

Global domain included

Visualizations based on indicator data

Show only the scores for the selected domain. Child domain and global domain scores are not included. The values can come from both data collection jobs and manual input.

Visualizations based on table data or database views

Combine the values of the global and selected domains, and any child or parent domains.

Global domain not included

Visualizations based on indicator data

Show only the score for the selected domain. Child domain and global domain scores are not included.

Visualizations based on table data or database views

Combine the values of the selected domain and the values of the child domains.

Performance Analytics domain configurations

See Grouping domains in Performance Analytics domain configurations for a detailed discussion of domain configurations.

Once you group domains in a Performance Analytics domain configuration, there are two considerations when you filter on a domain in that configuration:

- Does the domain have children or is it a standalone domain?
- Is the data aggregated?

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Global domain included

Visualizations based on indicator data

Show only the scores for the selected domain, and only if a data collection job collected indicator scores for that domain.

Aggregated scores come from all domains in the domain configuration, but exclude child domains. The global domain is also excluded.

Visualizations based on table data or database views

Include values from the selected domain, any child domains of that domain, and the global domain.

Aggregated results come from all domains in the configuration, including their child domains, plus the global domain.

Global domain not included

Visualizations based on indicator data

Show only the scores for the selected domain. Child domains and the global domain are excluded.

Aggregated scores come from all domains in the domain configuration, but exclude child domains. The global domain is also excluded.

Visualizations based on table data or database views

Include the values of the selected domain and children of the selected domain, if present. Global domain values are not included.

Aggregated results come from all domains in the domain configuration plus any children of domains in that configuration. Global domain values are not included.

Approaches to Performance Analytics with domain separation

Edit a Platform Analytics filter on a dashboard

When you highlight a filter on a dashboard that you have put into edit mode, you have several editing options depending on whether the filter is local to the dashboard or saved in the library.

Before you begin

Role required: dashboard_admin, or you must be the dashboard owner or have had editing rights shared with you.

About this task

Note: This topic covers only those editing options you have in the component header on a filter on a dashboard that is in editing mode. It does not cover the configuration options, such as selecting the filter source and target. Those options are available in the configuration panel, which is available in either a dashboard in edit mode or in the Filter Designer. The editing options in this topic apply to all filter types, whereas the configuration options differ by filter type. For more information, see Configure a Single/Multiple select or cascading filter, Configure a True/False filter, or Configure a Date filter in the inline editor.

Procedure

1. Navigate to the dashboard with the filter that you want to edit.
2. Select **Edit** to put the dashboard in edit mode.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the filter that you want to edit.
   A border around the filter appears with various information and options.

Options for a filter that is local to the dashboard

Options for a saved filter from the library

   - Filter | Saved filter: Shows whether the filter exists only locally in the dashboard or is a filter that is saved in the filter library. Options between the two filters differ.
   - Resize: Lets you drag the corners of a filter to resize it. Also lets you add other components around the filter.
   - Configure: Opens the filter in the Configuration panel, if it is not already open.

   > **Warning:** You need the viz_admin role or higher to edit a saved filter in a dashboard. If you do not have this role, you see a warning that you cannot configure the element. If you have the analytics_filter_admin role or higher (dashboard_admin), you can open the filter for editing from the Filter library. Alternatively, you can select **Unlink from library** to convert the filter to a local version that exists only on the dashboard.

   For more information about configuring the filter, see one of the following topics:

   - Configure a Single/Multiple select or cascading filter
   - Configure a Date filter in the inline editor
   - Configure a True/False filter

4. **Optional:** Expand the **Actions** ( ) menu and select from the following actions, which are different for local and saved filters:

Actions on local filter

Action	Description
Add to library	Adds the filter to the filter library so that any user can use it on other dashboards. Requires the analytics_filter_admin role.
Duplicate	Makes a copy of the filter on the same dashboard for you to edit.
Open record	Opens a form so that you can examine and edit the filter's JSON code. Requires the admin role.
Delete	Removes the filter from the dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions on saved filter

Action	Description
Edit in Designer	Opens the filter outside of the dashboard in the Filter designer for configuration. Requires the viz_admin role.
Unlink from library	Replaces the saved filter with an identical filter that exists only on this dashboard. The original filter remains in the library and on any other dashboards. Only dashboard editing rights are required to edit this local version.
Duplicate	Makes a copy of the current filter on both the same dashboard and in the library. Requires the viz_admin role.
Open record	Opens a form so that you can examine and edit the filter's JSON code. Requires the admin role.
Delete	Removes the filter from the dashboard. It remains in the library and on other dashboards.

5. Select **Save** to save your changes and continue editing or select **Exit editing mode** to finish editing.
   When you save changes to a shared filter, you have two choices:
   - Save the changes only for the current dashboard.

     This action creates a new version of the filter, like the **Unlink from library** action. The version of the filter in the library doesn't change.
   - Save changes to the library.

     When you make this selection, the new version of the filter is enabled on all dashboards that use it.

Troubleshoot breakdown filters

In Platform Analytics experience, it's not possible to do extend the functionality of a migrated breakdown filter that doesn't have an associated indicator.

Before you begin

Role required: Dashboard owner

This task describes how to address the error `This option is not available for the specified filter source` when you try to update a breakdown without an associated indicator.

Procedure

1. Navigate to **All** > **Library** > **Dashboards**.
2. Open the dashboard with the problem.
3. Select **Edit**.
4. Select the filter to view its configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Choose the **Data to filter** option.
   The error `This option is not available for the specified filter source` appears.
6. Identify the name of the indicator breakdown under **Filter source**.
7. Navigate to `pa_breakdowns.list` and open the breakdown.
8. On the breakdown record, open the **Indicators** tab under **Related links**.
9. Select **Edit** and choose one or more indicators that the breakdown applies to.
10. Select **Update**.

Result
You can edit the **Data to filter** section of the filter configuration.

Platform Analytics filter tables

The following tables relate to Platform Analytics filters and can be accessed through scripts.

Table	Description
par_component	Contains all data visualizations in the visualization library and all filters in the filter library.
par_component_filter	Contains all filters in the filter library. Extends the table of all dashboard components, par_component.
par_component_filter_permission	Contains the role, group, and user permissions for all filters in the filter library. Extends par_component_permission.
par_dashboard_filter	Lists all filters on Platform Analytics dashboards and the name of the dashboard.

Managing indicators from the Platform Analytics library

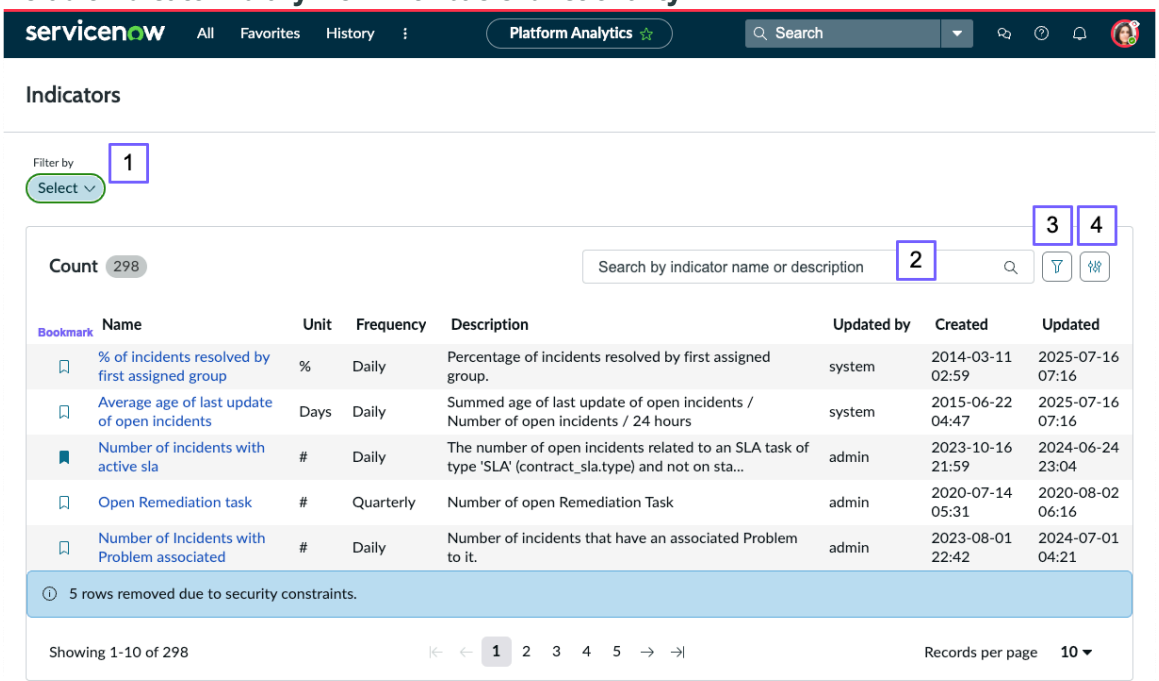
The indicator library lists all the Performance Analytics indicators/KPIs to which you have access. Users who can create or edit indicators or Performance Analytics collection jobs have additional information.

Open the list of indicators at **Platform Analytics** > **Library** > **Indicators**. The configuration of the Indicators page and the data access depends on your roles. All users with at least read access to an indicator get the basic indicator management functionality that is included in the default view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic indicator management

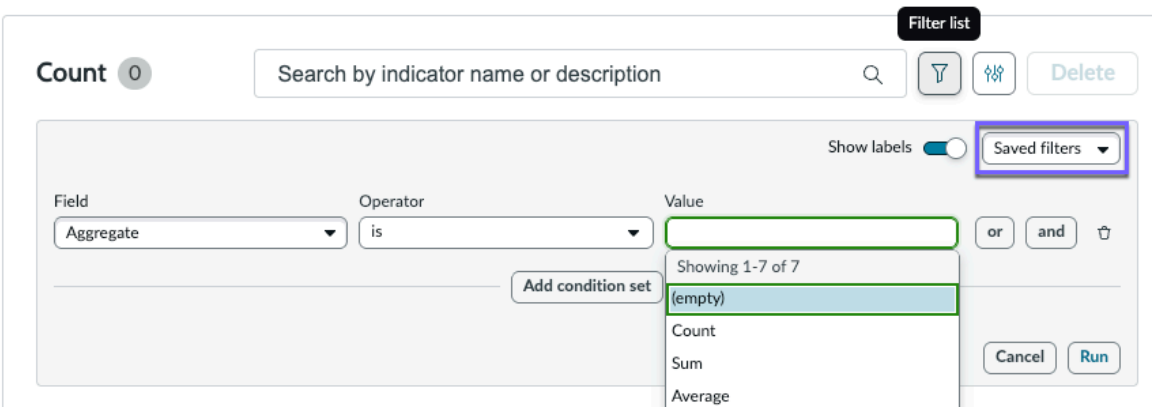
Default indicator library view with basic functionality



You can see any automated, formula, external, or manual indicator that has **Show in library** enabled on its indicator record and to which you have access, including benchmark indicators. Select the name of an indicator to open it in KPI Details, in a new tab.

You have several options for filtering what appears in the library. The numbered callouts in Default indicator library view with basic functionality match the numbers in the following list:

1. Under **Filter by**, you have the option to filter on bookmarked indicators. If you have the right to create indicators, you can also filter on the indicators that you have created.
2. Use the Search field to search by indicator name or description.
3. Expand the Filter list and add conditions for filtering the indicators. Under **Saved filters**, you can save the filters you currently have open and reopen them later. You can also toggle the labels on the filter fields on and off.



4. Open the Edit columns dialog, and select which indicator parameters appear as columns in the list.

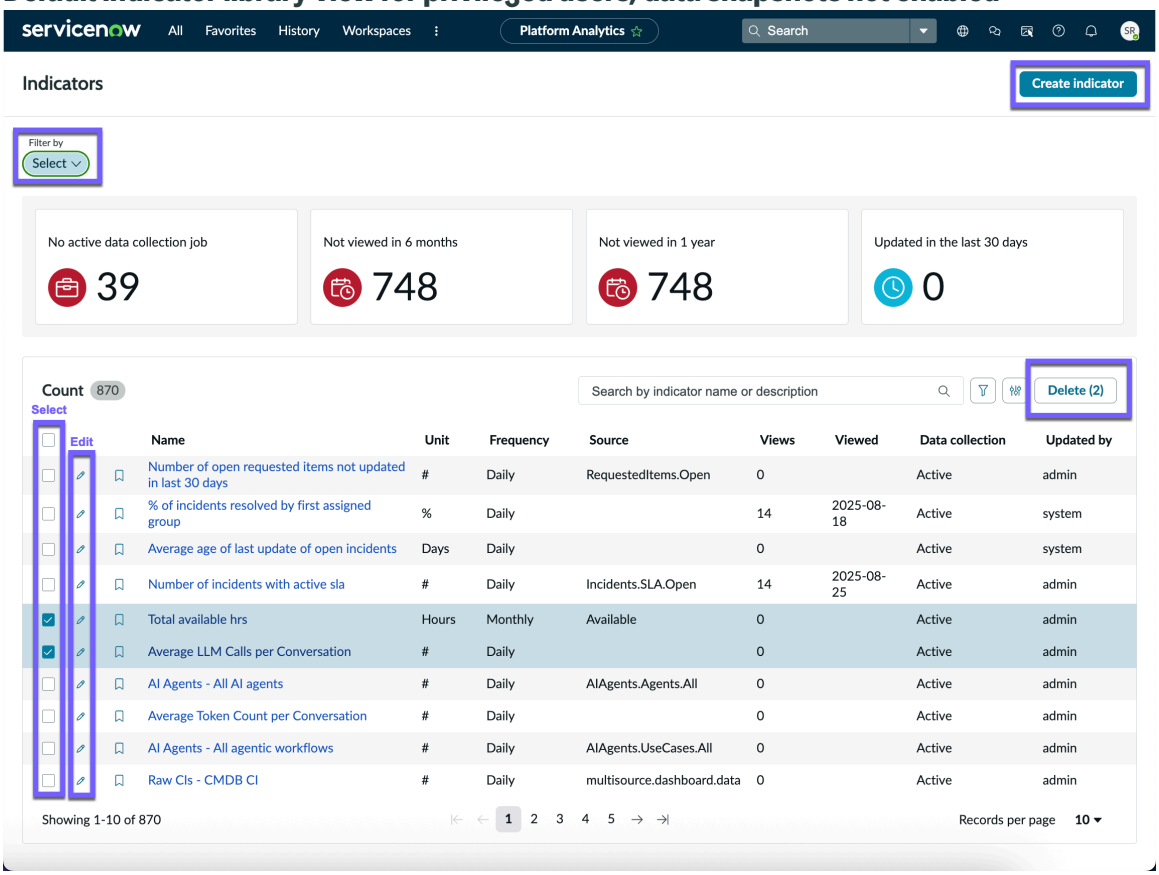
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sort the records according to a column's values by selecting the column label. Repeatedly select the label to switch between forward and reverse sorting. The type of sorting depends on the type of data in the column, such as alphanumeric sorting for text or date sorting for dates.

Indicator management for users who can edit indicators or collection jobs

Note: The functionality in this section is available only to users with the pa_power_user or pa_data_collector role or higher. Users also have all the basic functionality that was described in the previous section.

Default indicator library view for privileged users, data snapshots not enabled



Privileged users have the following extra functionality:

- Creating indicators: Press **Create indicator** to open a blank Indicator form. For more information, see Create an automated indicator or Create a formula indicator.
- Editing indicators: Select the pencil icon next to an indicator to open that indicator's record. Security restrictions may apply.
- Deleting indicators: Select one or more indicators by ticking the box in its row, then press **Delete**. The **Delete** button shows you how many indicators are selected for deletion.
- Indicator health: A row of tiles shows you useful statistics about the health of your indicators, such as how many automated and formula indicators do not have active collection jobs. The No active data collection job, Not viewed in 6 months, and Not viewed in one year tiles suggest how many indicators you may be able to delete. Conversely, Updated in the last 30 days gives you an idea how many indicators are truly active. Press a tile to filter the indicator list by that statistic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Filters on the list of indicators do not currently filter the tiles.

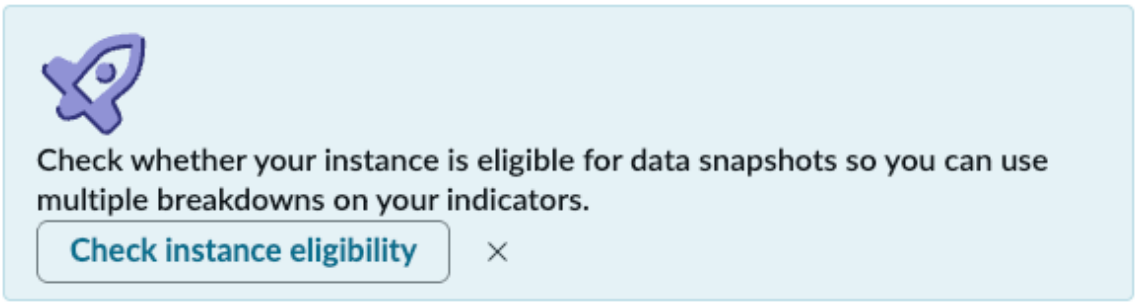
- Indicators you created: You have an additional **Filter by** option, to see only the indicators you have created.

Privileged users also see a different set of default columns. In place of the Description field, you see the following information:

- The indicator source for each automated indicator
- The state of the data collection job
- The last time the indicator was viewed
- How many times in total it was viewed in the last year

Indicator management for admin users with data snapshots enabled

If you have not tried to enable data snapshots on your instance, you have a banner at the top of KPI Details.



Press **Check instance eligibility** to see if your instance is eligible for data snapshots and, if not, why. For more information, see Activate data snapshots.

When your instance is eligible for data snapshots, you have a banner announcing this fact and two new tiles, Data snapshots enabled and Data snapshots supported. You can select one or more indicators in the list and press **Enable Data Snapshots (quantity of indicators selected)**.

Tip: If you show the data snapshot status column, you can see which indicators support data snapshots.

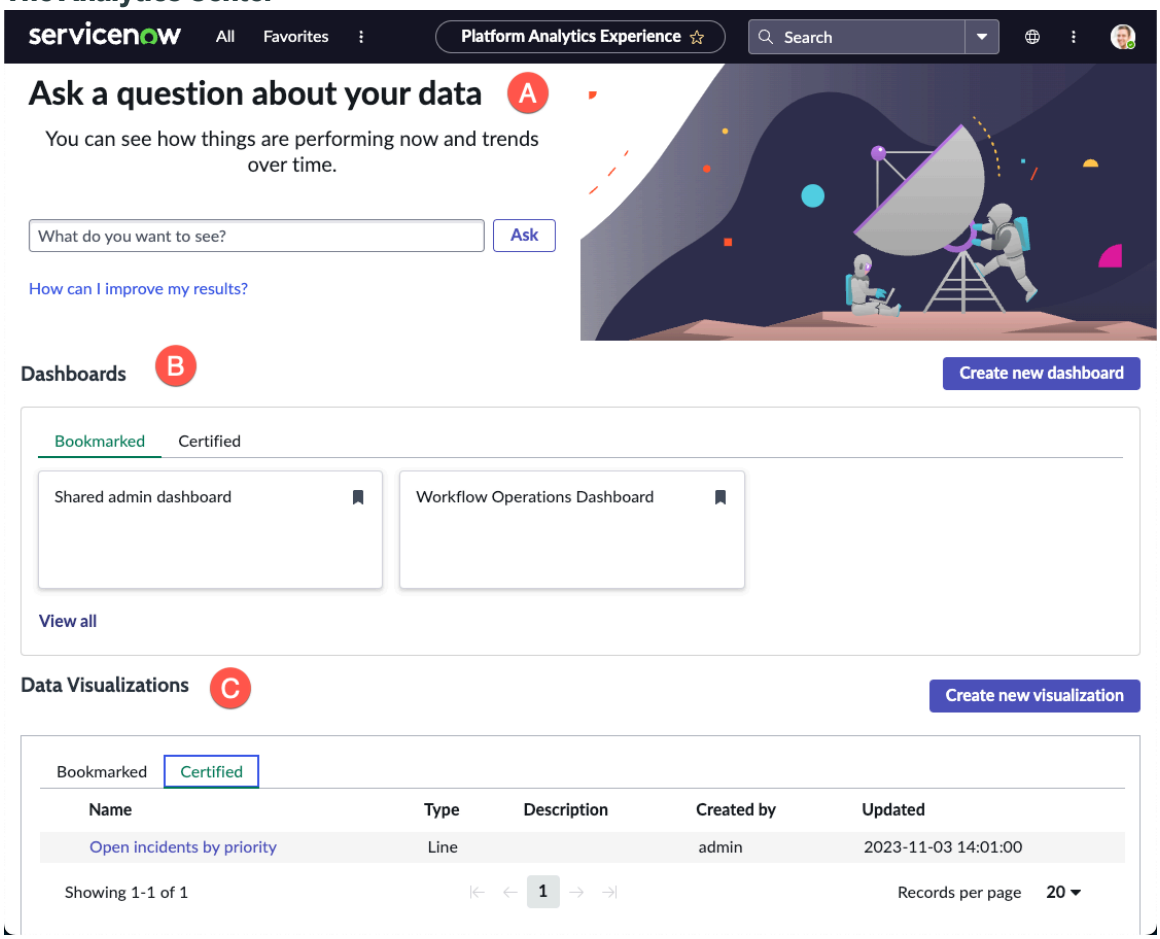
Analytics Center

The Analytics Center provides an overview of your most important dashboards and data visualizations along with a place for you to ask questions about analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Analytics Center



Access the Analytics Center by navigating to **All** > **Platform Analytics** > **Analytics Center**. It contains the following components:

A **Analytics Q&A**

A field where you can ask natural language questions about the trends and health of your processes. (The Natural Language Query feature is required.) For information about configuring and using this component, see the Analytics Q&A reference on the Developer Site.

B **Dashboards**

A set of tiles for each dashboard that you have bookmarked or that an administrator has certified. Click a tile to open that dashboard. To see all the dashboards you have access to, select **View all**. This action opens the Dashboards library. To start creating a new dashboard immediately, select **Create new dashboard**. This action opens either the inline dashboard editor or a dialog where you can select the inline editor or the technical editor, depending on your roles. For information about configuring and using this component, see Dashboards in Platform Analytics.

C **Data Visualizations**

A list of the saved visualizations that you can access based on your roles. You can select visualizations that you have bookmarked or that an administrator has certified. This action opens the Data Visualizations library. To start creating a new data visualization immediately, select **Create new visualization**. This action opens the visualization designer. For more information, see Data visualizations in Platform Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can add an Analytics Center to another experience or configurable workspace. For more information, see Creating Platform Analytics pages in your own workspace.

Analytics Q&A

You can make natural language queries related to indicators, tables, or columns from the Analytics Q&A in the Analytics Center.

Analytics Q&A supports the following languages:

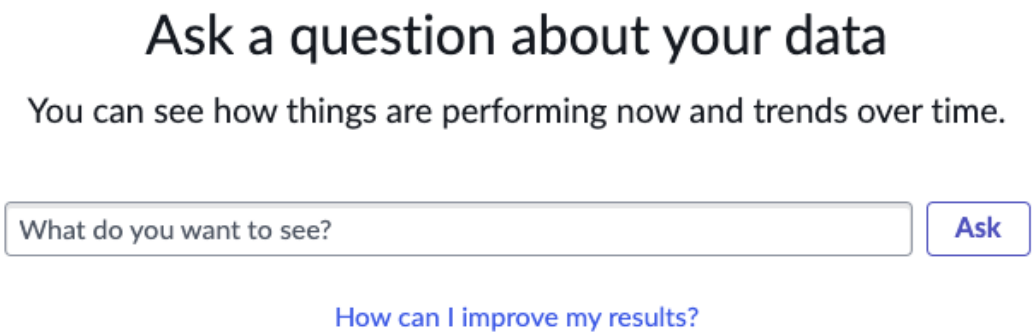
- English
- French
- Canadian French
- Spanish
- German
- Japanese

This feature is not available in sessions that use an unsupported language.

Note: Analytics Q&A is also available in the classic environment, in Report Designer. For more information, see Create a report with Analytics Q&A

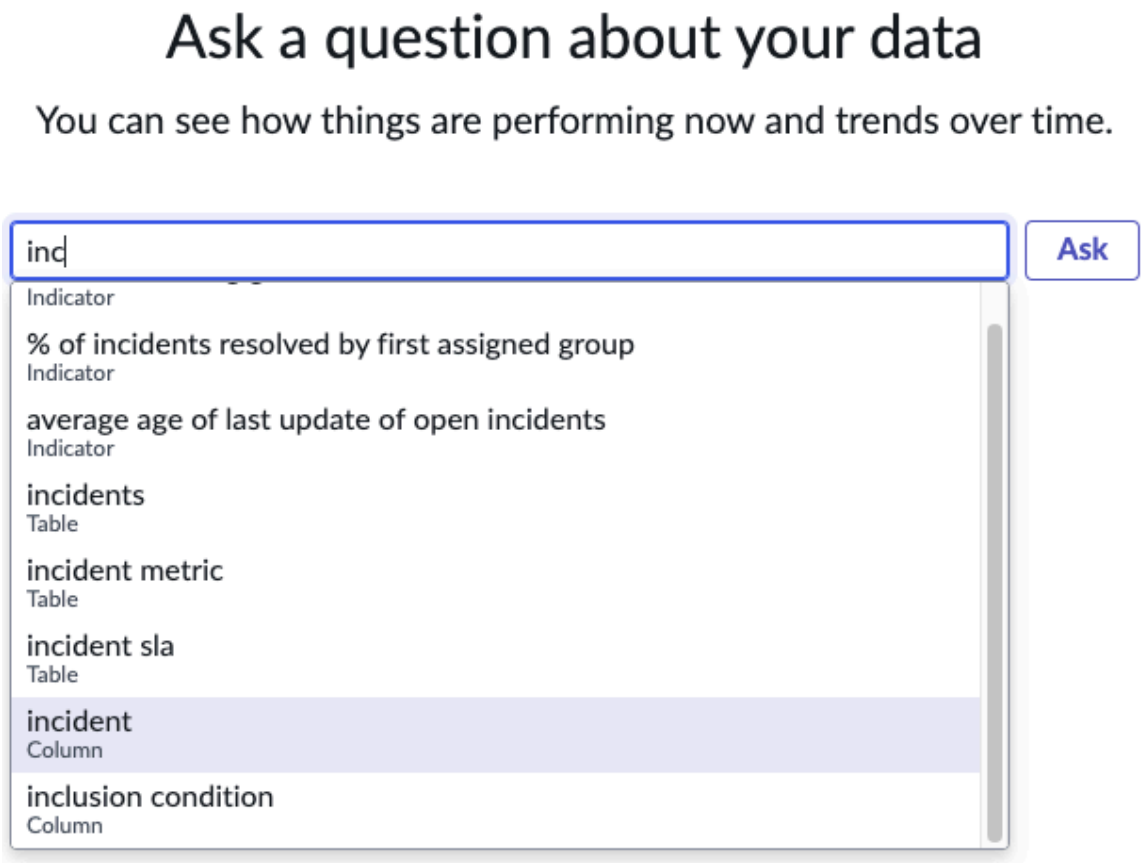
Entering queries

Analytics Q&A before you enter a query



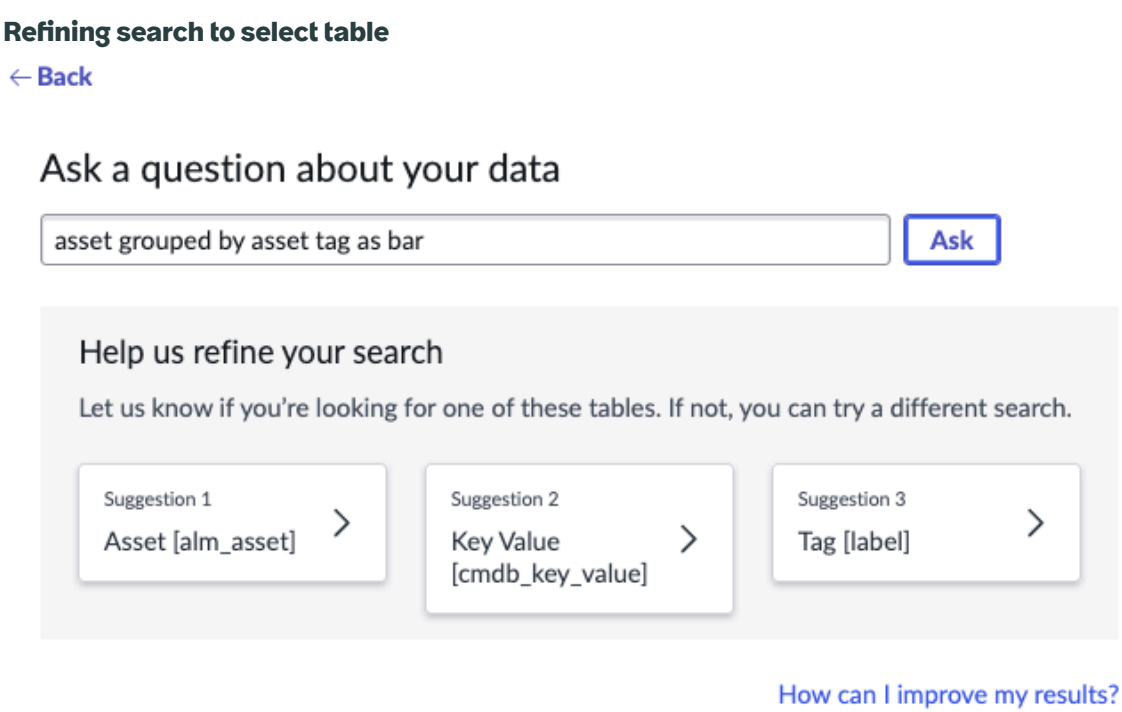
As you type in a query, Analytics Q&A suggests recent searches, indicators, tables, and columns that match what you have typed so far. Only the tables and columns to which you have access are shown.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Selecting from several likely tables

If Analytics Q&A cannot determine which table you want, it shows you up to three likely tables. In the following screenshot, the user has asked for assets grouped by asset tag and displayed as a bar visualization. However, the system cannot determine whether the user is interested in the Asset [alm_asset], the Key Value [cmdb_key_value], or the Tag [label] table.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

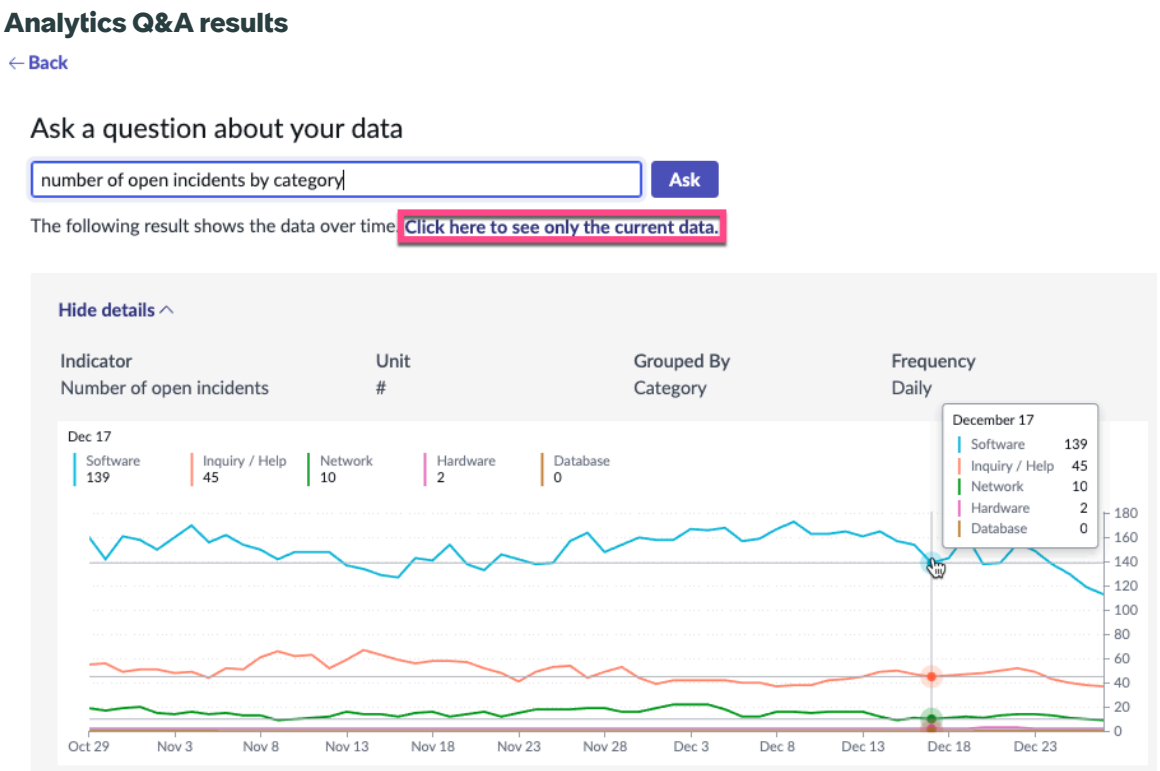
Results

If your query is successful, Analytics Q&A shows your result as whichever of the following visualizations you specified. If you do not specify a visualization, Analytics Q&A determines which visualization is the most appropriate:

- List
- Trend
- Single score
- Bar
- Pie

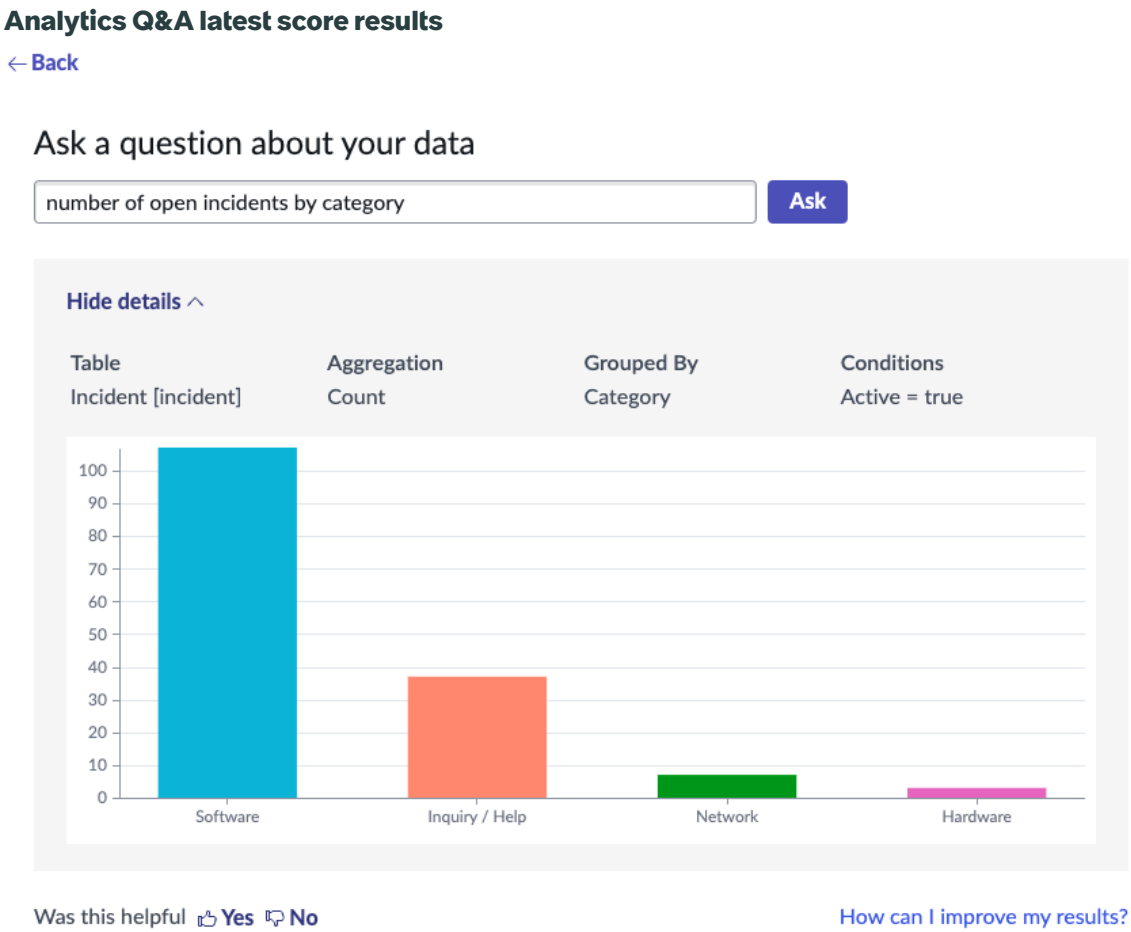
The results are subject to an ACL security check against your roles. Visualizations based on tables follow Reporting security. Visualizations based on Performance Analytics follow PA security.

The following example shows the results of a query where you specify a breakdown for grouping the results. Analytics Q&A determines that the query matches an indicator. Because indicators show trends over time, Analytics Q&A determines that a trend line is the appropriate visualization:



If you do not want to see the change in scores over time, click **Click here to see only the current data**. Analytics Q&A returns the current values on the underlying table instead of the indicator scores.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Hold your cursor over the chart to get more information about breakdowns. In a time series trend, you get the values for all the breakdowns on the selected day. In a column chart of the latest scores, you get the score of the breakdown you select. If the result is a visualization for an indicator, click on a value to open the indicator in KPI Details.

By default, you also see the following details if they apply:

- Which table you are querying
- The unit for the values
- The data aggregation method
- Which column you are grouping by
- What date field you are measuring the trend by, and at what frequency
- Which additional conditions you want to apply to your query

Lastly, you can send feedback on your query results by selecting thumbs up or down.

Note: If you only select one item from the suggestion or indicator or table, the feedback option is not available. By selecting only one item, you do not use the query parser. By not using the query parser, you do not create a query log. The feedback is attached to the query log, but the log must already exist.

New queries

To make a new query or view a list of your KPIs, click **Back**. Returning to the Analytics Center updates your list of the last five successful queries.

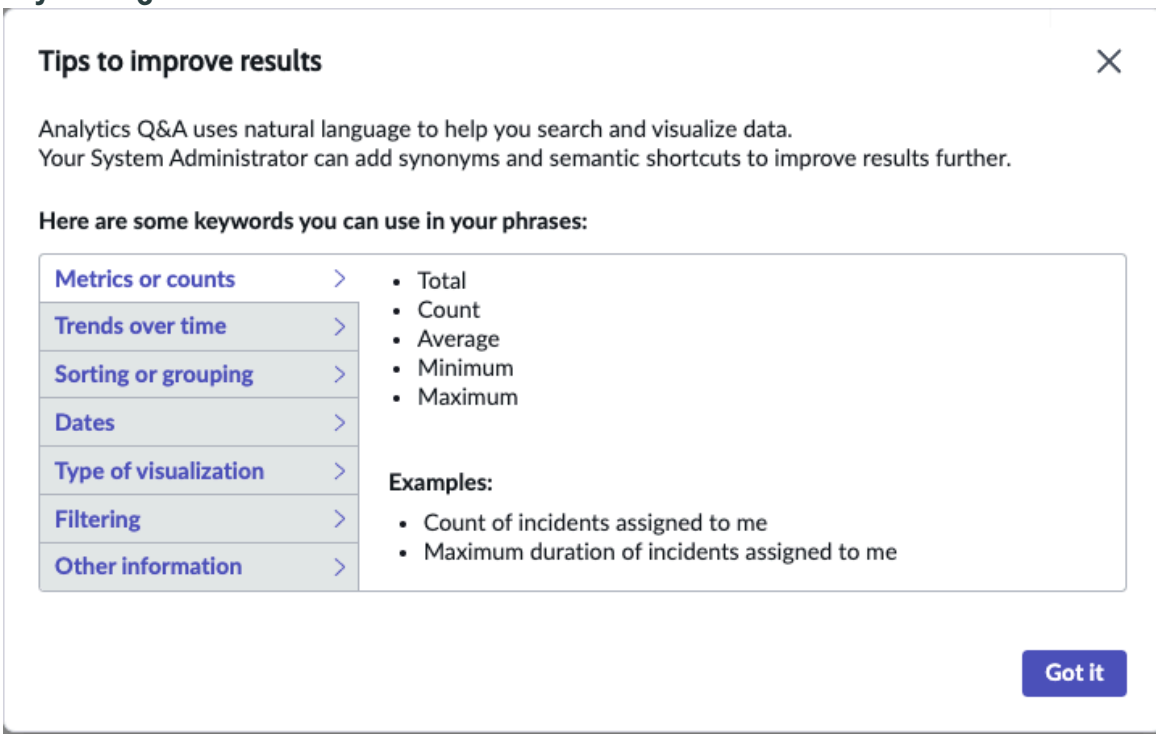
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How to make a valid query

When you write a query, use special keywords to denote the type and range of information you are looking for, filters you want to apply, and other parameters. To see a full list of keywords and their uses, click **How can I improve my results?**.

You can ask your ServiceNow AI Platform administrator to add synonyms and semantic shortcuts for keywords. For more information, see Create an NLQ synonym and Create an NLQ shortcut.

Keywords guide



Creating Platform Analytics pages in your own workspace

You can either create a new workspace with preconfigured Platform Analytics pages in App Engine Studio, or add Platform Analytics pages to your own workspace.

Choose from the following ways to add Platform Analytics to your workspace. These approaches differ in the degree of customization they provide:

- Add an entire pre-built workspace from App Engine Studio.
- Use the page templates that are provided in the UI Builder. You can re-create all of Platform Analytics experience, or you can add only selected parts.

Create a Platform Analytics workspace from App Engine Studio

The App Engine Studio includes a prebuilt workspace that you can add to an application. This workspace includes an Analytics Center page, along with the pages that the Analytics Center links to.

The event handlers for the Analytics Center components of the workspace are all preconfigured. For example, selecting an indicator in the Indicator Scorecard opens that indicator in KPI Details.

For more information about using App Engine Studio to create a workspace with an Analytics Center, see Add an application experience.

© 2026 ServiceNow, Inc. All rights reserved.

Add Platform Analytics pages to a configurable workspace

Add an Analytics Center and its related pages to your own workspace/experience through page templates.

Before you begin

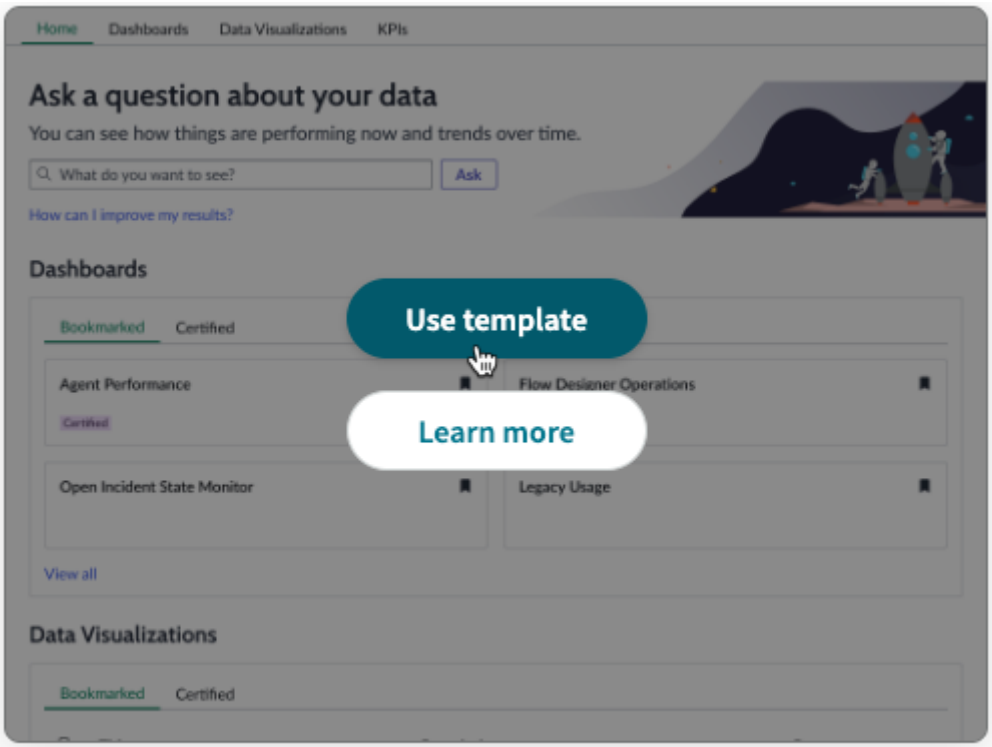
Role required: ui_builder_admin

About this task

In experiences and workspaces, the Analytics Center provides a central page with tabs for all the other pages related to Platform Analytics. You do not have to add an Analytics Center, but this procedure uses that page as example. The same procedure applies to adding the other Platform Analytics pages from templates. Details about those pages are provided at the end of this topic.

Procedure

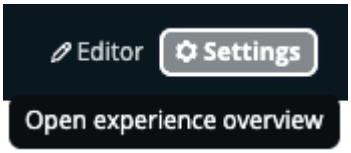
1. Open your experience in the UI Builder.
2. Scroll to the desired template.
   This procedure shows how to set up the Analytics Center template, but the instructions apply to any template, such as Dashboards.
3. Hold your cursor over the Analytics Center template and select **Use template**.



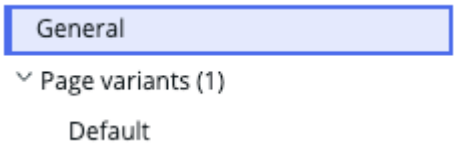
Analytics Center

4. Specify a name and a path for the page and press **Continue**.
5. In the URL parameters page, press **Looks good**.
6. **Optional:** Specify the variant name, audiences, and conditions.
7. Press **Create**.
   The page editor opens.
8. Change from the Editor to the Settings view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



9. Select the **General** variant.



10. Under URL parameters, add the following optional parameters:
    - tab
    - filter

    These parameters ensure that on page refresh, the last open tab of the Analytics Center opens. Also, the last selected filter (such as **Bookmarked**) is enabled.

11. Press **Save**.

Result

You now have a page with a fully configured Analytics Center, including all components. However, none of the links to other pages work until those pages are added and configured.

What to do next

Create pages using the following templates. Follow the same process you used to create the Analytics Center page. Give the pages the following paths and parameters:

Note:

- The default event handlers use the paths in this table. If you specify a different path, you have to customize the event handler as described in Configure custom redirection from a dashboard component.
- Simple List and Dashboard overview are legacy page templates, like Analytics Center. You must specify the parameters manually for these pages. Newer page templates give you the parameters in the course of page creation.
- Platform Analytics is modular. You can create only some of the pages and get their standalone functions. For example, if you only want dashboard support or KPI Details, create the pages with that functionality and don't create an Analytics Center.

Template name	Function	Required parameters	Optional parameters	Path
KPI Details	Displays the details of a single indicator	uuid	scoreDate, breakdowns, domain, aggregate	ac_kpi_details
Simple List	Displays a list of table records	table	listTitle, query, disableInlineEditing, listView	simplelist

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Template name	Function	Required parameters	Optional parameters	Path
Standard record	Displays the details of a table record	table, sysId	query, extraParams, views, selectedTabIndex	record
Dashboard overview	Displays all dashboard tiles	none	none	all-dashboards
Dashboards (see Add a dashboard to a Dashboards page)	Used to create, edit, and show dashboards along with data visualizations inside those dashboards. This page template is the minimum requirement for dashboard support.	none	edit, sysId, tabSysId, filter, element	dashboards
Visualization designer	Used to create and edit data visualizations independently of dashboards, without using the Dashboards editor.	sysid	none	visualization-designer

Important: You must use these paths, which are the same paths of the pages in the Platform Analytics experience. The preconfigured event handlers on the pages use these paths. If you do not give your pages these paths, the event handlers will not work.

Add a dashboard to a Dashboards page

Add a dashboard to a Dashboards page

You can add either a technical dashboard or one made in the inline editor to a page you built from the Dashboards page template. Configure the dashboard component on that page.

Before you begin

Role required: ui_builder_admin

About this task

To add a dashboard to a page in UI Builder, create the page from the Dashboards page template, as described in Add Platform Analytics pages to a configurable workspace. You can then either populate the dashboard in the inline editor or expose an existing dashboard. The existing dashboard can be either a technical dashboard or one created in the inline editor. You can expose an entire dashboard or only selected tabs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. If there is an existing dashboard that you want to show in your experience, add your experience or configurable workspace to the **Dashboard visibility** field in the details of that dashboard.
   Dashboard details are available through the inline editor, even for technical dashboards. For more information, see Configure Platform Analytics dashboard details.

   Note: Ignore this step if there is no existing dashboard that you want to show.

2. Navigate to **All** > **Experiences** and open your workspace.
3. Create a page in the workspace using the Dashboards page template, or open an existing page created from the template.
   For more information, see Create a page from a template and Add Platform Analytics pages to a configurable workspace.

   Note: You cannot add a Dashboard component to a page. You can only create a page from the Dashboards template. This page will include a Dashboard component.

   You now have an inline dashboard editor that you or another user can open by navigating to this page.
4. Open the Dashboard component on the page and go to the configuration panel.
   If you want this page to display an existing dashboard, continue to the next step. If you want this page to open on an empty inline dashboard editor, skip to Step 7.
5. In **Default dashboard**, select the dashboard that you want to add to the page.
   - If there is one specific dashboard you want to show, select it from the dropdown list. If your dashboard is not listed, be sure it is visible in this workspace or experience as described in Step 1.
   - If you want different dashboards to be displayed according to choices that the viewer makes on the page, use data binding to select the dashboard according to a @state variable.
   - For other ways to select the dashboard dynamically, write a script.

   Note: If you select a dashboard that was created in the inline editor, filters on that dashboard retain their values across logins or page refreshes unless the filter configuration is edited.

6. If you only want to show a specific tab of the imported dashboard, specify the **Tab SysId**.
   Like with the dashboard itself, you can specify a tab or have it selected dynamically through data binding or scripting.
7. Select **Use as embedded** if you want to use the dashboard component inside your page in isolation from the page's URL parameters.
   In other words, turn on for full control over what the dashboard renders, regardless of URL parameters. The Copy URL and Copy URL with filter options are not available on such embedded dashboards.
8. Set the other configuration options as they are described in Dashboard component properties.

What to do next

You can open the dashboard in runtime and edit it in the inline editor. Any viewer with edit rights can do the same. If the viewer has the rights to save a dashboard to the library, they have the option of saving the dashboard locally or altering the original dashboard in the library in Platform Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dashboard component properties

Disable and enable dashboard component runtime user abilities with these properties.

Field	Description
Tab Sys Id [tabSysId]	If you want to display only one tab of an existing dashboard, specify its SysID. Also specify the dashboard in Default dashboard. You can select a dashboard statically or dynamically, through a state variable or a script.
Use default redirections [defaultDrilldowns]	When activated, the inline editor adds default pre-configured redirections for when a segment of a data visualization is clicked. To implement a custom drilldown, set this property to false, then add and customize a Dashboard Widget Clicked event handler as described in the Events section. Default: true
Disable the whole header [hideHeader]	Viewers do not see the dashboard header, only the content.
Hide dashboard picker [hideDashboardPicker]	When true, hides the dashboard picker on all dashboards in the workspace Default: false
Disable sharing [hideShareButton]	Hides the Share button on all dashboards from all users, but applies only to the Dashboards page where this value is set. Default: false
Disable editing [hideEditButton]	Hides the Edit button on all dashboards from all users, but applies only to the Dashboards page where this value is set. Default: false
Disable dashboard creation [hideCreateNewButton]	Hides the Create New Dashboard option in the context menu of the Dashboard page. Users can still create dashboards from the Analytics Center or the dashboards library (Dashboard Overview component). When false:  When true:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	 Default: false
Use as embedded [useAsEmbedded]	Set to true when you, as a developer, want to use the dashboard component inside your page in isolation from the page's URL parameters. Meaning, you want full control over what the dashboard renders, regardless of URL parameters. The Copy URL and Copy URL with filter options are not available on such embedded dashboards. Default: false
Default dashboard [defaultDashboard]	Select an existing dashboard to show in this dashboard component. This other dashboard is usually in the Platform Analytics Experience. For that dashboard to be shown, it must include your workspace or experience in the **Dashboard Visibility** field in its dashboard details, as described in Configure Platform Analytics dashboard details. You can select a dashboard statically or dynamically, through a state variable or a script.
Shareable Filter SysID [filterId]	The sysId of the persisted filter set up of a dashboard
Global filters [globalFilters]	Filters for the visualizations within the dashboard. These filters apply to all relevant data visualizations. The format of the value passed to globalFilter is the stringified form of {encodedQueries: 'encoded-queries-string', filters: 'PAR-Filter'}. Both encodedQueries and filters are transformed into PAR filters internally and merged with existing filters in the dashboard. Either `encodedQueries`, `filters`, or both can be specified. In the following example, equivalent `encodedQueries` and `filters` values both filter visualizations that show records from the Incident [incident] table based on a State field value of 1 or 2: `JSON.stringify({ encodedQueries: {incident: 'stateIN1,2'}, parFilters: [{ order: 0, apply_to: ['incident.state'], values: ['1', '2'] }] })`
Drilldown to Core UI [drilldownToCoreUI]	Toggle on for drill down on table data sources to redirect to the Core UI list of table records. When off, drilling down opens a Simple List component of the table records, if the workspace contains a simple list. Does not apply to technical dashboards. Data visualizations on technical dashboards have to have their Visualization Clicked event handlers configured for drilldowns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Default: off
Use data broker to fetch data [useDataBroker]	When toggled on, the dashboard prefetches static JavaScript, such as dashboard metadata, using a data broker. The Dashboard data broker preset automatically toggles this property on. Without the preset, this property is off by default. For more information, see Configure dashboard data broker.
Data broker response for the dashboard [data]	The response for the data broker when it is used. The Dashboard data broker preset automatically sets a JSON object for this property. You can override this value or set it manually without turning the preset on, if you absolutely need to.

Dashboard component events

Select event handlers to configure the actions (events) provided with the dashboard component.

The Events tab shows the events used by the dashboard component. To view the available events, select **+ Add event mapping**. Select the event in the list to add one or more event handlers.

Event handlers

Event handlers work with data resources to link the dashboard actions to the data you want to display to your users. Select the event in the list to add one or more event handlers.

Event descriptions

Event	Description

Navigate to dashboard overview page	Dispatched when the dashboard is closed and redirects to the dashboard library. You can customize this behavior by changing the route and title in the Redirect to dashboard list client script. To open client scripts, select the <> icon in the page's side bar.
	`* @param {params} params`
	`* @param {api} params.api`
	`* @param {any} params.event`
	`* @param {any} params.imports`
	`* @param {ApiHelpers} params.helpers`
	`*/`
	`function handler({api}) {`
	`api.emit('SCREEN_STATUS_CHANGED', {status: 'closed'});`
	`api.emit('NAV_ITEM_SELECTED', {`
	`route: 'dashboard-library',`
	`title: 'Dashboard Library',`
	`});`
	`}`

Dashboard Widget Clicked	Add this event handler if you want to override the default drilldown with custom behavior when a visualization on the dashboard is clicked. It uses the Dashboard Widget Clicked client script. To add a custom drilldown:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event	Description
	1. Set the defaultDrilldowns property to false. 2. Add the Dashboard Widget Clicked event handler. 3. Open the Dashboard Widget Clicked client script. To open client scripts, select the <> icon in the page's side bar. 4. Locate the code `api.emit('NAV_ITEM_SELECTED', payload);` and update `payload` to align with your custom redirect logic.

Configure custom redirection from a dashboard component

If you have created a page in your workspace from the Dashboard page template, you can customize the on-click redirection from the dashboard component on that page. The inline dashboard that this component displays will follow the custom redirection.

Before you begin

You have created a workspace in UI Builder with a page generated from the Dashboard page template. You may also have set the dashboard component in that page to display a dashboard from the library as described in Add a dashboard to a Dashboards page.

Role required: ui_builder_admin

About this task

Important: The procedure described here applies only to dashboards created in the inline editor. For technical dashboards, you configure redirection through a drilldown event for each data visualization. For more information, see Add a drilldown event to a data visualization on a technical dashboard.

Procedure

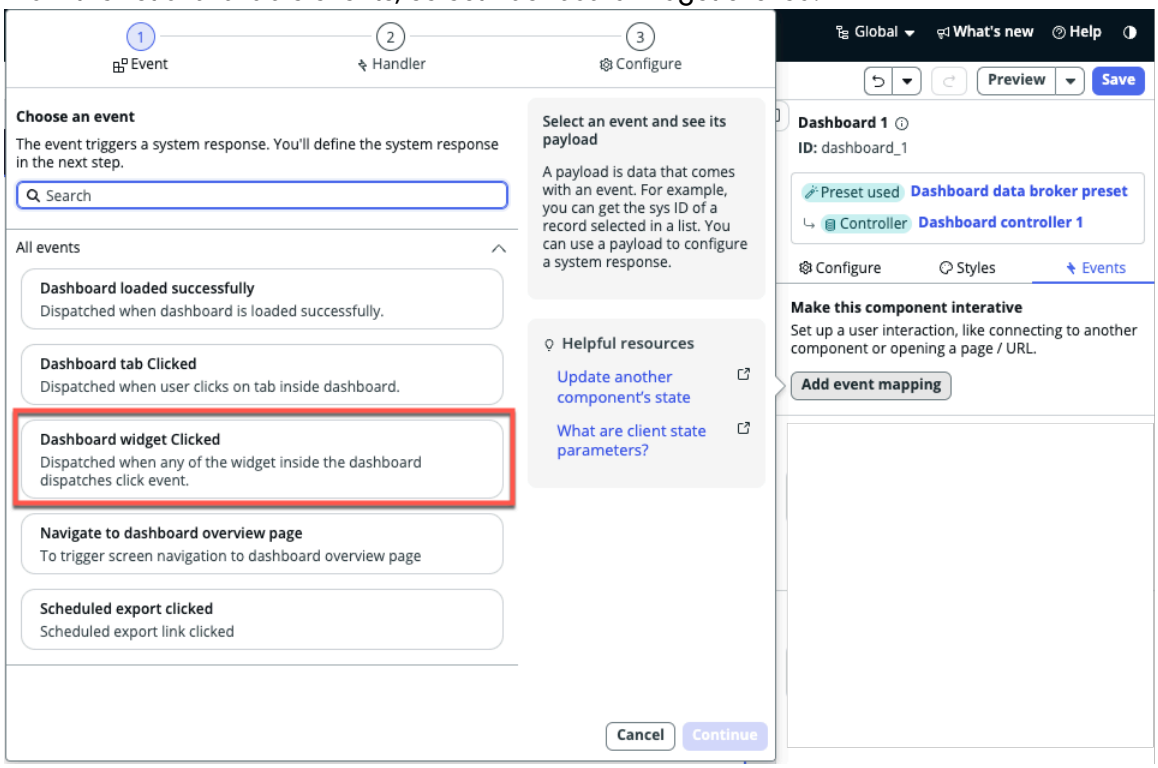
1. Open your workspace in UI Builder.
2. Open the relevant page.
   You will have built this page using the Dashbords page template.
3. Select the dashboard component.
4. In the configuration panel, turn off **Use default redirections**.

   You have turned off redirections. Clicking on a visualization at runtime does not trigger any actions.
5. In the events panel, look whether there is a "Dashboard widget clicked" event handler.
6. If there is no "Dashboard widget clicked" handler, add one.

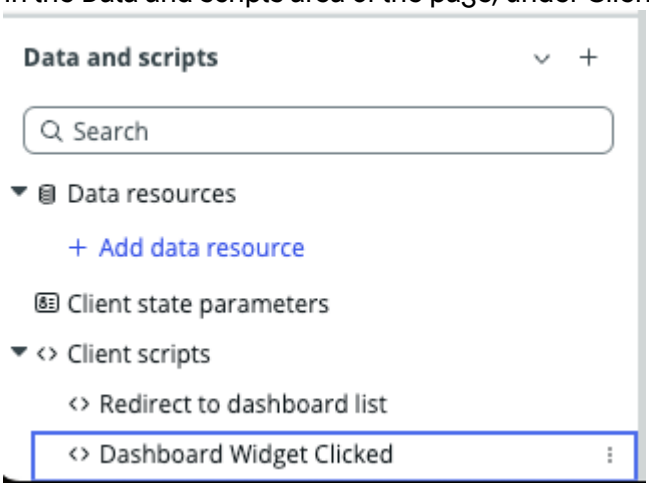
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **+ Add event mapping**.

b. From the list of available events, select Dashboard widget clicked.



7. In the Data and scripts area of the page, under Client scripts, open Dashboard Widget Clicked.



8. In the Edit client script pane, find the line `api.emit('NAV_ITEM_SELECTED', payload);`.
9. Update the payload to align with your custom redirection logic.

Result
All redirections from data visualizations on that dashboard open your specified target.

Pass global filters to the dashboard page template

Global filters are sent to the dashboard to serve as filters for the visualizations within the dashboard. These filters are merged with existing filters in the dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Global filters are filters that apply to visualizations on the target dashboard. These filters apply to all relevant data visualizations. The format of the value passed to globalFilter is the stringified form of {encodedQueries: 'encoded-queries-string', filters: 'PAR-Filter'}. Both encodedQueries and filters are transformed into Platform Analytics filters internally and merged with the existing filters on the dashboard.

Either `encodedQueries`, `filters`, or both can be specified. In the following example, equivalent `encodedQueries` and `filters` values both filter visualizations that show records from the Incident [incident] table based on a State field value of 1 or 2:

```
JSON.stringify({
    encodedQueries: {incident: 'stateIN1,2'},
    parFilters: [{ order: 0, apply_to: ['incident.state'],
 values: ['1', '2'] }]
})
```

Configure links to dashboards on UI Builder pages to open dashboards that are already filtered.

Before you begin

Role required: admin

Procedure

1. Navigate to the UI Builder page that you want to add a global filter to.
2. Configure the behavior of the hyperlink or button (or something else) on the page to point to the dashboard with the specified sys_ID.
   In this example, the sys_ID is 1238.

   The showInfoMessage parameter, if true, shows the configured infoMessage on the linked dashboard when filters are passed.

```
api.emit('NAV_ITEM_SELECTED', {
        route: 'dashboards',
        params: {
            sysId: '1238',
            unifiedFilters: JSON.stringify({
                showInfoMessage: true, // default false
                infoMessage: 'custom info message', // if not
 passed and if showInfoMessage is true then the default message
 is displayed
                encodedQueries: {
                    incident: 'priority=1'
                },
            })
        }
    });
```

Configure dashboard data broker

Activate the Dashboard data broker preset and configure the data broker to potentially speed the loading of dashboards by prefetching some data.

Before you begin

Role required: ui_builder_admin, admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

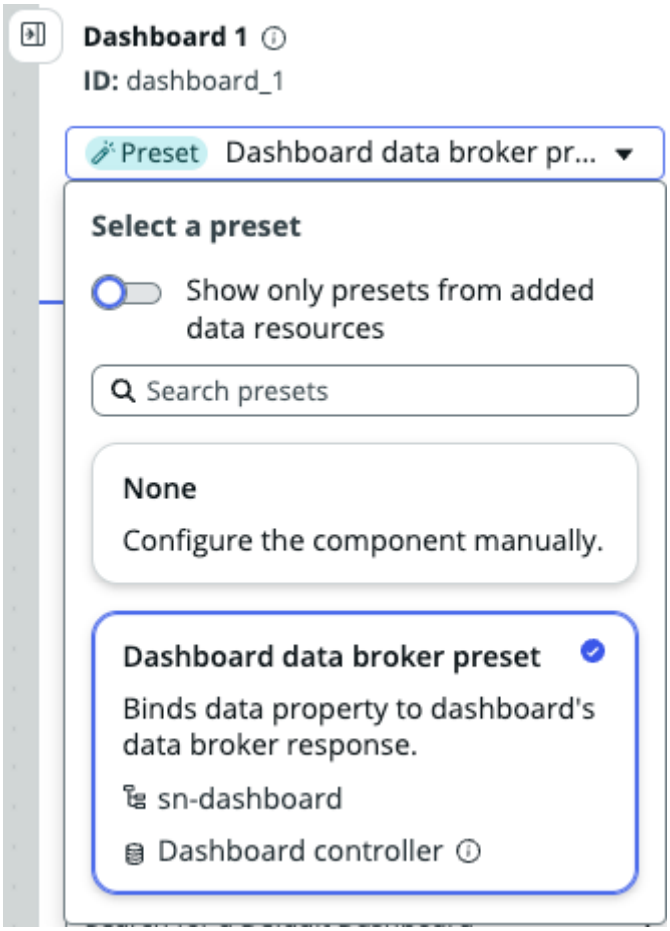
About this task

The dashboard includes a Dashboard data broker preset. This data broker prefetches all the static JavaScript assets that are required by the visualizations that are rendered in the dashboard. This prefetch could speed the loading of visualizations that include many such assets.

This data broker prefetches data only on direct page loads. It does not apply on click-through page loads, such as when the dashboard is opened by selecting a URL link from another page. It also does not function when the dashboard is used as an embedded component.

Procedure

1. Open your workspace and either create a page from the Dashboards template or navigate to an existing page from that template.
2. Open the Config tab in the configuration panel of the Dashboard component.
3. Check whether the Dashboard data broker preset is activated.
   The preset is activated by default.



4. In the **Data and scripts** section of the page, open **Data resources** > **Data controller 1**.
   You can rename the data resource if desired.
5. Check whether the properties are correct:

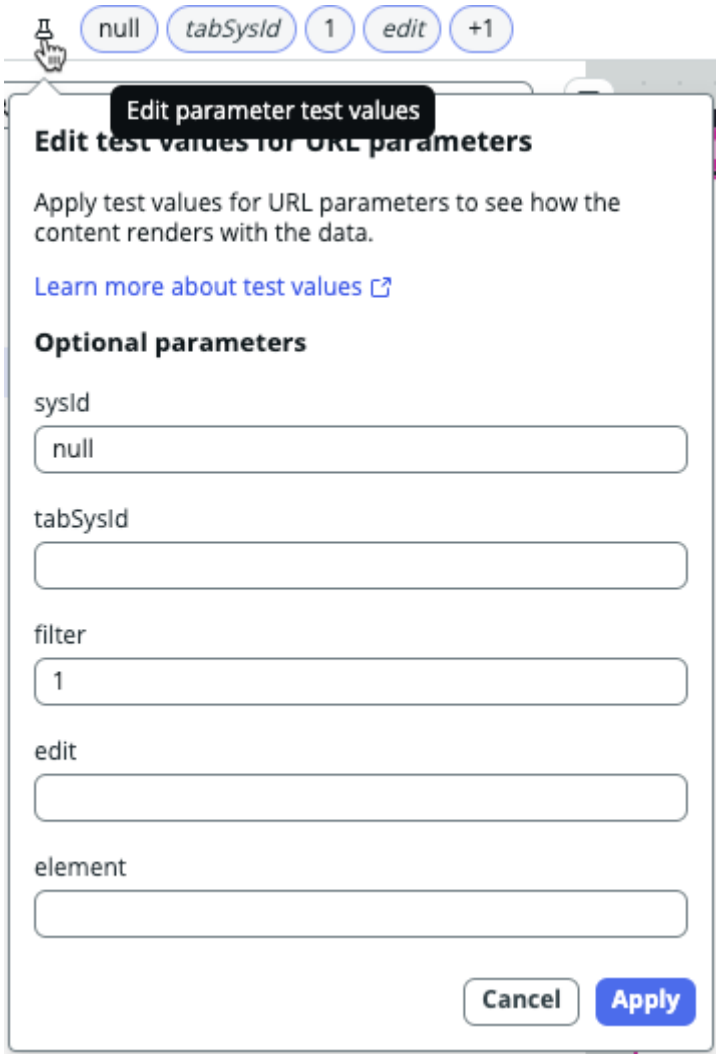
Property	Value
experienceId	app > appId

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Value
dashboardSysId	props > sysId
filterId	props > filter

6. Add default values for the optional page parameters.

Parameter	Value
sysId	null
filter	1



7. In the configuration panel, check whether the following properties are correctly set:

Property	Value
Use data broker to fetch data	true
Data broker response	dashboard > data: ({"success":false})

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can customize these values, but you probably do not have to.

8. Save the page and open it in runtime.

KPI Details

KPI Details page enables you to delve into the information inside your Performance Analytics indicators (KPIs).

Get started

Explore Learn the purpose of KPI Details and how to open it	Investigate indicators How to extract information from an indicator using KPI Details
Set targets and thresholds Define indicator value goals and set limits	Reference System properties and more

Troubleshoot and get help

Exploring KPI Details

KPI Details is an exploratory view of indicators, used for more detailed analysis. It lets you see trends, predictions, breakdowns, and associated records for a specific indicator.

https://player.vimeo.com/video/1058665909?h=4d57780e26&badge=0&autopause=0&player_id=0&app_id=58479

KPI Details lets you answer questions such as:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- “Are daily new critical incidents rising since the last update?”
- “Is the rise in critical incidents faster than the rise in P3 incidents?”
- “What are the top 3 groups with the highest increase in critical incidents over the past quarter?”
- “What specific incidents correspond to that spike in incidents last week?”
- “What’s my usual (median/ average/ total) number of new incidents over the past 3 weeks? Past 2 months?”

Learn how to use KPI Details to accomplish the following tasks:

- Review the overall health of an indicator.
- Explore trends for any indicator.
- Review individual records corresponding to any date.
- Manage Indicator targets and thresholds in KPI Details for your indicators.

Enhance KPI Details by configuring notifications of significant trends in KPI Signals.

Tip: A free training for KPI Details is available from the NOW Learning Center.

Note: Values between 10,000 and 999,999 are rounded off to the nearest thousand and abbreviated with a K, such as 11K for 11,234. Values between 1 million and 999,999,999 are rounded off to the nearest million and abbreviated with an M. Values of 1 billion and higher are rounded off to the nearest billion and abbreviated with a G.

Performance Analytics (Indicator data sources)

View KPI Details

From a list of indicators, select an indicator to open its KPI Details page.

Before you begin

Role required: None. However, upgraded instances may require pa_viewer.

About this task

The following actions open KPI Details:

Procedure

- Select an indicator in the Platform Analytics indicator library, **Platform Analytics** > **Library** > **Indicators**.
  For an indicator to appear in that list, the **Show in library** setting in the Access Control tab of that indicator record must be selected (true).
- Select a point on the graph of an indicator in a data visualization.
  While by default this opens KPI Details, the specific data visualization might be configured not to.
- If a query in Analytics Q&A returns an indicator, click on an indicator score to open the indicator in KPI Details.
- In an application built with Next Experience Components, a component such as Indicator Scorecard may link to KPI Details.

Result

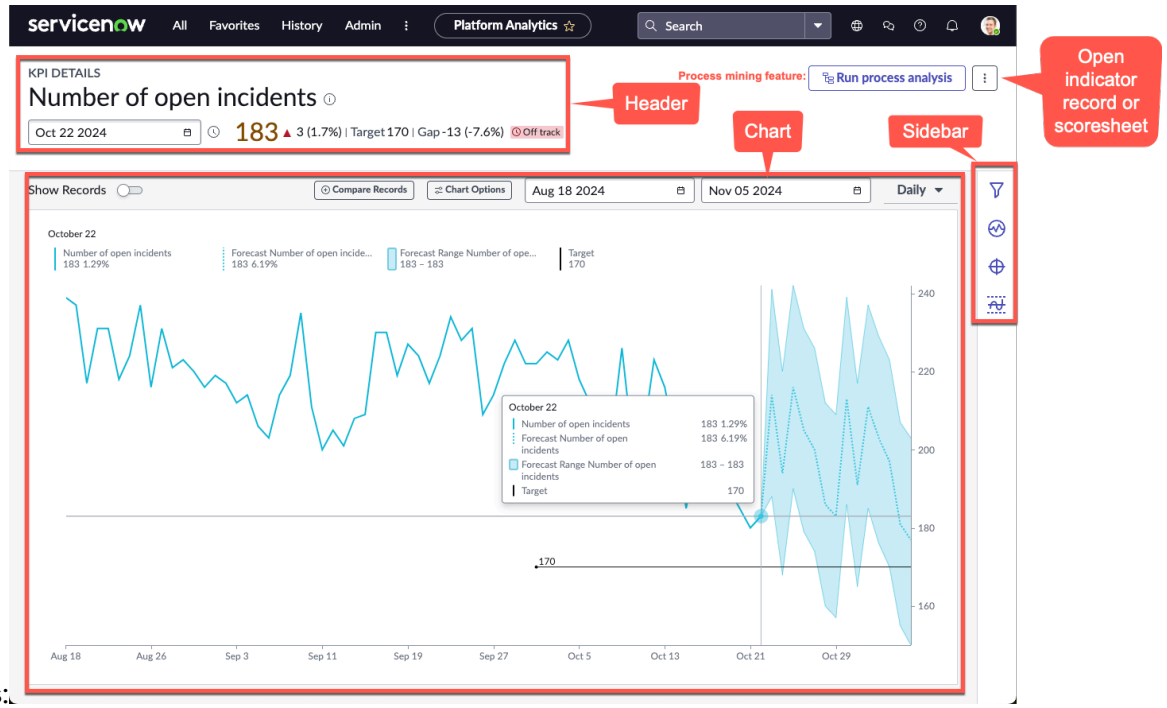
The KPI Details page on the selected indicator opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Examining indicators with KPI Details

The KPI Details feature enables you to delve into the information behind your key performance indicators. Apply forecasts, trends, targets, and thresholds. Filter by breakdown element or apply time series aggregations.

KPI Details has several sections:



Header

The header contains the name of the indicator, a date selector (default: last data collection), and the score on that date. The absolute and percentage differences between that score and the previously collected score are shown. If the indicator has Maximize or Minimize set, the color of the score and the score change direction arrow indicates whether the score is improving or getting worse.

The date selector uses whatever calendar the indicator uses.

If real-time scores are enabled for the indicator, select in the header whether to view them, using the clock icon. This icon is transparent when real-time scores are disabled and solid when they are enabled. For more information, see Real-time scores.

If a target is set for the selected date, the header shows the target value and the gap between the score on that date and the target, in both absolute and percentage terms. If both target and forecast are shown, as set in Chart options in KPI Details, a badge shows whether the indicator is on track or off track to meet the target by the review date.

Warning: Real-time scores can differ per viewer and differ from collected scores. Real-time scores are taken directly from the relevant facts tables. Therefore, the Access Control Lists (ACL) of those facts tables determine the real-time scores that each logged-in user sees.

Indicator chart

The indicator chart shows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Chart options** menu. For more information, see Chart options in KPI Details.
- A date picker to choose the date range of the information in the chart.
- A time series graphic representation of the indicator over time. Click on a point in the graph to see the details for that date.
- A time series aggregation selector. For more information, see Select time aggregation in KPI Details.
- The **Show records** toggle, which shows you the records associated with the indicator score on the selected date. For more information, see Show, compare, create, and edit records in KPI Details.

Warning: In some cases, when you collect second-level breakdowns, the score and the number of records do not agree. When these values do not agree, the score is correct. For more details and an example, see KB0748969.

Important: Records are not listed for the "Unmatched" breakdown element when you select it in the filter.

Sidebar

Use the sidebar controls to:

- Filter by breakdown and element .
- View KPI Signals for the indicator ( ). See KPI Signals.
- Set an indicator target or threshold( ). See Indicator targets and thresholds in KPI Details.

Process analysis

Besides these three sections, a **Run process analysis** button lets you launch a Process Mining analysis on the indicator. For more information, see Process Mining.

More actions menu

You also have a More actions menu that gives you access to the indicator record and scoresheet. For more information, see Access indicator record or scoresheet from KPI Details.

Related topics

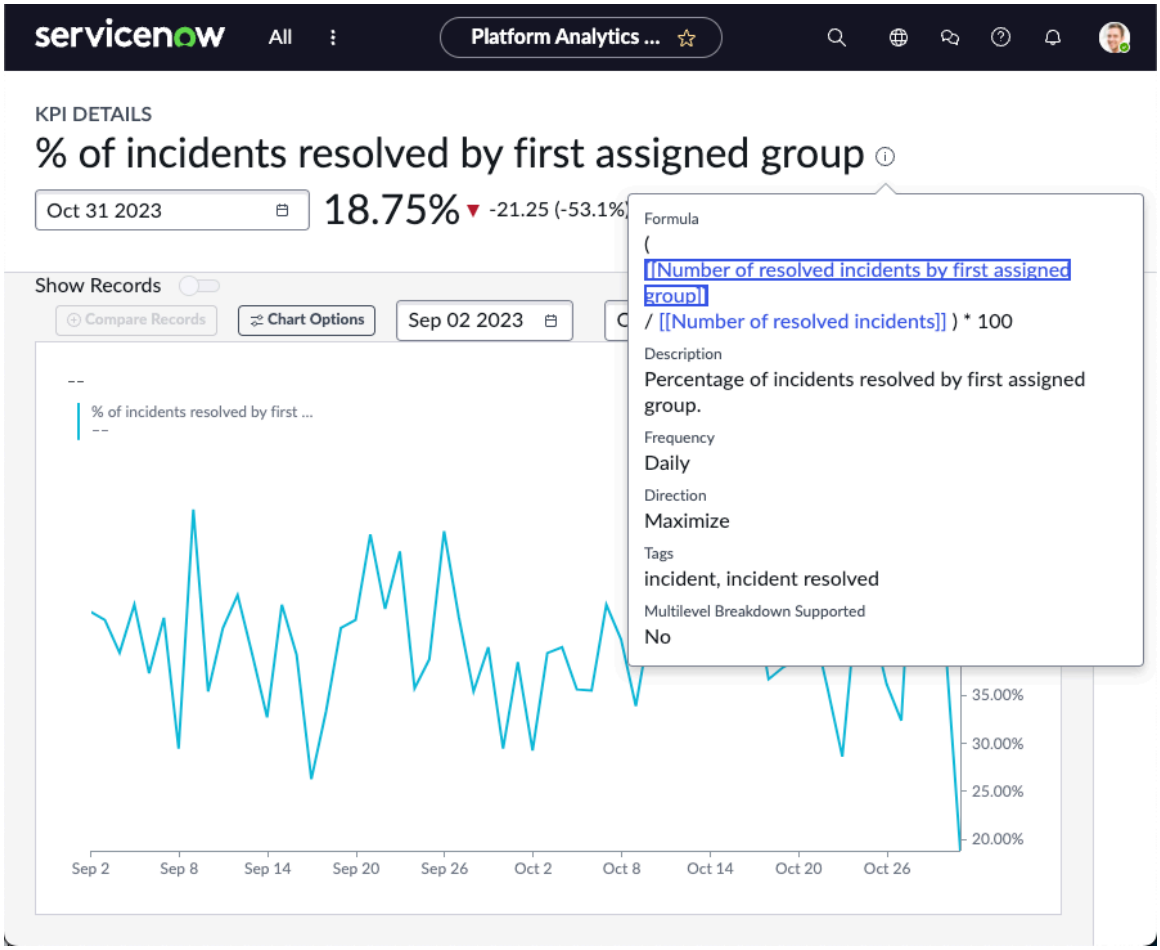
Performance Analytics (Indicator data sources)

View contributing indicators to a formula in KPI Details

If you're viewing a formula indicator in KPI Details, you can list the contributing indicators to that formula. Depending on the KPI Details configuration, you can open the contributing indicators in KPI Details.

The Information icon next to the name of the indicator opens an information pane. If the indicator is a formula indicator, the information pane includes the formula.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



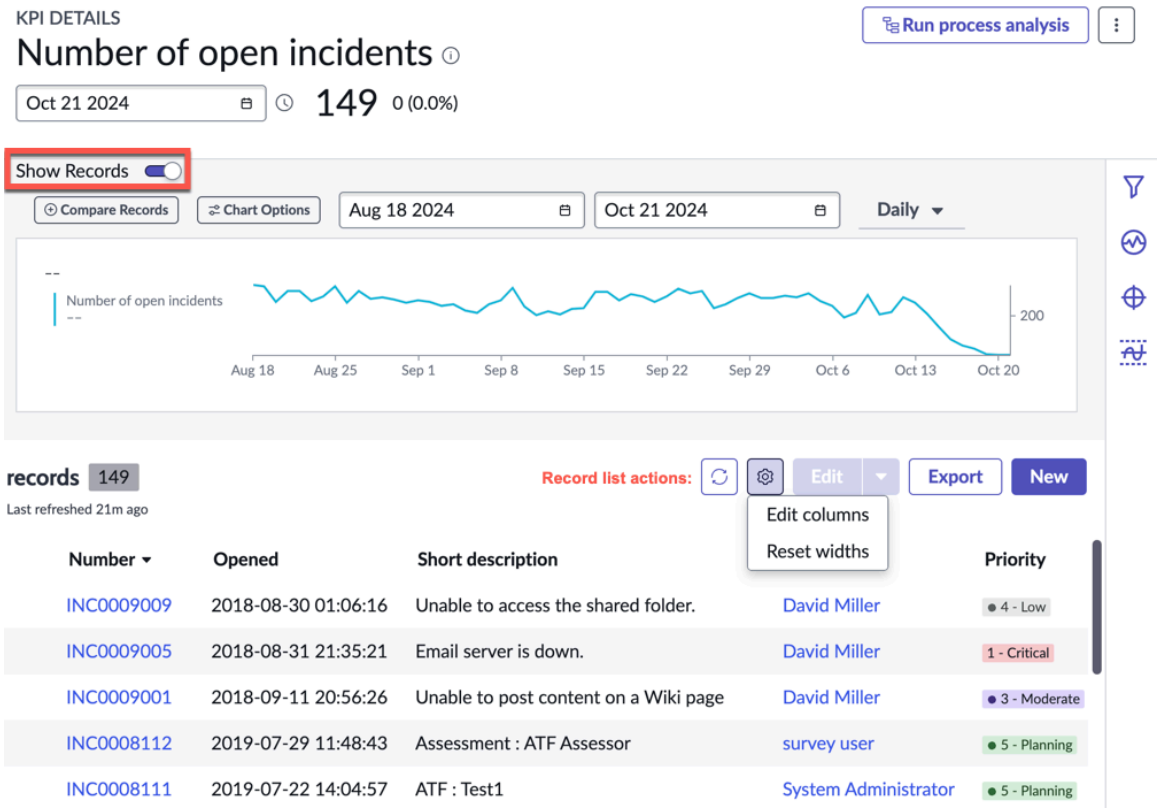
Depending on how the UI Builder admin has configured the KPI Details component you're viewing, the names of the contributing indicators can be clickable. If clickable, selecting an indicator name opens that indicator in KPI Details. Again depending on the configuration, the indicator can open either in the same KPI Details tab or a new tab in the same workspace.

Show, compare, create, and edit records in KPI Details

You can view the list of records underlying an indicator score. You can create a record, edit individual records, or compare records. You can also export the list of records.

The scores for automated indicators are based on values collected from table records. If you are looking at an automated indicator in KPI Details, toggle **Show records** to see a list of the records underlying the indicator score. You see the records behind the score for whichever date you have selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:

- Records are not available for formula indicators, such as indicators that calculate percentages or averages.
- The list view of shown records follows one of these settings, in order of priority:
  1. The value of the **Records list view** config property in the UI Builder, if set
  2. The value in the **List View** field on the indicator source, if set
  3. The Default view

View or edit a record

If you have activated **Show records**, you can edit one of the records from inside KPI Details.

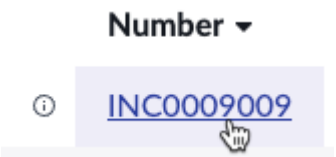
Depending on how the KPI Details component is configured, you can edit a listed record in one of the following ways:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the Quick view pane. To open the Quick view for a record, click the Information icon (ⓘ) next to the record's list entry. You can view the activity on the record or edit the record. Click **Update** when you are done.

  The Quick view pane is available only if it has been turned on in UI Builder.

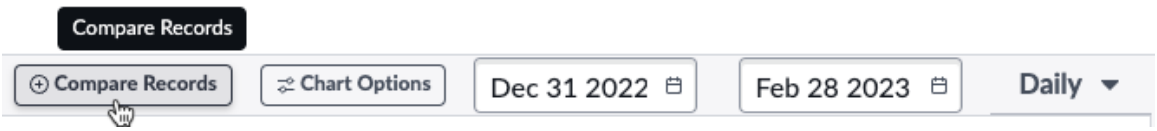
- In a separate tab for the record. To open the record in a new tab, click the value in the first column of its list entry.



Compare records

You can compare indicator scores and underlying records for any two periods. List the records that have been moved out, shared, or moved in between these periods.

Select **Compare records** above the visualization to open the record comparison view.



Select the periods to compare either by typing in the dates or by using a calendar. Dates are in a [Jan-Dec] DD YYYY format. The period on the left must be the same or earlier than the period on the right. If you try to select a later period on the left or an earlier period on the right, both scores switch to the period you just selected.

Between the two scores, you see the number of records that have been moved out, shared, or moved in between these periods. Each of these values is a button. Select a value to list the corresponding records.

You can compare records filtered on up to two breakdowns, each with one element. You cannot compare records filtered on multiple level elements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can compare records from a past period with real-time scores. When real-time scores are turned on, by default you compare the score from the last collected period to the real-time score.

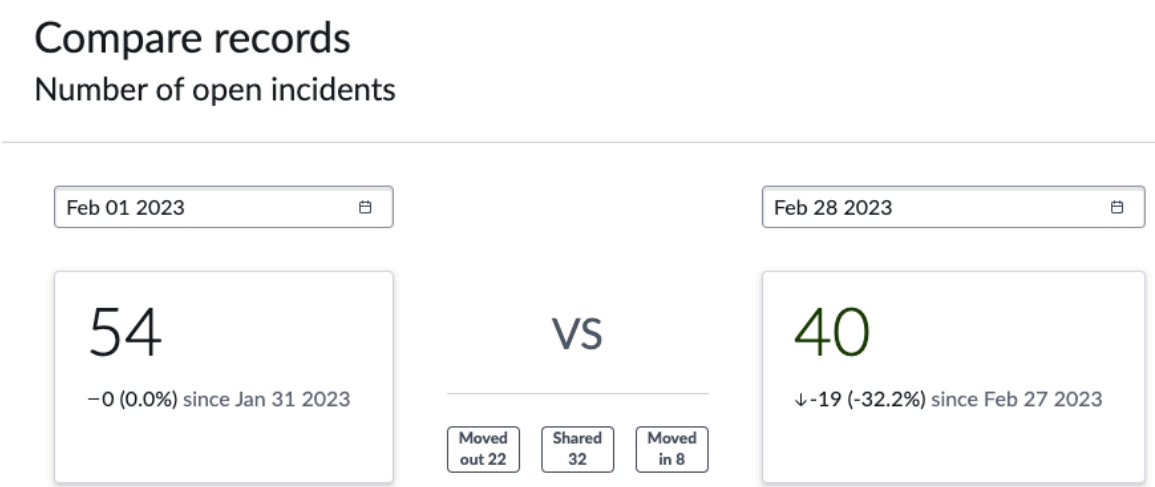
Important: Record comparison is available only for automated indicators that have record collection turned on. Also, if you apply a time aggregation, you can compare only scores, not records.

Example: Comparing records

In this example, the number of open incident records on February 1, 2023 is compared with that on February 28. You see the following changes:

February 01	February 28
54 records	40 records
Change of 0% since January 01	19 fewer records (-32.2%) since February 27

- Moved out (Removed between the dates): 22
- Shared (Present on both dates): 32
- Moved in (Added between the dates): 8



Record list actions on KPI Details

If you show underlying records on KPI Details, you can refresh or export the list, select the columns to view, or create a new record.

The records list on KPI Details has a set of buttons and icons for actions on the list:

- The Refresh action simply refreshes the list.
- The Records - List Actions control lets you select which columns to show in the list. The Reset widths option that is also listed when you select this icon is not enabled for KPI Details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Edit** button is not enabled for KPI Details. For technical reasons, a different mechanism is provided for editing individual records. For more information, see View or edit a record.
- The **Export** button opens a dialog where you can export the list of records either as a local file or as an email attachment, in one of the following formats:
  - Microsoft Excel
  - CSV
  - JSON
  - PDF
- The **New** button opens a blank form on the record table.

Chart options in KPI Details

The KPI Details **Chart options** menu enables you to show, hide, or change aspects of an indicator visualization. Selected chart options persist per user for each indicator. Chart options are divided into analysis, time series, and chart type options.

Analysis options

Note: Targets, thresholds, trends, and comments are not supported in KPI Details when indicator scores are aggregated on multiple elements.

Targets

Targets are the desired scores for the indicator. Select to show indicator targets on the visualization. If no targets are configured on the indicator, this option is not available.

Thresholds

Thresholds define a normal range of scores for an indicator. Select to show indicator thresholds on the visualization. If no thresholds are configured on the indicator, this option is not available.

Forecast

Forecasts enable you to forecast future scores based on existing trends. To configure forecasts, see Performance Analytics scores forecasts. If forecasts are not configured on the indicator, this chart option is not available.

Trend

Shows the linear trend in score values over the selected time period. Trends are not available for indicators that are filtered on multiple elements.

Comments

Select to show comments added to the indicator in the Analytics Hub or generated by system calculations. System calculations include notifications for breaching thresholds.

Labels

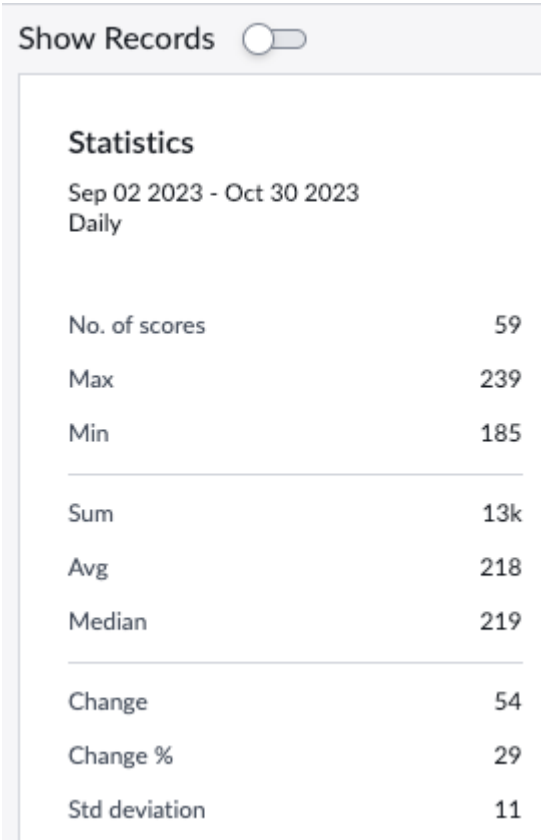
Labels show the main time series values of the indicator. Labels are not shown for derived time series lines such as targets and thresholds.

Statistics

Activate to display a set of statistics for the indicator over the selected date range. For details, see the Statistics section of this topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Statistics



When the Statistics chart option is activated, KPI Details shows the following statistics, across the date range that the chart shows:

No. of scores

The number of indicator scores in the selected time range.

Max

The highest, or maximum, score value in the selected time range.

Min

The lowest, or minimum, score value in the selected time range.

Sum

The sum of scores in the selected time range.

Avg

The average score in the selected time range, calculated by dividing the sum by the number of scores. The average is preferable to the median when you have a normal distribution of scores with no or few outliers.

Median

The middle number in the distribution of scores. Half the scores are higher than this number and half the scores are lower. The median is preferable to the average when the scores include one or more outliers, such as 130 in the series 2,3,3,5,7,130. If there is a large difference between the average and the median, the median is probably the more meaningful statistic.

Change

The difference between the last score and the first score in the selected time range.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change %

The difference between the last score and the first score in the selected time range, as a percentage of the first score.

Standard deviation

The amount of variation from the average value among the scores in the selected time range. A low standard deviation means that the scores are close to the average. KPI Details calculates the sample standard deviation, not the population standard deviation.

Not all statistics are applicable to every indicator. On the indicator record, you can exclude those statistics that do not apply from appearing in either KPI Details or the Analytics Hub. For example, you can exclude the Change % statistic from appearing for indicators whose unit is percentage. For more information, see Advanced indicator settings.

Time series options

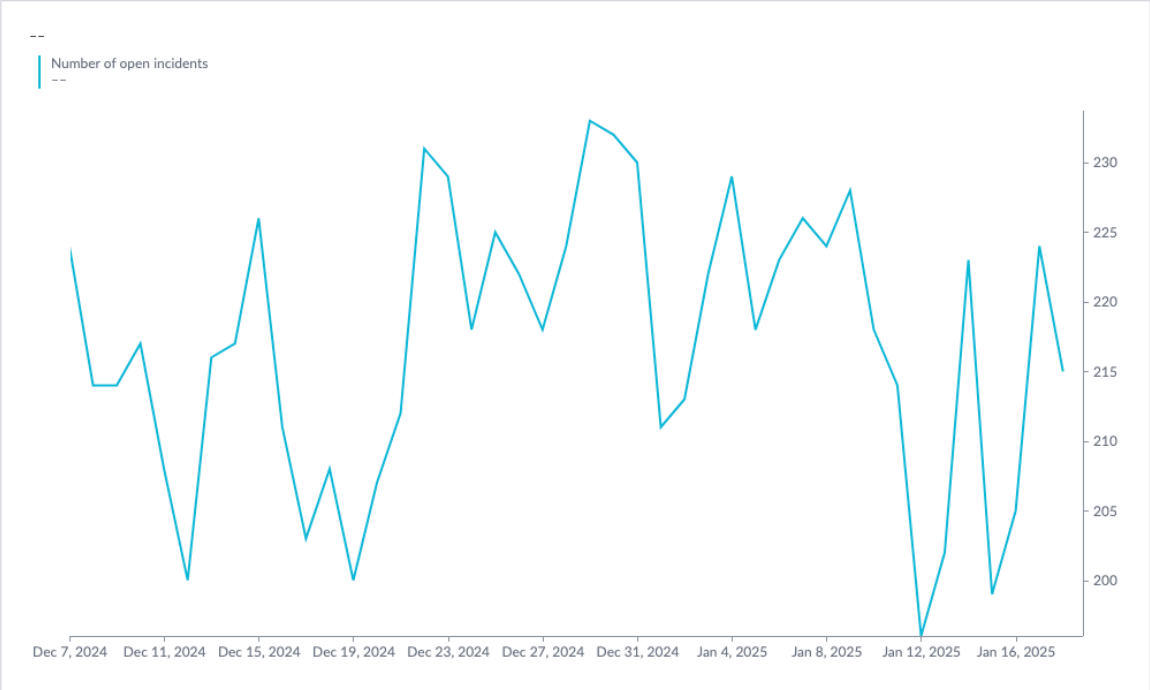
The time series options set the kind of measurements that the chart displays. All measurements can be shown together.

- Score (default)
- Change
- Change %

Chart type options

Select from the following chart visualizations:

- Line (default). Useful for tracking change over time and seeing differences in indicator scores.



- Spline. Useful to suggest smooth, gradual changes.

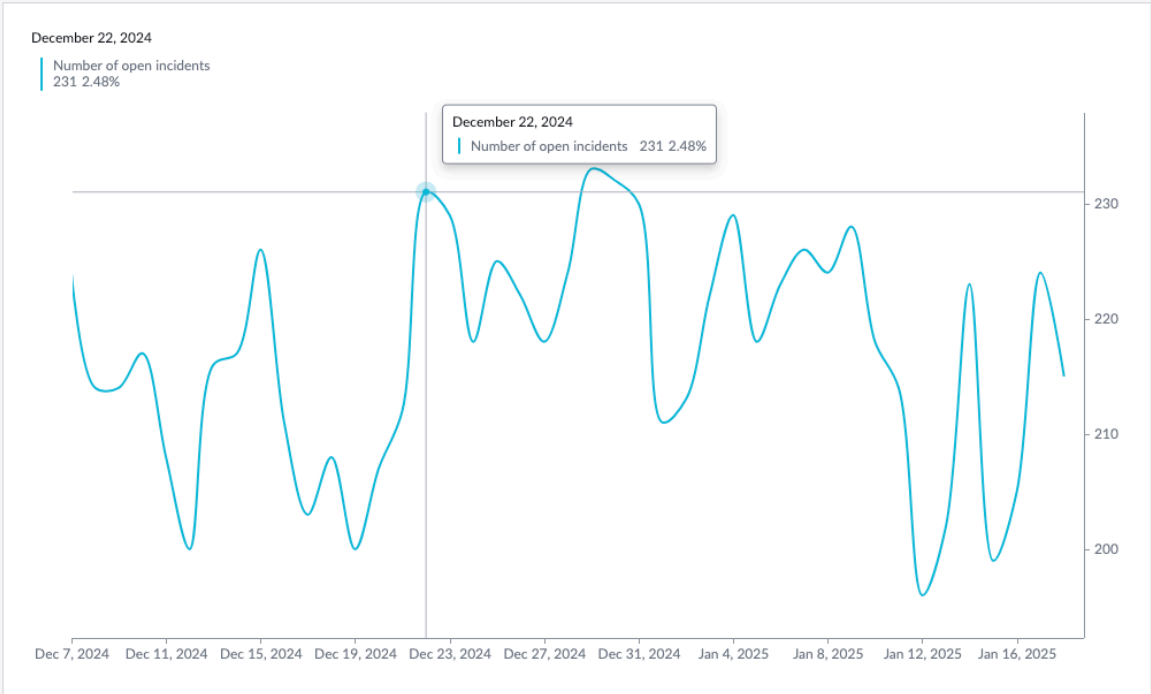
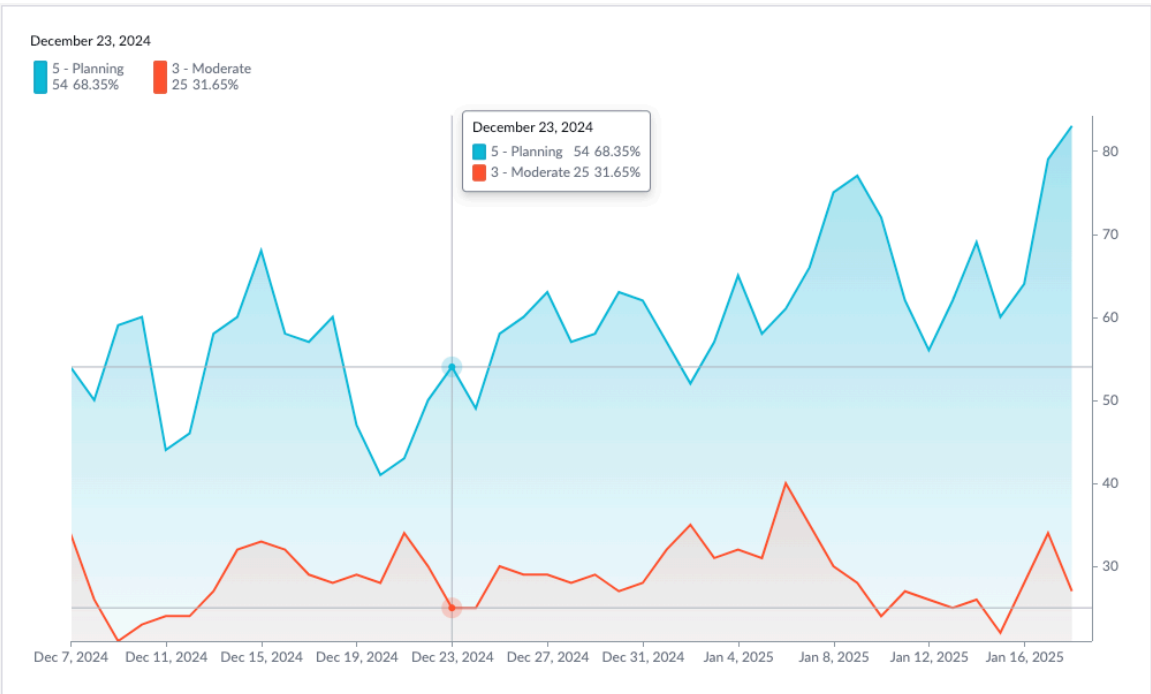
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

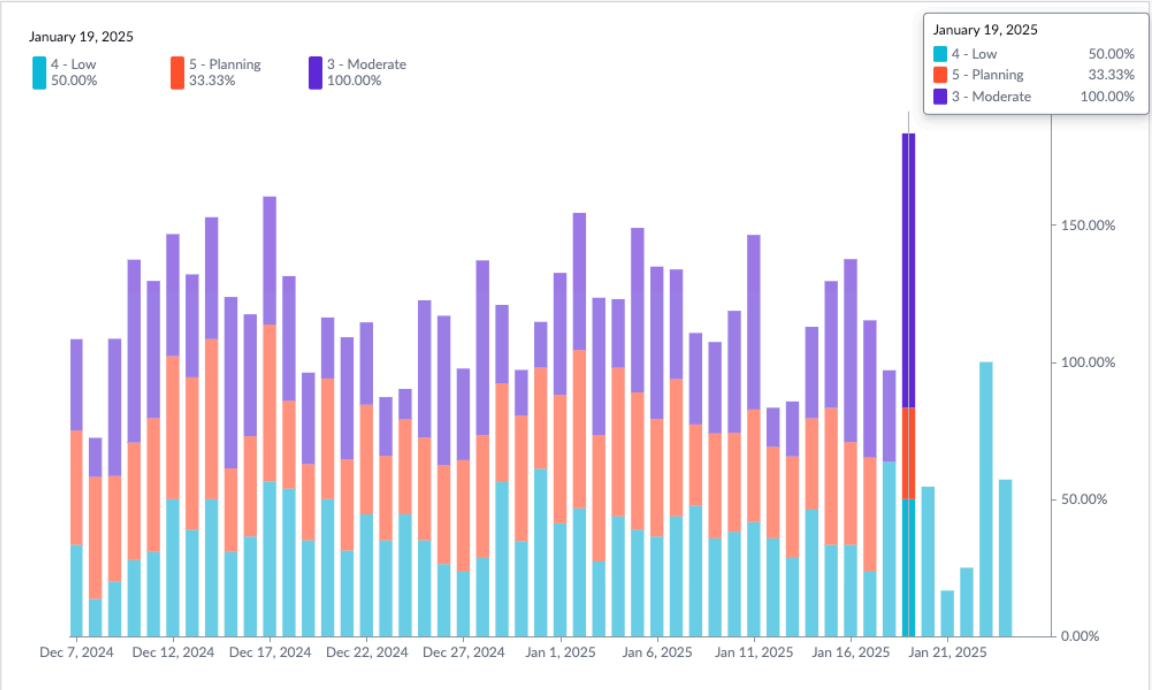


- Area. Useful to show trends over time in related breakdowns when **Display as separate time series** is selected under Filters.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Column. Useful for comparing multiple breakdown elements when **Display as separate time series** is selected under Filters.



Select time aggregation in KPI Details

You can aggregate changes in indicators into discrete time intervals. A time aggregation consists of an AVG or SUM function combined with a time series, such as By quarter.

Before you begin

Role required: None. However, upgraded instances may require pa_viewer.

About this task

To explore a different time aspect of the indicator, apply one of the following time aggregations:

Running

Smooth out spikes to reveal trends. For example, looking at daily incident counts may show a decrease every weekend, but a 7-day running average smooths out those drops.

Period

Aggregate data to a less frequent period. For example, you may want to track the number of P1 incidents daily, but the frequency is too high when scores are considered daily. Instead, you can set a target at the monthly level with a "By Month" time series.

To date

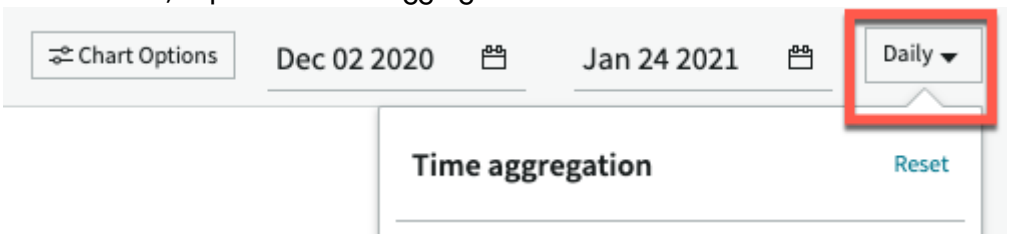
Show cumulative scores. These time aggregations are useful when you have a monthly target to hit, but you also need to see the velocity throughout the month.

For more information about the use, behavior, and limitations of time aggregations, see Applying time series aggregations. For examples and a deeper exploration of using time series aggregations with indicators, see this Performance Analytics Academy video, Leveraging Time Series with Performance Analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In KPI Details, expand the time aggregation menu on the indicator visualization.



> **Note:** Time aggregations are not available for real-time scores. When you select a time aggregation, real-time scores are disabled. If you return to the default frequency, real-time scores are re-enabled but turned off. You can turn them on if you want.

2. Select either a **Running**, a **Period**, or a **To date** aggregation to configure.
3. Select a time period.
   Invalid and excluded time periods for the indicator frequency are not enabled. For more information about excluded time periods, see Exclude time series from an indicator.
4. Select either the average or the sum function.
5. If you have selected a **Period** aggregation, decide whether to **Include partial periods**.
   If you include partial periods, you show a score for the current period even when it has not yet completed. Use caution because including partial periods can skew averages.

Result

The indicator visualization refreshes with each selection you make. Change your selection as much as you want. To return to the default time aggregation for the indicator, select **Reset**.

Example: Time aggregation on an daily indicator

In the following time aggregation menu, the daily indicator Number of open incidents is aggregated by period to a weekly sum. Partial weeks are not included.

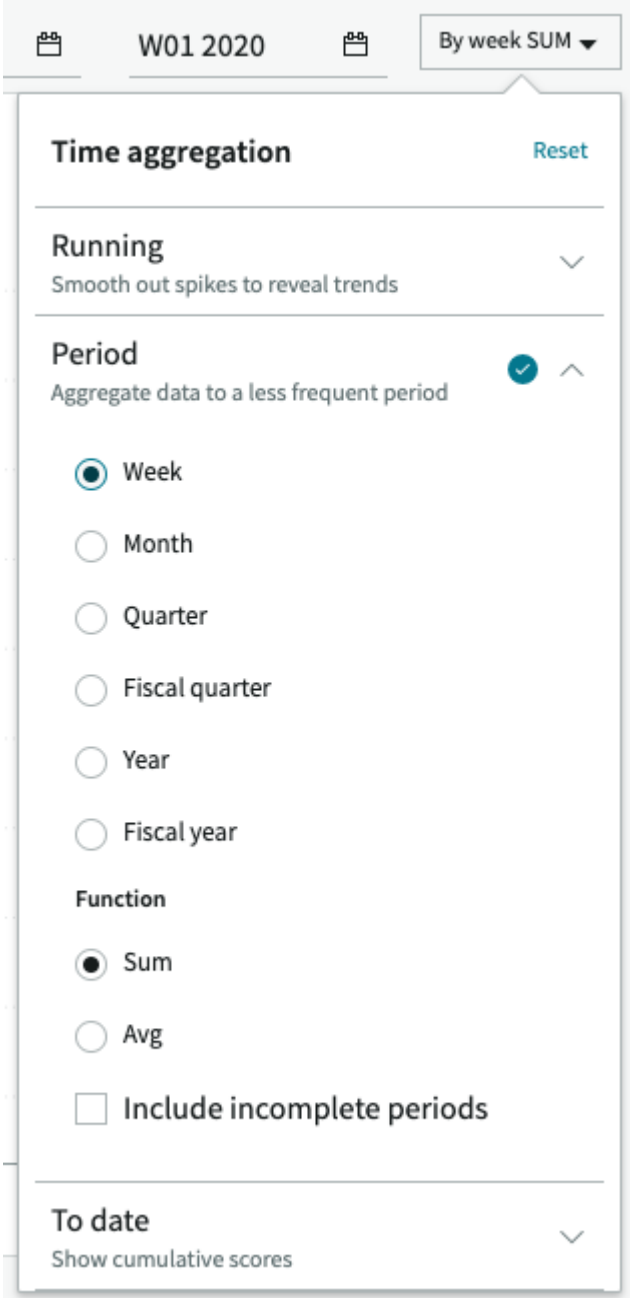
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Filter KPI Details by breakdown elements

In KPI Details, you apply breakdowns and elements to the indicator in the Filters sidebar.

Before you begin

Role required: None. However, upgraded instances may require pa_viewer.

About this task

You can select as many breakdowns as the indicator supports. With breakdown matrix collection enabled on the indicator, you can select up to two levels of breakdown, and you can select multiple elements on the first breakdown. (If the indicator is a formula indicator, breakdown matrix collection must be enabled on the contributing automated indicators.) With data snapshots enabled on the indicator, you can select any number of breakdowns and elements.

Important: Filter conditions do not persist between KPI Details page refreshes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

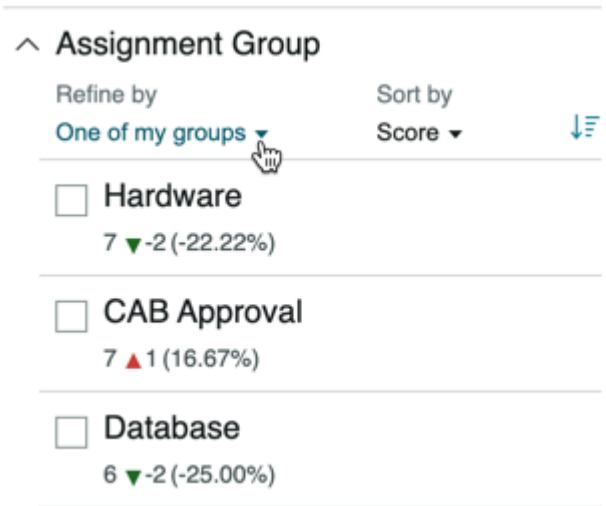
1. In the sidebar of KPI Details, select the Filter icon.
   You see a list of the breakdowns for this indicator.
2. Expand a breakdown.
   You see a list of the elements of the breakdown.
3. If an elements filter exists for the breakdown, you can use it to refine the list of elements.

   a. Expand the **Refine by** list to see the available element filters.

   Example
   This image shows the "Groups I manage" and "One of my groups" elements filters, which are available for the Assignment Group breakdown in the base system.

   b. Select an elements filter.

   Example
   In this image, the "One of my groups" is selected. The list of elements now includes only the assignment groups to which the logged-on user belongs.



4. In the **Sort by** menu, sort the elements by name, by the score for the selected date, or by the change from the previous date.
   If real-time scores are turned on, only sorting by name is available.
5. Select one or more elements.
   If the elements are sorted by score, the filter panel shows you the score for each breakdown element for the selected date. If the elements are sorted by change, the filter panel shows you

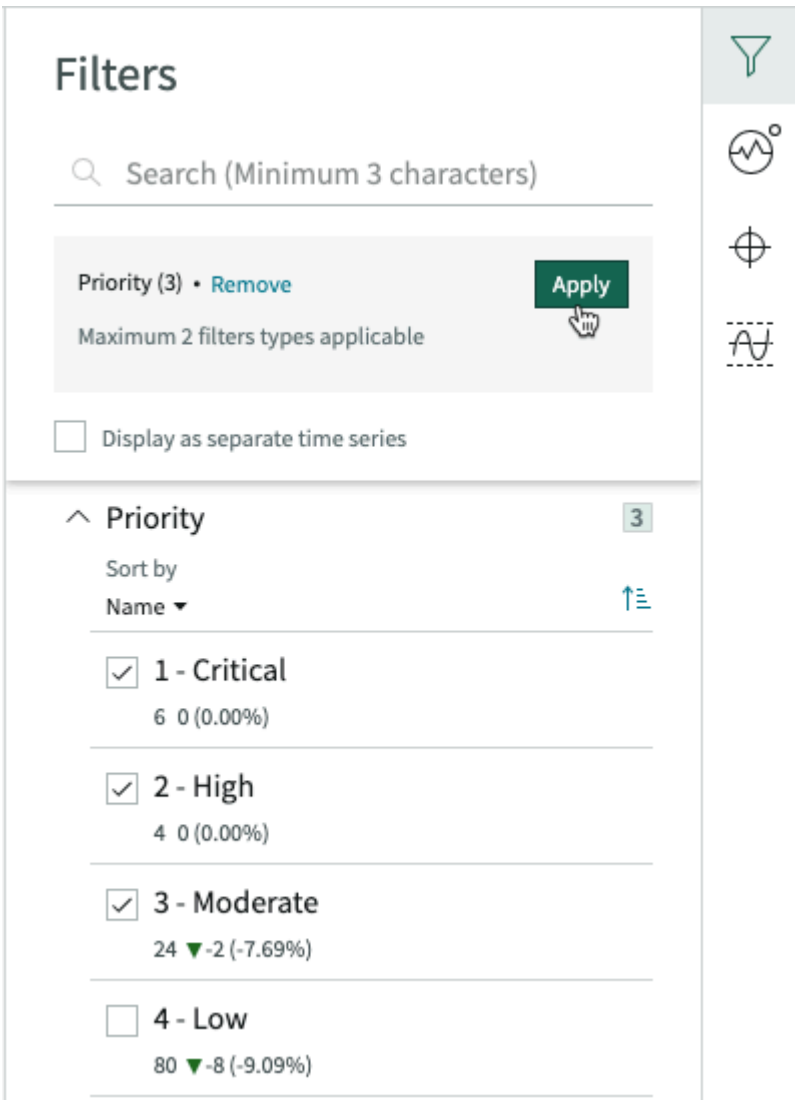
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the percent change since the previous collection period for the selected date. When real-time scores are turned on, no previews are available.

6. **Optional:** Select a second-level breakdown.
   a. Expand a second breakdown.
   b. Select only one element.
7. If you have selected multiple elements, select how to display the elements.
   By default, the aggregate score is displayed. Select **Display as separate time series** to show each element separately. You can make a selection only in cases where both aggregate and separate score displays are possible. For more information, see Aggregate score of multiple elements.
8. Click **Apply**

Example: Selecting elements to filter by

In this example, the filter sidebar has been opened. You expand the Priority breakdown and select the 1 - Critical, 2 - High, and 3 - Moderate elements. You are about to click **Apply**. You will see the values of these elements as a single aggregate, because you did not select **Display as separate time series**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Aggregate score of multiple elements

When you filter an indicator by multiple breakdown elements, you can either view a single aggregate score of all elements or a separate score for each element. However, not all indicators support an aggregate score of multiple elements.

The following indicators support an aggregate score of multiple elements:

- Automated indicators that aggregate data as a Count, Sum, Minimum, or Maximum value

  Note: The word "aggregate" is used for two different things here: the aggregate view of multiple indicator scores, and the data aggregation that is set on an indicator.

- Manual indicators
- External indicators that do not use `SQL AVG()` or `SQL COUNT(DISTINCT...)` in their SQL statement
- Formula indicators that have aggregate element views enabled on their indicator records. For more information, see the entry on the **Allow aggregation of multiple breakdown element scores** field on the Other tab in Create a formula indicator.

Note: When you navigate to KPI Details from a Performance Analytics widget on a Workspace Experience, and this widget uses an element filter that returns more than one element, only the first element is applied.

If the indicator supports a view of multiple elements, KPI Details shows the **Display as separate time series** control in the Filters sidebar. The behavior of this control depends on which views of multiple elements are supported:

- If an indicator supports both aggregate and separate views, you see the aggregate view by default. To show a separate line for each element of a breakdown, select **Display as separate time series**.
- If an indicator supports only the view of multiple elements as separate lines, **Display as separate time series** is selected and the choice is inactive.

Note: The **Display as separate time series** control is not enabled until you select multiple elements.

Example: Aggregate compared to separate view of multiple elements

In this example, the Number of open incidents indicator aggregates by Count and therefore supports an aggregate view of multiple elements. Both aggregate and separate views are shown.

Indicator breakdowns

Access indicator record or scoresheet from KPI Details

In KPI Details, the More actions menu lets you open the record or the scoresheet of the indicator you are viewing.

Before you begin

This procedure assumes you are already examining an indicator in KPI Details and want to view or edit the indicator record or the scoresheet. If you are not in KPI Details, you can open either of these items directly from unified navigation.

Role required: pa_power_user, pa_admin, or admin for record; pa_admin or admin for scoresheet

Procedure

1. In KPI Details, expand the **More actions** menu ⋮.
2. Select one of the following options:
   - To open the indicator record, select **Edit settings**.
   - To open the scoresheet, select **Edit scores**.

Indicator targets and thresholds in KPI Details

Targets are goals your organization wants to achieve. They show the difference between the desired and actual scores of an indicator on a certain date. Thresholds define a normal range of scores for an indicator and alert you when certain events occurs, like when a score reaches an all-time high.

Indicator targets

A target can be personal or global. A personal target is visible only to the user that created it and appears as a light line. A global target is visible to all users and appears as a dark line. Because you cannot share a personal target, it appears only in KPI Details and the Analytics Hub. Global targets can also appear in time series and single score data visualizations. Dashboards can alert viewers to events related to targets through proactive analytics insights cards.

Indicator thresholds

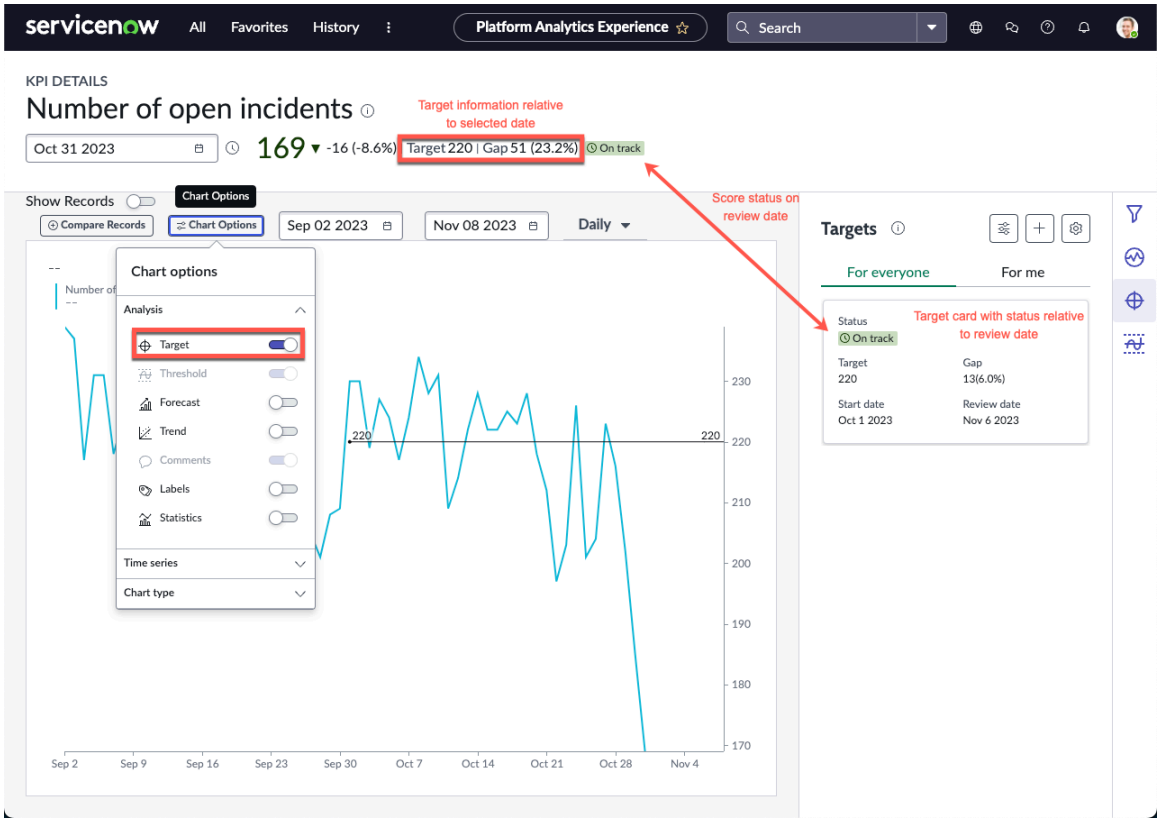
When a threshold is triggered, the instance generates an email notification. This message is associated with the indicator and the message is directly available via KPI Details.

A threshold can be personal or global. A personal threshold is visible only to the user that created it. It appears as a light grey dotted line. A global threshold is visible to all users and appears as a dark grey dotted line. Because you cannot share a personal threshold, it appears only in KPI Details. Global thresholds can also appear in time series data visualizations. Dashboards can alert viewers to events related to thresholds through proactive analytics insights cards.

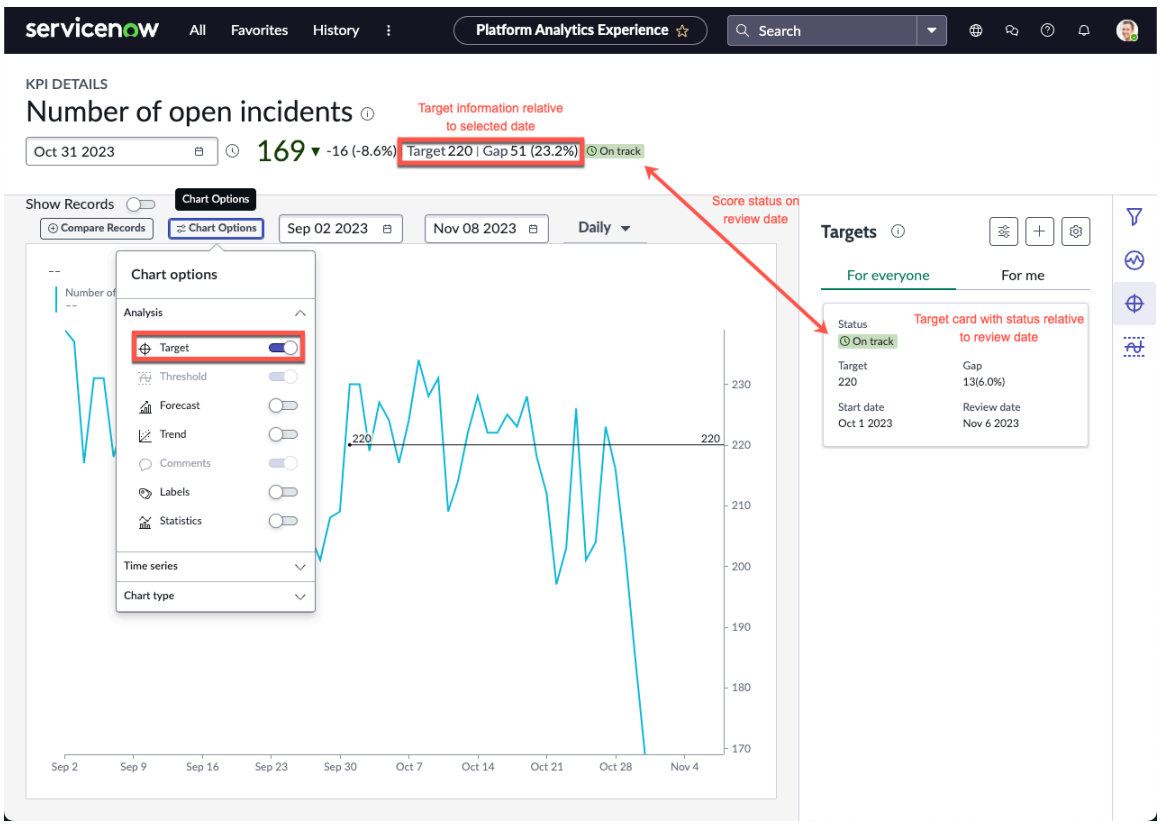
Example: KPI Details with current target

In the following example, one target has been set on the indicator. That target was set on 1 October, with a review date of 6 November. On 31 October, the score was 169. The gap on 15 March is calculated as `Target value - Score on selected date`. The gap is therefore 51, or 23.2%.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The card for the target in the Targets panel shows a different gap value. This gap is equal to `Target value - Forecast score on the review date`. If you enable **Forecast** in the Chart Options, you can see how this gap is calculated more clearly. In the following example, you see that the forecast score for the review date is 29 and the target is 30. The gap on the tile accordingly is one.

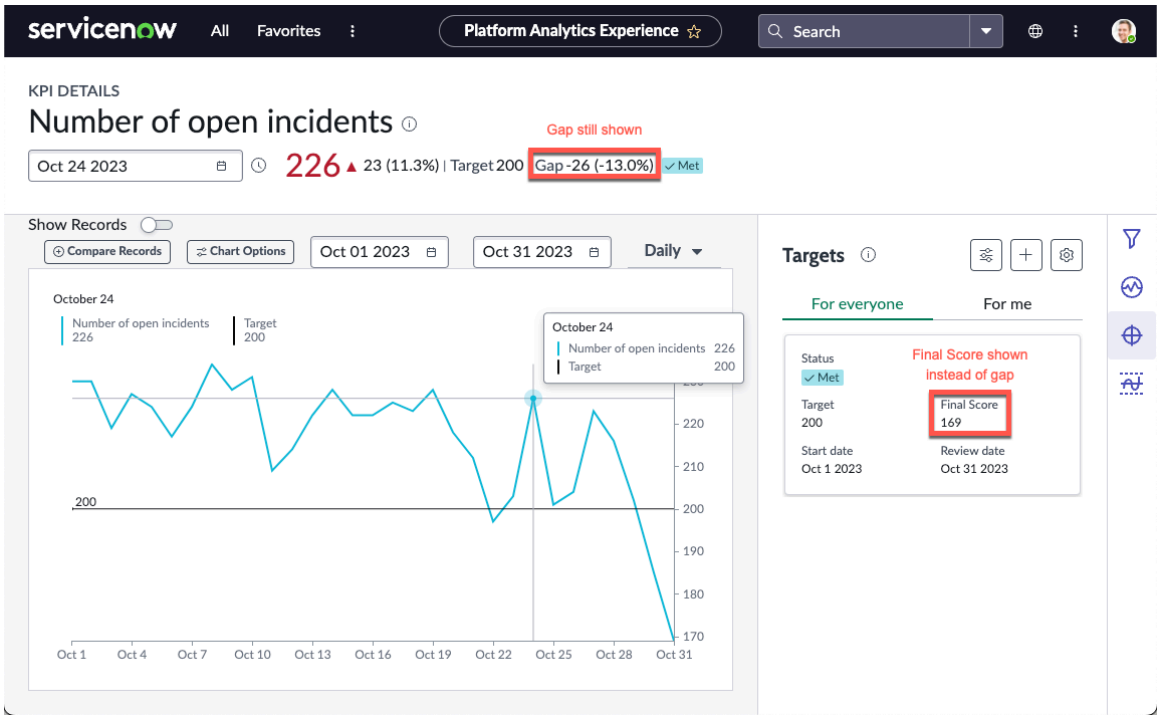


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An icon displays the status as On track, Off track, or Too early to track. This icon appears on both the chart and the Targets panel. The status is based on the predicted gap between target and score on the review date. Because the projected score is better than the target, the On track icon is displayed. Had it been worse than the target, the Off track icon would be displayed. If there hadn't been enough data to predict whether the target would be met, the Too early to track icon would be displayed.

Example: KPI Details with past target

When a target reaches its review date, it becomes known whether it has been met. The On Track, Off track, and Too early to track icons no longer apply. Instead, either a Met or a Not met icon is displayed. In the following example, the indicator met its target on the review date by a margin of two. On the card, the Gap information is replaced by the final score on the review date. This score is visible regardless of which date is chosen on the chart. The chart still displays the gap between the score and the target on the selected date.



Example: Past and current targets

When a target reaches its review date, it is no longer active. Usually you want a new target to take effect. When you add a new target, the expired targets are still visible, both in the chart and on cards. Here, a new target is added to the indicator after the target from the previous example has expired. This target is based on a 10% improvement to the previous target, as described in Create a target in KPI Details. The chart shows information about whichever target is in effect on the selected date.

Performance Analytics (Indicator data sources)

Performance Analytics targets and thresholds

Create a target in KPI Details

You can set target values for indicators that apply only to specific breakdown elements and time series aggregations. The target starts to apply at a selected date and continues to apply until you set the next target. You can set a date on which you expect to reach the target, and set a new target then.

Before you begin

Role required: pa_target_admin to create global targets that are visible to all users. Any user who can view an indicator on KPI Details can view targets and create personal targets. Personal targets and thresholds are visible on KPI Details only to the user that created them.

A responsible user can create a global target to replace the target they are responsible for, regardless of role. For more information, see Responsibility for global indicator targets.

Procedure

1. Navigate to **All** > **Platform Analytics** > **Library** > **Indicators**.
2. Locate the indicator and interact with its name to launch KPI Details for that indicator.
3. To limit the target to a subset of the scores, open the Filter and select a breakdown and a breakdown element.
   You can also select a 2nd-level breakdown and element.

   Note: To add targets for multiple breakdown elements, see Add targets for multiple breakdown elements in KPI Details.

4. If you want the target to apply to a specific time series aggregation, select the time series.
   For more information about time series aggregations, see Applying time series aggregations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click the target icon ( ).
   The Targets panel opens.
6. Click the Create Target icon ( ).
7. Select either **For everyone** or **For me**.
   The **For everyone** option creates a global target. The **For me** option creates a personal target. You see all the existing global or personal targets on this indicator that apply to whichever breakdown elements or time series you selected. You can select and deselect breakdown elements or a time series interactively, and the list of targets updates.

   Note: Instead of creating a new target, you can edit one of these existing targets. Select the tile for a target to edit that target. You can only change the absolute value of the target and the start and review dates. For more sophisticated target editing, see Edit targets in KPI Details.

8. In the **Based on** field, select either **New value**, **Average score**, or **Previous target**.
   New value is an absolute value for the target that you enter. **Average score** selects the target as an improvement to the average score. You set the amount of the improvement. The average is calculated over the time span shown in the chart. This average is shown as a read-only value in the **Average value** field.

   Previous target is available only if a previous target exists. The new target is a calculated value based on a change from the active target. The active target appears in the read-only **Reference value** field.
9. If you selected **New value**, enter the target value in the **New value** field.
10. If you selected **Average score**, or **Previous target**complete the following options:

Option	Description
Direction	Select **Increase** or **Decrease**. **Increase** means the target will be higher than the average score or previous target, while **Decrease** means it will be lower. By default, the value corresponds to the indicator's direction.
Change	Enter the amount by which you want the target to differ from the average score or previous target. This value can be in absolute units or a percentage.
% / Unit	Set whether the change is an absolute unit or a percentage.

   When you have completed these fields, the calculated target value appears in the read-only **New value** field.
11. Select a start date.
    You can set a date in the future.
12. Select a review date.
    The target applies from the selected start date until the start date of the next target, if any. If you do not define a later target, the target applies indefinitely. Thus, the review date serves as a reminder to consider changing the target. Whether or not you change the target value after review, consider selecting a new, future review date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you select a review date, you display a status icon on the chart indicating whether on that date you are on track to meet the target.

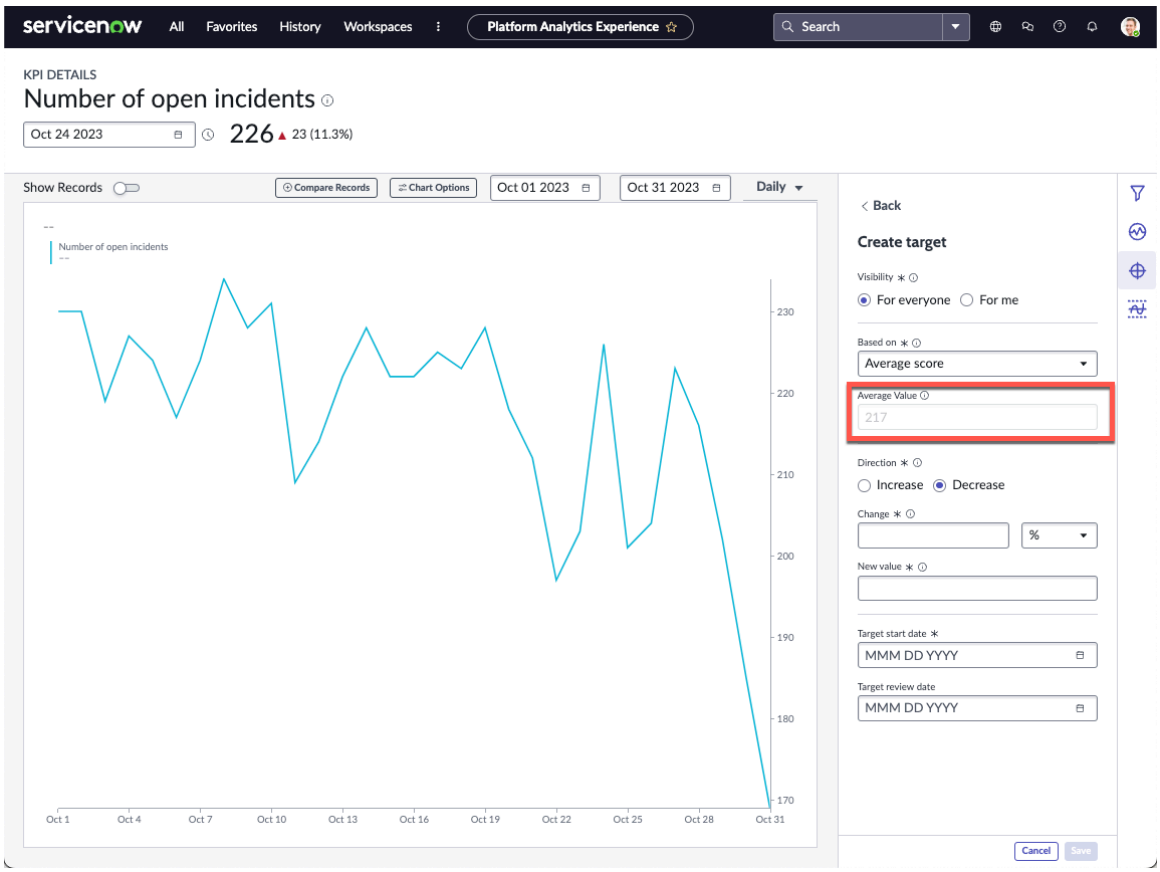
Note: KPI Details does not support overlapping targets. Only one target at a time can be active.

13. Click **Save**.

Example: Creating a target

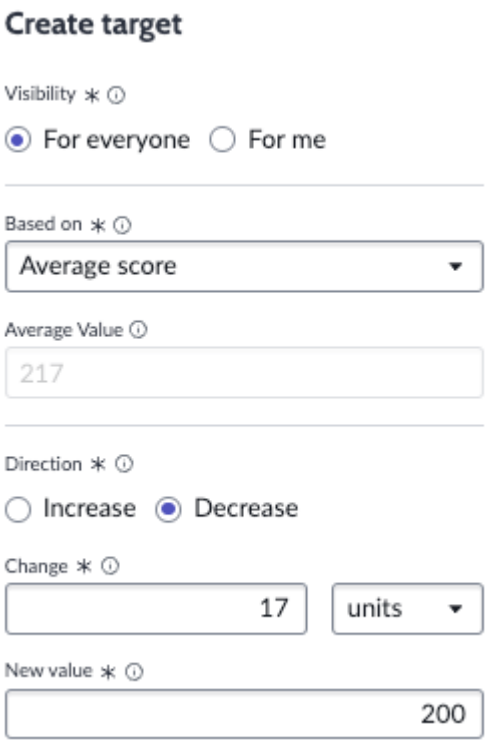
It's November 1 and your Number of Open Incidents in the Network category has varied considerably for the last month, with a recent sharp downturn.

As an incident manager, you want the number of open incidents to go down. You are not sure from your scores on a good target to set. You would be happy if it stayed below the average for October. So you start by basing the target on the average score for that month.

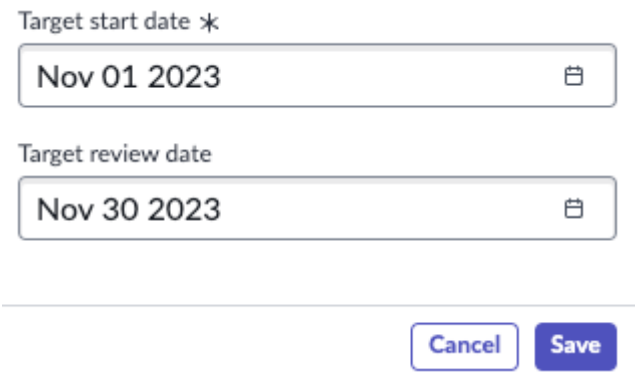


You see that the average value is 217, but you are an optimist and think your team might do a little better. So you leave **Decrease** selected, as indeed you want the number of incidents to decrease. Most of the low points on the chart were around 200, so you decide on that as the new target.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Finally, you decide to put your target into effect on the beginning of the next month. You hope to reach the target by the end of the month, so you set the last workday of the month as the review date.



When you click **Save**, you create your target. For an example of what such a target looks like in KPI Details, see Indicator targets and thresholds in KPI Details.

What to do next

After you create a global target, make yourself or another user responsible for maintaining the target. See Responsibility for global indicator targets.

Edit targets in KPI Details

Retroactively change one or more existing targets from their start date instead of ending them and starting new targets from a later date. You can edit multiple targets to have the same value, the same change in value, or the same date.

Before you begin

Role required: pa_target_admin to edit all global targets. Any user with a personal target can edit that target.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A responsible user can edit a global target they are responsible for, regardless of role. For more information, see Responsibility for global indicator targets.

About this task

If you have multiple targets set on the same indicator, the Target Configuration panel in KPI Details lets you set them in bulk to have the same start date, review date, or value. As a manager, you can use this feature to modify targets for a set of segments.

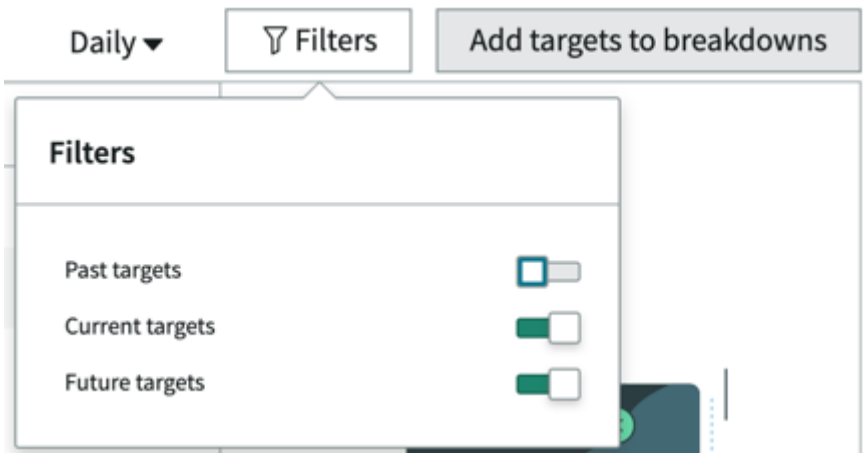
You can change only identical target values to new values. You can change differing start and review dates to new, identical start or review dates. However, none of the new periods when the targets would apply can overlap the periods of other targets that match the same filters.

Note: An alternative interface is available for a quick edit of a single target. Open the Targets panel and select the tile for a target. You can change the absolute value and the Start and Review dates of the target. For more options in editing a target, or to edit multiple targets, use the following procedure instead.

Procedure

1. Open KPI Details for an indicator.
2. Click the target icon .
   The **Targets** panel opens.
3. Click the cogwheel to open the **Targets Configuration** page.

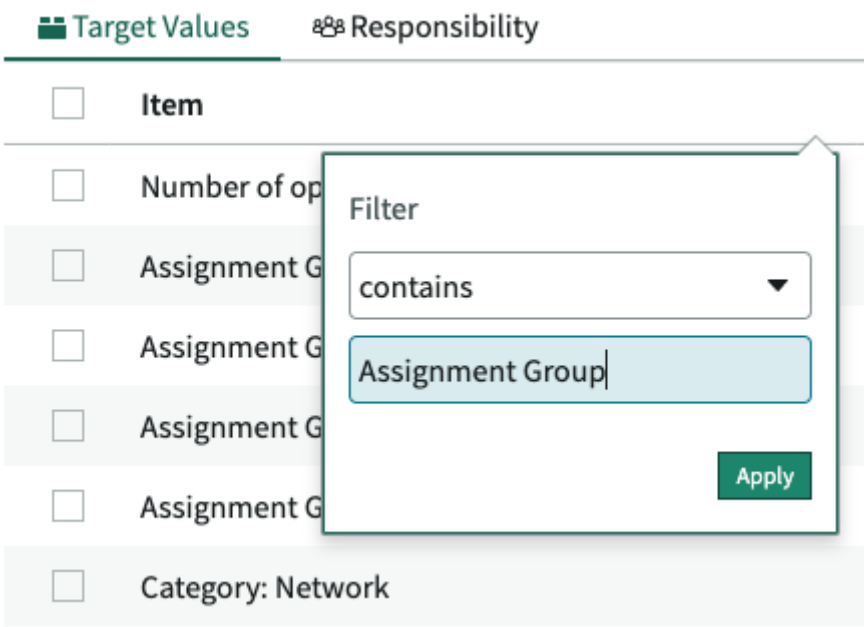
   The **Targets configuration** view opens.
4. Click **Filter** to set whether you see targets that have expired, targets that are currently in effect, or targets that will come into effect in the future.
   By default, you see targets that are currently in effect and those that will come into effect.



5. To further filter the selection of targets, select the hidden filter icon on the right side of each column header.
   You can filter or sort by item name, value, start date, or review date. In the following example, the **Item** column is about to be filtered for names containing `priority`. Only targets on the Priority breakdown will show.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip: You can filter on item name for either breakdowns or time aggregations. For example, filtering on `7d` returns only targets on weekly time aggregations.



6. Select one or more targets.
7. Set new target values, either as an absolute value or through a calculation.
   - To set an absolute value for the targets, select **None** in **Target calculation** and an absolute value in the **Value** field.
   - To select a change from the current targets, select the following:

Field	Value
Target calculation	Current target (units) or Current target (%)
Direction	Select **Increase** for the new target value to be higher than the current target or Decrease for the new value to be lower than the current target.
Change (units) or Change (%)	The value either added or subtracted to the current targets to calculate the new targets, depending on the setting in **Direction**. The value you enter is either an absolute value (units) or a percentage. For example, you have selected two targets with values of 20 and 5. You have also selected Current target (units) as the target calculation and Decrease as the direction. When you enter 2 in Change (units), the new target values are 18 and 3. If you instead select Current target (%) as the target calculation and enter 25 under Change (%), the new target values are 15 and 4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Minimum target value	The lowest value you want the target to have, regardless of calculation. You do not need to specify a value.
Maximum target value	The highest value you want the target to have, regardless of calculation. You do not need to specify a value.

- To select a change from the average score over a period of time, select the following:

Field	Value
Target calculation	Average score (units) or Average score (%)
First score	The opening date of the time period over which to calculate the average score
Last score	The closing date of the time period over which to calculate the average score
Direction	Select **Increase** for the target to be higher than the average score or **Decrease** for the target to be lower than the average score.
Change (units) or Change (%)	The value either added or subtracted to the average score to calculate the new targets, depending on the setting in **Direction**. The value you enter is either an absolute value (units) or a percentage.
Minimum target value	The lowest value you want the target to have, regardless of calculation. You do not need to specify a value.
Maximum target value	The highest value you want the target to have, regardless of calculation. You do not need to specify a value.

8. Select the start date, when the targets come into effect, and a review date.
   You expect to meet the target by the review date, or at least to review progress then.

Create, modify, or delete a threshold in KPI Details

Add, modify, or delete personal thresholds. With the required roles, you can also add, modify, and delete thresholds for all users.

Before you begin

Role required: Any role for your own personal thresholds. The pa_threshold_admin role or a role containing it (pa_power_user, pa_admin, or admin) for global thresholds and for personal thresholds created by other users.

About this task

Note: Thresholds are not available when multiple breakdown elements are selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the workspace with the indicator you want to work with.
2. Click the Analytics Center icon ( ) and navigate to the KPIs tab.
3. Click the threshold icon ( ).
4. Select either Global or Personal thresholds.
   You see all the existing Global or Personal thresholds on this indicator.
5. Click the Create Threshold icon ( ) or select an existing target to edit it.
6. Choose the visibility of the threshold, either **Global** or **Personal**.
7. Select or change the **Threshold Type**:
   - All time high
   - All time low
   - Less than

     Enter a threshold value to trigger a message if the value of the indicator drops below the threshold.
   - More than

     Enter a threshold value to trigger a message if the value of the indicator exceeds the threshold.
8. Click **Save** if you are creating a threshold or **Update** if you are modifying a threshold.

Add targets for multiple breakdown elements in KPI Details

Select multiple breakdown elements in the KPI Details target configuration panel. Add a target to each element. This target can be an improvement on a baseline instead of an absolute value.

Before you begin

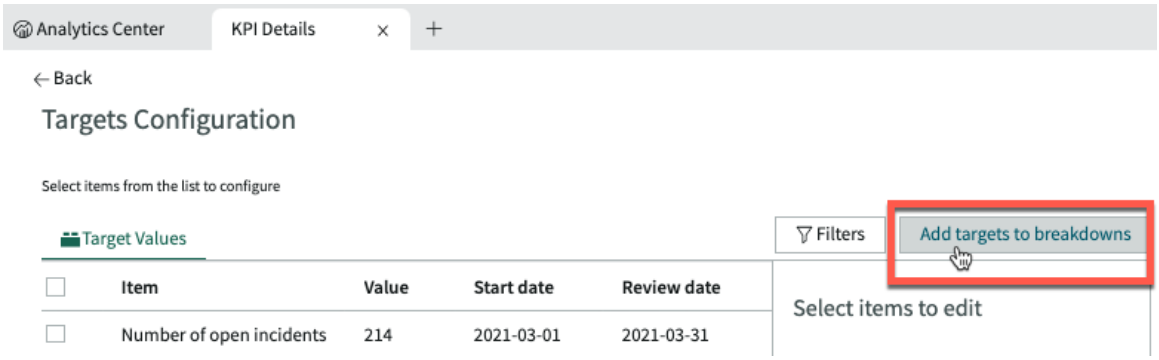
Role required: pa_admin, pa_target_admin, pa_power_user, or admin

Procedure

1. Open KPI Details for an indicator.
2. Click the target icon ( ).
   The **Targets** panel opens.
3. Click the cogwheel to open the **Targets Configuration** page.

   The **Targets configuration** view opens.
4. Select **Add targets to breakdowns**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



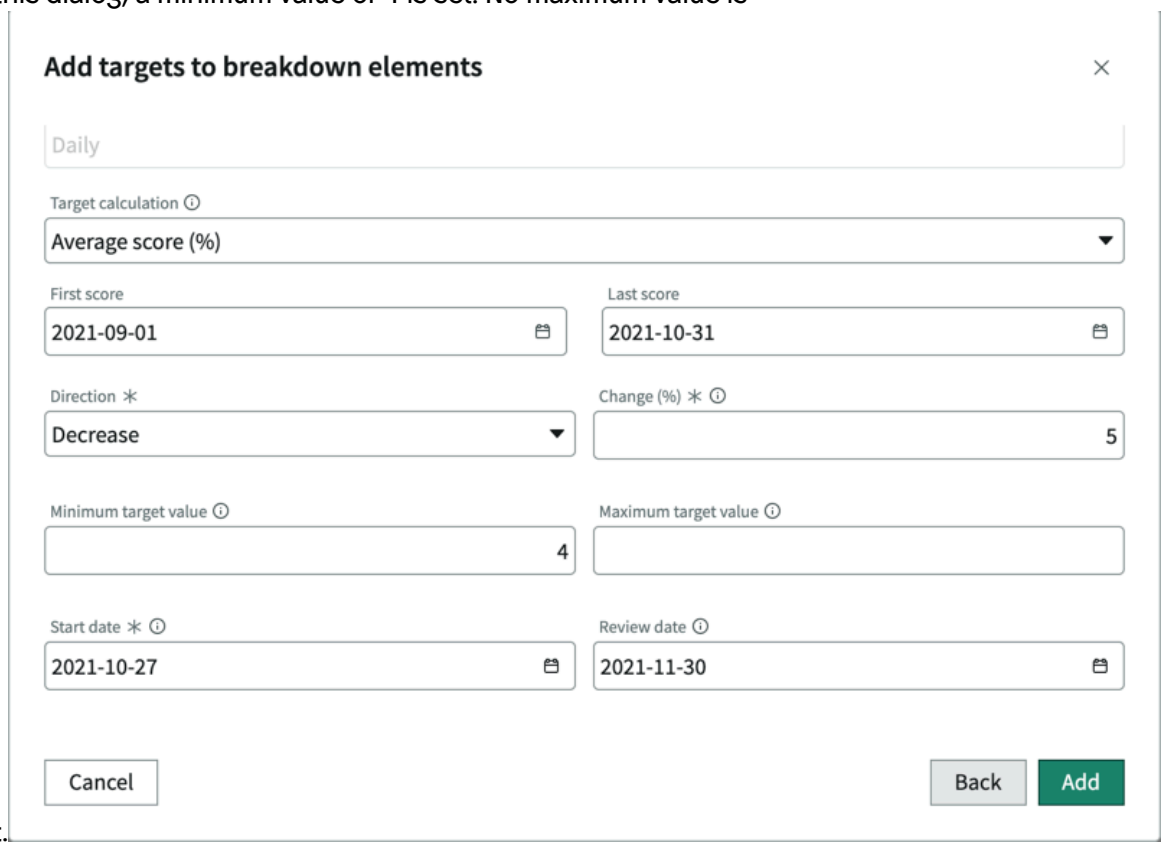
The **Add targets to breakdown elements** dialog opens.

5. Select one breakdown from the list of breakdowns for the indicator.
6. Select any number of elements for the breakdown and click **Next**.

> **Tip:** If you have many elements to scroll through, sort or filter on a value in any of the columns. You can also click **Filter** and use the condition builder to narrow down the selection.

7. Set targets for the elements as described in Step 7 in Edit targets in KPI Details.
8. Set a start date, when the targets come into effect, and a review date.
9. **Optional:** If you are calculating the targets from an average or a previous score, and you don't want the new targets to be above or below certain values, set minimum and maximum values.

   Example
   In this dialog, a minimum value of 4 is set. No maximum value is set.



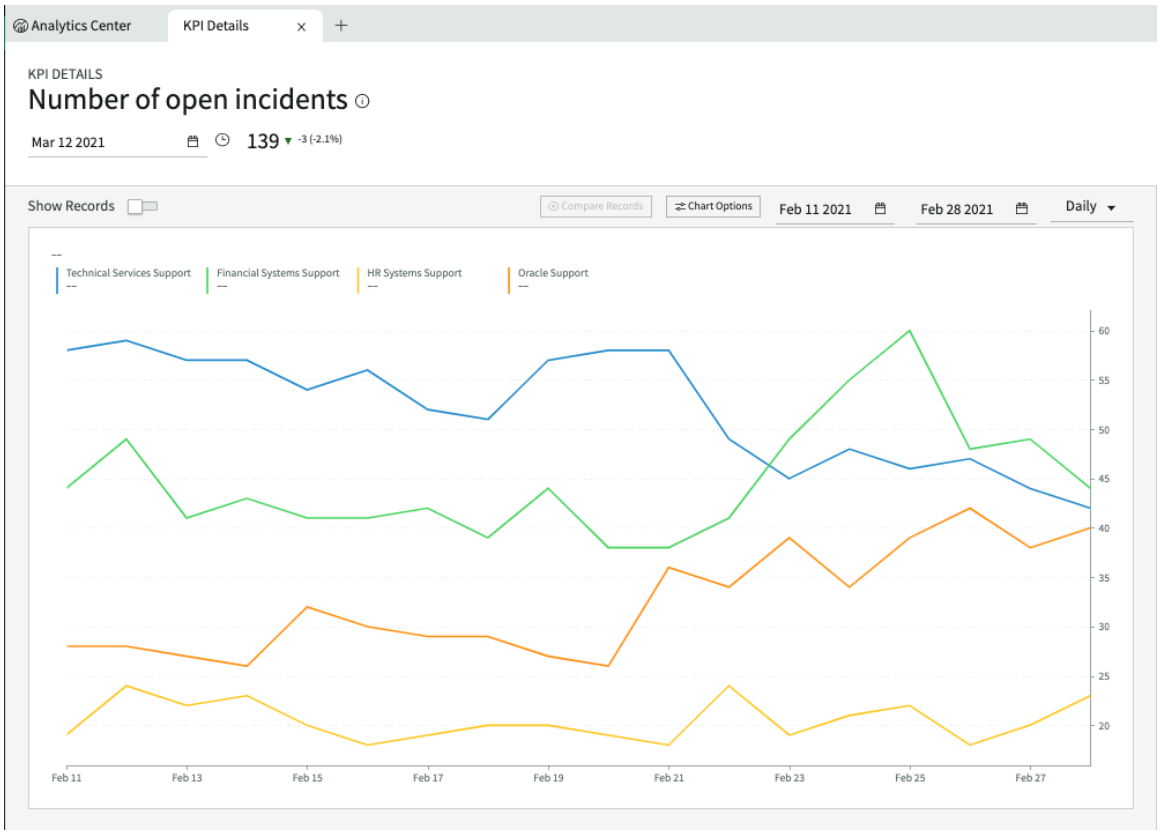
10. Select **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

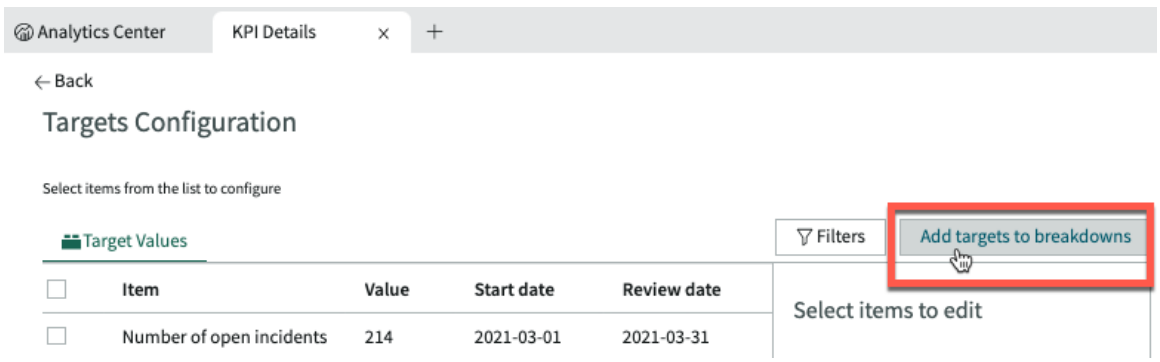
Result
Batch target creation happens asynchronously. You might see a progress bar.

Example: Configuring targets for multiple elements

Starting February 11, your company began tracking open incidents for each assignment group. By the end of the month, the number of open incidents assigned to your top 4 groups had varied from 18 to 60. The trends also were highly variable.

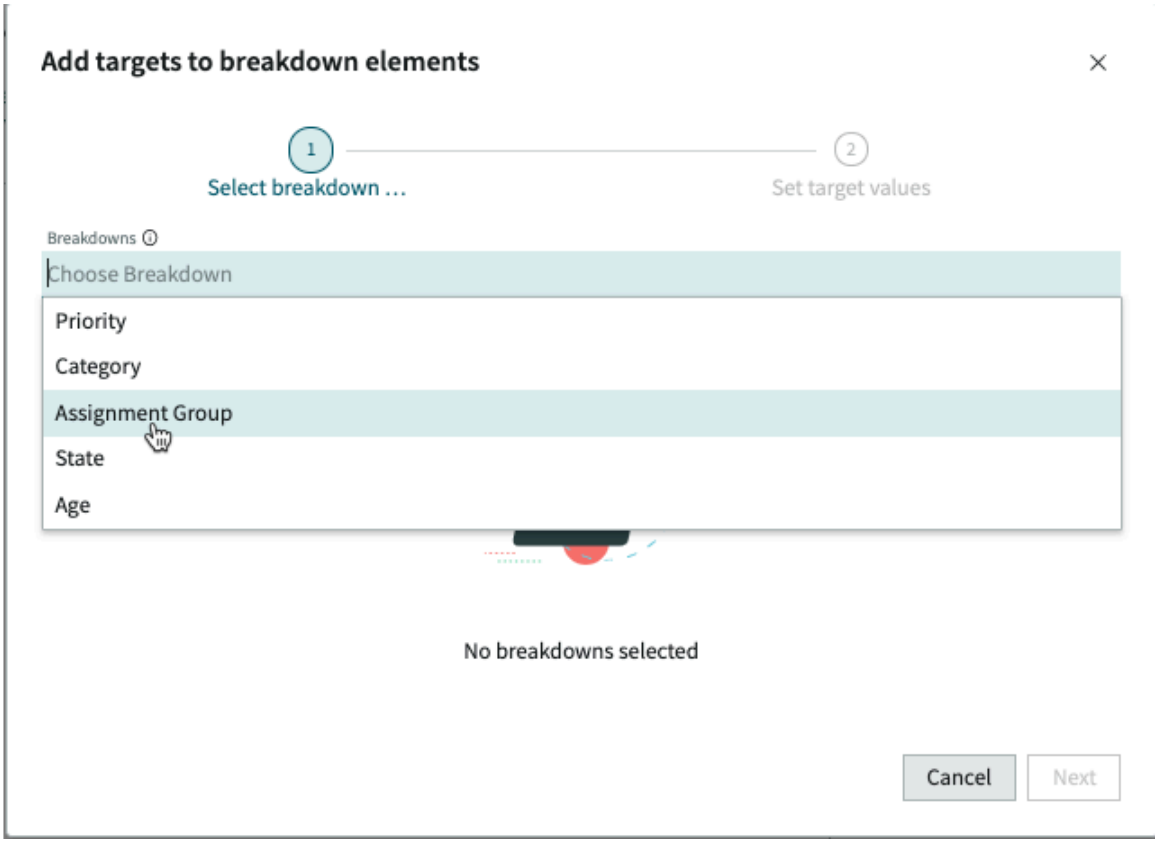


You would like consistent improvement across these four groups. Therefore, you want to set them targets that are equivalent despite the differences in absolute values. You also want to set the targets together. To achieve this aim, you open the **Targets configuration** view and click **Add targets to breakdowns**.

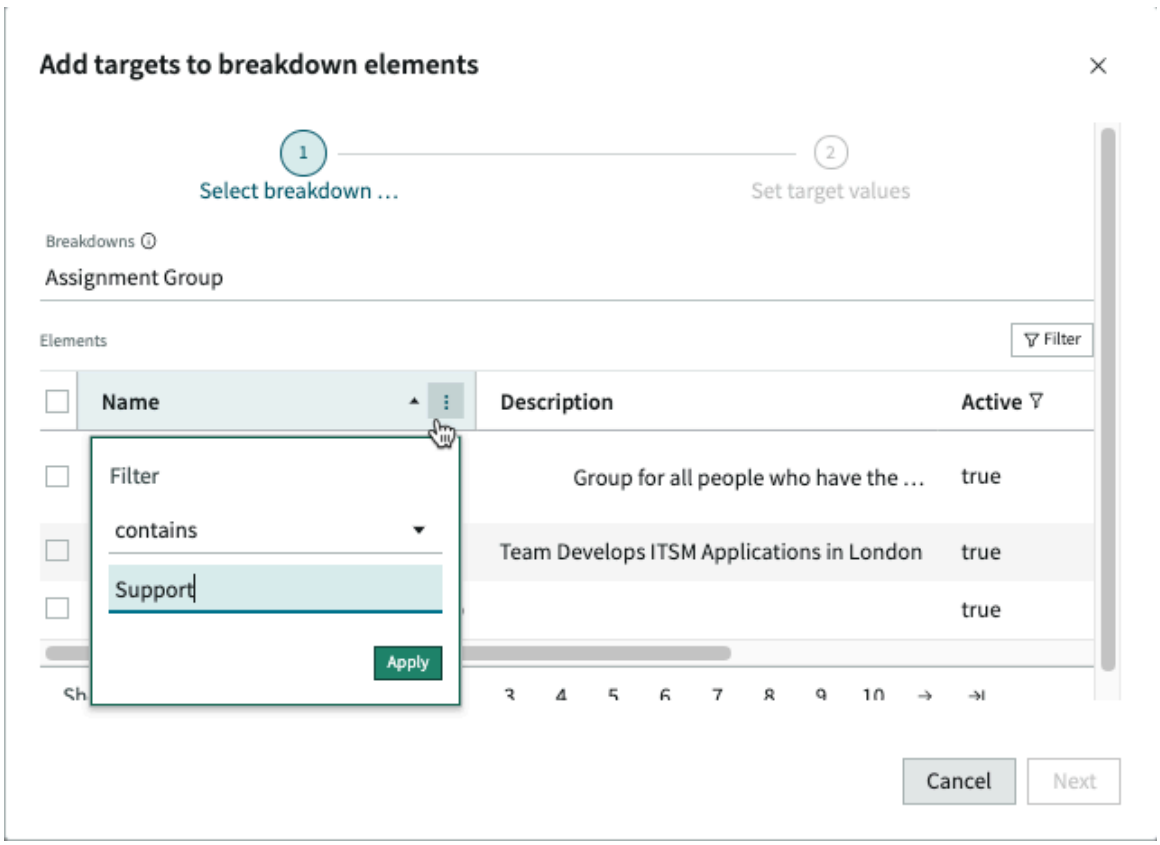


You select the Assignment group breakdown.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You get a list of the elements of the Assignment Group breakdown. There are many elements. The four elements you are looking for all have "Support" in the name, so you filter the **Name** column on "Support."



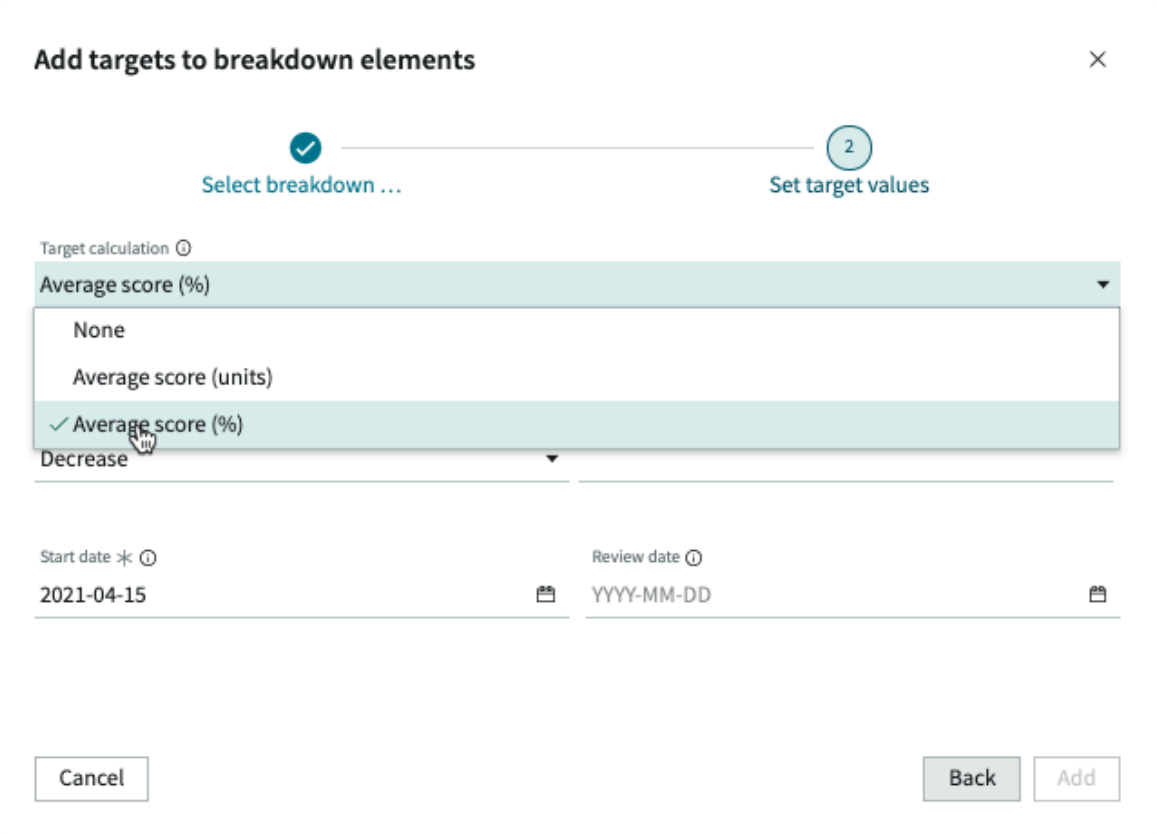
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The filter reduces the number of elements to browse to 9, from which you easily select the 4 that you want and click **Next**.

You can either specify a target value or base it on a calculation. The difference between HR Systems Support and the other three elements is too much to give all four elements the same target value. Therefore, you base the target on a calculation applied to each element.

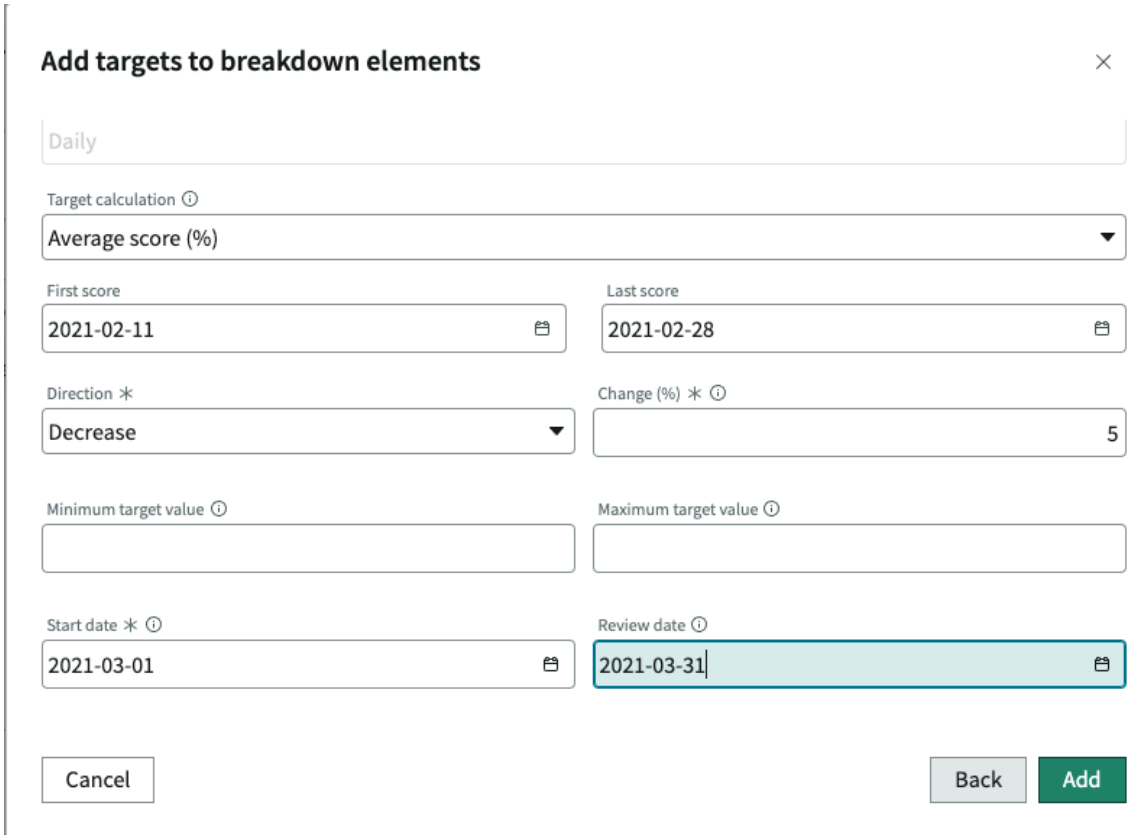
Calculations can be made on the existing target or on an average score over a time period. There are no existing targets for these elements, so you must select an average score.

You can set the target either as a unit number improvement on the average score, such as 3 or 4.5, or as a percentage improvement. The scores are close enough that you could probably use a unit number. However, you decide to set the target as a percentage improvement on the average score.

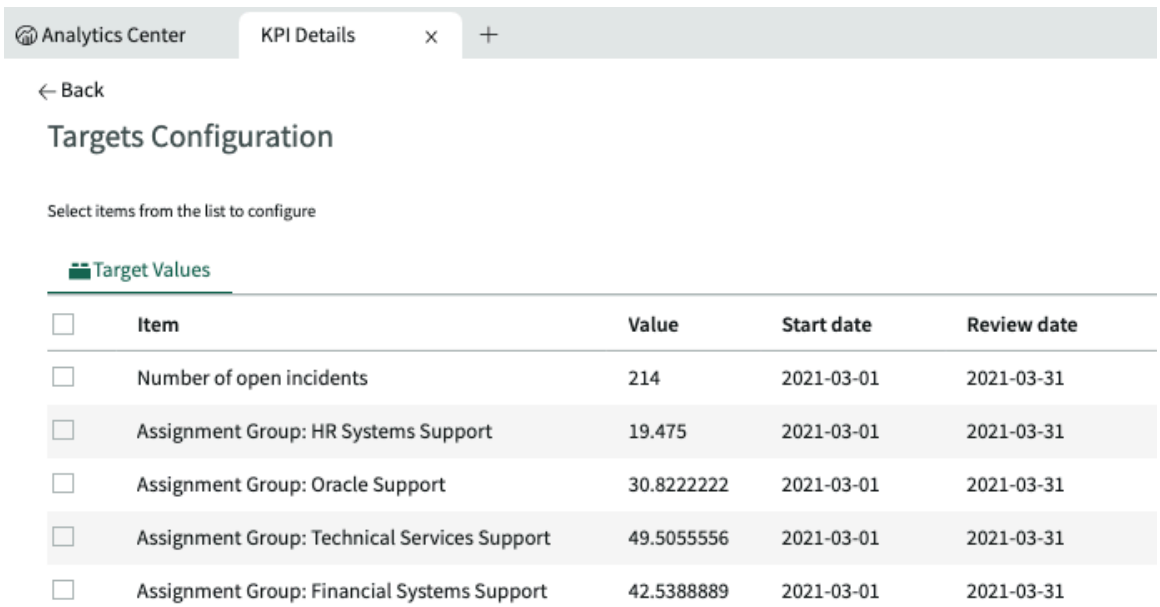


You take the average score from February 11 until February 28. You think 5% is a good improvement target for the next month, so you set the targets to begin March 1 and to review them March 31. You don't think you want to constrain the target values within a range, so you don't set maximum or minimum values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



After you click **Add** and dismiss the success message, you see the four targets that you created.



Here is a table with the targets you created and their values. All targets take effect on 1 March and are scheduled for review on 31 March.

Target	Value (rounded to integer)
Assignment Group: HR Systems Support	20
Assignment Group: Oracle Support	31

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Target	Value (rounded to integer)
Assignment Group: Technical Services Support	50
Assignment Group: Financial Systems Support	43

Responsibility for global indicator targets

A user can be responsible for targets on one or more Performance Analytics indicator/breakdown combinations (KPIs). Responsible users are expected to track progress towards the targets and can change the targets on their KPIs.

Responsibility is separate from access control list (ACL)-based roles. A target admin role, such as pa_target_admin, allows a user to create and edit global targets on any unique indicator/breakdown element combination (referred to here as a KPI). Such a role is normally restricted to a few Performance Analytics experts. However, a business-area expert, such as a manager, is likely to know more about the appropriate target to set for a specific KPI. Conversely, a Performance Analytics expert is unlikely to be able to maintain appropriate targets for all the KPIs in their organization.

Here the concept of responsibility comes in. A user with any role can be responsible for managing a KPI's global targets, which everyone can see. They can create a new target or edit the target for any KPI they are responsible for. Responsible users can create or edit their targets either in KPI Details or the classic Analytics Hub. However, they have this right only for KPIs that they were explicitly made responsible for. Also, if ACLs prohibit a user from viewing a KPI, they cannot be responsible for that KPI.

Only users, not groups, can have responsibility. Responsible users can assign responsibility for their KPIs to other users or remove responsibility from other users or themselves. A user can be responsible for the targets of multiple KPIs, and a KPI can have multiple users responsible for its targets.

Note: Responsibility for targets is independent of any other responsibility for a KPI, such as responsibility for signals.

A user with a target admin role has to create the initial global target for a KPI. After they create that target, they can assign responsibility to any user with any role, if the user can view the KPI. The responsible users maintain the targets for that KPI thereafter. The expected workflow follows:

1. A target admin creates an initial global target on a KPI. This target can be a meaningful value, or it can be a placeholder that a responsible user is expected to change.
2. The target admin makes themselves or a different user responsible for targets on the KPI.
3. At any point, the responsible users make other users responsible or remove responsibility from users.
4. The responsible users replace or edit targets for which they are responsible.

Note: You can assign responsibility to targets only in KPI Details. You cannot assign responsibility from a KPI Targets component.

Assign responsibility for targets

After an admin creates a target, assign responsibility for reviewing and editing the target to a subject matter expert (SME) in the business area.

Before you begin

Role required: pa_admin, pa_target_admin, pa_power_user, or admin.

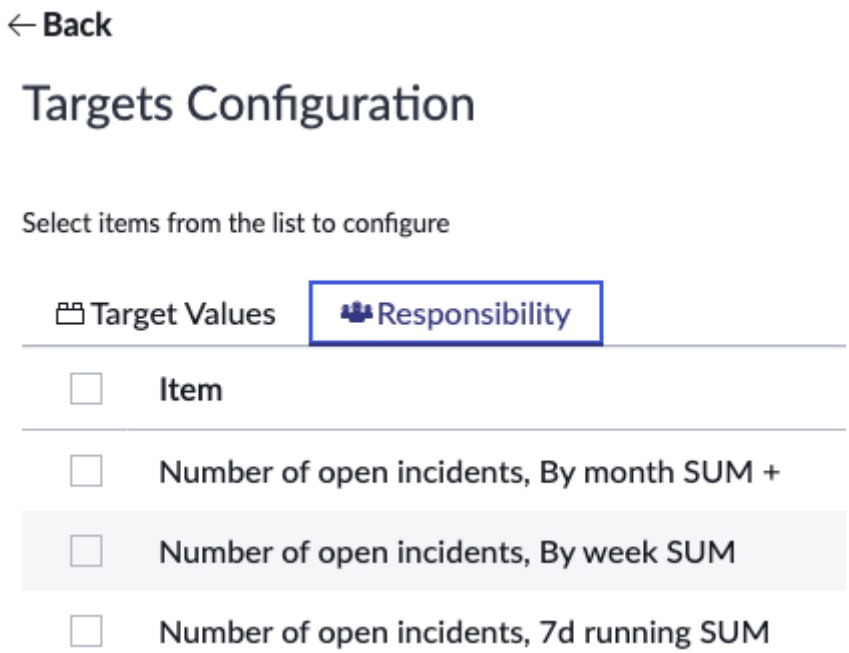
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open KPI Details in a Workspace.
2. Either:
   - Create a target, as described in Create a target in KPI Details.
   - Open an existing target, as described in Edit targets in KPI Details.
3. Click the cogwheel to open the **Targets Configuration** page.

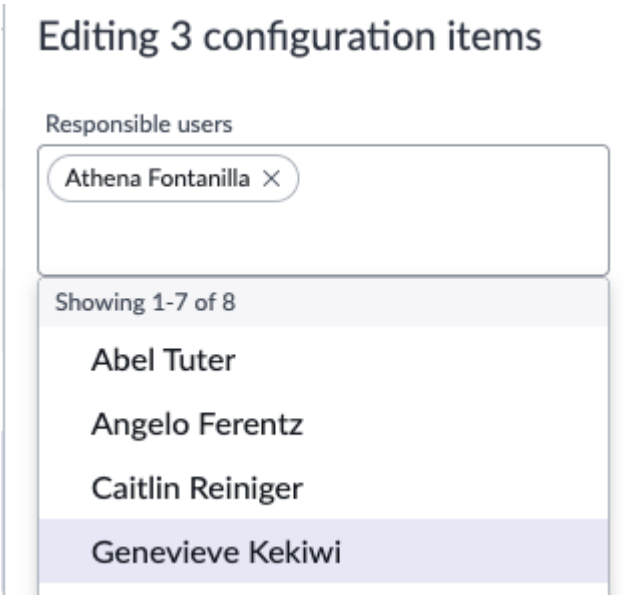
The **Targets configuration** view opens.

4. Open the Responsibility tab.



5. Select one or more unique indicator/breakdown element combinations (KPIs).
6. In the **Editing configuration items** panel, select one or more users to be responsible.
   You can select only one user at a time, but you can repeat the selection process as often as you want. Only users who can view all selected KPIs are available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Click **Update**.

Result

The users you selected appear in the **Responsible users** column for the KPIs you selected.

KPI Details reference

View system properties associated with KPI Details. See also how UUIDs are formed.

KPI Details Performance Analytics properties

KPI Details supports several Performance Analytics properties. These system properties control the behavior of Performance Analytics elements in the context of KPI Details.

To configure properties, navigate to **Performance Analytics** > **System** > **Properties** or to **sys_properties.list**.

Property	Description
com.snc.pa.indicator_target_default_color_schema	Default indicator target color scheme
com.snc.pa.chart_default_color_schema	Default visualization color scheme
com.snc.pa.scorecards.max_breakdown_elements	Maximum number of breakdown elements in KPI Details lists.
com.snc.pa.target_batch_operation_limit	Maximum number of targets that can be inserted or updated in one bulk action on the KPI Details Targets Configuration page. If you face timeouts while inserting or updating targets in bulk, consider reducing this limit. Default: 100
com.snc.pa.default_chart_line_color	Color of the scores in a KPI Details page and widgets, including the trend line and bullet chart.
com.snc.pa.defaut_chart_target_color	Color of the target in a chart.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
com.snc.pa.default_chart_personal_target_color	The line color for personal targets displayed on KPI Details pages.
com.snc.pa.default_chart_threshold_color	Color of the threshold in a chart.
com.snc.pa.default_chart_personal_threshold_color	The line color for personal thresholds displayed on a KPI Details page.

KPI Details UUIDs

Every combination of breakdowns, elements, a time series aggregation, and a domain that you specify for an indicator has a unique identifier (UUID). To understand how the KPI Details and KPI Signals applications work, you should understand how these UUIDs are constructed.

In the Analytics Hub and the workspace KPI Details, you select an indicator and can specify it further by the following:

- Up to two levels of breakdown
- Element filter
- Up to two levels of breakdown element, including multiple elements per level (aggregate score)
- A time series aggregation
- Domain separation

Each combination is represented by a so-called UUID. The UUID is concatenated from the sys_IDs of the indicator and any of these specifiers, in the following order (note the semicolon before the domain id):

<indicator_sys_id>:<breakdown_sys_id>:<elements_filter_sys_id or element_sys_ids>:<lvl-2 breakdown_sys_id>:<lvl-2 elements_filter_sys_id or element_sys_ids>:<aggregate_sys_id>;<domain_sys_id>

All specifiers other than *`indicator_sys_id`* are optional, with one exception: If a *`breakdown_sys_id`* is specified, so must be at least one *`element_sys_id`*. To specify a breakdown and not specify elements, for example to get a list of all elements, the breakdown sys_id goes in a separate parameter. For an example, see this GET/now/pa/scorecards REST API example. To refer to those scores that do not match any elements of the specified breakdown, the string `unmatched` goes in place of an *`element_sys_id`*.

Targets, thresholds, and other Analytics Hub and KPI Details functions apply per UUID. In other words, they apply separately to each unique combination of indicator, breakdowns, elements and element filters, time series aggregation, and domain. The KPI Signals application also monitors each fully specified indicator separately, per UUID.

KPI Signals

KPI Signals notifies you when the behavior of a process changes significantly. This feature applies standard statistical Process Behavior Charts to Performance Analytics indicators.

Exploring KPI Signals

KPI Signals notifies you when the behavior of a process changes significantly. This feature applies standard statistical Process Behavior Charts to Performance Analytics indicators.

KPI Signals overview

Tip: A free training for KPI Signals is available from the NOW Learning Center.

Every process undergoes variation. Most of this variation is normal, or 'common cause' variation, such as the small differences between each time you sign your name. What you need to know about is abnormal, or 'special cause' variation, such as when you sign with your off hand. KPI Signals lets you know when abnormal variation is occurring. KPI Signals incorporates Process Behavior Charts. These charts use standard statistical methods to pick out the signal of special cause variation from the noise of common cause variation.

KPI Signals uses standard 3-sigma parameters. "Three-sigma" means that the indicator scores for the process are expected almost always to remain within three standard deviations of the norm. The charts require at least five consecutive scores to calculate parameters.

© 2026 ServiceNow, Inc. All rights reserved.

KPI Signals users

Users

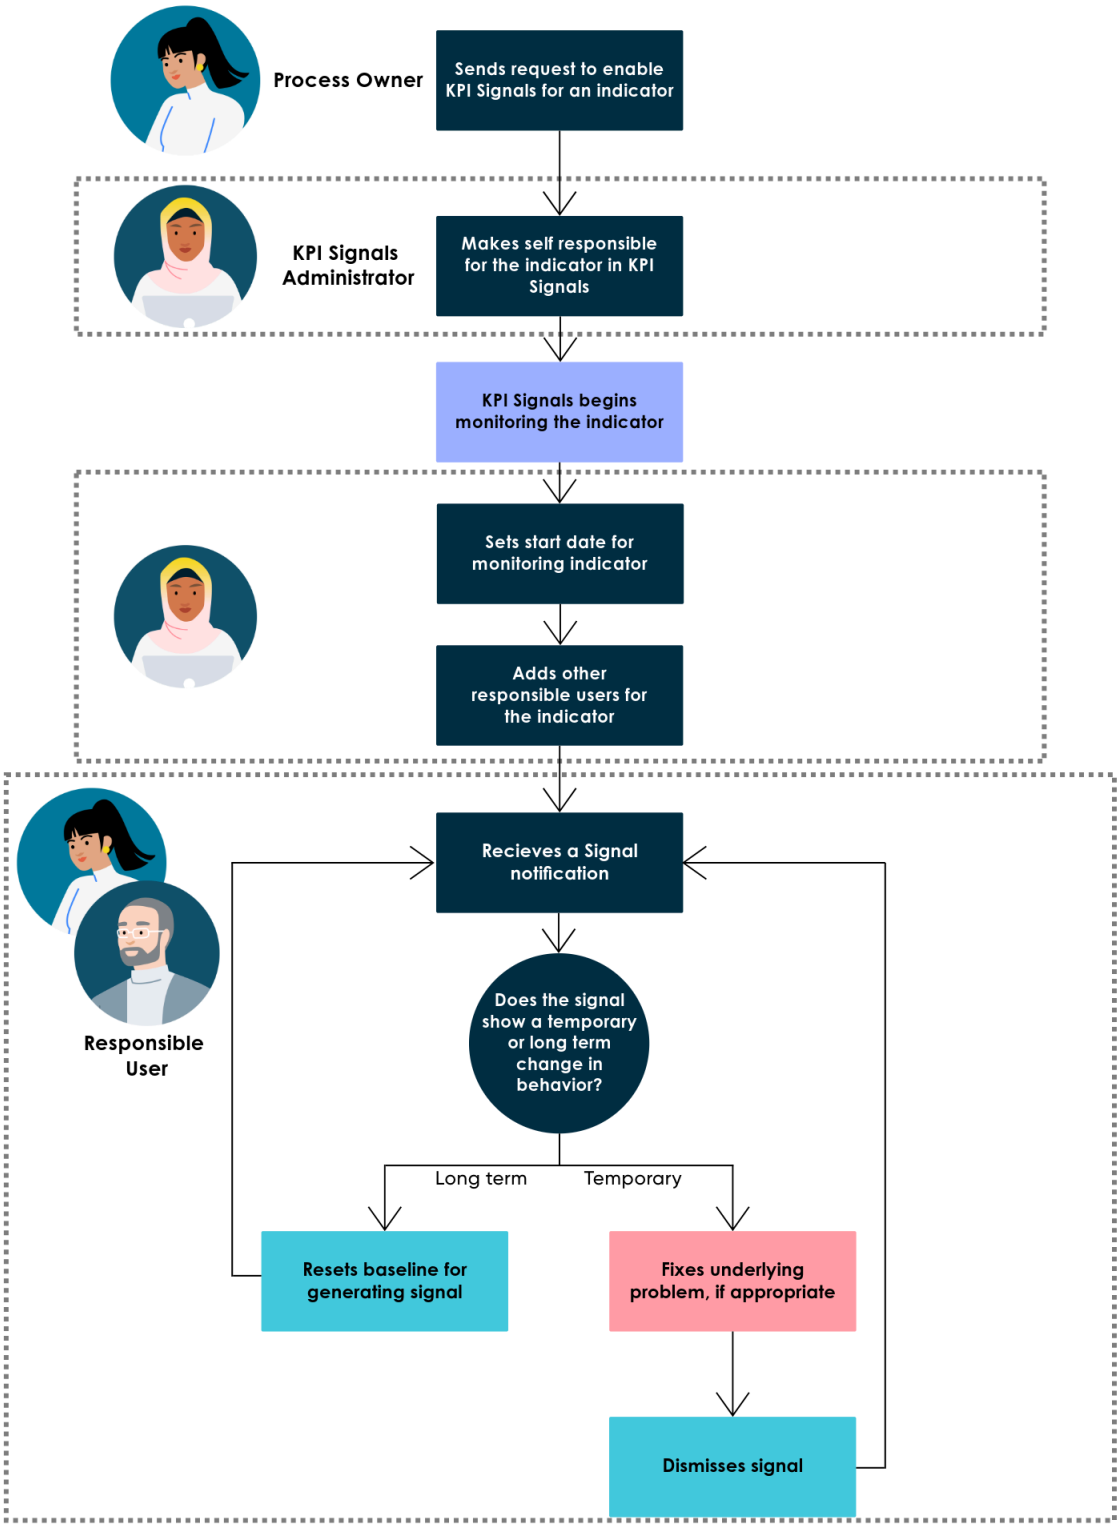
User	Description
Process owner	Requests signals monitoring on an indicator in the following circumstances: The indicator is important enough that the process owner wants to know if the trends deteriorate significantly and wants to be notified of this off-platform. However, the process owner does not want to track the trends continuously. Instead, they want the system to inform them when they need to look more closely. Alternatively, the process owner wants to catch the trend early in the process, before it is bad enough to be obvious to the human eye.
KPI Signals administrator	Sets up KPI Signals for an indicator at the request of the process owner. Also assigns responsible users for the indicator, generally also at the request of the process owner.
Responsible user	Receives signal notifications and acts upon them. The process owner is usually the key responsible user, but they can delegate this responsibility to other users as well.

KPI Signals workflow

The following diagram shows the workflow for setting up KPI Signals for a Performance Analytics indicator, and the workflow for responding to a signal notification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting up and using KPI Signals



1. Process owner requests an administrator to enable KPI Signals for an indicator.
2. Administator makes themselves a responsible user for the indicator. Doing so activates KPI Signals monitoring for the indicator.
3. Administrator sets start date for monitoring indicator.
4. Administrator adds other responsible users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Responsible user receives a notification from KPI Signals that an indicator should be examined.
6. Responsible user decides whether the signal is showing a temporary change, possibly due to a problem that can be corrected, or the signal is showing a long-term change in process behavior.
7. If the change is temporary, the responsible user addresses the underlying problem, if appropriate, then dismisses the signal.
8. If the change is long-term, the responsible user resets the baseline for generating the signal appropriately.

Other exploration topics

Signal, no signal, and anti-signal

When KPI Signals detects abnormal variation in the scores of a KPI, it generates a signal. When KPI Signals does not detect abnormal variation for a significant amount of time, it generates an "anti-signal." The anti-signal lets you know that your workflow is under control.

Both the presence and absence of signals conveys information:

- The presence of signals lets you know that a workflow has changed, or at least is not statistically stable.
- The long-term absence of signals indicates that a workflow is statistically stable. With this information you can decide to launch a process improvement initiative, for example.

Note: By default, dashboards that show indicators with KPI Signals enabled have insight cards for signals that get generated. For more information, see Proactive analytics insights on dashboards.

Signals

The KPI Signals application considers the following behaviors to 'signal' special cause variation:

Outlier

Every score beyond a three standard deviation (3-sigma) upper or lower limit.

Short run

Four consecutive scores on the same side of the central line, with three of the scores close to the upper or lower limit. "Close to the limit" is defined as outside two standard deviations.

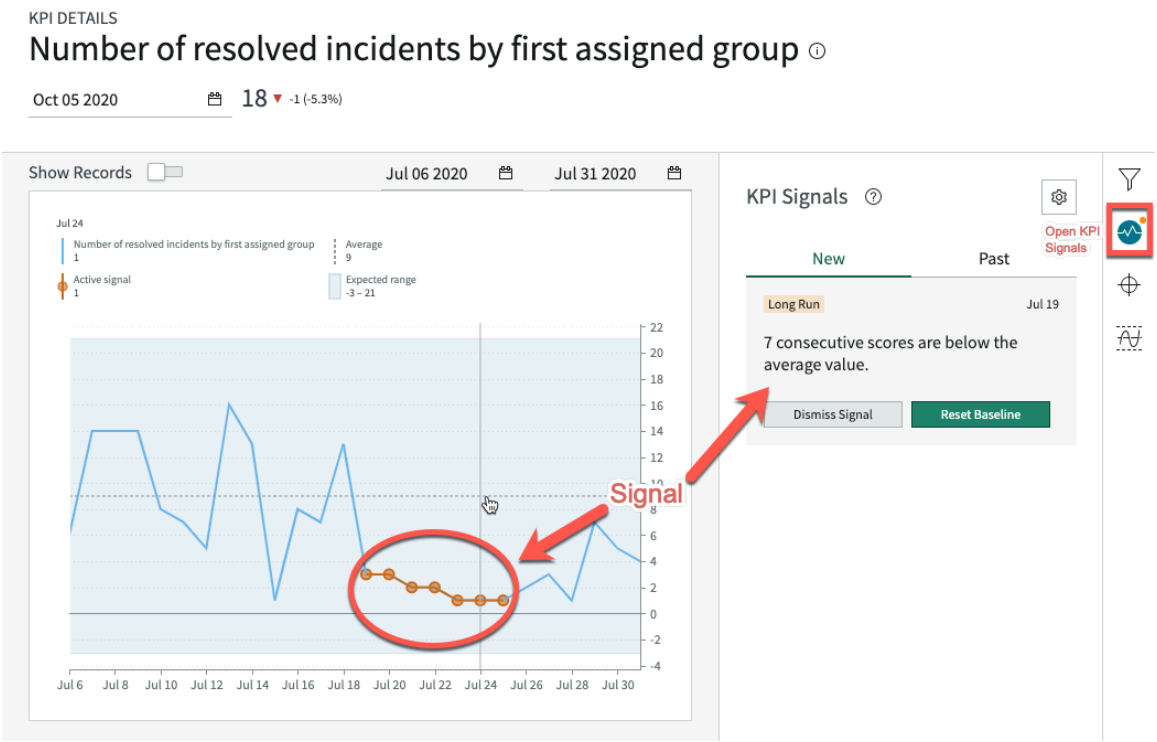
Long run

Seven consecutive scores on the same side of the central line. That is, seven scores in a row all greater than or all less than the average value.

Note: The KPI Signals app counts outliers (dismissed or not) when calculating whether a short or long run has occurred.

In the following example, you see a "Long run" signal: seven consecutive scores above or below the central line.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: The KPI Signals application can detect signals for an indicator with no more than one first-level breakdown element. The application does not support multiple breakdown elements or a second-level breakdown.

Anti-signals

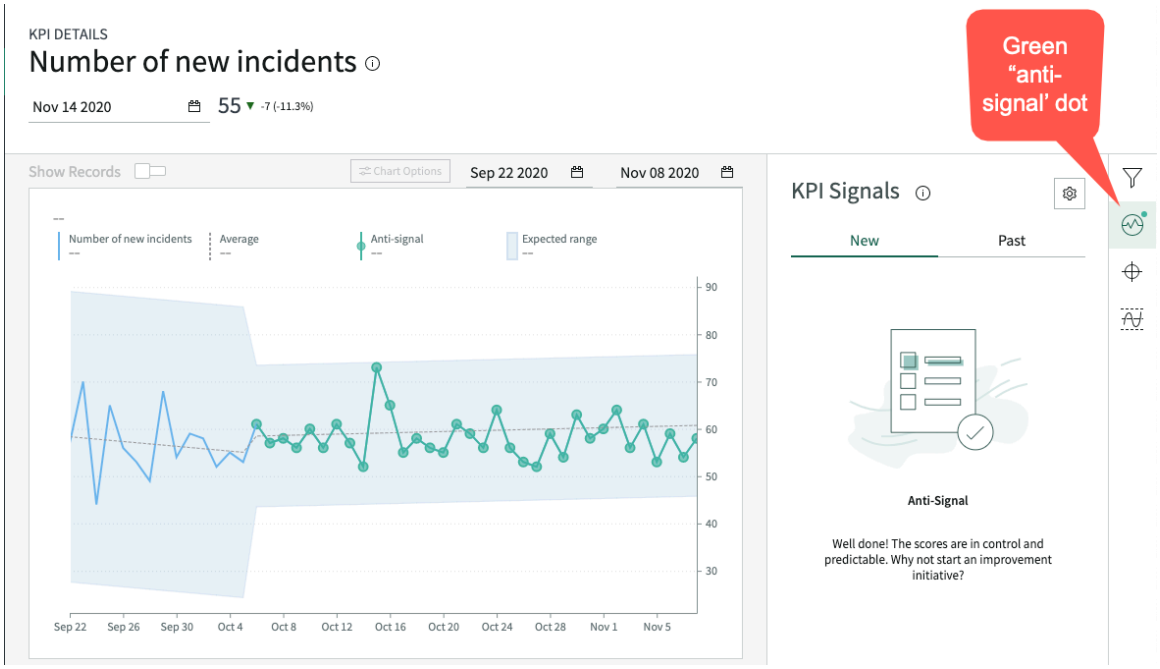
The application issues an anti-signal when it has not detected a signal for a length of time equal to the following formula:

```
Length of time to calculate the baseline for the KPI *
 Anti-signal factor
```

The application takes 14 days by default to calculate the baseline for a daily indicator. The default anti-signal factor is two. Thus, the default length of time to detect an anti-signal on a daily indicator is 28 days. For more information about setting the time to calculate a baseline, see Configure signal detection. For more information about setting the anti-signal factor, see Configure signal notifications.

In this example, the default configuration values apply to a daily indicator. The application has not detected a signal for 28 days, so it shows a 28-day anti-signal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

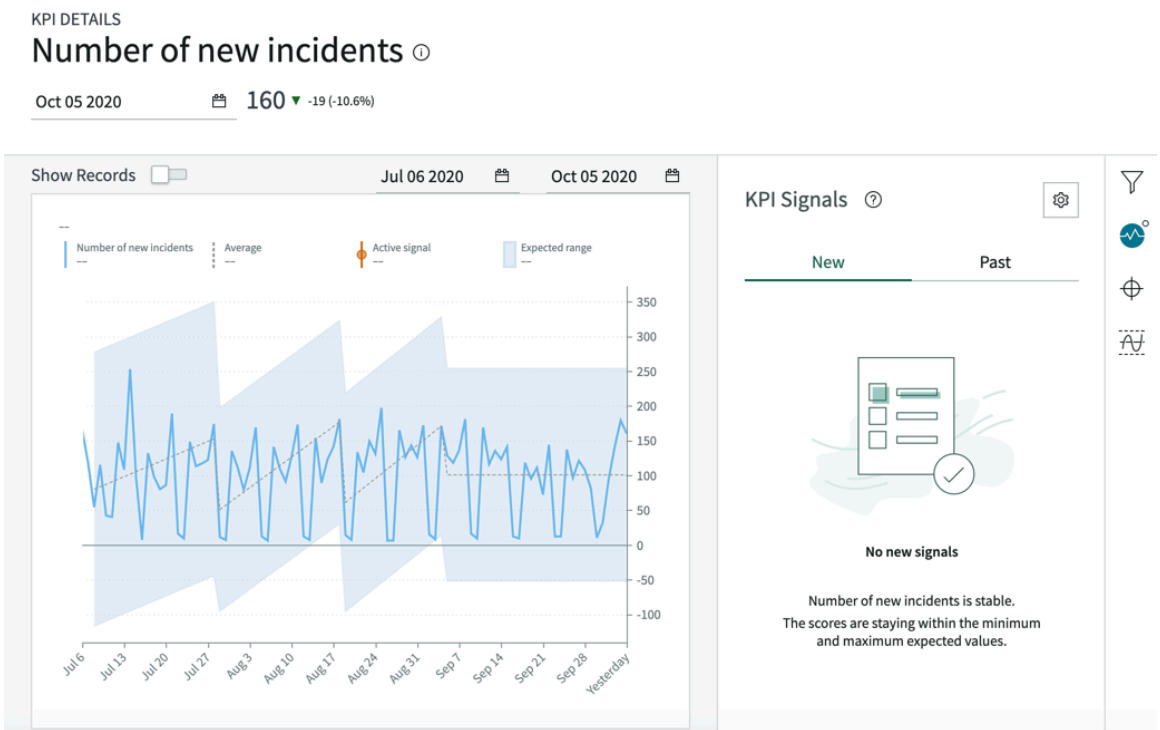


Although responsible users are notified when an anti-signal is generated, no action is required.

No signal

Usually no signal is detected for a shorter amount of time than it takes to detect an anti-signal. In this case, the application shows a simple "No signal" message. No notifications are sent and no action is necessary.

In the following example, no signal is detected for five days after the baseline was most recently reset. The baseline has been reset three times in the period being shown.



View KPI Signals

Access KPI Signals from the KPI Details page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: Any roles necessary to access the workspace. The access control lists (ACLs) for indicators and breakdowns are also respected.

Procedure

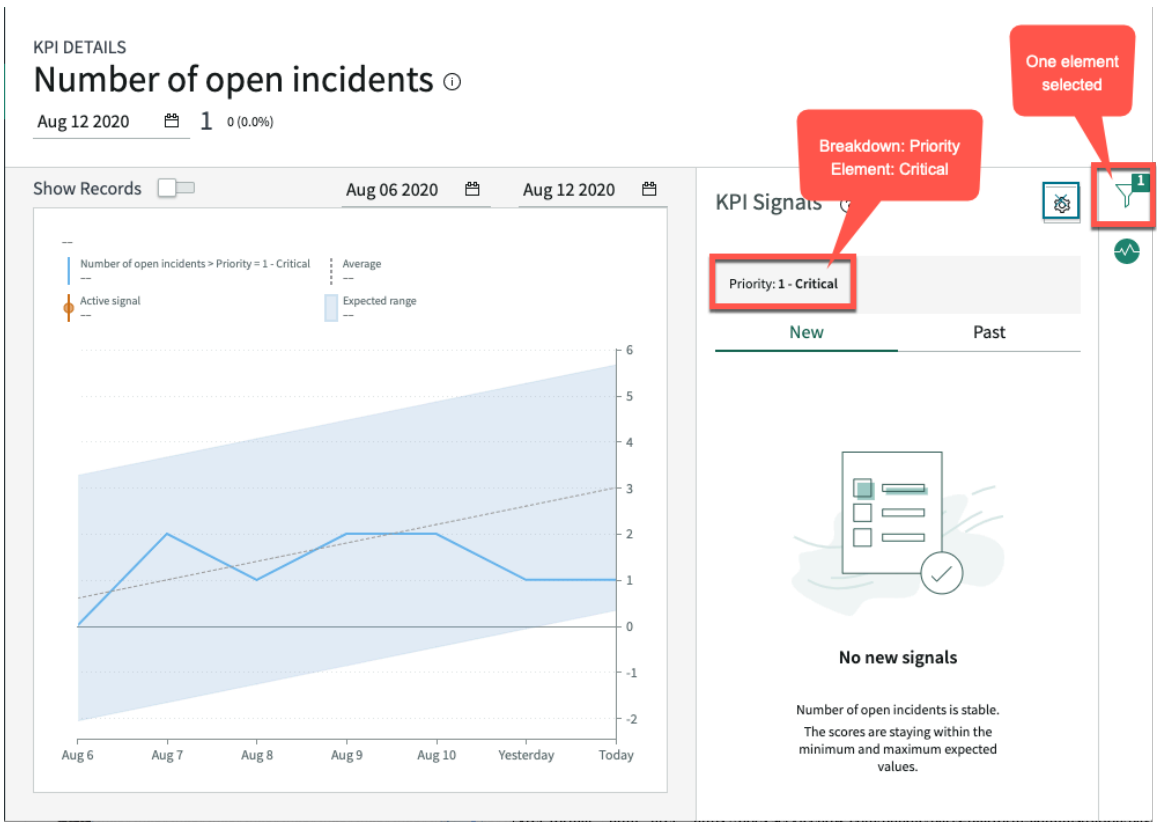
1. Open KPI Details for an indicator as described in View KPI Details.
2. **Optional:** Open the **Filters** ( ) panel and select one breakdown and one element.
   KPI Signals can monitor each first-level breakdown and element applied to an indicator. It cannot monitor second-level breakdowns.

   Note: In the context of KPI Signals, the term KPI refers to an indicator with optionally a first-level breakdown and element.

3. Select the Open KPI Signals icon.
   The KPI Signals panel opens.
4. If KPI Signals monitoring is not active for this KPI, you can follow the instructions in Activate KPI Signals monitoring for an indicator (KPI).
   If you do not have a role that allows you to activate KPI Signals monitoring for a KPI, contact an administrator instead.

Example: KPI Signals with a breakdown element

In the following example, you see the KPI Signals panel for the Number of open incidents indicator. This indicator is filtered on the Priority: 1 - Critical breakdown element. No signals have been detected.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring KPI Signals for an indicator

Activate KPI Signals for an indicator and set up signal detection and notifications. Assign responsibility for receiving and handling KPI Signals notifications for an indicator.

Activate KPI Signals monitoring for an indicator (KPI)

KPI Signals does not monitor indicators by default. You activate monitoring for individual indicators. When you activate KPI Signals for an indicator, you make yourself a responsible user for that indicator.

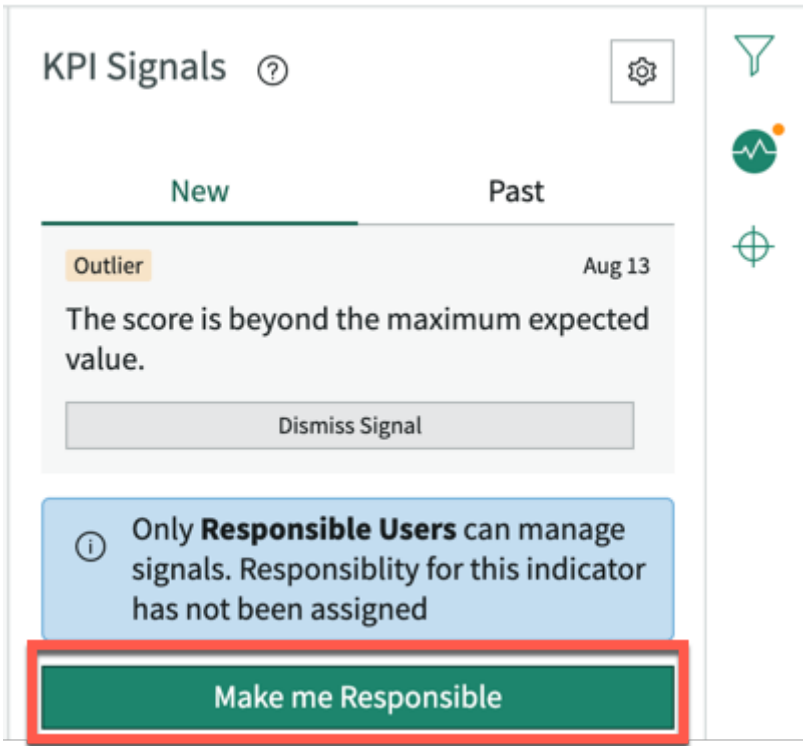
Before you begin

Important: Data snapshots do not support KPI Signals.

Role required: pa_kpi_signal_admin, pa_admin, or admin

Procedure

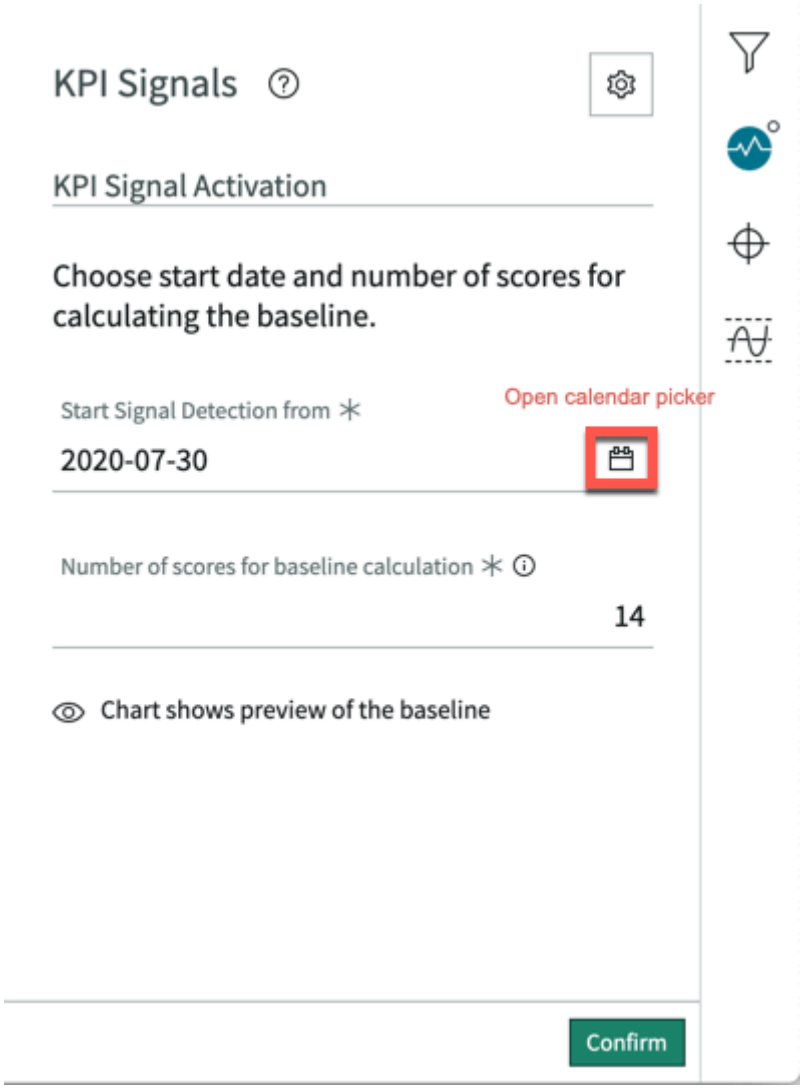
1. Open KPI Signals for an indicator, as described in View KPI Signals.
2. If KPI Signals monitoring for the indicator has not been activated, click **Make me responsible** in the KPI Signals panel.



KPI Signals monitoring cannot be active for a indicator unless there is at least one responsible user. Therefore, when you activate monitoring, you automatically make yourself a responsible user. You can then reassign responsibility. For more information, see Configure responsibility for KPI Signals.

3. Select a start date from which to evaluate the indicator for signals.
   By default, signals are calculated starting three months before you activate KPI Signals for the indicator. If meaningful data for calculating a baseline begins earlier or later than this date, change the date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Set the number of indicator scores that are used to calculate the baseline.
   The default number of scores for calculating the baseline depends on the indicator frequency. Do not change this number unless you are confident you have good reasons. The minimum number is five.
5. Click **Confirm**.

What to do next

After you activate KPI Signals monitoring for an indicator, you can:

- Deactivate monitoring on the indicator
- Reactivate monitoring if it was deactivated
- Reconfigure the number of points for calculating the baseline
- Change the start date for calculating the baseline
- Change the type of trend calculation for the baseline

For more information, see Configure signal detection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure signal detection

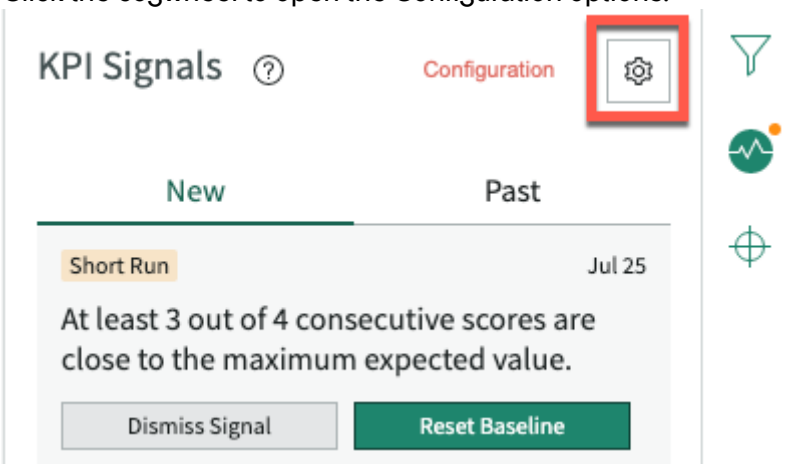
You can set the start date of the current baseline calculation, the number of scores used to calculate the baseline, and the trend method. You also can deactivate or reactivate KPI Signals monitoring for a KPI.

Before you begin

Role required: admin, or must be a responsible user.

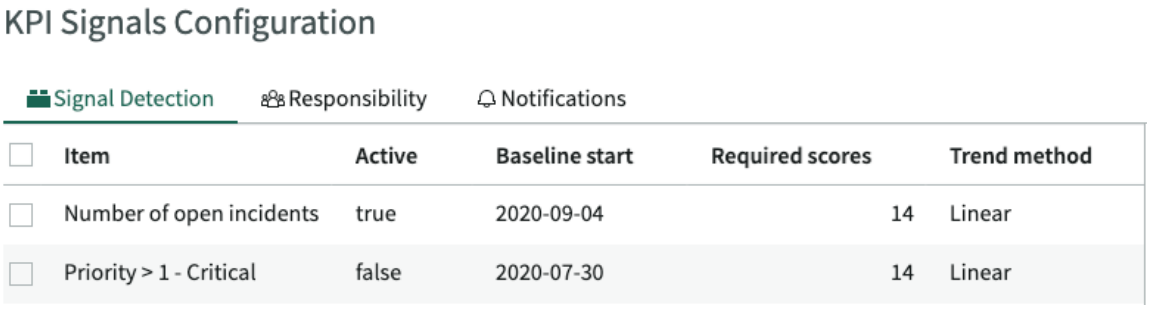
Procedure

1. Open KPI Signals for a KPI.
2. Click the cogwheel to open the Configuration options.



3. Open the Signal Detection tab.

   In this image, you see the Number of open incidents indicator with no breakdowns, and the same indicator with the Priority = 1-Critical breakdown and element. The KPI with the Priority = 1-Critical breakdown has been deactivated. Only KPIs that had been activated at some point appear in this list.



Item	Active	Baseline start	Required scores	Trend method
Number of open incidents	true	2020-09-04	14	Linear
Priority > 1 - Critical	false	2020-07-30	14	Linear

4. Select the KPIs that you want to edit.
5. Fill in the following fields:

Field	Description
Active (check box)	Deselect to deactivate KPI Signals monitoring of the KPI. The KPI remains in the list afterwards. Select**Active** later to reactivate monitoring on the KPI. If you reactivate monitoring on a KPI, it begins from the date

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	you deactivated monitoring, not the date you reactivated it.
Baseline start	The beginning date of the data points used to calculate the baseline. This date is based on the most recent resolved signal. If there never was a resolved signal, the date was set when monitoring on the KPI was first activated.
Number of scores for baseline calculation	The number of scores, or data points, that the application uses to calculate the baseline. The default number of scores for calculating the baseline depends on the indicator frequency. Do not change this number unless you are confident you have good reasons. The minimum number is five.
Trend method	The statistical method for calculating the baseline. Options are: ○ Linear trend, calculated by linear regression ○ No trend, just the average score

6. Click **Save**.

Example: Linear trend versus no trend

In the following example, the initial linear trend kept resulting in signals despite the average remaining stable. Following the signal in early September, signal detection was changed to "no trend." Following this change, the average remained stable and no further signals were detected.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure responsibility for KPI Signals

Besides security access, a user needs a level of responsibility to act on a signal. Responsibility is granted for individual indicator/breakdown element combinations (KPIs) that the KPI Signals application monitors.

A KPI can have multiple responsible users.

Users with the admin, pa_admin, or pa_kpi_signal_admin role can reset a baseline or dismiss a signal without explicitly being a responsible user. Users with other roles must become responsible users to take such actions. These users also need a role that gives them access to a relevant workspace.

Responsible users get email notifications about the following:

- New signals
- Unresolved signals
- Actions to resolve signals
- "Anti-signals," which indicate that a KPI is long-term stable

Even responsible users without workspace access get these email notifications.

Related topics

Configure signal notifications

Assign responsibility for signals

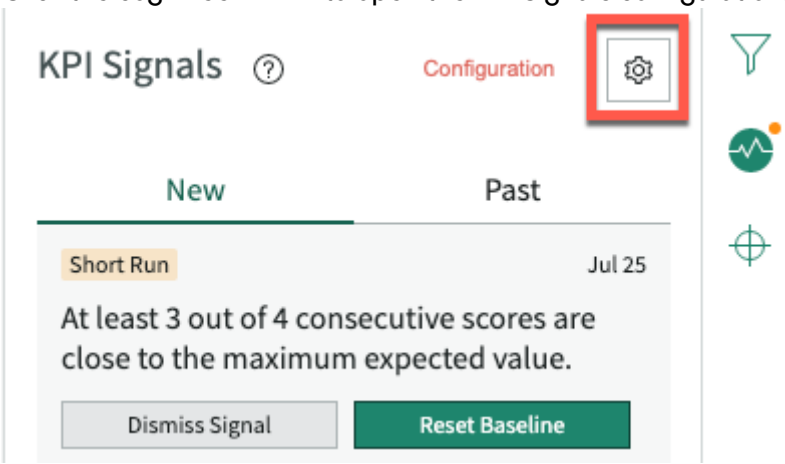
You can assign responsibility for KPI Signals for a KPI to yourself or someone else. You can also unassign responsibility.

Before you begin

Role required: Any role if a responsible user, or pa_admin or admin

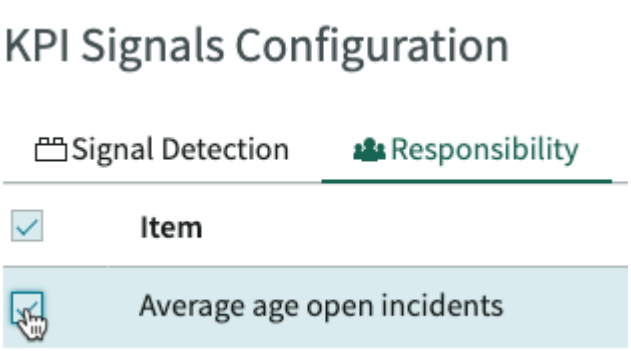
Procedure

1. Open KPI Signals for an indicator, as described in View KPI Signals.
2. Click the cogwheel to open the KPI Signals configuration.



3. In the KPI Signal Configuration screen, open the **Responsibility** tab.
4. Select the KPI that you want to assign responsibility for.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The user needs relevant workspace roles to view or act on signals. However, a responsible user without these roles still gets email notifications about unresolved signals or actions on signals.

5. In the **Editing configuration items** panel, open a list of users and select whom to assign responsibility to.
6. To unassign responsibility, click the x next to a user's name.
7. Click **Save**.

Configure signal notifications

As a responsible user, you receive email reminders about signals that have not been resolved. You can configure how frequently you get these reminders and the maximum number of reminders to get for a signal.

Before you begin

Role required: admin, or must be a responsible user

About this task

As a responsible user, you receive email notifications in the following circumstances:

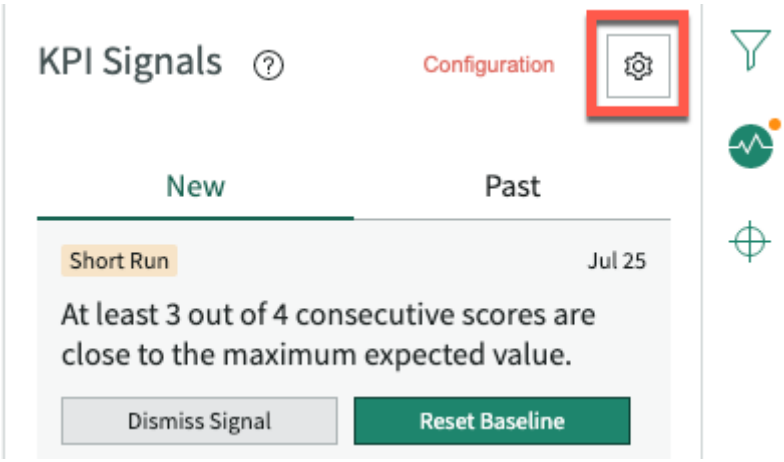
- A new signal is detected on a KPI that you are responsible for.
- No signal has been detected on a KPI long enough for it to be considered long-term stable (an "anti-signal").
- A signal for a KPI you are responsible for is resolved (baseline reset or dismissal).
- A signal for a KPI you are responsible for has not been resolved, according to subsequent signal collection jobs.

In this last case, you can set how frequently a KPI is checked for resolution. You can also set the maximum number of reminders you get.

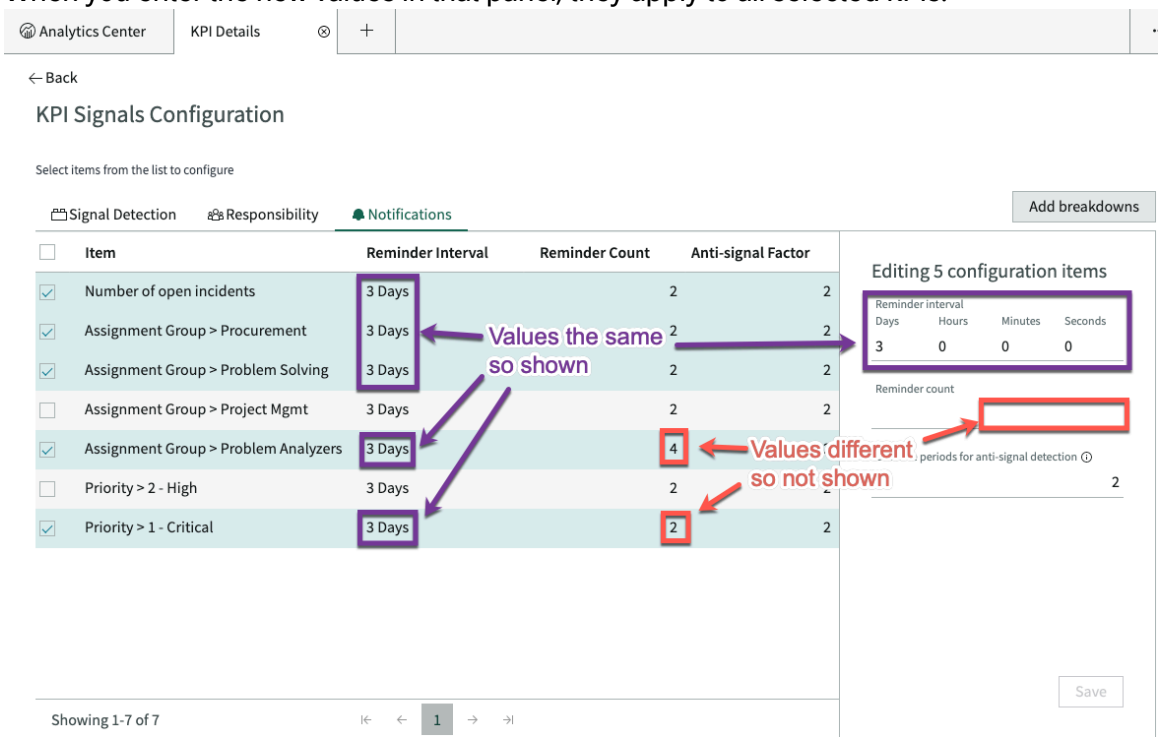
Procedure

1. Open KPI Signals for a KPI.
2. Click the cogwheel to open the Configuration options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Open the Notifications tab.
   You see a list of all the KPIs that you are responsible for on this indicator. KPI refers to the combination of the indicator with any breakdown elements.
4. Select the KPIs that you want to edit.
   If you select one KPI, its settings appear in the **Editing configuration items** panel. If you select more than one KPI, only the values that are the same for all these KPIs appear in the panel. When you enter the new values in that panel, they apply to all selected KPIs.



5. Set the interval between getting reminders about unresolved signals.
6. Set the count of the maximum number of reminders you want to receive about an unresolved signal.
7. Set the anti-signal factor.
   This factor helps determine when a KPI is stable enough to generate an "anti-signal," according to the following formula:

```
Length of time to calculate the baseline for the KPI *
 Anti-signal factor
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The default anti-signal factor is two. Set this factor if you decide it needs to be changed. For more information, see Signal, no signal, and anti-signal.

8. Click **Save**.

Configure signals for breakdown elements

Configure signal detection and assign responsibility for multiple breakdowns and breakdown elements on one indicator.

Before you begin

An administrator must activate KPI Signals for the indicator. For more information, see Activate KPI Signals monitoring for an indicator (KPI).

Role required: responsible user for the indicator or admin.

About this task

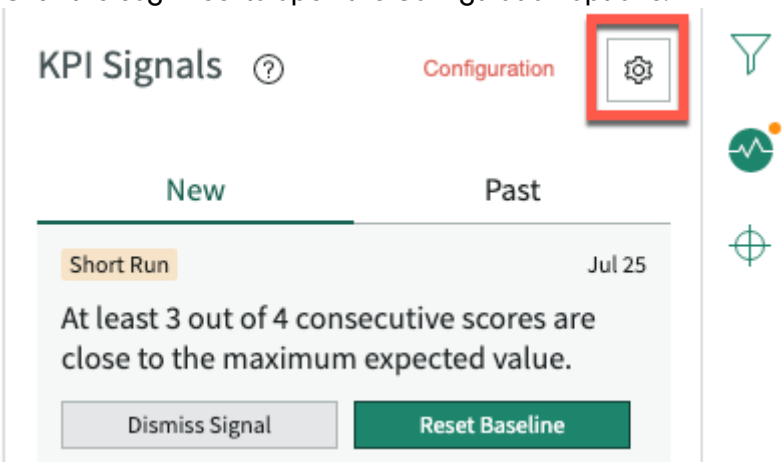
For example, KPI Signals could simultaneously monitor the following indicators and breakdowns:

- Number of open incidents (no breakdown)
- Number of open incidents, Priority = 1-Critical
- Number of open incidents, Priority = 2-High
- Number of open incidents, Category = Software

However, KPI Signals could not monitor "Number of open incidents, Priority = 1-Critical, Category = Software."

Procedure

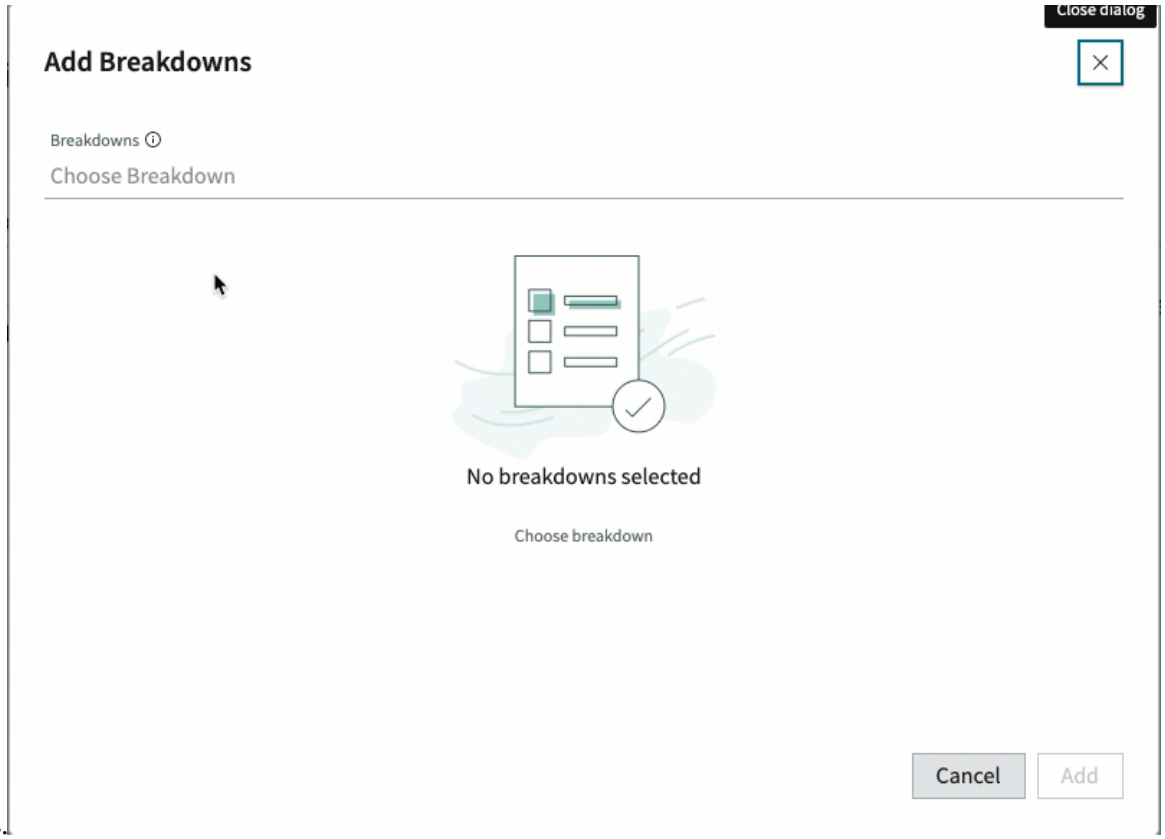
1. Open KPI Signals for the indicator, without first selecting a filtering breakdown in KPI Details.
2. Click the cogwheel to open the Configuration options.



3. Click **Add breakdowns**.
   The **Add Breakdowns** dialog opens.
4. Click in the Breakdowns field and select a breakdown.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A list of elements for the breakdown



appears.

5. **Optional:** Click **Filter** and use the condition builder to build a filter for the elements.
6. Select at least one element and click **Add**
7. To monitor signals on elements of another breakdown, click **Add breakdowns** again and repeat the steps.
8. In the Signal Detection tab, activate monitoring for the KPIs and set the baseline start and number of scores required to calculate the baseline.
   For more information about the settings on the Signal Detection tab, see Configure signal detection.
9. Open the Responsibility tab and assign a responsible user to each KPI.
   For more information about responsible users and the settings on the Responsibility tab, see Configure responsibility for KPI Signals.
10. Open the Notifications tab and set how often the responsible user should get an email notification for an unresolved signal.
    You can also set the total number of reminders the responsible user gets for an unresolved signal. Also set the anti-signal factor, which is used to calculate how many scores without a signal result in an anti-signal. For more information about anti-signals, see Signal, no signal, and anti-signal. For more information about the settings on the Notifications tab, see Configure signal notifications.

KPI Signals automated detection jobs

The KPI Signals application includes jobs that detect signals automatically. These jobs run so responsible users can be notified of new signals without opening the application. The job for signals on formula indicators requires scheduling.

When you view an indicator in KPI Details and open the KPI Signals panel, that indicator is checked for signals. You therefore always have the most up-to-date signals. However, the KPI

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Signals application also has automated signal detection jobs. These jobs send notifications about signals to subscribed users without them having the application open.

For automated indicators, these jobs run whenever a data collection job runs. The KPI Signals application checks all indicator and breakdown element combinations that it is active for. The data collection jobs are domain specific, so the signals are also domain specific.

The situation is different for formula indicators. The formula in a formula indicator uses the scores of other indicators. These other indicators are referred to as contributing indicators. The scores of these indicators can be collected in different data collection jobs. Bear in mind the KPI Signals calculation uses the most recently detected contributing indicator scores. The KPI Signals job should run after the scores of all the contributing indicators have been detected.

To help you ensure that formula indicators are checked for signals at the right time, the KPI Signals application comes with a scheduled job: PA - KPI Signals - Formula Indicator Signals Calculation Job. This job has a default setting to run every 8 hours, but you have the possibility to optimize this timing.

Schedule the job to detect signals for formula indicators

Set the PA - KPI Signals - Formula Indicator Signals Calculation Job to run after all data detection jobs have run.

Before you begin

Review the Performance Analytics data detection jobs. Determine a time after these jobs have run that signals should be detected for formula indicators.

Note: This procedure is optional. Modifying the job schedule can prevent lags between new scores and new signals on formula indicators. However, the default signal detection every 8 hours should not produce errors and may be sufficient for you.

Role required: admin.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Filter the list for jobs whose name contains `KPI Signals`.
3. Open the PA - KPI Signals - Formula Indicator Signals Calculation Job.
4. Modify the following fields to schedule the job:

Field	Description
Run	Frequency you want the job to run. The choice of subsequent fields depends on your setting in this field. By default, the job runs **Periodically**.
Day	Day you want the scheduled job to run. If you selected **Weekly** in the **Run** field, this field displays the days of the week. If you selected **Monthly** in the **Run** field, this field displays the days of the month.
Time	Time you want the scheduled job to start.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Repeat Interval	Number of days and hours before the scheduled job runs again. This field appears when **Periodically** is selected from the **Run** list. By default, the job runs every 8 hours.
Starting	Date and time to start the periodic updates. This field appears when **Periodically** is selected from the **Run** list.

Disabling KPI Signals

KPI Signals can be disabled on request.

KPI Signals is activated by default. If you do not want this feature, request a ServiceNow AI Platform administrator to set the property *com.snc.pa.activate_kpi_signals* to *false*. Because this property does not exist by default, the administrator must add it. You can refer them to Add a system property.

Important: If you reactivate KPI Signals, signal detection resumes from the time you originally deactivated the feature, not from the time you reactivated it.

Using KPI Signals

When a responsible user receives a signal notification, they either dismiss the signal or reset the baseline.

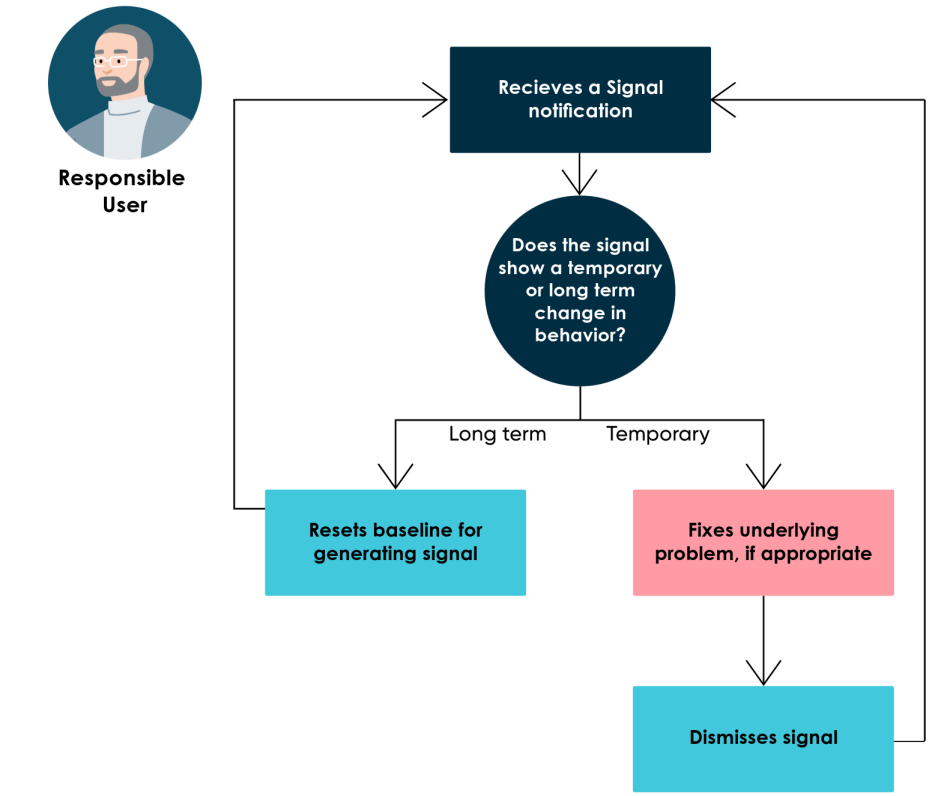
Overview of responses to KPI Signals notification

A responsible user evaluates the KPI Signals notification. If they determine that the underlying issue is a temporary problem, they fix the problem if appropriate and dismiss the signal. If they determine that the notification is due to a long-term change in the behavior of the underlying business process, they update the baseline that is used to generate a signal.

If it is later determined that it was a mistake to dismiss the signal or update the baseline, a responsible user can undo the action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Responses to a KPI Signals notification



1. Receive a notification from KPI Signals that an indicator should be examined.
2. Decide whether the signal is showing a temporary change, possibly due to a problem that can be corrected, or the signal is showing a long-term change in process behavior.
3. If the change is temporary, address the underlying problem, if appropriate, then dismisses the signal.
4. If the change is long-term, reset the baseline for generating the signal appropriately.
5. If the decision turns out to be incorrect, undo it.

Other use topics

Reset baseline or dismiss signal

When you get a signal that abnormal variation has occurred, either dismiss the signal or recalculate the parameters.

Before you begin

Role required: You must be a responsible user, unless you have the admin, pa_admin, or pa_kpi_signal_admin role.

About this task

Investigate the reason for the variation before deciding to reset the baseline or dismiss the signal. If you determine that the signal represents a "new normal," recalculate the baseline. If you determine that the signal is the result of a temporary circumstance, dismiss the signal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open KPI Signals from KPI Details.
   In the KPI Details page for an indicator, you see a notification dot on the KPI Signals tab. This dot tells you that you have a signal for the indicator.

   Note: KPI Signals can detect signals for an indicator that is filtered on one first-level breakdown element. It does not support multiple elements or second-level breakdowns.

2. Examine the signal and investigate the business reasons behind this variation in process behavior.
   - If you determine that the signal shows a temporary change in behavior, click **Dismiss signal**. A temporary change in behavior may be due to a temporary change in circumstances, or due to a problem you are able to quickly correct.
   - If you determine that the signal shows a long-term, real change in the process behavior, click **Reset baseline**.
3. If you recalculate the baseline, fill in the following fields:

Field	Description
Reset from date	The date from which to begin calculating the new baseline. By default, this date is the first date of the signal. If the signal is irregular or followed immediately by more variation, consider a later start date.
Number of scores for baseline calculation	The default number of scores for calculating the baseline depends on the indicator frequency. Do not change this number unless you are confident you have good reasons. The minimum number is five.

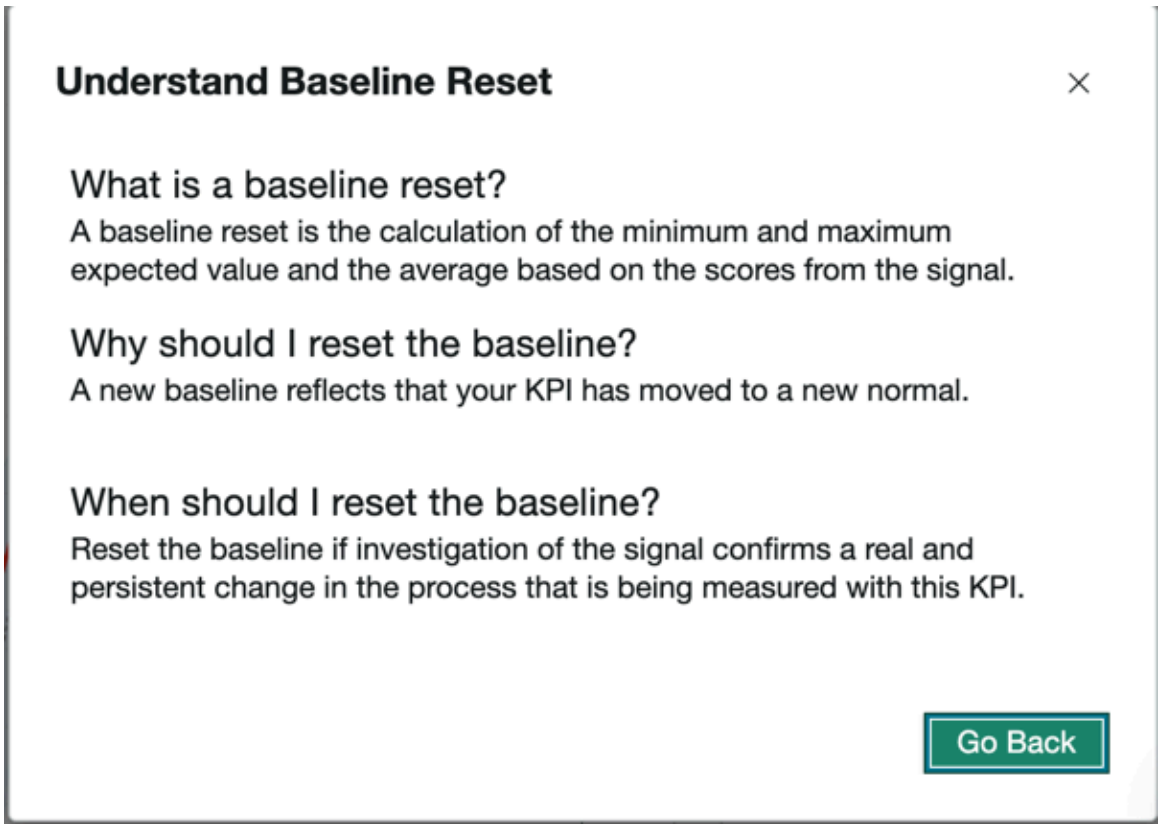
4. Whether you dismiss the signal or reset the baseline, give the reason for your decision.
   A required field labeled **What has changed?** appears in the KPI Signals panel. Briefly describe the results of your investigation into the signal.

   The reason for your decision appears when you view **Past** signals. It is key information for deciding whether to revert a signal dismissal or baseline reset.

5. Click either **Dismiss signal** or **Confirm**, to dismiss the signal, or reset the baseline, respectively.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the dialog for resetting the baseline, you can first click **How does it work?** Doing so opens a window with information about what a baseline reset is and when to perform one.



Result

If you reset the baseline, a message appears that the baseline is reset. You also see whether there is a more recent signal than the one you just handled. You can review the signals that you dismissed and your baseline resets in the **Past** tab.

Revert baseline reset or signal dismissal

Review previous decisions to reset the KPI Signals baseline or dismiss a signal. Revert the decision if necessary.

Before you begin

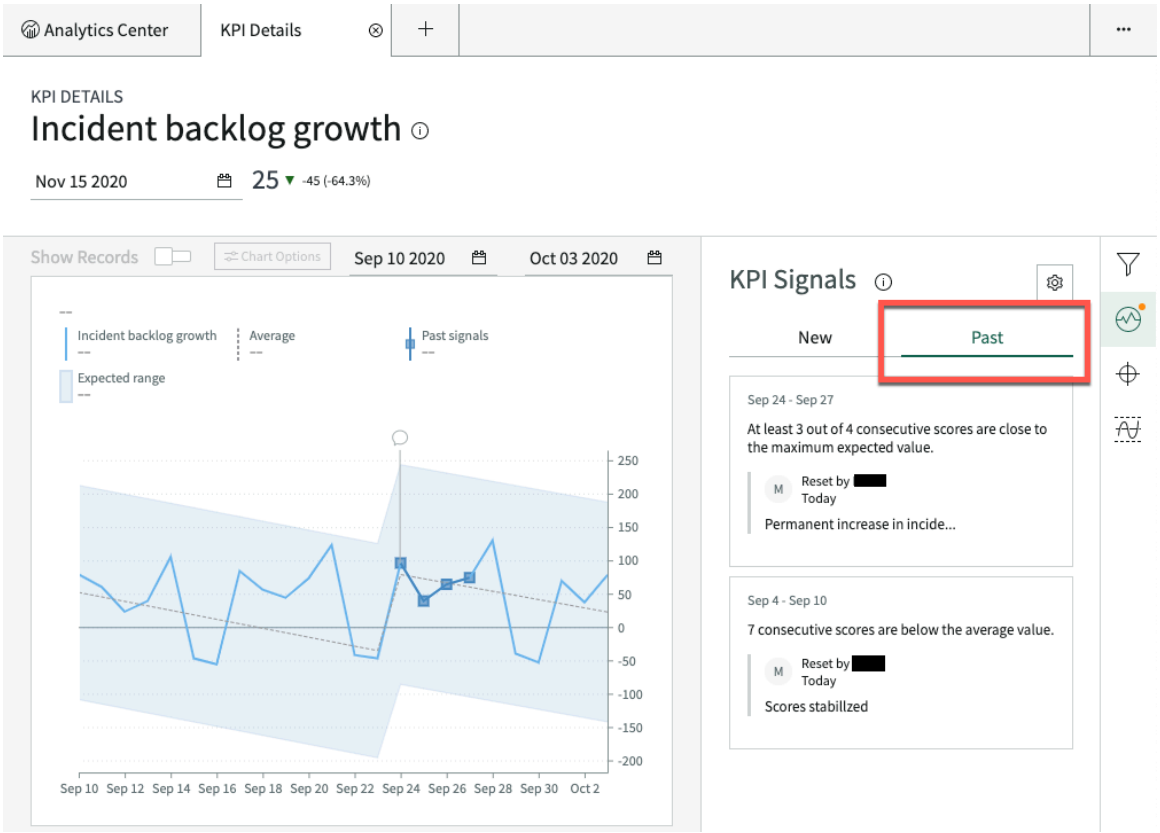
You must have access to KPI Details.

Role required: You must be a responsible user for the KPI, or have the admin, pa_admin, or pa_kpi_signal_admin role.

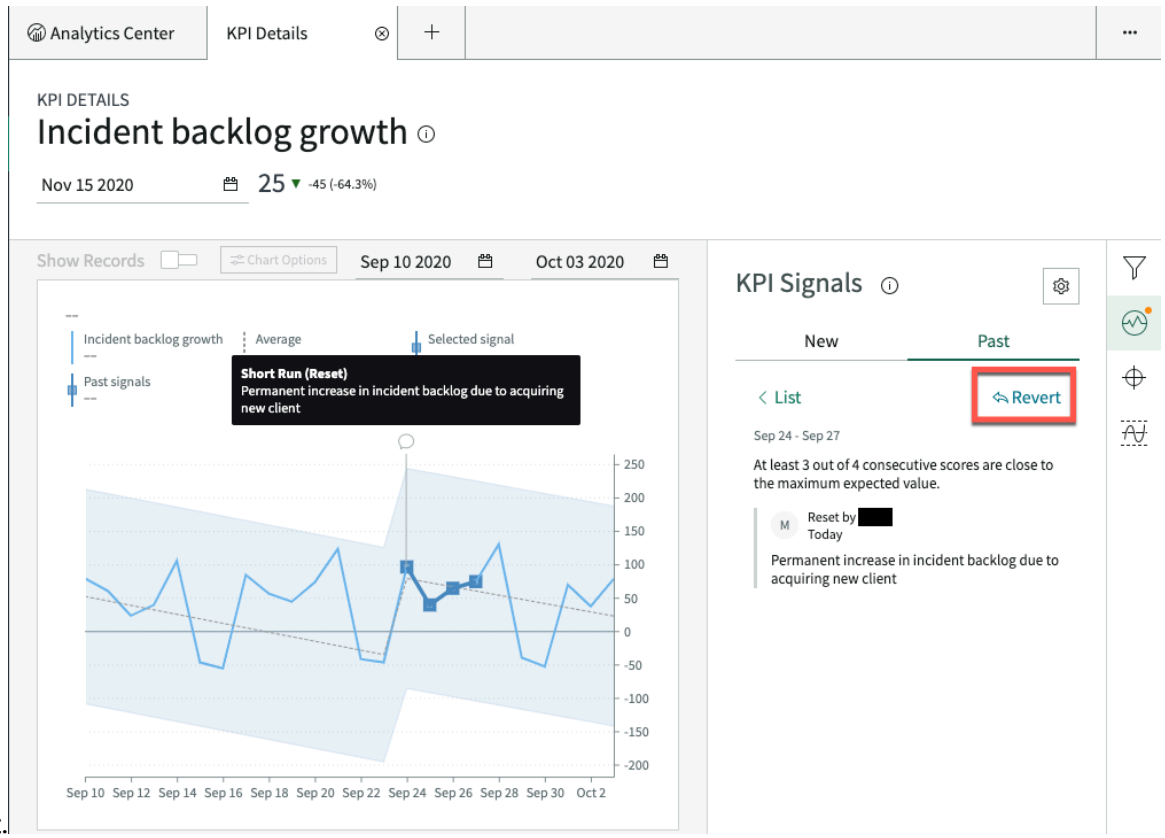
Procedure

1. From KPI Details, open the KPI Signals panel.
2. Switch to the **Past** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. To focus on a baseline reset or a signal dismissal, click the card for that decision. You can also point to the callout for a signal to see the reason for its dismissal or for the baseline reset.



Note: You cannot revert an anti-signal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. If you determine that an earlier decision to dismiss a signal or reset a baseline was incorrect, click **Revert**.
5. Review the list of all decisions that you would revert.
   When you revert a signal dismissal or baseline reset, you also revert all later

   decisions.
6. If you decide to proceed with reverting the decisions, click **Confirm**.

What to do next

Now make a new decision for the oldest signal whose decision you reverted. Then work your way through any subsequent signals.

KPI Signals roles

The following roles apply to KPI Signals

Any role

A user with any role can be made responsible for receiving and responding to signal notifications for a specific indicator. This user can also configure signal detection and notification and assign responsibility for the indicators they are responsible for. They must also have access to the indicator.

pc_kpi_signals_admin

A user with this role or who inherits this role (via pa_admin or admin) can activate KPI Signals for an indicator. They can also configure signal detection and notification and assign responsibility for any indicator on the instance.

Platform Analytics experience reference

Resources shared across all features and applications in the Platform Analytics experience

Data caching in Platform Analytics

Data caching can help data visualizations load faster by reusing older responses when available. Users can always get the latest data by refreshing the dashboard manually.

Data caching could potentially speed up the load time of dashboards and data visualizations, especially for large datasets, for the following reasons:

- Caching can avoid long aggregation calculations when there have been no changes to the data.
- Caching can avoid aggregation calculations for users who have access to the same aggregated result data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Caching can reduce the toll on the instance from long-running requests piling up.
- Caching may be suitable for use cases where users are more interested in the speed with which their dashboard loads than in the freshness of the data.

Supported data sources

Table and indicator data support caching.

Activating data caching

Before you activate data caching, the property *glide.analytics.cache.enabled* must be set to `true`.

In the inline dashboard editor, you can activate or deactivate data caching per dashboard. Caching then applies to all data visualizations on that dashboard that have a data source that supports it. For more information, see Configure Platform Analytics dashboard settings.

In the UI Builder, you can activate or deactivate data caching per data visualization. For an example, see the *useDataCache* property for either table or indicator data sources in Single Score UIB Setup.

In the UI Builder, you can also enable data caching for a local data instance of the table or indicator type. For more information, see Enable data caching for a local data instance.

Default dashboard caching

By default, new dashboards that you create in the inline editor do not have caching enabled. You have to enable caching per dashboard, as described in the previous section. However, you can change the default behavior so that all new dashboards that you create in the inline editor have caching enabled. To do so, set the property *glide.analytics.cache.enable_dashboard_default* to `true`.

If you set the default behavior to have caching enabled on new dashboards, consider whether you want to change the default expiration time. The default value for the default expiration time is 24 hours. You can set this value in the property *glide.analytics.cache.dashboard_default_value*. The options are 1, 2, 4, 8, 12, or 24 hours. When setting this value, consider the impact on data prefetching.

It is not possible to enable caching by default for data visualizations created in the UI Builder.

Prefetching data

The first loading of a dashboard does not have cached data to use, so can be subject to a slow load time. For example, the first time an IT agent logs in for the day, their cached data from the previous day has expired, so they must wait for the system to fetch data before any of their dashboards load. The prefetch mechanism addresses this issue for frequently used dashboards and data visualizations with long cache expiry times.

Prefetching keeps cache entries alive by refreshing the data automatically as the cache approaches expiry time, without any user interaction. A scheduled job looks for cache entries with prefetch enabled where the entry is due to expire in the next 30 minutes. The job collects all such records and queues them to be refreshed. After refreshing, the expiry time is reset. This scheduled job runs every 15 minutes, so that the table cleaner will not delete a valid cache entry that has not yet been processed.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prefetch settings and defaults

Prefetching is activated by default with settings chosen to balance minimizing system load with maximizing value to the user. An admin can change these values, but should do so with great caution and only for pressing reasons.

Property	Setting	Value	Notes
glide.analytics.cache.prefetch.min_age_in_seconds	Lower limit of cache expiration time [cacheExpirationTime] for data to be subject to prefetching	8 hours	Eight hours is the minimum safe lifespan of cached data for it to be prefetched. You may need to increase this value but should not decrease it.
glide.analytics.cache.prefetch.max_refresh_counter	Number of consecutive times data is prefetched without a cache hit before prefetching stops for this data	10	Prefetching is meant for frequently used data. In order to reduce system load, if data is prefetched 10 times in a row without a user looking at the data, prefetching ceases. The data then follows default cache behavior and will reload when next viewed. The default value was

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Setting	Value	Notes
			selected to cover weekends. You may need to decrease this value but should not increase it.

Platform Analytics roles

Platform Analytics has both unique roles and roles from other applications that apply to it.

Users with any role

Users with any role can create visualizations in dashboards that they have editing rights to. They need access to the data that they wish to display. They can add data visualizations that have been shared with them to their dashboards. In the Visualization Designer, they can bookmark or export such visualizations, and if a visualization has been shared with them with sharing rights, they can share it with other groups and users. Specific roles are needed to create or edit visualizations in the Visualization Designer.

Users with any role can create dashboards and share them with groups, users, and roles. If a data visualization has been shared with them, they can add this visualization to their dashboards from the library. These users can share a dashboard that has been shared with them if sharing rights were also granted. They can pass along editing rights if granted.

User groups

Simplify user administration by creating groups that contain all the roles necessary for specific personas rather than to individual users. You can then assign individual users to those groups. When users transition to new roles, you can then re-assign their group memberships, and avoid scenarios where users retain unexpected roles.

For details on the administration of users, groups, and roles, see User Administration.

Role description

The following table provides the following information about each role associated with Platform Analytics.

Role name

Name of the role from the **Name** field in the Roles [sys_user_role] table.

Description

Description of the role and its intended use.

Contains Roles

List of roles contained within the role.

Contained by roles (except admin)

Any roles, besides admin, that contain the role. The admin role contains all the roles.

The following attributes are shared by all of the roles:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- None of the roles are assigned to a group by default.
- None of the roles require users to be allocated as part of a paid subscription, although a paid subscription is required for most Performance Analytics functionality.
- None of the roles are elevated, meaning none grant access to High Security Settings.
- All of the roles are included in the base system, except for analytics_admin and sn_process_optimization_analyst, which are included with Usage Insights and Process Mining, respectively.

Tip: Try to assign the least inclusive role that still provides the necessary access. For example, if you want a user to be able to create data visualizations in the library and share them with users, but not schedule their export, grant that user viz_creator and not viz_admin.

Role name	Description	Contains Roles	Contained by roles (besides admin)
admin	Can create dashboards. Can create data visualizations in the Visualization Designer, which are automatically saved to the Library. Can edit, duplicate, share, and delete any dashboard and data visualizations. Can add filters to the filter library or edit or delete any filter. Has Usage Insights administrator privileges.	All other roles in this table	Not applicable
platform_analytics_admin	Role for administrative privileges in the Platform Analytics experience. This role includes administrative privileges for products and features that are part of Platform Analytics, including Performance Analytics and Usage Insights. Has the rights of all roles listed here except report_admin rights to Core UI reports.	• analytics_admin • analytics_categories_admin • analytics_filter_admin • dashboard_admin • pa_admin • par_scheduler • viz_admin	None

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role name	Description	Contains Roles	Contained by roles (besides admin)
	Equivalent to admin role from a security perspective.		
analytics_admin	Role for Usage Insights administrative privileges	All other Usage Insights admin and viewer roles. For more information, see Roles installed with Usage Insights.	platform_analytics_admin
analytics_categories_admin	Role for creating, editing, or deleting category tags on dashboards.	None	• platform_analytics_admin • dashboard_admin
analytics_filter_admin	Role for editing or deleting any Platform Analytics filter. Can add filters to the filter library. For more information, see Filters in Platform Analytics.	None	• platform_analytics_admin • dashboard_admin • pa_admin • report_admin • viz_admin
dashboard_admin	Can create, edit, duplicate, share, and delete any dashboard. These rights extend to both Platform Analytics and responsive dashboards. For more information, see Dashboard permissions. Can schedule the export of all dashboards on an instance. Can also delete scheduled exports.	• analytics_filter_admin • analytics_categories_admin • sn_par_sche_export.par_scheduler_admin • par_scheduler	platform_analytics_admim
now_assist_explorer_user	• Can view the trigger point to start a AI Data Explorer exploration from data visualizations, Lists, or the Now Assist panel.		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role name	Description	Contains Roles	Contained by roles (besides admin)
	• Can edit an exploration. • Can create a new exploration		
pa_kpi_signal_admin	Can activate KPI Signals for an indicator. For more information, see Activate KPI Signals monitoring for an indicator (KPI).	None	None. However, pa_admin has the same privileges
pa_admin	Role for Performance Analytics administrative privileges. Equivalent to admin role from a security perspective.	• viz_admin • analytics_filter_admin • All other Performance Analytics roles. For more information, see Performance Analytics roles.	platform_analytics_admin
par_scheduler	Can create and edit the scheduled email distribution of any dashboard or data visualization they can view or edit	None	sn_par_sche_export.par_scheduler_adı
sn_par_sche_export.par_scheduler_admin	Same as par_scheduler, but has full CRUD rights to the par_export table, including deletion	par_scheduler	• dashboard_admin • viz_admin
sn_process_optimization_analyst	Can configure a Process Mining map on a dashboard. For more information, see Configure a Process Mining map on a dashboard.	None	None
viz_creator	Can create data visualizations in the Visualization Designer, which are then available in the library. Can also edit, export, and share data visualizations in the Visualization	None	• viz_admin (implicit) • itil • report_user

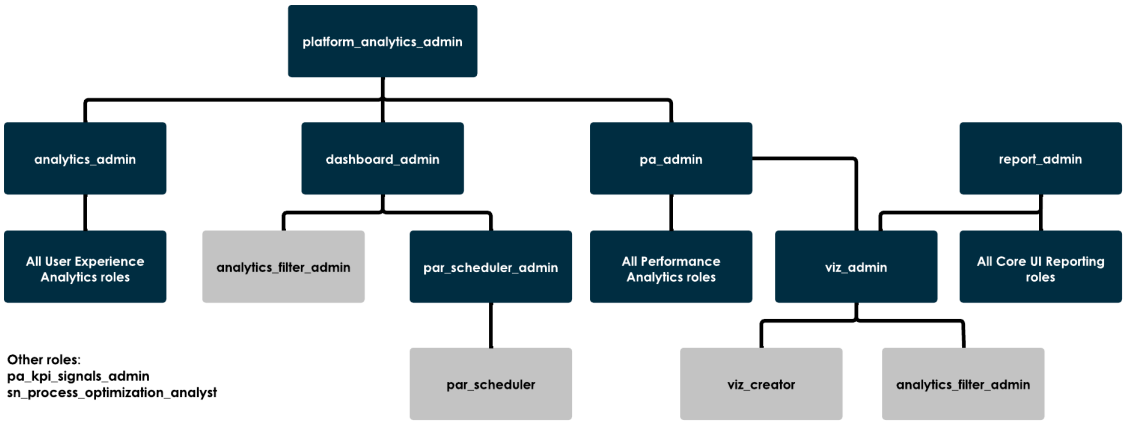
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role name	Description	Contains Roles	Contained by roles (besides admin)
	Designer, if they own that visualization or have had it shared with them with the relevant rights. Can only delete visualizations that they created. Can share visualizations only with groups and users.		
viz_admin	• Can create data visualizations in the Visualization Designer, which are then available in the library. • Can access all data visualizations in the library, either to add to a dashboard or open in the Visualization Designer. • Can perform all actions in the Visualization Designer on any visualization. • Can share a visualization with groups, users, or roles. • Can schedule the export of all data visualizations on an instance. Can also delete scheduled exports.	• analytics_filter_admin • sn_par_sche_export.par_schedule_admin Also includes the same privileges as viz_creator	• platform_analytics_admin • pa_admin • pa_power_user
report_admin	As viz_admin, but can also create, edit, delete, and export all Core UI reports, including those on the Service Portal.	• viz_admin • analytics_filter_admin • report_user	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The role hierarchy in the table is also shown in the following diagram:



Role lookup by use case

Dashboard roles

Use case	Required role
Create a dashboard	Any role
Share a dashboard	Any role to share a data visualization that you created or that was shared with you with sharing rights. With the viz_admin role or higher, you can share any data visualization on the instance. When you share a data visualization, you can pass along the rights to share that visualization further. You also decide whether to share with editing rights or only viewing rights. If a data visualization has been shared with you with sharing and editing rights, you can also pass along editing rights. dashboard_admin to share any dashboard A role with read access to the Roles [sys_user_role] table to share with roles
Edit a dashboard	Any role, if you created the dashboard or have had it shared with you with editing rights. dashboard_admin or higher for any dashboard Technical dashboards also require ui_builder_admin
Duplicate a dashboard	Any role, if you can view the dashboard. You cannot duplicate technical dashboards.
Create a printer-friendly copy of a dashboard	Any role, if you can view the dashboard.
Export a dashboard	Any role, if you can view the dashboard.
Schedule the export of a dashboard	par_scheduler for dashboards that you own or that have been shared with you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dashboard roles (continued)

Use case	Required role
	dashboard_admin or higher for any dashboard
Delete the scheduled export of a dashboard	sn_par_sche_export.par_scheduler_admin (contained in dashboard_admin)
Bookmark a dashboard	Any role, if you can view the dashboard.
Delete a dashboard	Any role, if you created the dashboard. dashboard_admin or higher for any dashboard
Configure dashboard details	Any role, if you created the dashboard or have had it shared with you with editing rights. dashboard_admin or higher for any dashboard
Configure dashboard settings except scheduled refreshes	Any role, if you created the dashboard or have had it shared with you with editing rights. dashboard_admin or higher for any dashboard
Schedule dashboard refreshes	dashboard_admin or higher
Configure dashboard tab cache timeout	admin
Create dashboard categories	analytics_categories_admin or higher
Assign categories to a dashboard	Any role, if you can edit the dashboard. analytics_categories_admin or higher to assign a category to any dashboard.

Data visualization roles

Use case	Required role
Create a data visualization	Anyone with access to data can create a visualization of that data on a dashboard that they own. Users with the viz_creator role can create a visualization in the Visualization Designer. If you create a visualization in the Visualization Designer, it is saved to the library.
Edit a data visualization	You can edit any visualization that you created or that was shared with you with editing rights, if it is not in the library. If it is in the library, you also need the viz_creator role. Edit any visualization on the instance with viz_admin or higher.
Add a visualization from the library to a dashboard	Any role, if the visualization has been shared with you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data visualization roles (continued)

Use case	Required role
	viz_creator to add any visualization from the library.
Add a visualization that was created in a dashboard to the library	viz_creator or higher and the right to edit the dashboard
Unlink a data visualization on a dashboard from the library, creating a version that is local to that dashboard.	Any role, if you can edit the dashboard containing the visualization
Duplicate a visualization in the Visualization Designer	viz_creator or higher
Share a visualization with users or groups	Any role to share a data visualization that you created or that was shared with you with sharing rights. With the viz_admin role or higher, you can share any data visualization on the instance. When you share a data visualization, you can pass along the rights to share that visualization further. You also decide whether to share with editing rights or only viewing rights. If a data visualization has been shared with you with sharing and editing rights, you can also pass along editing rights.
Share a data visualization with roles	viz_admin or higher
Export a visualization	Any role, if you can view the visualization in the Visualization Designer.
Schedule the export of a data visualization	par_scheduler or higher to schedule the export of a data visualization that you can edit. viz_admin or higher to schedule the export of any data visualization on the instance.
Delete the scheduled export of a data visualization	sn_par_sche_export.par_scheduler_admin (contained in viz_admin)
Delete a visualization	Any role, to delete a data visualization that you created. viz_admin or higher to delete any data visualization on the instance.
Control data source availability by role	admin
Configure visualization interactions	Any role if you have the right to edit the data visualization. The viewer needs the right to view any data they drill down to.
Use service catalog variables in data visualizations	viz_creator or higher
Create coloring rules for data visualizations	Any role if you have the right to edit the data visualization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filter roles

Use case	Role
Add a filter or a filter group to a dashboard	Any role, if the user has editing rights to the dashboard. dashboard_admin or higher to add a filter or filter group to any dashboard
Edit a filter on a dashboard	Any role, for a filter that is not in the library, if the user has editing rights to the dashboard. analytics_filter_admin or higher is also needed if the filter is in the library. Alternatively, the user can detach the filter on the dashboard from the library and edit a local copy.
Add a local filter on the dashboard to the library	analytics_filter_admin or higher, and editing rights to the dashboard
Create or edit a filter in the Filter Designer	analytics_filter_admin or higher

Miscellaneous roles

Use case	Role
Configure a Process Mining map on a dashboard	sn_process_optimization_analyst
Activate KPI Signals monitoring for an indicator (KPI)	pa_kpi_signal_admin
Create or edit an exploration in AI Data Explorer	now_assist_explorer_user

Platform Analytics tables

The following tables relate to Platform Analytics data visualizations and dashboards and can be accessed through scripts.

Data visualization tables

Table	Description
par_component	Contains all data visualizations in the visualization library and all filters in the filter library. Extends sys_metadata.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
par_component_permission	Contains the role, group, and user permissions for all data visualizations and filters in their respective libraries.
par_export	Lists all scheduled dashboard and data visualization exports. Extends sys_metadata.
par_export_job	Stores details of every attempt to export a dashboard or data visualization.
par_export_visualization	Stores the export details of all scheduled data visualization exports. Extends par_export.
par_metadata	Stores the metadata for each data visualization type.
par_notification	Lists email notification definitions of scheduled dashboard and data visualization exports. Extends sys_metadata.
par_notification_email	Stores metadata of scheduled dashboard and data visualization export emails, including subject and message. Extends par_notification.
par_notification_email_recipients	Stores groups and users who receive a notification email with a scheduled dashboard and data visualization export. Contains the non-metadata information for the emails.
par_visualization	Contains all data visualizations in the visualization library. Extends par_component.
par_visualization_permission	Contains the role, group, and user permissions for all data visualizations in the visualization library. Extends par_component_permission.

Dashboard tables

Table	Description
par_automated_kpi_promin_project	Stores references to Process Mining maps that are on Platform Analytics dashboards.
par_computed_insight	Contains all standard proactive analytics insights
par_custom_insight_content	Contains all custom-built proactive analytics insights
par_dashboard	Contains all dashboards in the dashboard library. Technical dashboards can be identified by belonging to the Advanced Dashboards experience. Extends sys_metadata.
par_dashboard_cache	Stores all changes to Platform Analytics dashboard layouts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
par_dashboard_canvas	Stores the names, descriptions, and layouts of Platform Analytics dashboards and dashboard tabs. Extends sys_metadata.
par_dashboard_config	Contains the macroponent definitions for each type of data visualization that you can create inside a dashboard. Extends sys_metadata.
par_dashboard_filter	Lists all filters on Platform Analytics dashboards and the name of the dashboard.
par_dashboard_permission	Contains the role, group, and user permissions for all dashboards in the dashboard library. Extends sys_metadata.
par_dashboard_tab	Contains the name, domain, application scope, and parent dashboard of all Platform Analytics dashboard tabs. Extends sys_metadata.
par_dashboard_user_metadata	Contains all options set by a dashboard viewer that persist between that viewer's user sessions. Extends sys_metadata.
par_dashboard_visibility	Cross-references all dashboards in the library by which experiences and workspaces contain them. Extends sys_metadata.
par_dashboard_widget	Cross-references all components that appear on dashboards by the dashboard canvas and the library component, if any. Extends sys_metadata.
par_dashboard_widget_group	Contains the configuration for a set of grouped widgets including name, coordinates, and color properties for border and background.
par_dashboard_widget_group_mapping	Contains a mapping of elements in a widget group to those elements. Group this table by Elements Group to see the widgets in each group clearly.
par_export	Lists all scheduled dashboard and data visualization exports.
par_export_dashboard	Stores the export details of all scheduled dashboard exports. Extends par_export.
par_export_job	Stores details of every attempt to export a dashboard or data visualization.
par_indicator_model	Contains recommendations related to Performance Analytics analytics in proactive analytics insights.
par_insight_user_actions	Stores actions that viewers took on proactive analytics insights.
par_notification	Lists email notification definitions of scheduled dashboard and data visualization exports.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
par_notification_email	Stores subject line and message body of scheduled dashboard and data visualization export emails. Extends par_notification.
par_notification_email_recipients	Stores groups and users who receive a notification email with a scheduled dashboard and data visualization export.
par_recommendation	Stores recommendations of Process Mining projects to create. These recommendations are given through Process Mining insights.
par_recommendation_user_action	Stores whether users accepted or dismissed a Process Mining insight recommendation.

Now Assist in Platform Analytics

Platform Analytics includes several applications that leverage AI to generate insights into data.

Get started

AI Data Explorer	Platform Analytics in the Now Assist Panel	Query Generation
Ask quick questions, receive tailored recommendations, and collaborate with AI and your colleagues to build long-term analysis.	Generate and export Platform Analytics artifacts from conversational interactions.	Shared back end for interpreting natural language questions as database queries and returning responses.

Use AI to explore data with AI Data Explorer

AI Data Explorer is your AI-companion for instant insights and deep data explorations. Ask quick questions, receive tailored recommendations, and collaborate with AI and your colleagues to build long-term analysis.

Important:

- Not all model providers are available for customers with in-country SKUs, and some Now Assist products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some Now Assist products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some Now Assist products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect information from tables that will be used to generate analytics. For example, information from the Incident table or the Number of open incidents indicator could be collected for requests for incident data visualizations. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

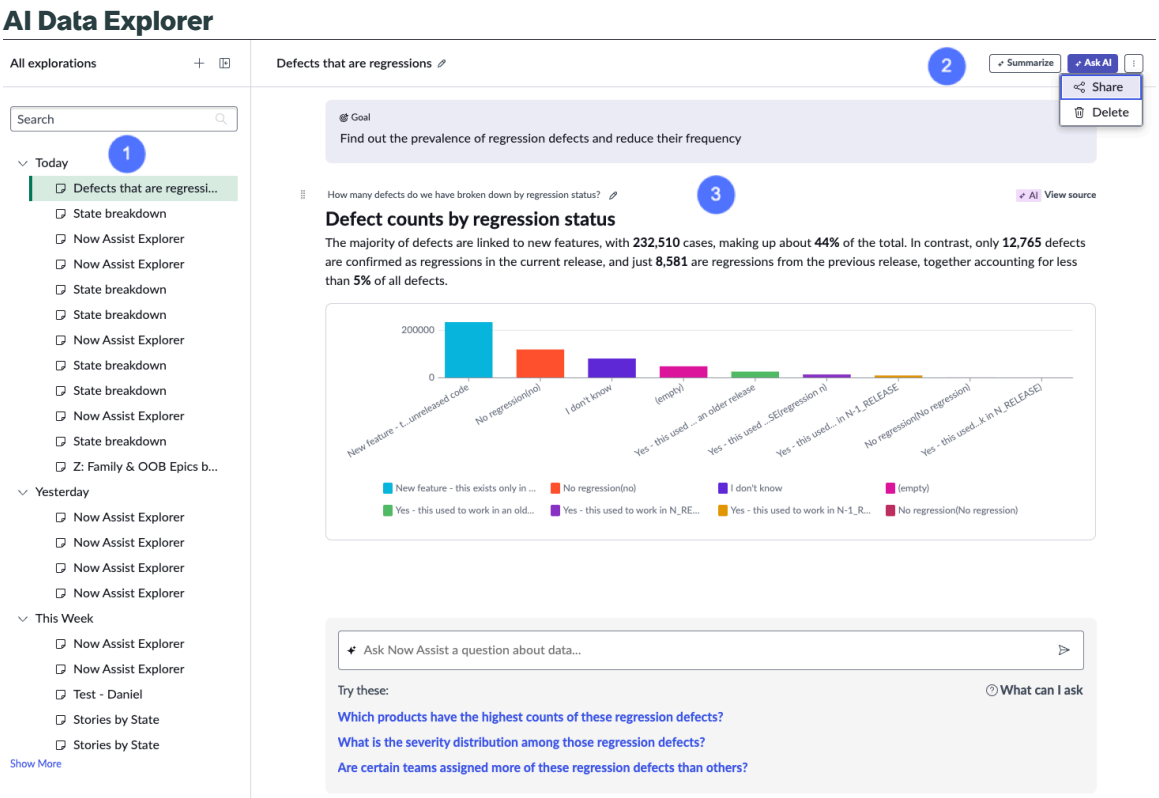
For more information, see the Now Assist documentation.

Understanding AI Data Explorer

AI Data Explorer is your AI companion for instant insights and deep data explorations. Ask quick questions, receive tailored recommendations, and collaborate with AI and your colleagues to build long-term analysis.

AI Data Explorer overview

The objective of AI Data Explorer is to bring your thoughts into one place by empowering users to explore, generate interesting findings, and collaborate seamlessly. This is achieved through an AI-assisted, interactive exploration that serves as a centralized space for data-driven decision making.



AI Data Explorer can be divided into the following sections:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- 1 Exploration list. Expand or hide the list with the show/hide icon . The list shows all explorations that you own or that have been shared with you. You can also create exploration with the plus (+) icon.
- 2 Title and action bar. This section includes an editable title for the exploration, buttons for summarizing the exploration and asking a question about data, and a More Options menu for sharing and deleting the exploration. It also shows which other users are currently in the exploration. You can share an exploration only if you own it or it has been shared with you with sharing rights.
- 3 Exploration content. This section displays the results of data exploration queries. The results typically include a data visualization or list and a summary of the contents of that visualization or list. The exploration can also include its purpose or "goal" and any text that the participants have added, such as a discussion about the results.

AI Data Explorer users

Users

User	Description
Exploration creator	Creates new explorations. Sets the goal of the exploration. Generates the first graphics. Can use the exploration just for themselves, or can invite participants and viewers, who must have access to the data in generated data visualizations. Role required: now_assist_explorer_user or higher.
Exploration participant	Anyone with whom the exploration is shared with editing rights. Can generate more data visualizations or comment on the exploration. May be able to share the exploration further. Role required: now_assist_explorer_user or higher.
Exploration viewer	Anyone with whom the exploration is shared either without editing rights or without the now_assist_explorer_user role or higher. A viewer cannot ask questions of the AI or add text to the exploration, but they can read it.

AI Data Explorer benefits

- AI-Guided insights: Gain insights using natural language queries, with AI guiding your analysis and suggesting the next questions to explore.
- Document Editing and Organization: Collect insights in a single document. Edit, organize, and add your own thoughts to understand a topic comprehensively.
- Collaboration with Other Users: Work together in a shared space to refine analyses, align on insights, and drive data-driven decisions with ease.
- Seamless integration with all applications: Trigger Now Assist explorer from any list or data visualization to ask questions about the data in your experiences.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to explore next

To learn more about configuring and using AI Data Explorer, see:

- Activate AI Data Explorer skills
- Using AI Data Explorer
- AI Data Explorer reference

Configure AI Data Explorer

Activate the AI Data Explorer skills. If necessary, you can disable AI Data Explorer on specific workspaces.

AI Data Explorer implementation checklist

Complete these steps to enable AI Data Explorer and verify that the semantic layer is configured correctly for your organization.

Use this checklist to verify that AI Data Explorer is properly configured and ready for use in your organization.

Prerequisites and configuration

- Verify that required AI skills are activated.
- Enable Record Level Analysis in the Analytics Exploration skill to get better insights.
- Check the base health of Query Generation using the Query Generation Health page.
- Confirm that AI Search is active.
- Verify that the Semantic Layer is built. Entities and dimensions should not be 0.

Testing and validation

1. Navigate to **AI Data Explorer** from the main menu.
2. Try a simple question such as "Open incidents" to verify end-to-end functionality.
3. Verify that tables you want to use are added to the semantic layer and that semantic generation is turned on for them. Task extended tables and some base tables are added by default, but custom tables that are not task-based might have to be added manually.
4. To check if a table is already in the semantic layer, navigate to **Query generation** > **Entities**. If the table is in the list and marked as active, it is already configured.
5. If you want to access data in a protected scope, configure ACLs and Restricted Caller Access (RCA) records to grant access to the scope to AI Data Explorer.

User access

Grant users who need access to AI Data Explorer the *now-assist-explorer-user* role.

General usage guidelines

- Use short, simple questions for best results.
- Only simple analytical questions are supported. Questions should be answerable with a single chart or single data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- AI Data Explorer cannot answer general definition questions or questions requiring comparison across multiple data sources. Break down complex analysis into multiple questions.
- When asking follow-up questions, use words like "these" to ensure that filters are not dropped. For example, "Of these incidents, how many are critical?"

Related topics

Add a table to the semantic data layer

Enabling access to protected scope applications for AI Data Explorer and Query Generation

Query Generation Health page

Roles, tables, and scheduled jobs included with Query Generation

Activate AI Data Explorer skills

Enable AI Data Explorer skills under Now Assist skills for Data and Analytics to give users AI-assisted, shared spaces to explore data.

Before you begin

Install the AI Data Explorer application from the ServiceNow® Store. The correct Workflow Data Fabric entitlement is required.

Important: This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see Now Assist skills, agents, and agentic workflows on by default.

The Query Generation skills "analytics query generation," "analytics insight generation," "analytics hidden insight generation," and "analytics follow-up generation" are required. These skills are active by default. For more information, see Query Generation skills.

Role required: now_assist_explorer_admin or higher

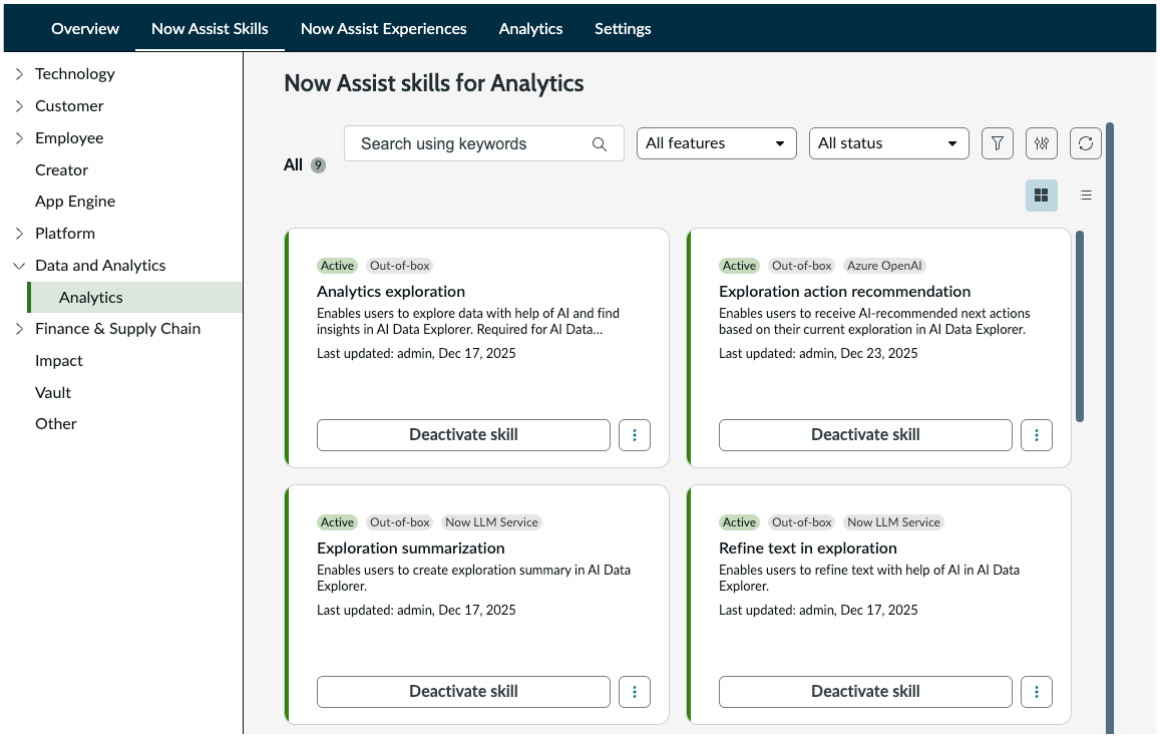
About this task

Assign the now_assist_explorer_user role, and activate the AI Data Explorer skills.

Procedure

1. Grant the now_assist_explorer_user role to users who need to explore data with AI Data Explorer.
2. Navigate to **All** > *Now Assist Admin* > **Skills**.
3. In the product area pane, select **Data and Analytics** > **Analytics**.
4. In Now Assist skills for Analytics, search for the analytics exploration skill.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Select **Activate skill**.
6. Configure the analytics exploration skill.

   a. In the **Advanced analysis** page, you can activate record-level analysis and set which tables it applies to.
   For more information, see Configure record level analysis in AI Data Explorer.

   b. Select **Save and continue**.

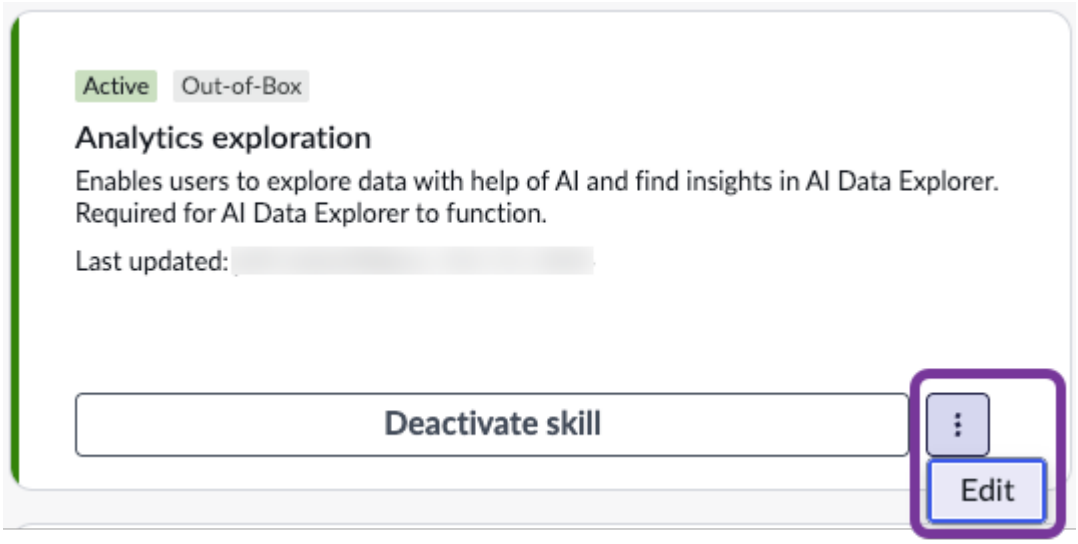
   c. In the **Define access** page, you can add roles who can create and edit explorations in AI Data Explorer.
   All AI Data Explorer and Query Generation skills should have one role in common. The default role for this skill, now_assist_explorer_user, contains the default Query Generation role, sn_query_gen.user. Any changes you make must preserve the rights of the AI Data Explorer user to access Query Generation skills.

   d. Select **Save and continue**.

   e. In the **Review and activate** page, review the settings you made and either go back and change them or select **Activate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can come back later and edit the settings for this or any other skill.



7. To enable users to generate recommendations based on the findings in their exploration, turn on the exploration action recommendation skill.
   You can set the roles that can generate recommendations. The default role is now_assist_explorer_user. This role contains sn_query_gen.user, granting necessary access to Query Generation.

   Requires Zurich Patch 7 and the associated application upgrade.

8. To enable users to generate recommendations based on the findings in their exploration, turn on the exploration action recommendation skill.
   You can set the roles that can generate recommendations. The default role is now_assist_explorer_user. This role contains sn_query_gen.user, granting necessary access to Query Generation.
9. To enable users to generate summaries of explorations, turn on the exploration summarization skill.
   You can set the roles that can generate summaries. Again, the default role is now_assist_explorer_user. This role contains sn_query_gen.user, granting necessary access to Query Generation.
10. To enable users to use AI to help refine text that they write in explorations, activate the refine text in explorations skill.
    A dialog opens asking you where you want to display the refine text option.

    a. In the **Select display** page, under **Choose where to display**, toggle **Display** on for **In-product desktop**.

    b. **Optional:** You can set the roles that can use AI to refine texts in their explorations.
    Again, the default role is now_assist_explorer_user. This role contains sn_query_gen.user, granting necessary access to Query Generation.

    c. Select **Save and continue**.

    d. Browse the review and select **Activate**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure record level analysis in AI Data Explorer

Get more detailed answers based on the content of individual records to provide more meaningful insights.

Before you begin

Roles required: now_assist_explorer_admin or higher

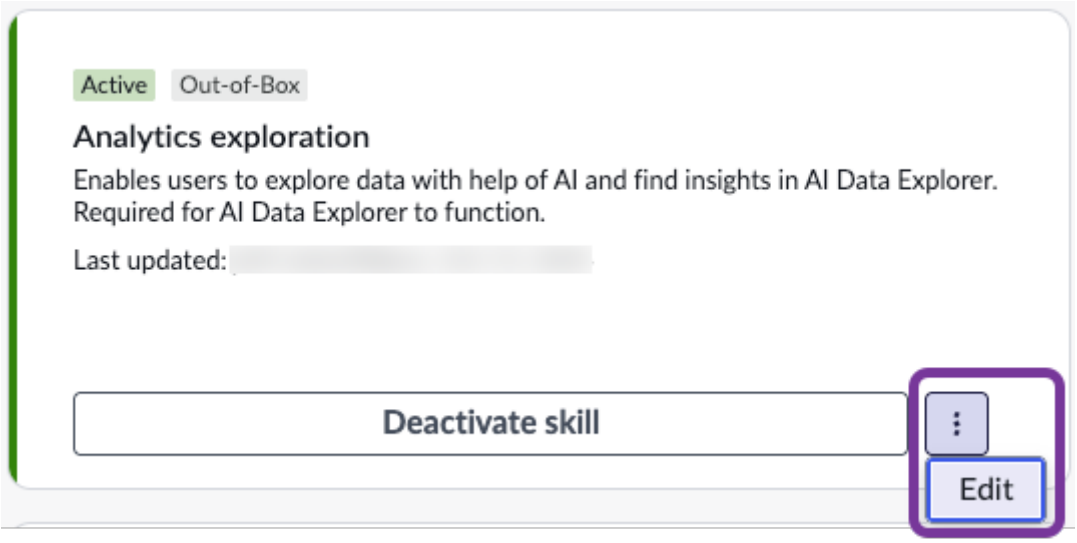
About this task

Record-level analysis provides deeper insights into your data. You can activate it as an administrator. You can activate it as an opt-in, where you specify the tables to which it applies, or as an opt-out, where it applies to all tables you don't specify. Whether activated or not, queries that touch on more than 50 records in a table aren't supported.

⚠ **Warning:** Take care when activating record-level analysis for a table with record-level security. The LLM applies the record-level security when analyzing records, but it applies only report_view ACLs when the exploration is shared. Therefore, users may see data about records that they are not authorized to access when an exploration is shared with them.

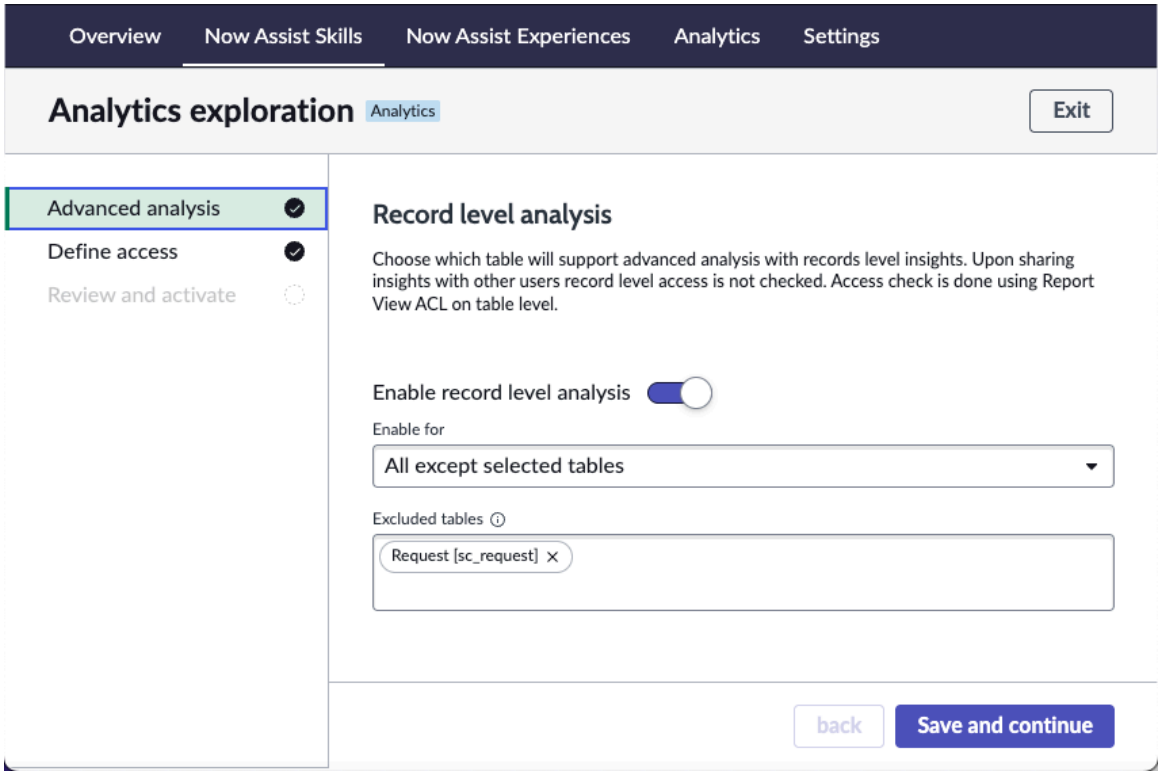
Procedure

1. Navigate to **All** > *Now Assist Admin* > **Skills**.
2. In the product area pane, select **Data and Analytics** > **Analytics**.
3. In Now Assist skills for Analytics, search for the analytics exploration skill.
4. If the **Activate skill** button is visible for this skill, press it to activate the skill.
5. If the **Deactivate skill** button is visible for this skill, expand the 3-dot menu ⋮ and select **Edit**.



6. Select **Advanced analysis** from the menu, which opens the Record level analysis page.
7. Toggle on **Enable record analysis**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



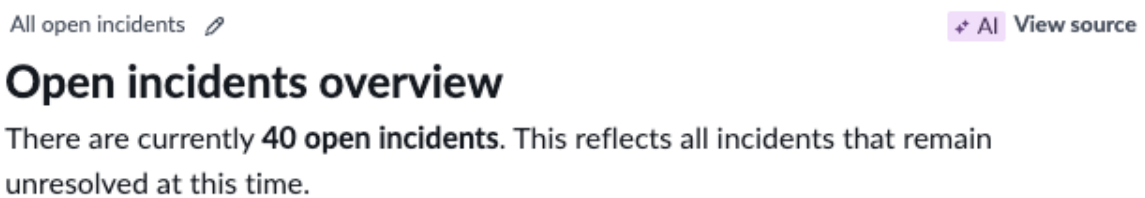
8. In the **Enable for** field, select whether to create an include list or an exclude list of tables.

Option	Description
Selected tables	Select a list of tables to which record level analysis will apply. Record level analysis will not apply to any other tables.
All except selected tables	Select a list of tables to which record level analysis won't apply. Record level analysis will apply to all other tables.

9. In the **Supported tables** or **Excluded tables** field, select which tables to include or exclude, respectively.
10. Select **Save and continue**.
11. Finish configuring the skill as described in Activate AI Data Explorer skills, or exit if the skill is already activated and you don't wish to make further changes.

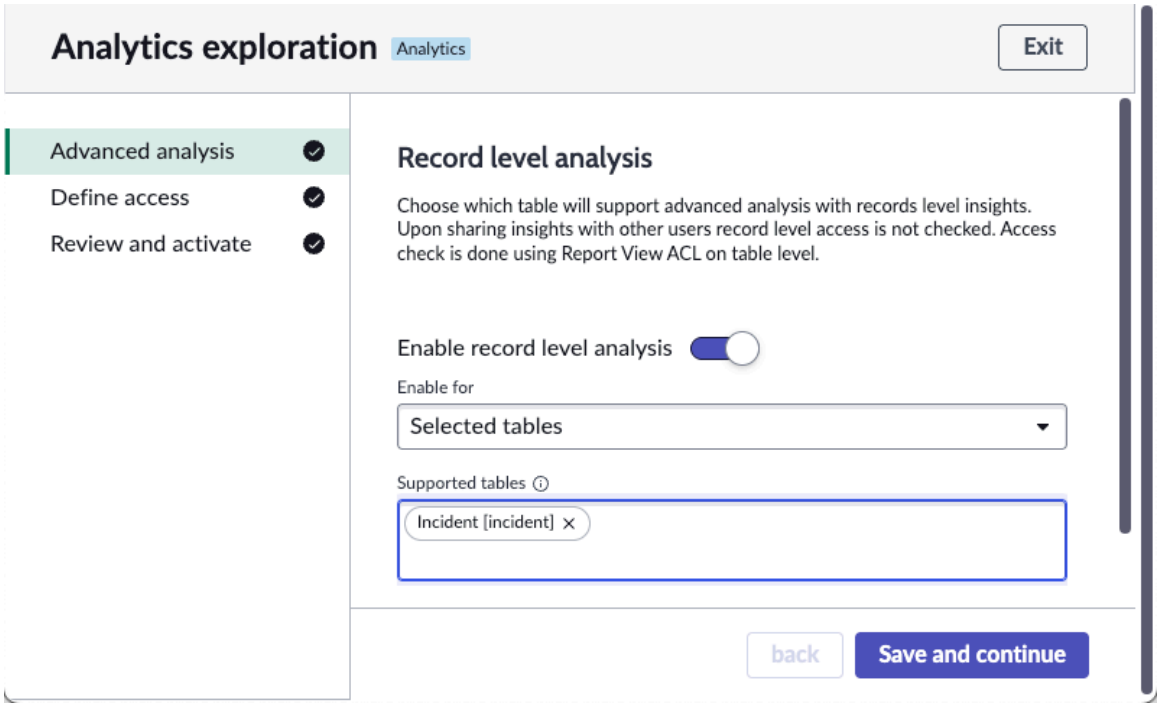
Example: Simple request with and without record level analytics

You don't have record level analytics enabled, and you open an exploration and ask for all open incidents. You're told "There are currently 40 open incidents. This reflects all incidents that remain unresolved at this time."

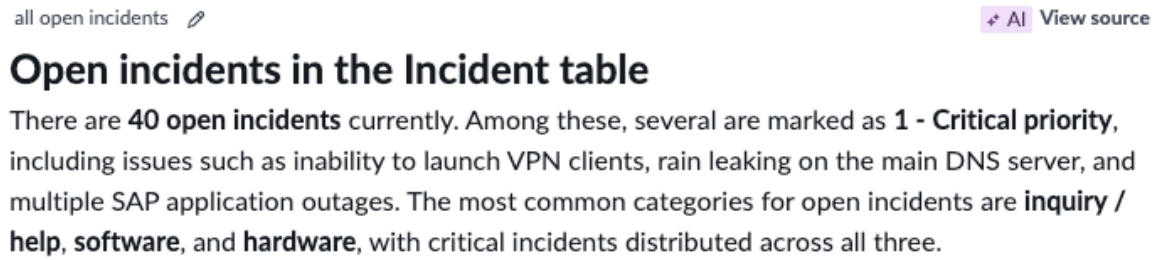


Now you enable record level analytics on the instance. You choose an opt-in approach and specify Incident [incident] as the only table included in record level analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Finally, you ask the same question again in an exploration, asking for all open incidents. Now the response includes details about the differences between open incident records. You're told "There are 40 open incidents currently. Among these, several are marked as 1 - Critical priority, including issues such as inability to launch VPN clients, rain leaking on the main DNS server, and multiple SAP application outages. The most common categories for open incidents are inquiry / help, software, and hardware, with critical incidents distributed across all three."



Remove data visualization links to AI Data Explorer in a specific workspace

If you don't want data visualizations in a specific workspace to have an entry point for AI Data Explorer, add the workspace to the PAAI Canvas Workspace Configs table.

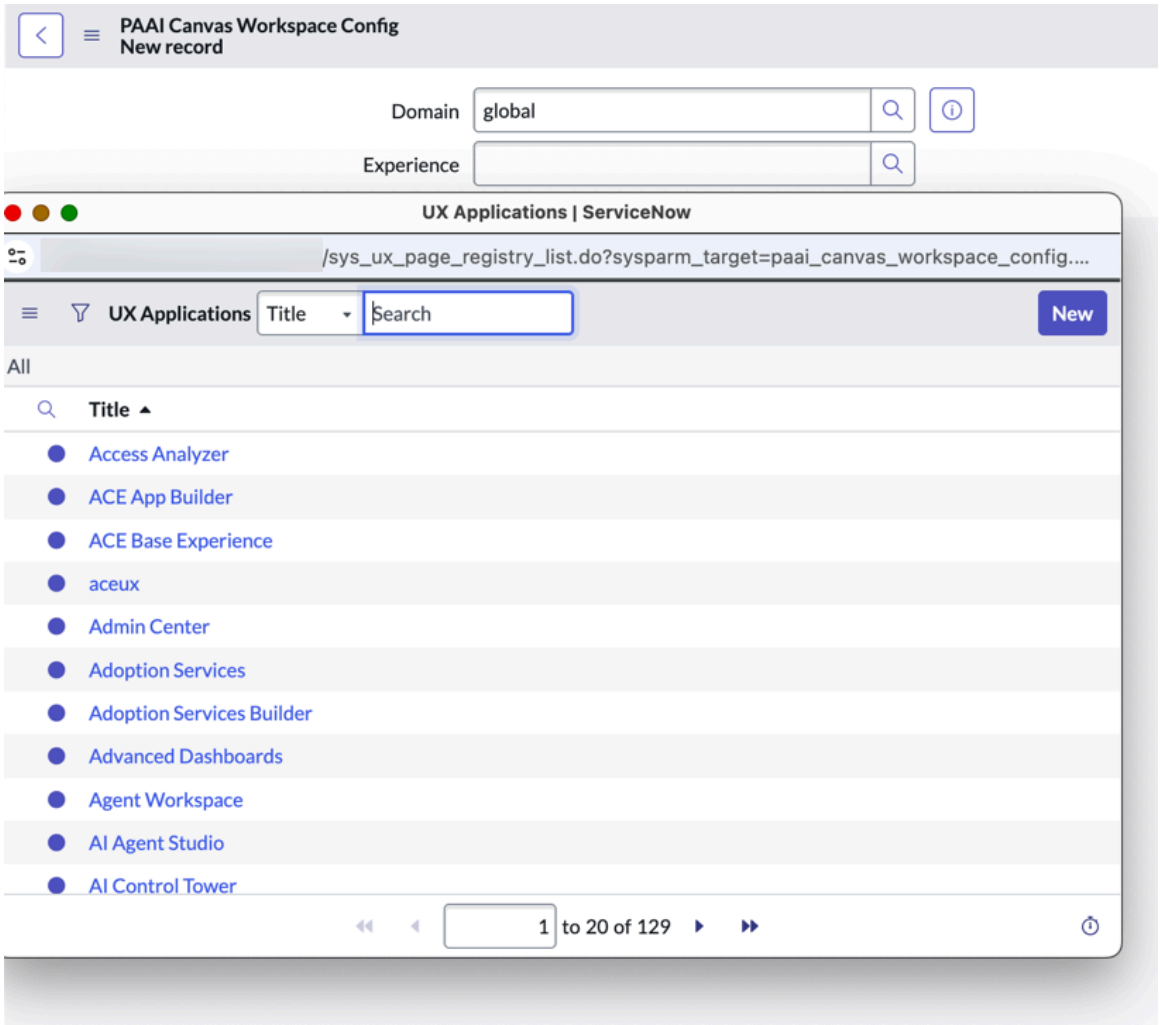
Before you begin

Role required: now_assist_explorer_admin or higher

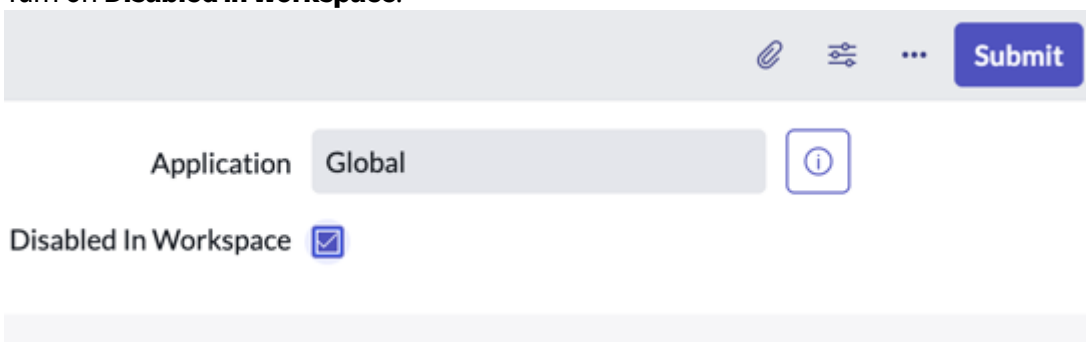
Procedure

1. Navigate to **All** and search for paai_canvas_workspace_config_list.do.
2. Select **New**.
3. In the new PAAI Canvas Workspace Config record, select the workspace or experience from the **Experience** list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Turn on **Disabled in workspace**.



5. Select **Submit**.

Common AI Data Explorer issues and fixes

Use Query Generation logs to inspect failed or incorrect queries and identify common issues with AI Data Explorer responses.

Go to **Query Generation** > **Administration** > **Logs** to inspect failed or incorrect queries.

1. Find the entry by user, date, or utterance.
2. Check **Semantic Entities/Dimensions/Segments Count**
3. Open **Query Constitutor Output** to see what was selected.
4. Compare with **Semantic Filter Result** for raw semantic matches.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Data Explorer troubleshooting guide

Symptom	Likely cause	Fix
"Unable to understand" response	System cannot find a matching table	Improve entity description; rephrase with table name; verify AI search is running; verify that all Indexed Sources are fully processed.
Wrong table selected	Similar table names, no disambiguation	Add semantic usage instructions to differentiate.
Wrong table selected (permissions)	User lacks read access to the intended table or fields.	Verify and grant table and field read ACLs for the intended data.
"Error accessing table data" or "Scope access not granted" response	Some data is in protected application scopes that AI Data Explorer cannot access.	Create ACLs granting access to the scope for AI Data Explorer. Approve the subsequently generated Restricted Caller Access (RCA) records. For more information, see Enabling access to protected scope applications for AI Data Explorer and Query Generation.
Missing field in results	Dimension turned off, unclear label, or field not in semantic layer	Check dimension is active; update label.
Related fields not pulled in	Referenced table missing from semantic layer or reference dimension turned off	Add and enable the referenced table entity; enable the reference dimension.
Wrong filter applied	Bad segment match	Fix segment name and description; disable the segment.
No filter when expected	No matching segment; phrasing too vague	Create a manual segment; rephrase question.
Segment from report is wrong	Auto-generated segment has stale or irrelevant filter	Disable the report segment source or the specific segment.

Using AI Data Explorer

Create "explorations"—editable documents where you analyze data with the help of AI. Set goals to guide smarter follow-up suggestions. Refine responses and add your own input. Collaborate easily with others and make data-informed decisions faster.

Launch AI Data Explorer

You can launch AI Data Explorer from either unified navigation or a data visualization or list . If you have the right role, you can create an exploration.

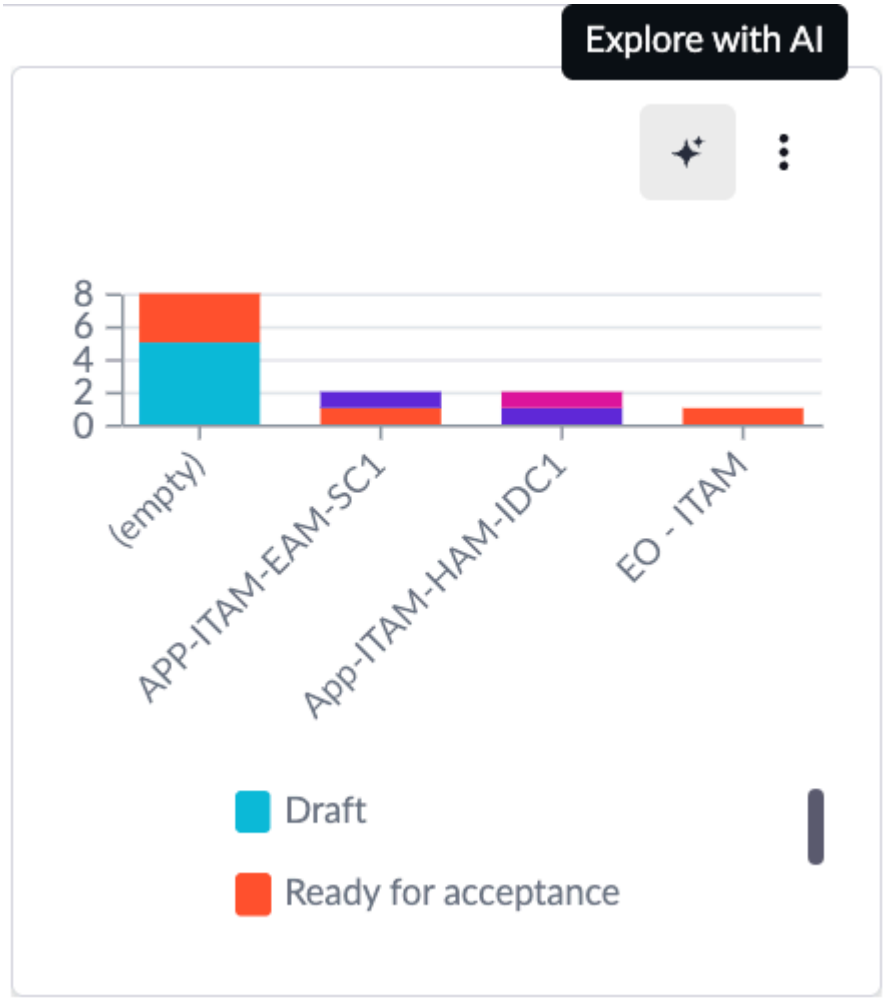
Before you begin

Role required: now_assist_explorer_user to create or edit explorations, any role to view explorations that have been shared with you.

Procedure

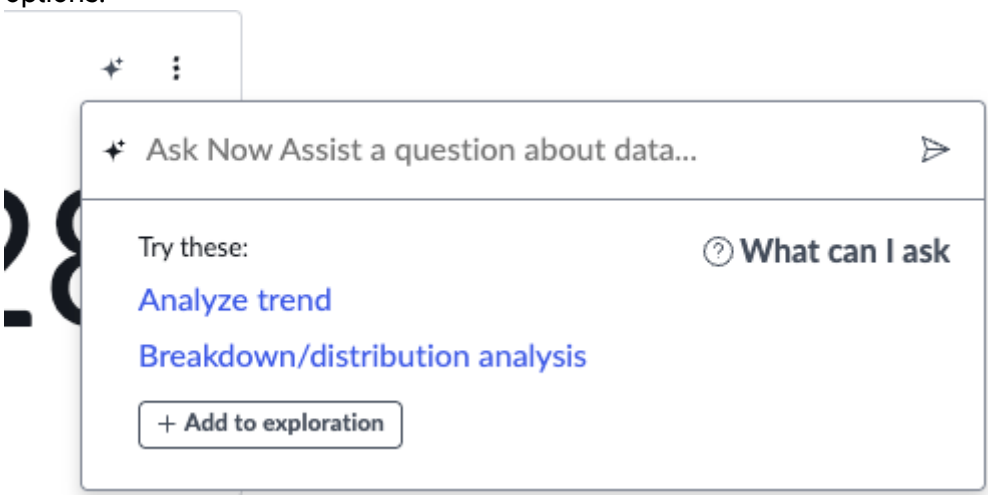
1. Perform one of the following actions:
   - To launch AI Data Explorer from Unified Navigation, navigate to **All** > **AI Data Explorer** > **AI Data Explorer**.
   - To launch AI Data Explorer from a data visualization or list, select the Explore with AI button .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: If the data visualization shows data from a protected scope that is not supported in Query Generation and AI Data Explorer, there is no Explore with AI icon. For more information, see Enabling access to protected scope applications for AI Data Explorer and Query Generation.

2. If you launch AI Data Explorer from a data visualization or list, choose from the following options:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Ask a specific question about your data.
- Choose a suggested question about the data visualization, such as **Analyze trend** or **Breakdown/distribution analysis**.
- Add the visualization or list to a new exploration or one that is open in another tab. For more information about adding visualizations to existing explorations, see Add an existing visualization to an exploration.

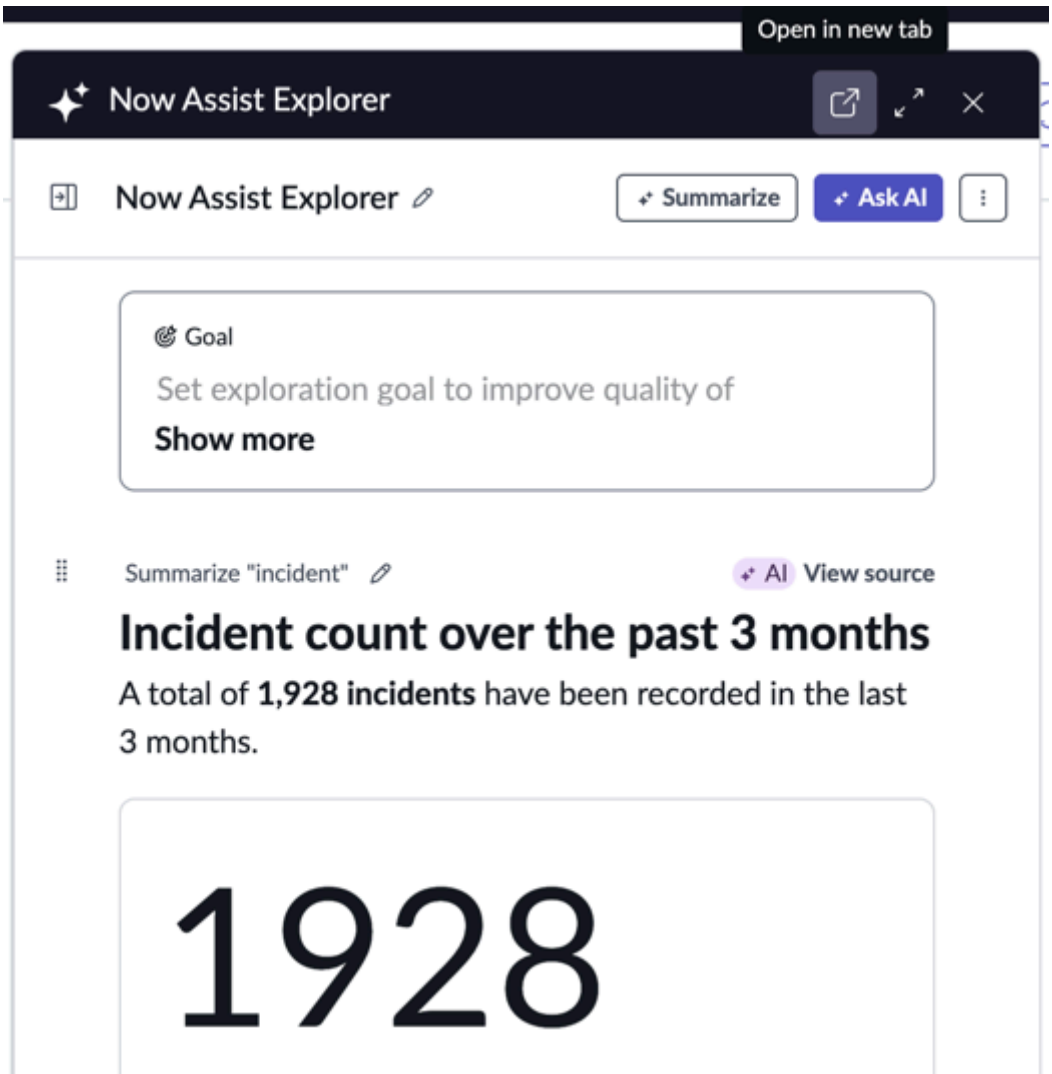
Important:

- The data visualization or list must display table data.
- Supported table data sources include database views and Workflow Data Fabric tables.
- The table or database view must be included in the Query Generation semantic layer. For more information, see Add a table to the semantic data layer.
- If the data is from an application with a protected scope, access to that scope must be configured. Otherwise, the Explore with AI icon does not appear. For more information, see Enabling access to protected scope applications for AI Data Explorer and Query Generation.

The results are shown in a new exploration. If you have an exploration open in another tab, you have the option to display the results there instead.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The exploration opens in a floating panel. You can expand the dialog to a full screen or move the exploration to a new tab.



Questions and responses in an exploration

Ask the AI specific questions in AI Data Explorer, to which it responds with data visualizations, a summary, and suggested follow-up questions.

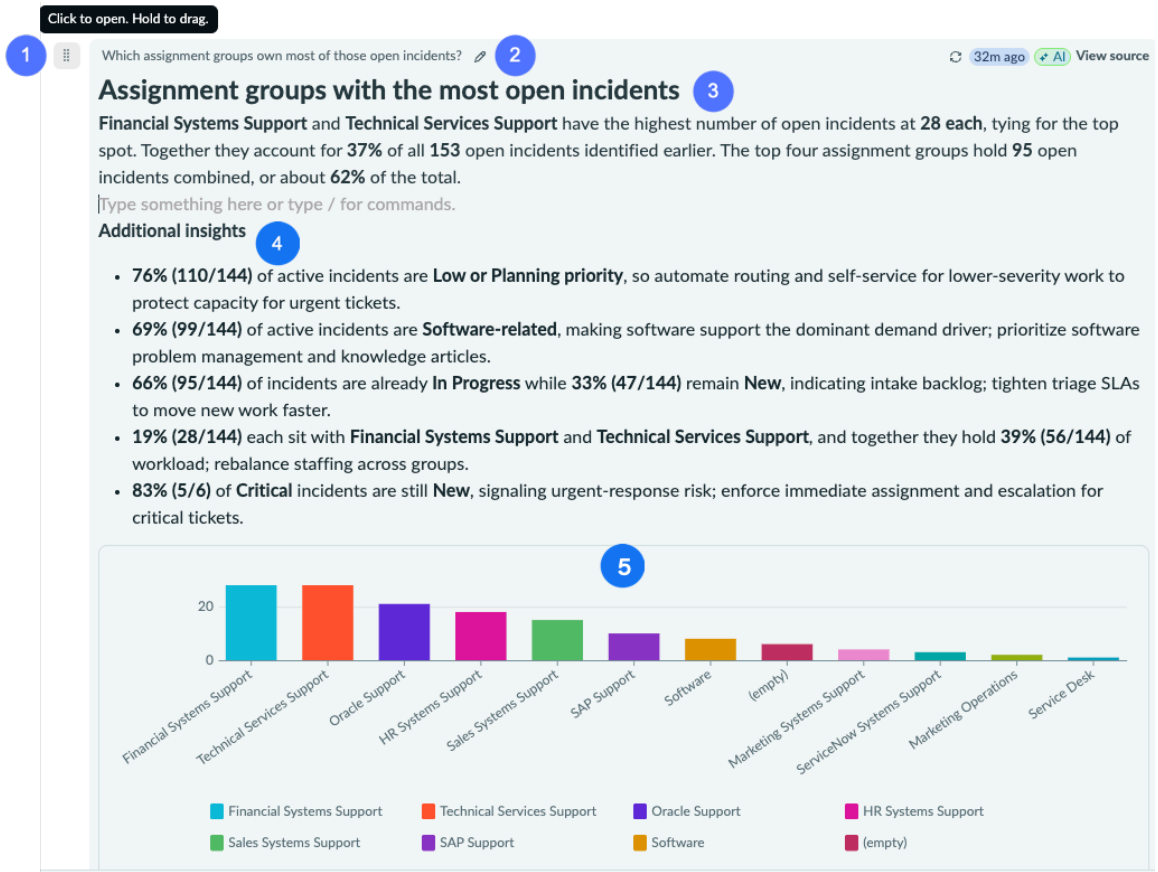
To ask a question in an exploration, launch AI Data Explorer from a data visualization or list or open an existing exploration. You will see a field with the placeholder "Ask Now Assist a question about data." For more information, see Launch AI Data Explorer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- The question you ask has to be about data in one of the tables listed in the Query Generation Semantic Table Configuration table. These tables can include database views or Workflow Data Fabric tables. For more information, see Add a table to the semantic data layer.
- If the data is from a protected application scope, access to that scope must be configured for AI Data Explorer. For more information, see Enabling access to protected scope applications for AI Data Explorer and Query Generation.
- When you have submitted a question, you cannot submit another question or do other work in the exploration until your question is processed. You can cancel the processing of your question.

When you write a question in an exploration, the AI converts the question to a database query and returns a response. The response includes the following sections:

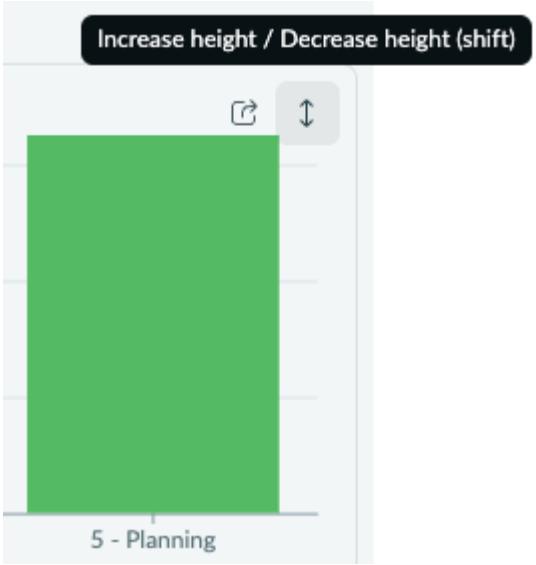


- 1 An expandable set of actions to take on the response. For more information, see Duplicate, delete, copy to another exploration, or move an answer in an exploration.
- 2 Your original question. You can edit this question to generate new output.
- 3 The title of the response and a summarization of the AI findings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- 4 If extended analysis is enabled, you get additional insights after the title and summary. For more information, see Extended analysis.
- 5 A list or data visualization. This response can be an existing visualization instead of a generated one. For more information, see Launch AI Data Explorer.

  You can add the list or visualization to a dashboard or change its height by interacting with controls in its corner. Point at the corner to make the controls appear. For more information, see Add a data visualization from an exploration to a dashboard.



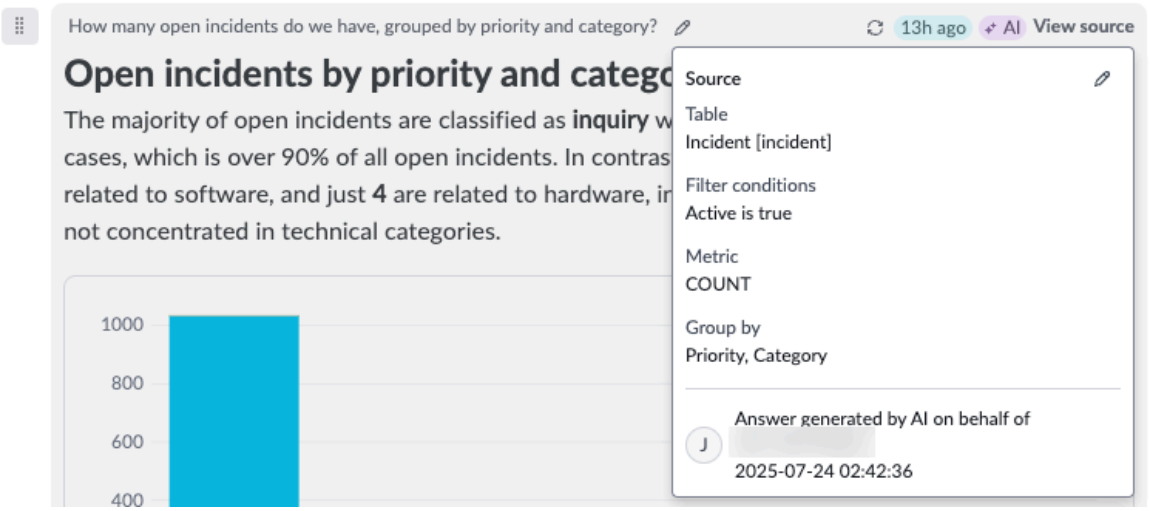
Viewing the response source

After you receive a response from the ServiceNow AI Platform, point at the response to see the technical details of the response. The source details include the following information:

- The source table
- The filter conditions
- The metric
- Any grouping criteria

If the exploration is too narrow on the screen, select **View source** instead of pointing at the response.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Tips for asking questions

The goal of AI Data Explorer is to understand your prompts in your own words, delivering the analytics insights you want. However, if you do not know where to begin to formulate questions, or you're unsatisfied with the results, here are some tips:

Name your table

If you know the name of the table that contains the data you are interested in, add it to your prompt. Partial names or similar names are fine too.

Example: Instead of "How many P1s were opened this week," write "How many P1 requests were opened this week," which references the request tables. Better yet, write "How many P1 catalog requests were opened this week," which references the specific Catalog Requests table.

Explain what you mean

Query Generation tries to understand your terms, but you can add details to help guide it. If you get unexpected results, try being more specific about what you're looking for.

Example: Instead of "Show me all stale incidents," write "Show me all incidents not updated in 5+ days."

Be specific with names

When filtering by referenced records like users, groups, or services, try to use their full display names for best results. The AI model may learn from previous queries in the same document, but using full names ensures accuracy.

Example: Instead of "Cases with Workplace Ops," write "Cases with Workplace Operations."

Edit and refine queries

If the generated query isn't quite right, you can manually edit the filter conditions. The AI model will learn from your edits and apply them to future questions in the same document. For more information, see Change the parameters for a data source in an exploration

Example: You ask "Show me critical incidents from the network team" but are not satisfied with the response. Instead of asking repeated variations of the same question, hoping for a better result, edit the filter to find records where Assignment

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Group is ‘Network Operations’ and Priority is ‘1 - Critical’. Then ask "Show me the inflow trend for these incidents over time”.

Don't leave bad queries in your exploration

The AI model uses the previous document context to write the next query. Therefore, if you cannot refine a query to get a useful response, delete it. Otherwise bad queries can accumulate in your exploration, leading to ever-worsening responses.

Import complex filters

For complex data that's hard to describe, import data visualizations or lists into your exploration. If the visualization or list is on a dashboard, you can apply any filters on the dashboard before importing. The AI model will use imported queries to understand related questions in the same document.

Example: Don't ask "Show me servers about to retire by location." Such a prompt is vague and complex. Instead, import a visualization from a dashboard titled "PostgreSQL servers nearing retirement,” with the desired values for the dashboard filters Lifecycle State and Days Until Retirement pre-applied. Then ask "Show me the same servers but grouped by location”.

Once you have a productive exploration going, with a lot of context, you may find that you can ask more abstract questions and get useful answers. However, these tips might help you get started.

Extended analysis

Generate a deeper level of analysis that can reveal new insights, enabling you to make more informed decisions.

Extended analysis involves aggregating the records related to a response in an exploration. It examines the same columns that you see when you view the list of records for the relevant table. It takes a Count of Choice, Reference, and Boolean columns. Therefore, you can influence extended analysis by selecting which fields to view in the relevant tables. The relevant tables include any related tables that Query Generation dot-walks to.

The number of columns that extended analysis examines is set in the system property *sn_query_gen.hidden_insights.groupby.min_fields*. The default value is 5. If the number of eligible columns that are visible on the record list is lower than this value, the system searches for more fields on the table. The search stops when the total number of fields from both the list view and the table search reaches the value of the system property. If the system can’t find that many fields, it uses the fields it does find.

The search for fields on the table follows this logic:

1. The system searches for Choice fields on the table.
2. If the count of located Choice fields and eligible columns on the record list is greater than the value of *sn_query_gen.hidden_insights.groupby.min_fields*, not all located Choice fields are selected. Instead, the system selects the Choice fields with the highest cardinality, to bring the total count of fields up to the value of the property. The search then stops.
3. If the system can’t find enough Choice fields to bring the total count of fields up to the value of the property, the system selects the ones it finds, then looks for Reference fields. The same logic that was used for selecting Choice fields applies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. If the system can't find enough Reference fields to bring the total count of fields up to the value of the property, the system selects the ones it finds, then looks for Boolean fields. The same logic that was used for selecting Choice and Reference fields applies.
5. Extended analysis insights are generated for however many Choice, Reference, and Boolean fields are found, up to the value of the property. If no fields are found, extended analysis isn't performed.

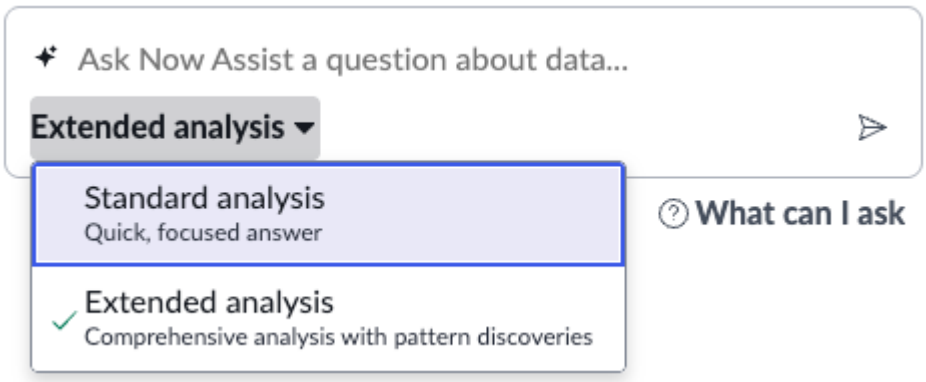
While the results of extended analysis usually enrich the responses in an exploration, the analysis takes more time and uses more system resources than a standard analysis. You have to use your judgment on when to employ it.

Sometimes different questions or follow-up questions return the same extended analysis findings. Instead of repeating those findings as insights, the system digs deeper into the underlying reasons for the repetition. As a user, you have three benefits from this approach:

- Every insight that is generated is unique.
- You don't need to posit as many follow-up questions to get the insights you need, because the system drills down automatically, directing you to the interesting part of the data to focus on.
- Results are faster, because extended analysis focuses on an increasingly specific subset of the data.

Extended analysis requires the analytics hidden insight skill from Query Generation to be active. For more information, see Query Generation skills.

To turn on extended analysis for an exploration, select it in the **Ask Now Assist a question about data** field. You have the same choice when you launch AI Data Explorer in a data visualization or list.



Example: Standard vs. extended analysis

Consider the following request made in an exploration: "Analyze the incident creation trend over the past 12 months." Using standard analysis, you get the following insights: "Incident creation peaked in July 2025 with 2,441 incidents, while the lowest monthly count was 1,177 incidents in August 2025. The first half of the period (September 2024 to February 2025) saw monthly incident counts consistently above 1,700, but the final month dropped by more than 50% compared to the peak."

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Insights from standard analysis

Making the same request with extended analysis, you get the same insight plus the following information:

- Incident volume dropped 49.2% from 2,441 in July 2025 to 1,177 in August 2025, indicating a major shift.
- The largest monthly increase was 28.3% in April 2025, with incidents rising by 512 to 2,321.
- Incident counts show a consistent downward trend (slope: -24.22), which suggests an ongoing reduction in reported issues.
- Monthly incident counts vary widely (range: 1,264; standard deviation: 369.24), indicating unstable operational demand.

Insights from extended analysis

Add a data visualization from an exploration to a dashboard

Put the visualization contained in a response from AI Data Explorer on a new or existing dashboard. Do so without interrupting your workflow in your exploration.

Before you begin

Role required: now_assist_explorer_user and ownership or editing rights to the exploration and the dashboard.

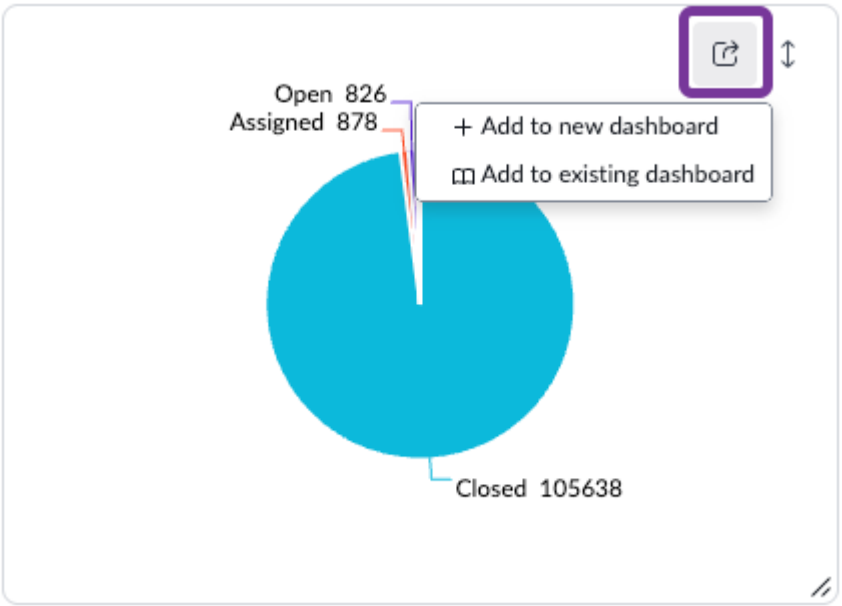
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Launch AI Data Explorer.
   For more information, see Launch AI Data Explorer.
2. Open or create an exploration.
3. When you get a response with a data visualization that you want to put on a dashboard, select the **Add to dashboard** button on the visualization.
4. Select a new or existing dashboard, or the current dashboard if applicable.

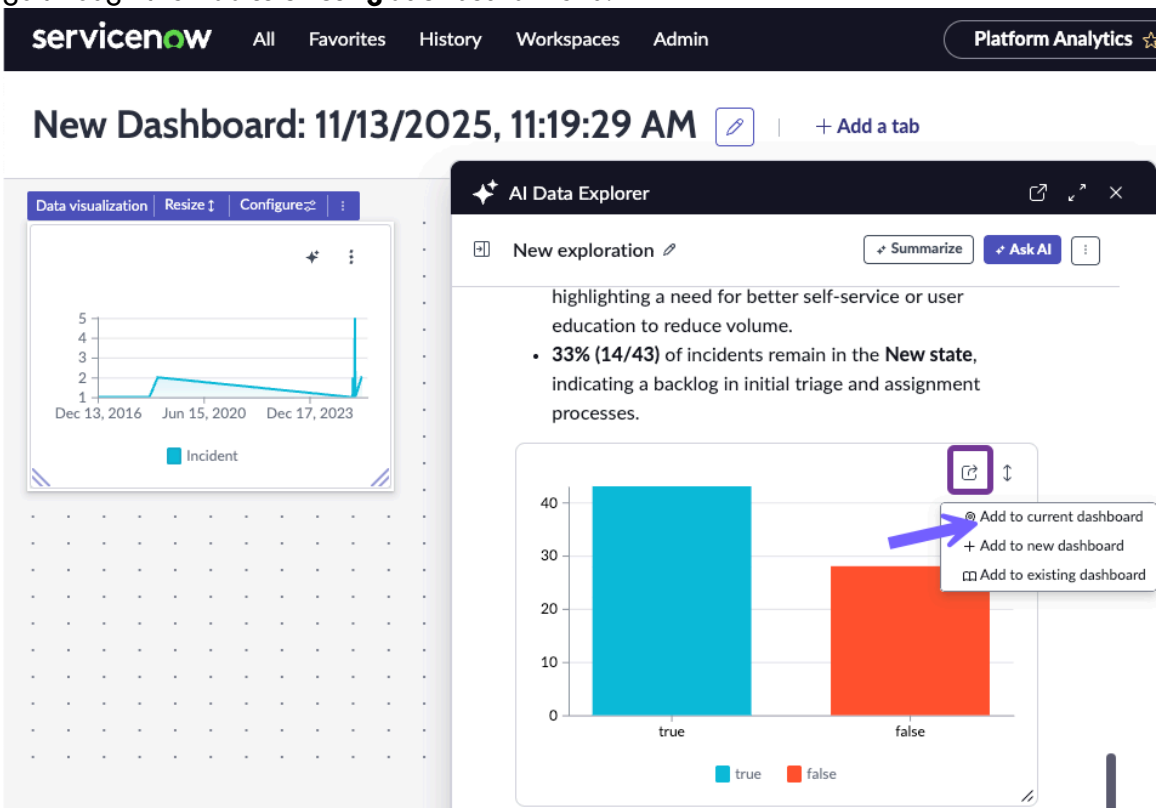
   Your options depend on whether you launched AI Data Explorer in its own tab, such as from Unified Navigation, or in a floating panel over another page.

   - If you are in AI Data Explorer in its own browser tab, you have the choice of adding the visualization to a new dashboard or to an existing one. (These are also your choices if you have AI Data Explorer open in a floating panel above a page that is not a dashboard.)



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you have a dashboard open in your main tab and AI Data Explorer in a floating panel on top of it, you can also add a visualization directly to the current dashboard tab without having to go through the **Add to existing dashboard** menu.



5. If you select **Add to existing dashboard**, choose the dashboard and a tab, if applicable. The list of available dashboards is filtered on those dashboards that you can edit.

Result

The dashboard opens in full screen while the exploration moves to a modal in the foreground, if this isn't already the case. You can now use the **Add to current dashboard** option to copy more data visualizations from your exploration to the dashboard.

To save your visualization in the dashboard, select **Save** in the dashboard controls. You can either edit the dashboard further or continue working where you were in the exploration. You can maximize the modal with the exploration or open it in a new tab. If you hover over the **Explore with AI** button on the visualization on the dashboard and select one of the follow-up questions, that question is processed in the exploration. Exit the edit mode to enable the **Explore with AI** button.

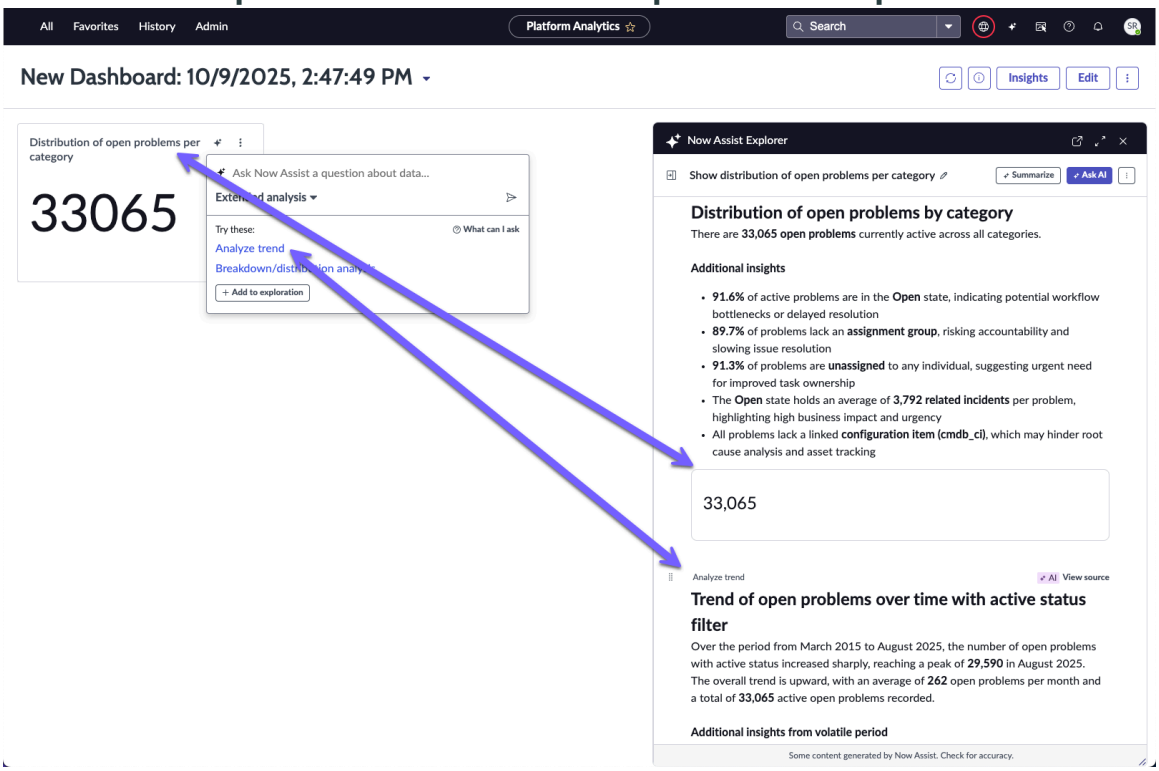
Dashboard and exploration after visualization is copied and follow-up is asked



Refresh a response with new data

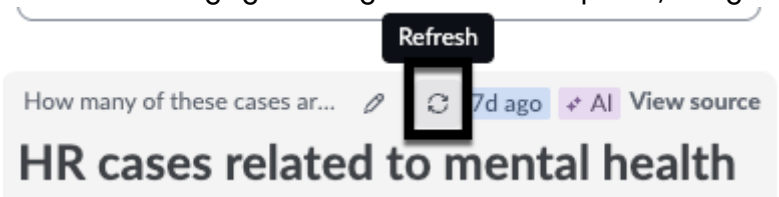
Look at the age of the response to a question in an AI Data Explorer exploration. Then regenerate the response with fresh data.

Before you begin

Role required: now_assist_explorer_user and ownership or editing rights to the exploration.

Procedure

1. Launch AI Data Explorer.
   For more information, see Launch AI Data Explorer.
2. Open an exploration that has questions and responses that may be out of date.
3. Locate a response of interest and hold the cursor over **View source**.
   You see how long ago the AI generated the response, along with a **Refresh** button.



4. If you decide that the data in the response is too old, select **Refresh**.

Result

The visualization, summary, and suggested follow-up questions in the response are all refreshed.

Note: Refreshing a response removes all changes that you made manually to the text in the summary.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change the question in an exploration

Edit a question in an AI Data Explorer exploration and submit it to overwrite the original response.

Before you begin

Role required: now_assist_explorer_user and ownership or editing rights to the exploration.

Procedure

1. Launch AI Data Explorer.
2. Open an exploration that has a question and response that you want to change.
3. Locate the question and response of interest.
4. Select the **Edit question** button .

   a. Edit the question.

   b. Select the **Send the prompt** arrow.

   A new response is generated, replacing the old one.

Change the parameters for a data source in an exploration

In an AI Data Explorer exploration, change the filter conditions for a table source. Then regenerate a response with updated data.

Before you begin

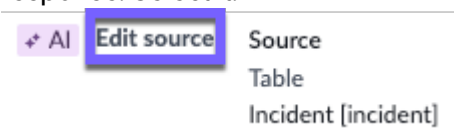
Role required: now_assist_explorer_user and ownership or editing rights to the exploration.

Procedure

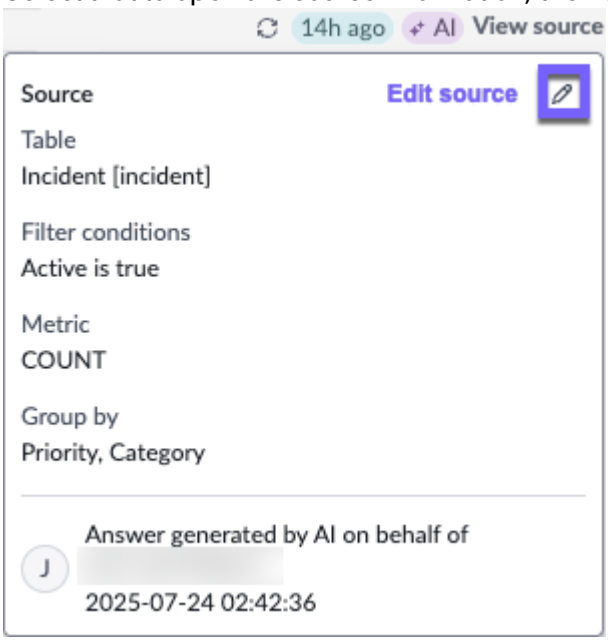
1. Launch AI Data Explorer.
2. Open an exploration that has a question and response whose source you want to change. For example, you may have imported a data visualization, and you want a different set of filter conditions than the original.
3. Locate the question and response of interest.
4. Open the source editor, depending on how wide the exploration is on your screen:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the exploration is wide, you see an **Edit source** button next to the **AI** button on the response. Select it.



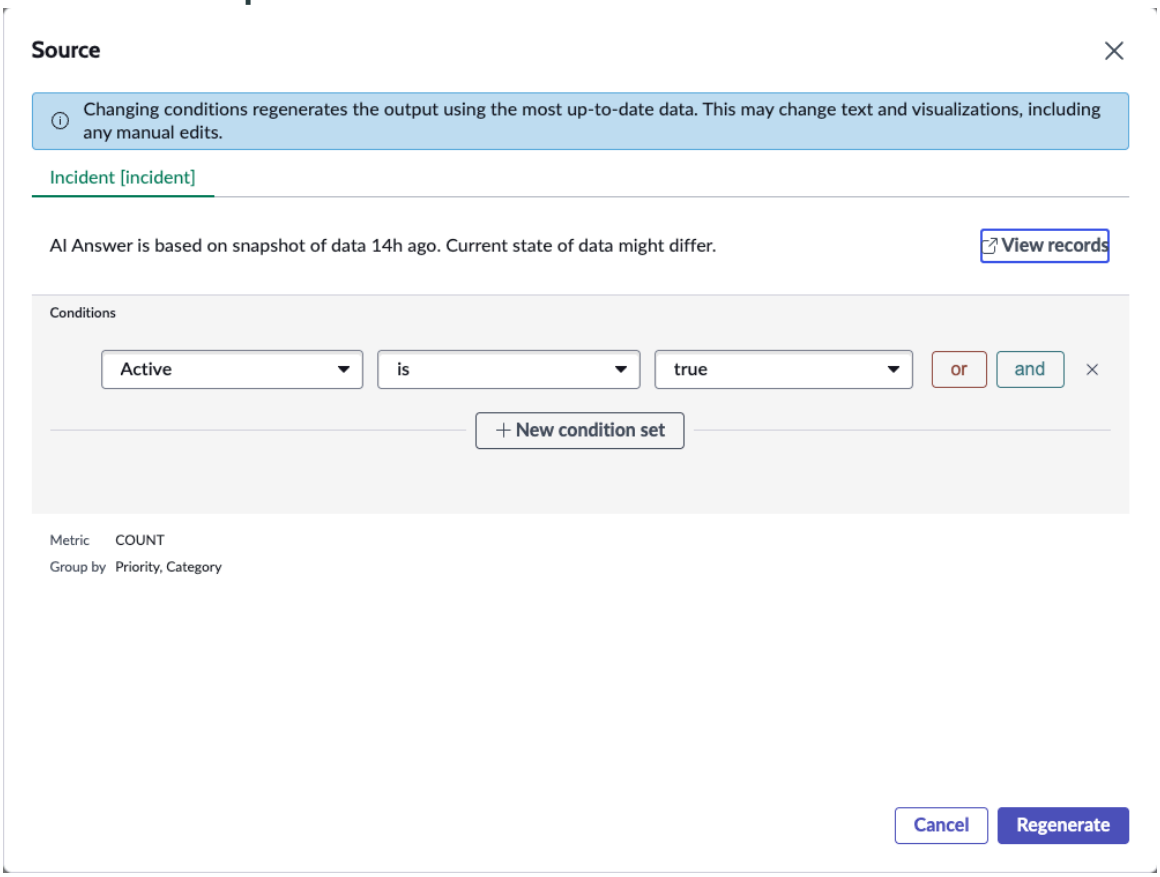
- If the exploration is narrow, you see a **View source** button instead of an **Edit source** button. Select that to open the source information, then select the in the source information.



The Source dialog opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table source for exploration



5. Change the filter conditions to meet your needs.
6. Select **Regenerate**.

Result

The data visualization, summary, and suggested follow-on questions are regenerated using your modified conditions or parameters.

Note: Regenerating a response removes all changes that you made manually to the text in the summary.

Duplicate, delete, copy to another exploration, or move an answer in an exploration

Duplicate, delete or reorder an individual question and response from inside an exploration. Yiou can also copy a response to another exploration.

Before you begin

Role required: now_assist_explorer_user and editing rights to the exploration

About this task

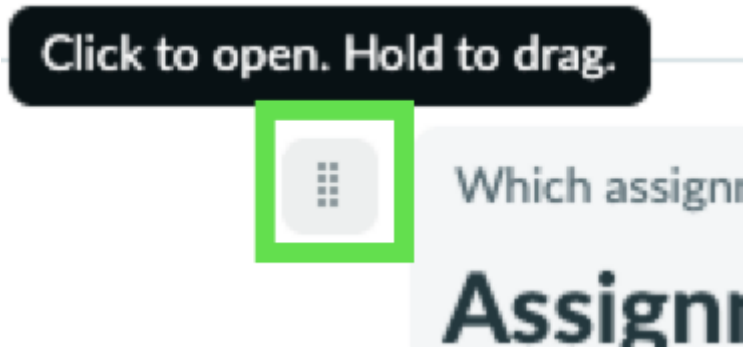
Duplicate a response when you want to modify a response slightly while preserving the unmodified version, such as seeing what the response looks like with a different group-by value. You could also duplicate a response and refresh only one version, to compare the old and new values.

Copy a response when you want to share only a response, not the whole exploration, with another user. Copy the response to an existing exploration that the user can access, or copy it to a new exploration and share that exploration with the user. You can use this function to give yourself an editable version of the response in an exploration you own.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Launch AI Data Explorer.
   See Launch AI Data Explorer.
2. Open the exploration that contains a question and answer that you want to duplicate, delete, copy and send, or move.
   See Open an existing exploration.
3. Point the cursor at the question and answer.
   A control appears next to the question and answer.
4. Point at the control, which is a rectangle of dots.



5. Move, duplicate, copy, or delete the question and response.
   - To move the response, hold the control and drag the block to a different location in the exploration. Alternatively, tap the control and select **Move up** or **Move down**.
   - To duplicate the response, tap the control and select **Duplicate**. The duplicate of the response appears immediately after the original.
   - To copy the response to another exploration, tap **Copy to...**. You are given the choice of copying the response to an existing exploration or a new exploration.
   - To delete the response, tap the control and select **Delete**.

Delete an exploration

Setting exploration goals

Help Now Assist understand your intent and what you hope to get from the data exploration by setting a goal for an exploration. The goal can improve the relevance of AI outputs.

In the goal, explain the outcome you're trying to accomplish with your exploration. Clear goals guide the AI model to generate queries and write summaries that move you closer to that outcome.

Tip:

- Keep goals short and specific.
- Document any key assumptions that drive your outcome. For example, define success criteria for a business process, or explain negative patterns that you want to eliminate.
- If you know them, include the names of tables, fields, or data visualizations that contain the data you want to explore.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Examples of goals

Type of goal	Example
Answer high-level questions, make decisions	Determine staffing level required to triage and resolve incoming Incidents for the Cloud Services assignment group based on historical data. The key sign of success for the team is closing P2 or higher incidents in a timely manner.
Document evidence and actions taken for future reference	Compile a Post Incident Review report for all P2+ Incidents for the Cloud Services group from Q1 2025. Show all relevant incidents and the related problems and change requests required to address them. Document timeliness of response and relevant SLAs.
Explore data without specific questions in mind	Explore potential drivers for the Cloud Services team's incident spikes.

Write or edit text in an exploration

Edit text that the AI generated, or share your thoughts in AI Data Explorer by adding text to an exploration.

Before you begin

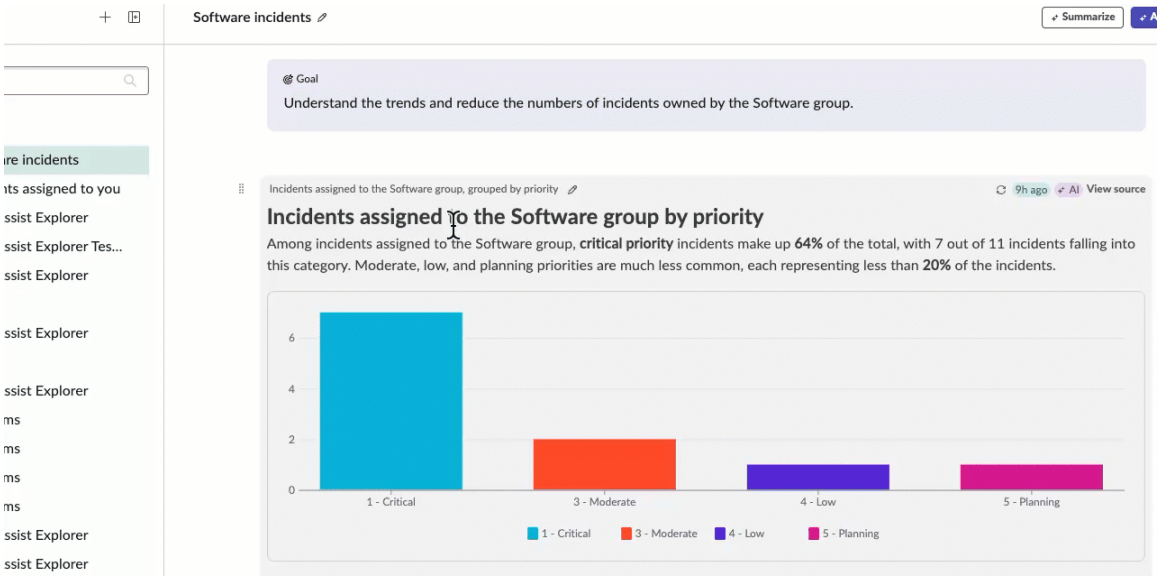
To access AI writing tools, the refine text in exploration skill must be activated. For more information, see Activate AI Data Explorer skills.

Role required: now_assist_explorer_user, and you must own the exploration or have editing rights to it.

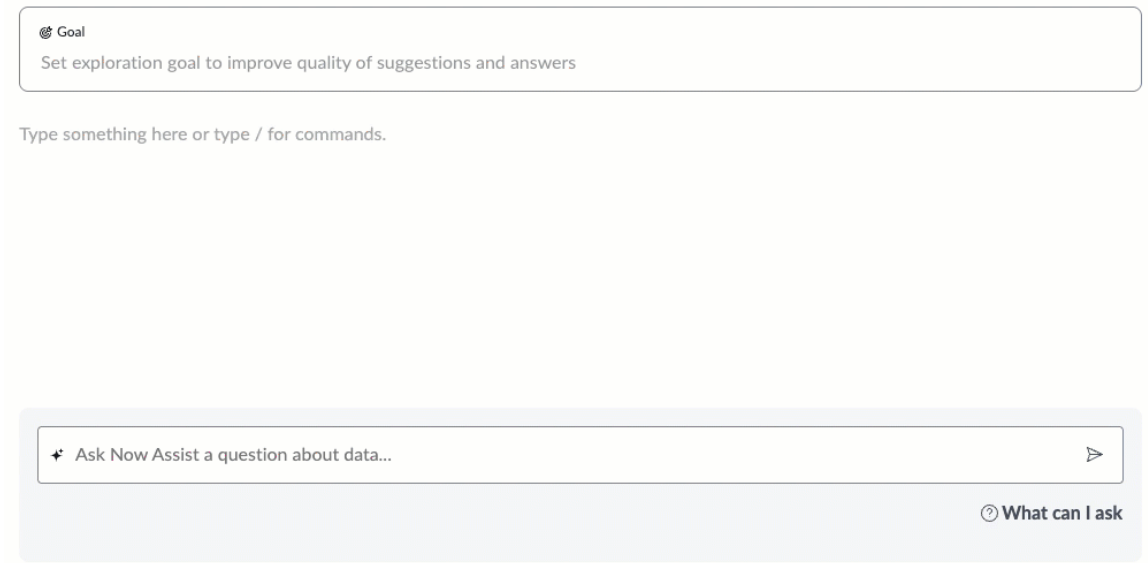
To edit the summary of insights that the AI has generated, place the cursor anywhere in the answer and start typing. You can also select all or part of that text and type over it. You have style options for your edits. You can also select the entire summary and have AI shorten it, lengthen it, or change the tone. The AI shows you its modified text, which you can copy and paste or insert below the original.

Note: Refreshing or regenerating a response removes all changes that you made manually to the text in the summary.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To add your own text to an exploration, place your cursor in an empty space and start typing. When you have finished your draft, select your text to add styling or have AI refine the text, like when you are editing generated text.



When editing your own text, you also have markup options. You can tag a colleague, who is notified of the tag if they have editing rights. If the colleague cannot access the exploration, you see a message to that effect. If you have sharing rights, you can immediately share the exploration with that user with editing rights. You can also add text markup by typing a forward slash (/) and selecting what you want from a list. Options include four levels of headings, tables, and bullet or numbered lists.

Add an existing visualization to an exploration

You can add a data visualization or a list to a new or existing AI Data Explorer exploration from a dashboard, the data visualization library, or other areas of your workspace.

Before you begin

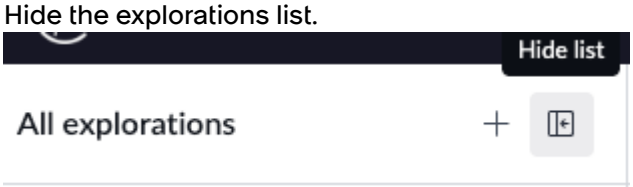
Role required: now_assist_explorer_user, access to the dashboard or library

About this task

Add an existing visualization to highlight an insight, add context to your exploration, or serve as a starting point for further analysis.

Procedure

1. Navigate to **All** > **AI Data Explorer** > **AI Data Explorer**.
2. Expand the explorations list and open the desired exploration.
3. Hide the explorations list.



4. Open a new browser tab and navigate to the workspace page or dashboard that contains the desired data visualization or list, or to the data visualization library.

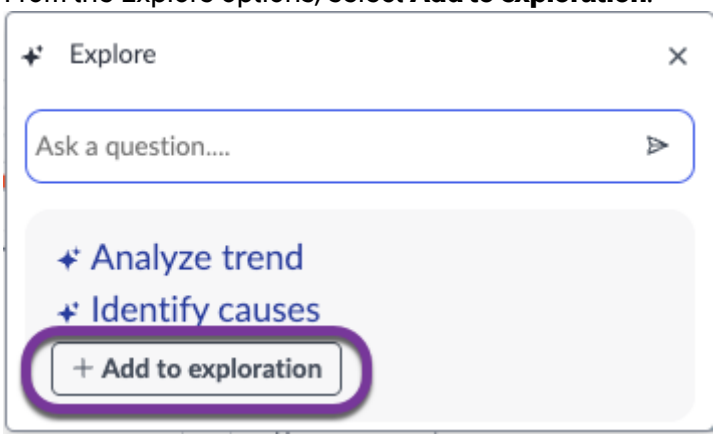
   Important: Do not close the original tab with the exploration.

5. If the page or dashboard has filters, set the desired filter values.
   These filter values apply to the imported data visualization or list.
6. Locate, and if necessary open, the data visualization or list and select the Explore with AI icon .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the data visualization shows data from a protected scope that is not supported in Query Generation and AI Data Explorer, there is no Explore with AI icon. For more information, see Enabling access to protected scope applications for AI Data Explorer and Query Generation.

7. From the Explore options, select **Add to exploration**.



If the data visualization shows data from multiple protected scopes, there is no option to add the visualization to an exploration.

You are asked whether you want to add the data visualization or list to a new exploration or an existing one that is open.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Select **Add to an open exploration**.
9. Select from the explorations that are open in other tabs and choose **Add**.

Result

The exploration opens in a dialog in the tab that you are in. The list or data visualization is added to the end of the exploration. You can add more lists or data visualizations. When you select **Add to exploration**, the list or data visualization is automatically added to the open exploration.

View recommended actions in AI Data Explorer

Receive AI recommendations of actions to take based on your current exploration in AI Data Explorer.

Before you begin

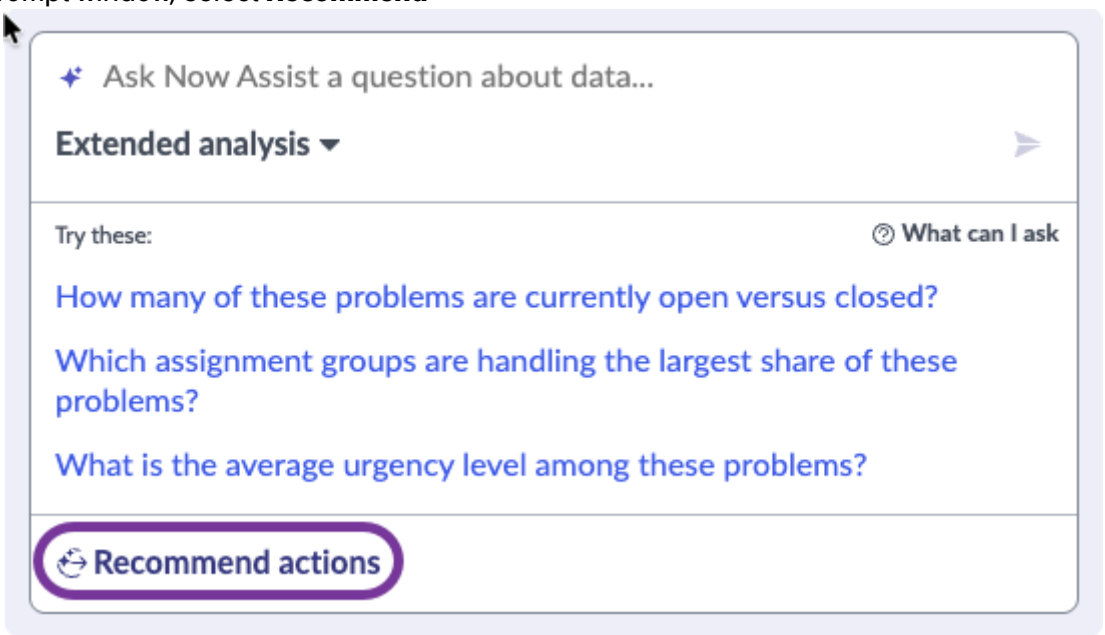
To use this feature, the exploration action recommendation skill must be turned on.

Role required: now_assist_explorer_user

Procedure

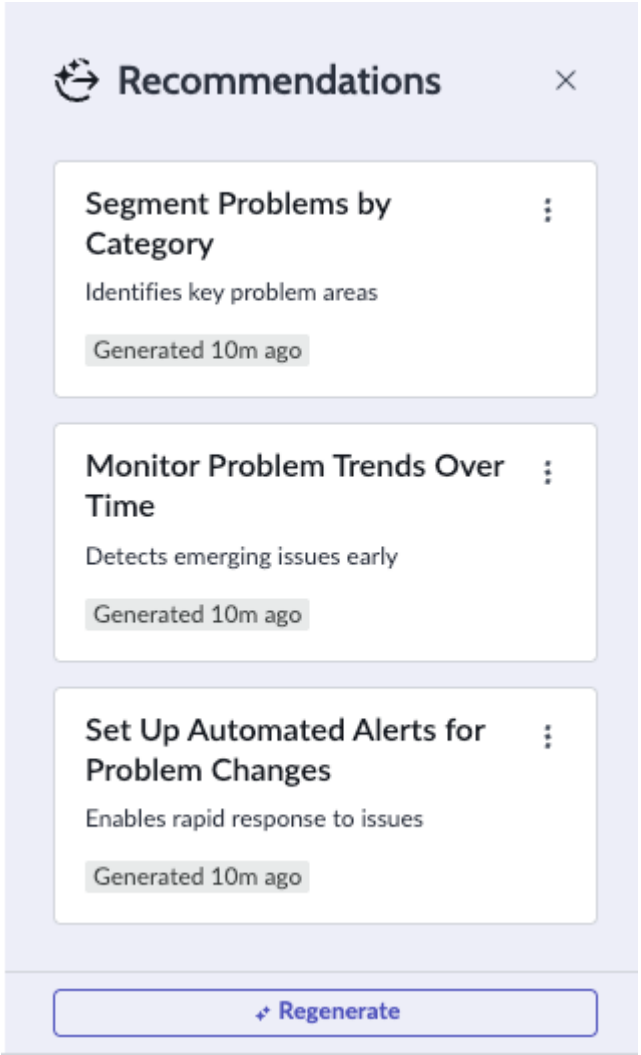
1. Launch AI Data Explorer.
   For more information, see Launch AI Data Explorer.
2. Open an exploration that already has generated insights.
3. For best results, set an exploration goal.
   For more information, see Setting exploration goals.
4. Perform one of the following actions:
   - In the border of the exploration, press the **Actions recommendation** button.

   - In the prompt window, select **Recommend actions**.



5. Read the recommendations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. If you need more details about a recommendation, expand the three-dot menu on that recommendation and select **Show details**.
7. If you disagree with a recommendation, you can expand the three-dot menu on that recommendation and delete it.
8. To hide or show the recommendations, press the **Actions recommendation** button. When the recommendations are hidden, you can also show them with the **View recommended actions** control, which replaces the **Recommend actions** control in the prompt window.
9. Follow the recommendations you agree with.
10. When you have addressed the recommendations, you can press the **Regenerate** button after the recommendations to generate new recommendations.

Summarize an exploration

Use AI to generate a summary of an exploration. If you update the exploration, you can regenerate the summary.

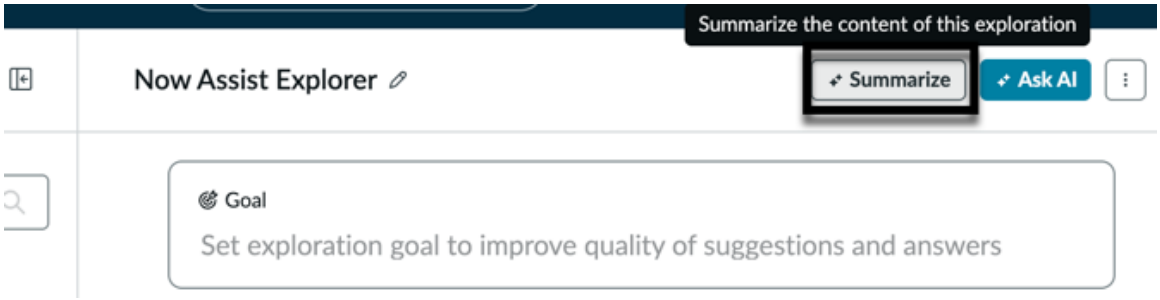
Before you begin

To access the AI summarization tool, the exploration summarization skill must be activated. For more information, see Activate AI Data Explorer skills.

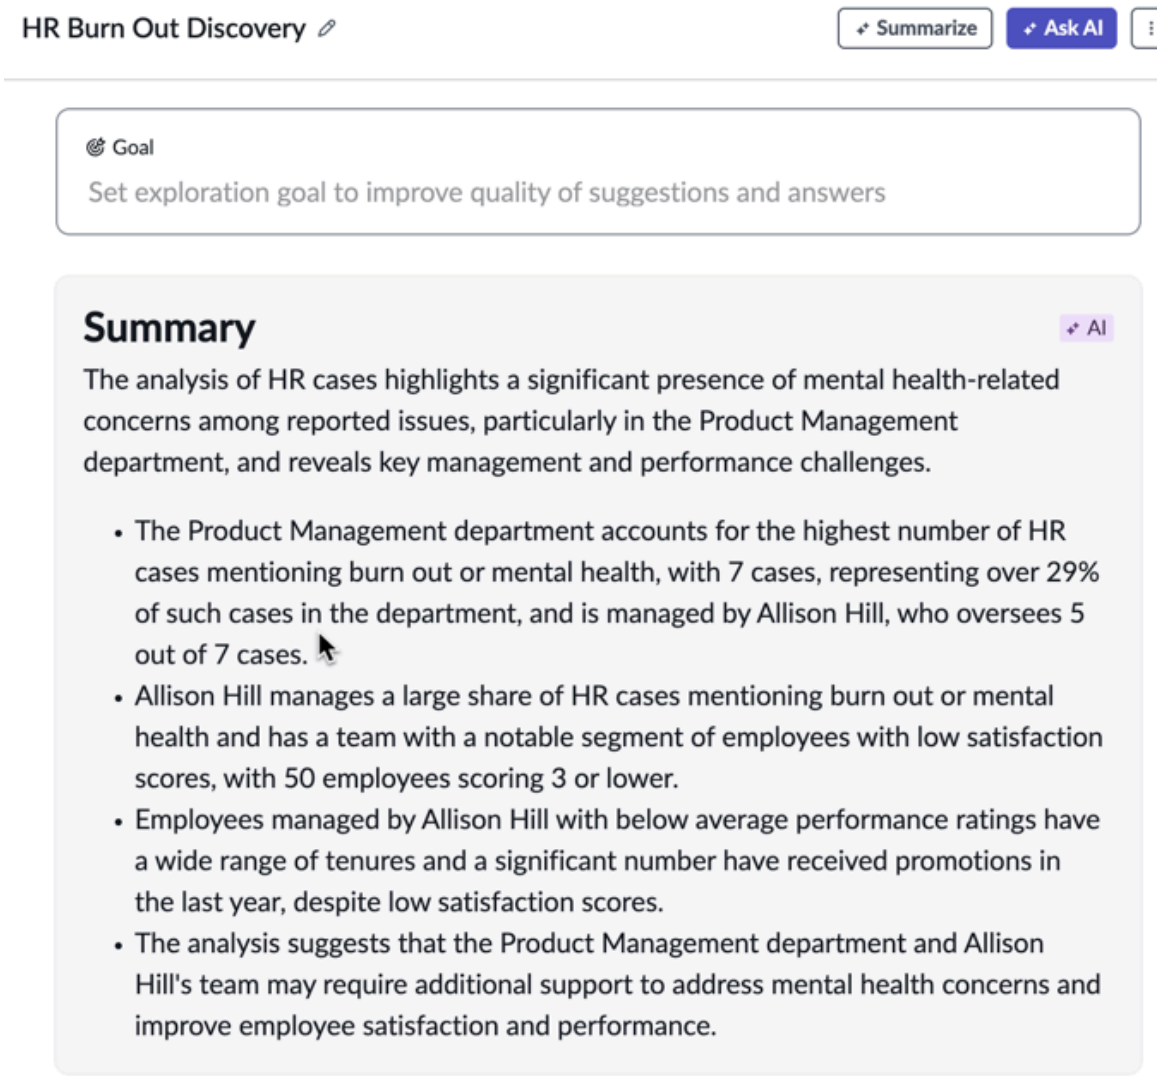
Role required: now_assist_explorer_user. You need editing rights to the exploration.

Generate a summary by pressing the **Summarize** button in the exploration header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

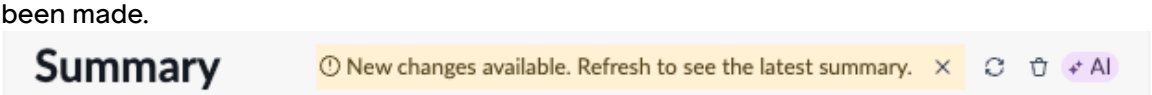


AI generates a summary and places it beneath the goal. The **Summarize** button disappears.



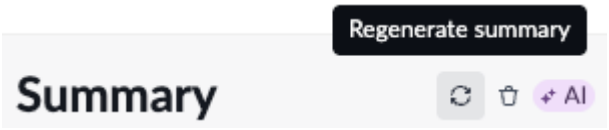
You can place your cursor in the generated summary and edit it, as described in Write or edit text in an exploration.

If you change the exploration, you get a message in the summary header that changes have been made.



To refresh the summary, press the **Regenerate summary** button in the summary header. You are asked to confirm that you want to regenerate the summary. If you confirm, the summary now reflects the most recent changes, and the Refresh message is dismissed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You can also delete a summary when you no longer need it. Press the **Delete** button in the summary header.

Note: The Regenerate and Delete summary actions are not available if the exploration summarization skill is deactivated or the exploration is made read-only.

Duplicate an exploration

Create multiple copies of a AI Data Explorer exploration to repeat analyses, give yourself editing rights without affecting the original, or experiment with multiple variations of an exploration.

Before you begin

Role required: now_assist_explorer_user, and you must have the exploration shared with you at least with viewing rights.

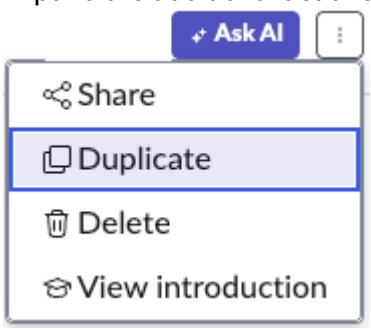
About this task

Duplicating an exploration grants the following possibilities:

- Create repeating analyses on the basis of an existing exploration. For example, you see an exploration about trends in May. You want to repeat the same analysis for June. By duplicating the May exploration, you don't need to start the exploration flow from scratch.
- Duplicate an exploration where you have only read-only access, to create a copy that you can edit. With editing rights, you can refine existing questions or ask new ones.
- Create a polished version of an exploration. To gather the right insights to drive decision making, you may need a sandbox where you can try out different takes and sets of questions. You can duplicate an exploration and experiment with the duplicates without losing the original detailed analysis.

Procedure

1. Launch AI Data Explorer.
   See Launch AI Data Explorer.
2. Locate and open the exploration that you want to duplicate.
   See Open an existing exploration.
3. Expand the additional actions list and select **Duplicate**.



4. In the Duplicate exploration dialog, set a name for the duplicate exploration and decide whether you want it to have the same access permissions as the original.
   If you select **Copy with access permissions**, the users who had the original exploration shared with them have the same access to the duplicate. You have editing access to the duplicate whether or not you could edit the original, regardless of the choice you make here.
5. Press **Duplicate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Share and collaborate on an exploration

Work with others to generate, discuss, refine, and follow up on insights related to a shared project, concern, or goal.

Before you begin

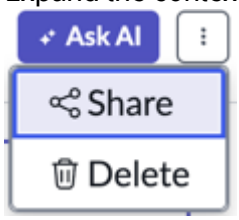
Role required: Any, with sharing rights to the exploration

About this task

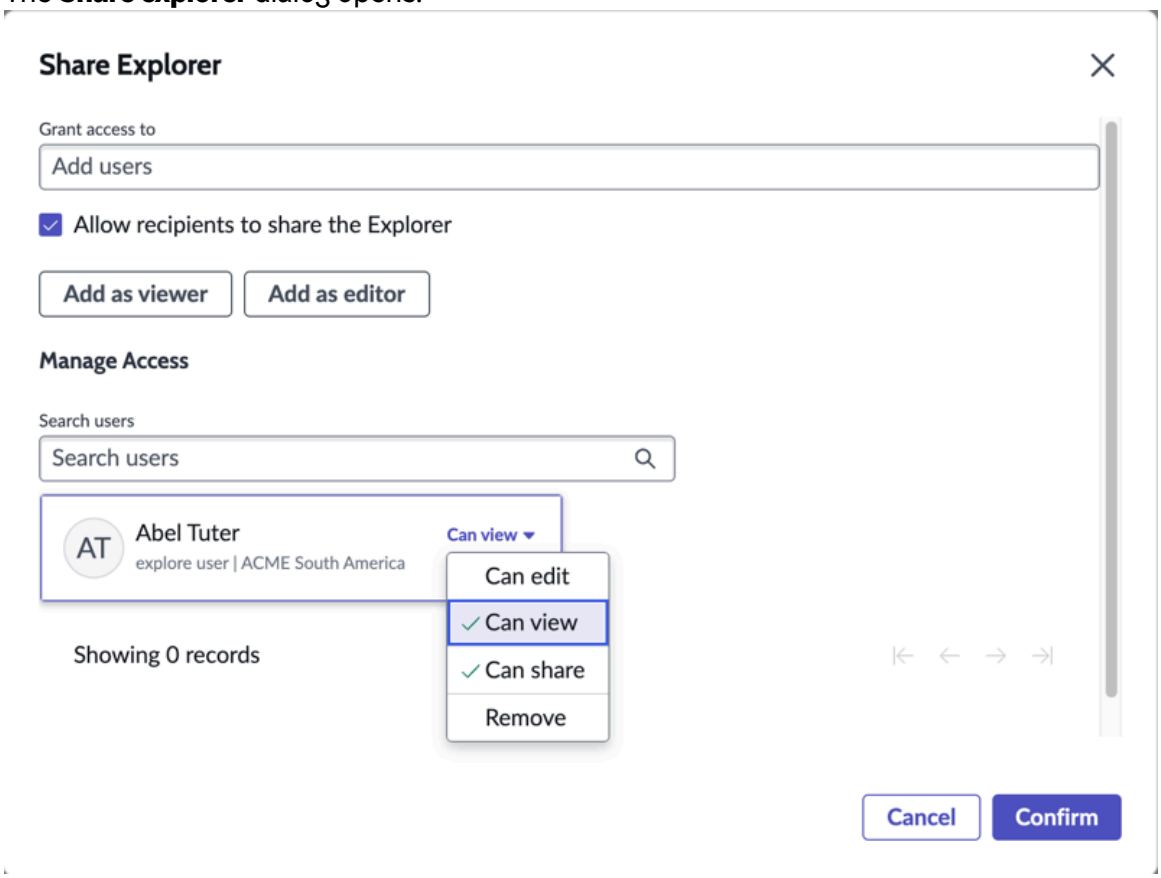
Participants (shared with editing rights) in an exploration can work together in real time to ask questions of the AI, discuss the results, refine those results, and pursue follow-up questions. You can tag colleagues in text. If they can edit the exploration, they are notified when they are tagged. If you tag someone without access, you see a message that you have done so, and if you have the right to share the exploration, you can immediately share it with them with editing rights.

Procedure

1. Launch AI Data Explorer.
   See Launch AI Data Explorer.
2. Create or open the exploration that you want to work on with others.
3. Expand the context menu ⋮ and select **Share**.



The **Share explorer** dialog opens.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **Grant access to** field, enter the names of one or more users you want to share the exploration with.
   You can share an exploration only with users who can access the data that the exploration shows.

   Warning: If a user adds data to an exploration that not all other collaborators are allowed to access, those users will no longer be able to view the exploration's content. The affected collaborators are notified that they can no longer view, receive data from, or make any changes to the exploration.

5. To allow the people you share the exploration with to share the exploration as well, select **Allow recipients to share the exploration**.
   When you add a user as a viewer, they can only share the exploration as a viewer. When you add a user as an editor, they can share the exploration as a viewer or as an editor.
6. Select one of the following options.

Option	Description
Add as viewer	Grant only viewing rights to the users you are sharing the exploration with. They cannot edit it.
Add as editor	Grant editing rights to the users you are shar ing the exploration with. They are notified when they are tagged in text. You must be in the same application scope as the exploration to add a user as an editor. **Important:** The user must also have the now_assist_explorer_user role to ed it the exploration.

7. Select **Confirm**.

What to do next

You can add or remove users to share the exploration with. You can also change the rights of the users who you have shared the exploration with.

Open an existing exploration

In AI Data Explorer, you can open any exploration that you own or that has been shared with you.

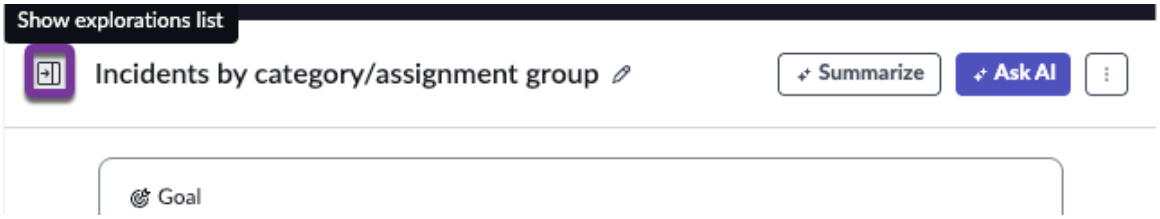
Before you begin

Role required: Any role to open an exploration that has been shared with you. now_assist_explorer_user to edit the exploration, even if it has been shared with you with editing rights. admin to open and edit any exploration.

Procedure

1. Navigate to **All** > **AI Data Explorer** > **AI Data Explorer**.
2. Expand the All explorations list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Search the name of the exploration or browse the list.
4. Select the exploration name to open it.

Delete an exploration

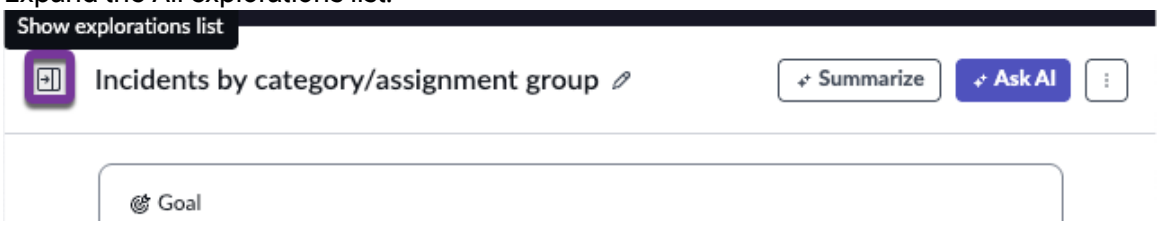
Authorized users can delete an exploration in several ways.

Before you begin

Role required: now_assist_explorer_user and ownership of the exploration. Users with admin role can delete any exploration.

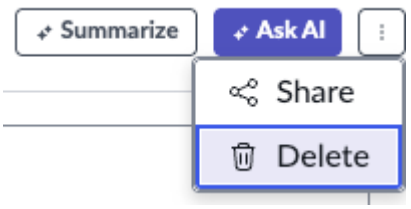
Procedure

1. Navigate to **All** > **AI Data Explorer** > **AI Data Explorer**.
2. Expand the All explorations list.



3. To delete an exploration, either
   - Delete the exploration from the All explorations list.

   - Open the exploration and delete it from the additional actions list in the toolbar.



Related topics

Duplicate, delete, copy to another exploration, or move an answer in an exploration

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Data Explorer reference

Reference topics provide additional information about the roles and tables in AI Data Explorer. They also describe how AI Data Explorer supports domain separation.

Roles and tables installed with AI Data Explorer

Reference information for roles and tables installed when you activate AI Data Explorer. Use this information to understand permissions and metadata storage for explorations.

Roles installed

Role name	Description	Contains roles
now_assist_explorer_user	Enables users to see AI Data Explorer in unified navigation and the Explore button on eligible lists and widgets on dashboards. Users can create explorations or browse and edit shared explorations. **Note:** If you share an exploration with edit rights, but the user does not have this role, they can only view the exploration regardless.	sn_query_gen.user
now_assist_explorer_admin	Can access and manage all explorations on the instance. Can control the visibility of AI Data Explorer in workspaces. Can view logs and manage tables in the semantic data layer (inherited from sn_query_gen_admin). For more information, see Query Generation logs and Add a table to the semantic data layer.	now_assist_explorer_user, sn_query_gen.admin, uxframework_user

Tables installed

The AI Data Explorer application is private. You cannot edit these tables directly. However, if you have the admin role, you can read them. Each table begins with the prefix "paai_canvas."

PAAI Canvas, PAAI Canvas Component, and PAAI Canvas Conversation records follow this hierarchy: Canvas (one record per exploration) > Conversation (currently one per canvas) > Component (one or more per conversation).

Table	Description
PAAI Canvas [paai_canvas]	Contains name, goal, sys ID, domain, and other metadata that defines an exploration. Each record is a separate exploration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
PAAI Canvas Component [paai_canvas_component]	Contains the metadata for the UX macroponents, such as data visualizations, that get added to an exploration.
PAAI Canvas Conversation [paai_canvas_conversation]	Conversations include AI answers with text, links to data visualizations, and any user input. Currently there is one conversation per exploration.
PAAI Canvas Log [paai_canvas_log]	Stores relevant licensing information.
PAAI Canvas Permission [paai_canvas_permission]	Permissions governing who an exploration is shared with. Each collaborator has a permission record for their rights in that exploration. A user has one such record for each exploration they collaborate in.
PAAI Canvas Workspace Config [paai_canvas_workspace_config]	Workspaces/experiences for which links from data visualizations to AI Data Explorer are turned off.

Domain separation support for AI Data Explorer

Domain separation is supported for AI Data Explorer. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Overview of domain separation in AI Data Explorer

The goal of AI Data Explorer is to provide shared spaces, called "explorations," where collaborators can ask for and discuss AI-generated data visualizations with summaries. The AI also suggests follow-up questions. AI Data Explorer shows data only from domains that collaborators can access.

How domain separation works in AI Data Explorer

When a user in an exploration asks a question of the AI, the answer is limited to data from domains that the user and other collaborators can access. Users from a child domain cannot

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

see explorations from parent or sibling domains, but users from a parent domain can see explorations from child domains if those explorations are shared with them.

All AI Data Explorer tables have domain fields to associate explorations to domains and restrict access accordingly.

Domain separation for service providers

Generate or export dashboards and data visualizations in the Now Assist panel

Generate and export Platform Analytics artifacts from conversational interactions. For example, ask for information about the number of open incidents and get a single-score data visualization. Then export that visualization as a PDF file, all in the Now Assist panel.

Get started

Explore Learn more about how you can work with Platform Analytics in the Now Assist panel	Configure Enable visualization generation and export skills for an instance	Generate data visualizations How to create data visualizations conversationally in the Now Assist panel
Export dashboards and data visualizations  Use AI to export dashboards and data visualizations conversationally in the Now Assist panel	Reference Roles and tables that are included with the data visualization generation and export skills	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- Not all model providers are available for customers with in-country SKUs, and some Now Assist products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some Now Assist products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base . Be sure to check for availability updates in future releases.
- Some Now Assist products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect information from tables and indicators that will be used to generate analytics. For example, information from the Incident table or the Number of open incidents indicator could be collected for requests for incident data visualizations. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the Now Assist documentation.

Explore generating or exporting dashboards and visualizations in the Now Assist panel

Generate and export Platform Analytics artifacts from conversational interactions. For example, ask for information about the number of open incidents and get a single-score data visualization. Then export that visualization as a PDF file, all in the Now Assist panel.

Overview of skills

There are two skills pertaining to working with data visualizations and dashboards conversationally in the Now Assist panel:

Data visualization generation

Lets you create relevant visualizations based upon natural language questions and available data, leveraging Platform Analytics and Query Generation. The visualizations can show data from any ServiceNow AI Platform tables. The user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

can add the visualization to a dashboard. This skill simplifies the process of data visualization generation and configuration, potentially increasing efficiency.

Dashboard and visualization export

Lets you export existing Platform Analytics dashboards and data visualizations conversationally, leveraging Query Generation. The available output formats depend on what you are exporting, but typically include PDF and Microsoft PowerPoint.

Roles

The now_assist_panel_user and either now_assist_analytics_generation or now.assist.creator.analytics roles are required to use the data visualization generation skill. The user must also have access to the data for which they are requesting a visualization.

The user can add a generated visualization to any dashboard to which they have editing rights.

The now_assist_panel_user role is required to use the dashboard and visualization export skill. To schedule the export, the user also needs par_scheduler.

Activation

The data visualization generation and dashboard and visualization export skills are included with Workflow Data Fabric applications from the ServiceNow Store. You have to activate the skills after installation. For more information, see Configuring Now Assist panel skills for Platform Analytics.

Supported user interfaces

Access the data visualization generation skill by starting a conversation in the Now Assist panel and asking for information available from a Platform Analytics table.

Similarly, access the dashboard and visualization export skill by starting a conversation in the Now Assist panel and asking to export a specific visualization or dashboard.

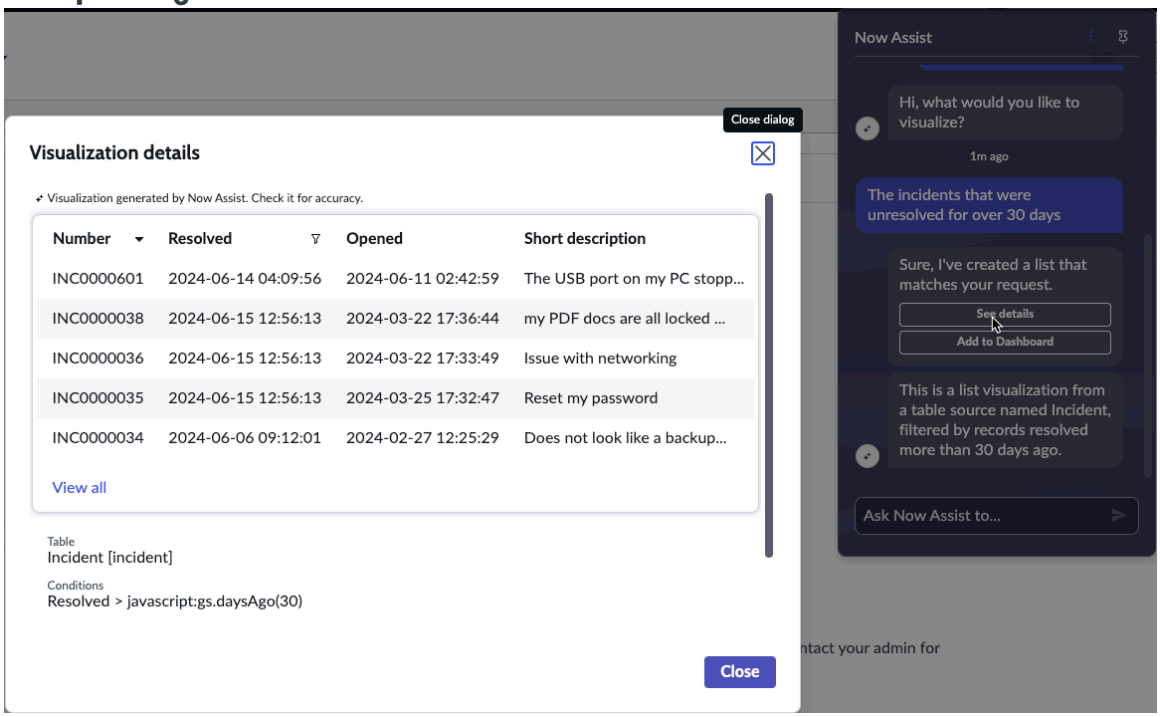
Example of a generated data visualization



Configuring Now Assist panel skills for Platform Analytics

Activate the skills for generating and exporting Platform Analytics dashboards and data visualizations from conversations in the Now Assist panel.

The dashboard and visualization export skill are included in the Generative AI Controller application and plugin, which contains a range of utilities. This plugin is included in all Now Assist applications.

The Query Generation skills "analytics query generation," "analytics insight generation," "analytics hidden insight generation," and "analytics follow-up generation" are required. These skills are active by default. For more information, see Query Generation skills.

Activate the data visualization generation skill

Give users generative AI capabilities for creating data visualizations from the Now Assist panel by activating the data visualization generation skill.

Before you begin

The data visualization generation skill is included in Generative AI Controller, which is in most Now Assist applications from the ServiceNow® Store.

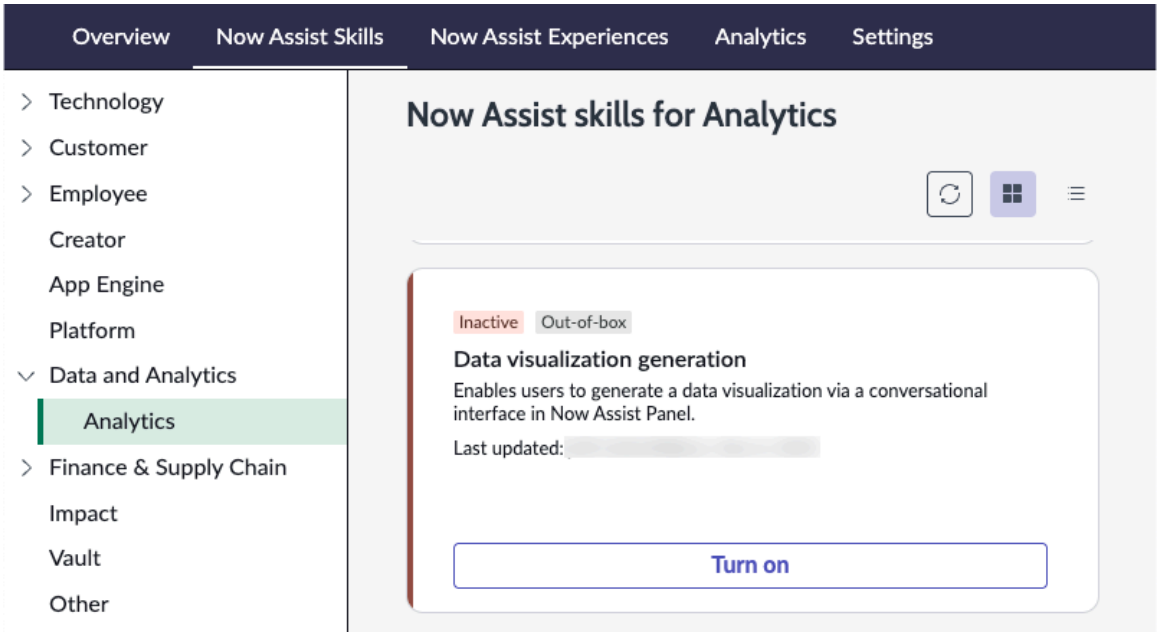
The Query Generation skills "analytics query generation," "analytics insight generation," "analytics hidden insight generation," and "analytics follow-up generation" are required. These skills are active by default. For more information, see Query Generation skills.

Role required: admin

Procedure

1. Navigate to **All** > *Now Assist Admin* > **Skills**.
2. In the product area pane, select **Data and Analytics** > **Analytics**.
3. In Now Assist skills for Analytics, search for the data visualization generation skill.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. **Optional:** In the **Define access** page, you can add roles who can use this skill. By default, the now.assist.creator.analytics, now_assist_explorer_user, and now_assist_analytics_generation roles have these rights. Think carefully before making any changes.

   (Optional) All **Analytics** skills have this option. The data visualization skill and Query Generation skills should have one role in common. Note that each default data visualization generation role contains the sn_query_gen.user role, which is the default role for Query Generation skills.

5. Select **Turn on**.

Result
If the skill was successfully activated, the system notifies you.

The dashboard and visualization export skill

Give users generative AI capabilities for creating data visualizations from the Now Assist panel by activating the dashboard and visualization export skill.

Before you begin
The dashboard and visualization export skill is included in Generative AI Controller, which is in most Now Assist applications from the ServiceNow® Store.

Role required: admin

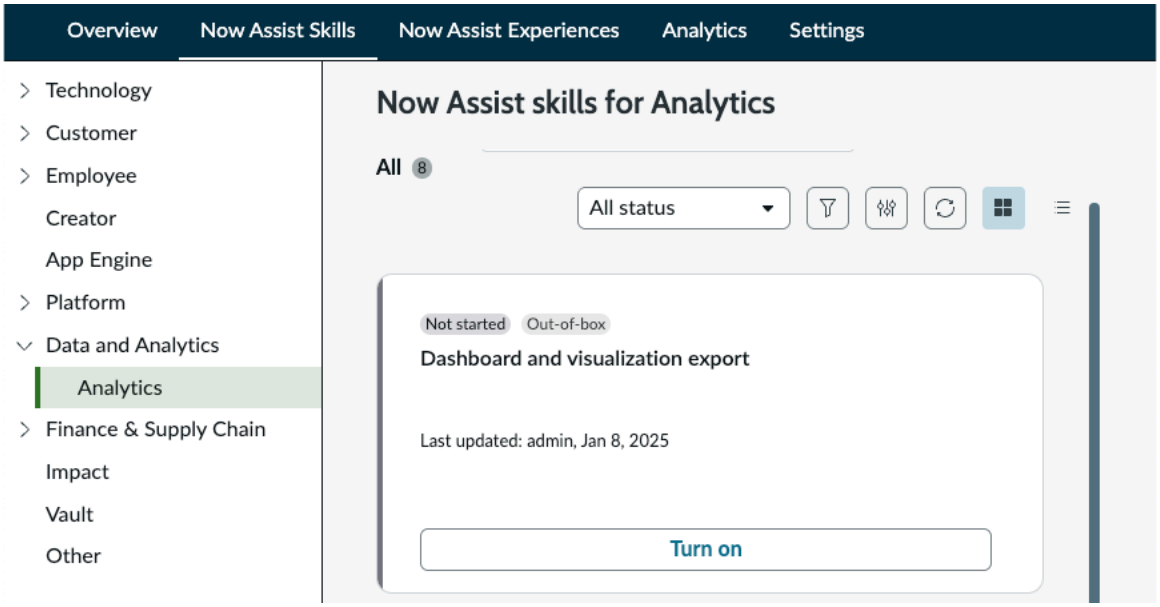
About this task

Important: This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see Now Assist skills, agents, and agentic workflows on by default.

Procedure

1. Navigate to **All** > *Now Assist Admin* > **Skills**.
2. In the product area pane, select **Data and Analytics**.
3. In Now Assist skills for Analytics, search for the dashboard and visualization export skill.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Turn on**.

Result
If the skill was successfully activated, the system notifies you.

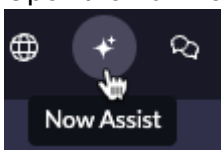
Generate visualizations in the Now Assist panel

Request generative AI to create a visualization of data that you want to see. If you are on a dashboard that you can edit, you can add the visualization to that dashboard.

Before you begin
Role required: now_assist_panel_user and either now_assist_analytics_generation or now.assist.creator.analytics. You need access to the data that you want to see. If you want to add the visualization to a dashboard, you need editing rights to that dashboard.

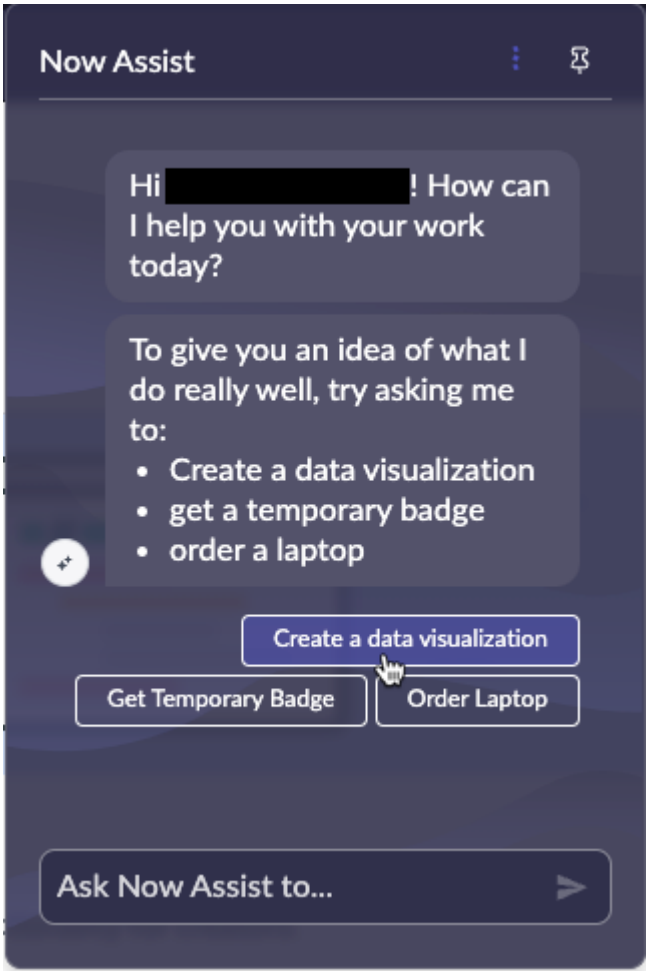
Important: You need the correct entitlements to this skill and to Query Generation.

Procedure
1. If you want to add a visualization to a dashboard that you can edit, navigate to **All** > **Platform Analytics** > **Library** > **Dashboards** and open the dashboard from the library.
2. Open the Now Assist panel.



3. Select **Create a data visualization**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

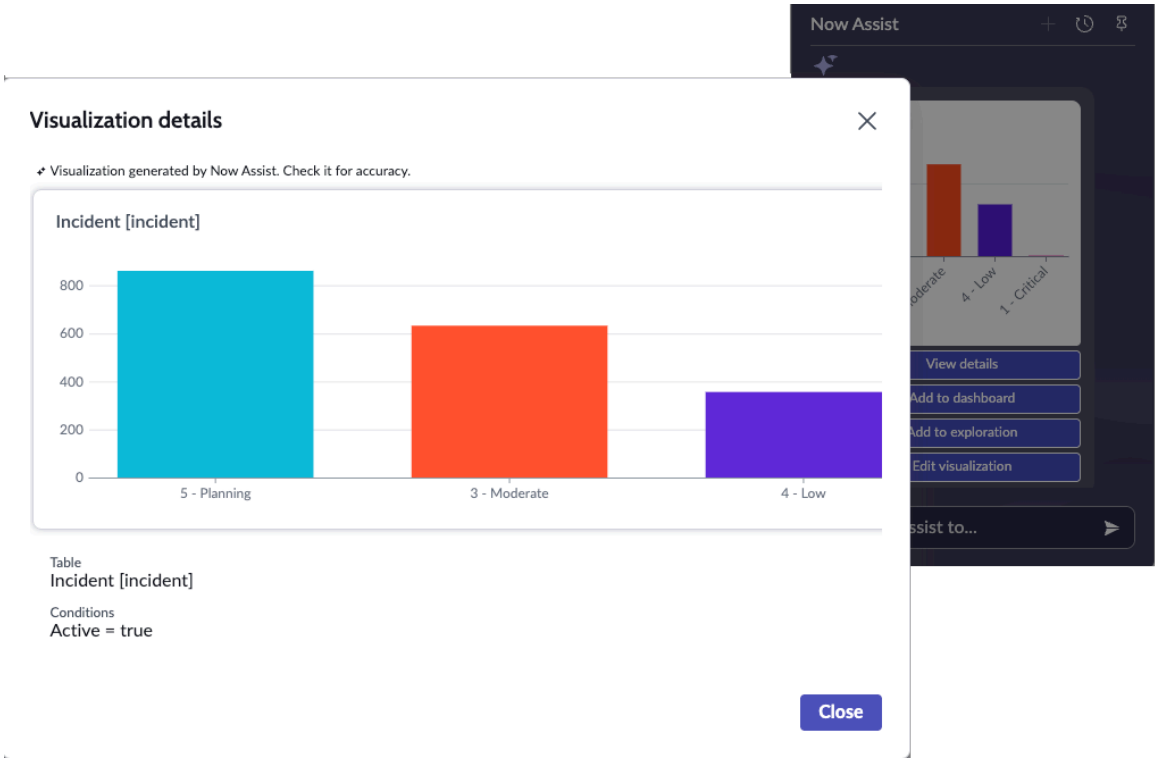


4. Ask for data to see.
   For example, ask "Can I see open incidents by priority?" You then would get a visualization of the count of incidents divided across priorities where active=true. You can specify the chart type, too, but not all charts are supported. For more information about what kind of questions you can ask, see Guidelines and example questions and Limitations to generating data visualizations.

   Note: Analytics Generation only returns visualizations of data in tables for which semantic generation is enabled. If you have a question, ask your admin to check the Semantic Table Configurations [sn_query_gen_table_config_list] under **Query Generation** > **Administration** > **Semantic Table Config**.

5. To pop out a larger view of the visualization that shows the table name and conditions, select **View details**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. To add the visualization to a dashboard, select **Add to dashboard**.
   A pane opens where you can choose from any of the dashboards that are available to you to edit. You can also create a new dashboard to contain the visualization. Note that technical dashboards are not supported.
7. To add the visualization to a collaborative workspace in AI Data Explorer, select **Add to exploration**.
   For more information, see Use AI to explore data with AI Data Explorer.
8. To edit the visualization, select **Edit visualization**.
   If you have the viz_creator role, you can save the visualization to the Data Visualizations library. For more information, see Edit a data visualization in the Visualization Designer.
9. Under **What would you like to do next**, you see several suggestions:

Suggestion	Description	Example of prompt
Change visualization type or condition	Change a configuration field like Group by, or the filter conditions, or the visualization type.	Change group by to Priority.
Use another table as the data source	Change the data that you want to visualize, according to table name. You may be prompted for the aggregation type, such as Count.	Change table to Problem.
Leave this topic	Select this button to finish work on this visualization	Not applicable

Guidelines and example questions

This section shows guidelines and some typical questions that you could ask in the Now Assist panel to generate data visualizations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Follow these guidelines when asking Now Assist to generate a data visualization:

Be precise in your questions

- Use the correct term for the subject of the data you want, such as 'incident' or 'change request.' If you know the name of the table, include that name in the question.
- Be as detailed and precise in your conditions as possible. Do not say "all incidents not resolved in 30 days," say "all incidents that were still open 30 days after they were created."
- If you want a specific visualization type, say so.

Experiment with questions

Save your questions somewhere, including any modified versions. Saving your questions enables easy comparison of results.

When you generate a data visualization, look it over carefully. Check whether it really shows you what you want to know. Keep refining your questions until you're satisfied.

Examples

Show me the number of open incidents by priority

Gives you a visualization of records on the Incident table grouped according to the Priority column value.

Show task sla as pie

Here you are asking for a pie visualization of Task SLA records, but you have not specified the field by which to group the records. Now Assist gives you a list of fields to choose from, and then it shows you a pie visualization based on your selection.

Show unresolved problems where Assignment group is not empty

Gives you a list of records from the Problem [problem] table, filtered to show only records with a value in the Assignment group field.

Show me the total number of tasks with high priority

Gives you a single score visualization with the number of unique records (Count Distinct aggregation) on the Task table with a priority of 2 (High).

Tasks created this month, grouped by priority

Gives you a bar visualization of records on the Task table that were created this month, grouped by the value of the Priority field.

Limitations to generating data visualizations

While data visualization generation is designed to handle a wide range of queries and scenarios, certain cases are not supported or only partially supported.

Unsupported queries

Query contents	Example	Limitation
Visualization type	"Show me a heatmap of open incidents by creation date"	Only the following visualization types are supported: • Scores: single score, dial, gauge • Bar: horizontal and vertical bars • Donut, pie, and semi-donut

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Unsupported queries (continued)

Query contents	Example	Limitation
		• Time series: area, line, column, scatter, spline, step • List
Data source	"Show me open asset contracts"	Only table data sources listed in the Semantic Table Configuration table are supported. See Add a table to the semantic data layer.
Multiple Group By conditions	"Show me open incidents by group and state."	Data visualization generation will produce results, but only the first 'group by' clause (group) will be considered. The second 'group by' clause (state) will be ignored in the current output.
Multiple time periods	"Show me open incidents last week, month, and year."	Data visualization generation is currently unable to process queries that request data for multiple time periods simultaneously. Only one time period can be handled at a time.
Conflicting or complementary conditions	"Show me resolved and unresolved cases last week."	Data visualization generation detects only the first condition (resolved) under the state column. The second condition (unresolved) is misinterpreted and may be incorrectly mapped to another column or ignored.
Multiple data tables	“Show me high priority incidents, problems and changes”	Data visualization generation identifies only the first table and ignores the other ones.
Non-English queries	--	Only English is supported
Technical dashboards	--	Data visualizations can be added only to dashboards that are created in the inline editor. Technical dashboards are not supported.

Possible ways to circumvent limitations

- Simplify your queries by focusing on one 'group by' clause at a time.
- Specify a single time period per query.
- Avoid multiple conditions in a single query.

Export dashboards and data visualizations from the Now Assist panel

Export or schedule the export of dashboards and data visualizations conversationally through AI instead of going through the Platform Analytics user interface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

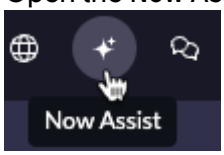
Before you begin

Important: This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see Now Assist skills, agents, and agentic workflows on by default.

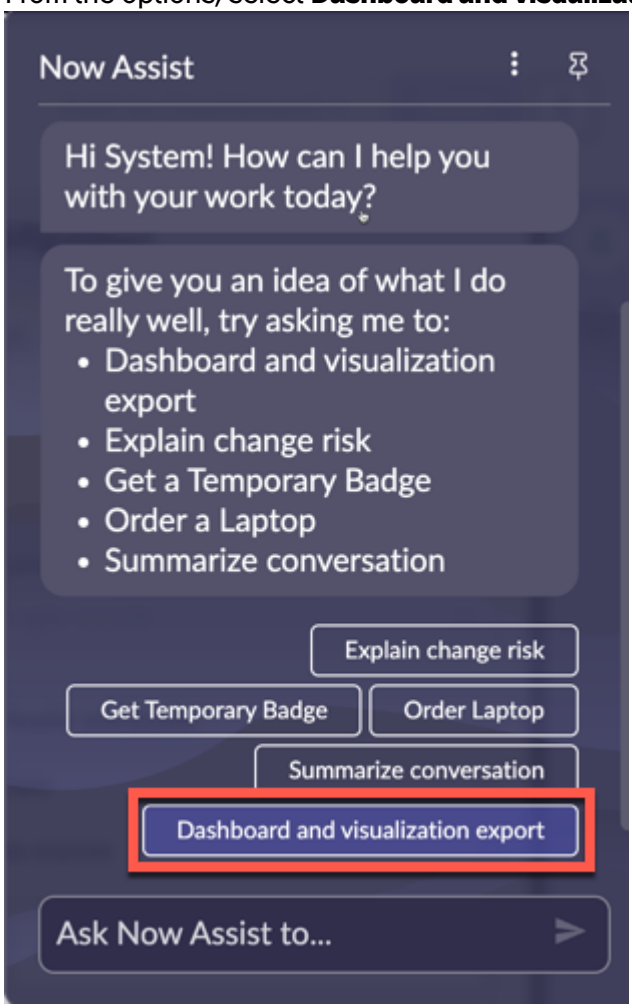
Role required: now_assist_panel_user. To schedule an export, you also need par_scheduler. You need access to the dashboard or the data in the visualization.

Procedure

1. Open the Now Assist panel.



2. From the options, select **Dashboard and visualization export**.



3. Engage in an iterative conversation until Now Assist produces the export you want.
   - If you want an immediate export, specify the word "Export" in your prompt. If you want to schedule an export, specify "Schedule."
   - Specify the name of the data visualization or dashboard.
   - Specify the word "visualization" or "dashboard" depending on what you want to export. Specify the word multiple times for best results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Specify the desired output type.
- Specify whether you want to download the export or have it emailed.
- You can only export dashboards or data visualizations that have been saved to the library.
- Although you can directly export only visualizations that are in the library, if you export a dashboard, you export all visualizations on that dashboard, including those that were not saved to the library.

For more information, see the topics linked after this procedure.

What to do next

Tip: After an export request is complete, reset the conversation before beginning a new request. Otherwise, some option selections might carry over to the new request. If this happens anyway, consider clearing your browser cache.

Related topics

Export a data visualization from the Visualization Designer

Export a Platform Analytics dashboard

Schedule the export of data visualizations or dashboards

Supported export output types

The dashboard and visualization output skill supports the same outputs for the same data visualizations as Platform Analytics generally.

You can export dashboards as Microsoft PowerPoint or PDF files, but not all dashboard components support these formats. Unsupported components are not exported. The formats for exporting data visualizations directly also depend on the visualization type.

Supported export formats

Data visualization or dashboard element	Supported dashboard export formats	Supported data visualization export formats
Calendar reports, Indicator scorecards, Pivot tables, Geomap	None	None
Lists	PDF	PDF, Microsoft Excel (.xls or .xlsx), Embedded LIST, CSV
Other data visualizations	PowerPoint, PDF	PowerPoint, PDF, PNG, JPEG, Embedded PNG
Non-data visualization dashboard elements, like Headings	None	Not applicable

Export destinations

When you export a dashboard or data visualization in the Now Assist panel, you have to specify the destination.

You can select from the following file destinations:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Download
- Email
- Scheduled email

Specify recipients for an email. If you select scheduled email, also specify the frequency of the email. You are asked for more details depending on the frequency you have selected.

Note: If you select **Download** and the export takes longer than 10 seconds, you receive the export as an email attachment instead of a download. Thus the export completes asynchronously, freeing up the Now Assist panel.

Limitations for exporting dashboards and visualizations

The dashboard and visualization export skill supports only some dashboards for export. Requests for export are not always recognized or understood correctly.

Bear these limitations in mind:

- You can only select dashboards or data visualizations for export that have been saved to their respective libraries.
- You cannot export technical dashboards, only dashboards that have been created in the in-line dashboard editor.
- By default, you can export a maximum of 150 visualizations in one PowerPoint export. If you need more slides, consider exporting the dashboard as separate tabs.
- Recognition of request content can be intermittent. The more detail you specify in your request, the more likely it is that not all of it will be recognized.

Some prompts are not recognized at all. Avoid the following phrases:

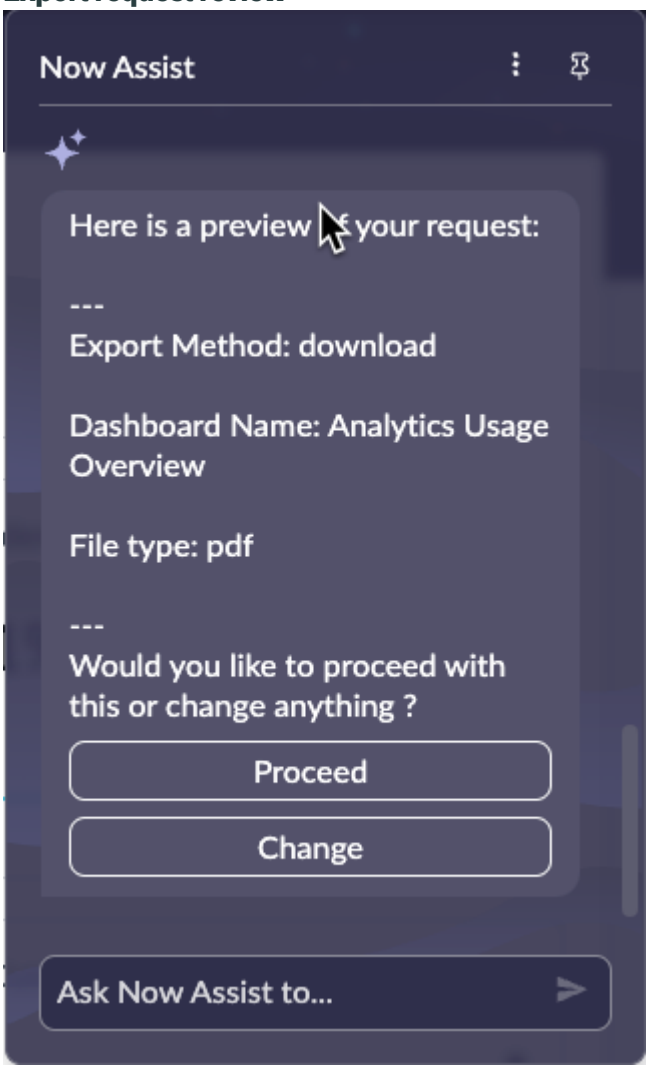
- Mail to me
- Mail with subject and body as Visualization/Dashboard name

Export guidelines and examples

In your prompts for the dashboard and visualization export skill, you can describe the export you want with a variable amount of detail. You are prompted for any necessary information that is missing. Before the export runs, you are asked to review the request, giving you a chance to change any options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Export request review



Here are some example requests with different levels of detail, to use in different circumstances:

Export this visualization to PowerPoint

If you have a dashboard or data visualization open, you do not have to specify the name. Now Assist is aware of the context. For this request, you would be asked for the export method.

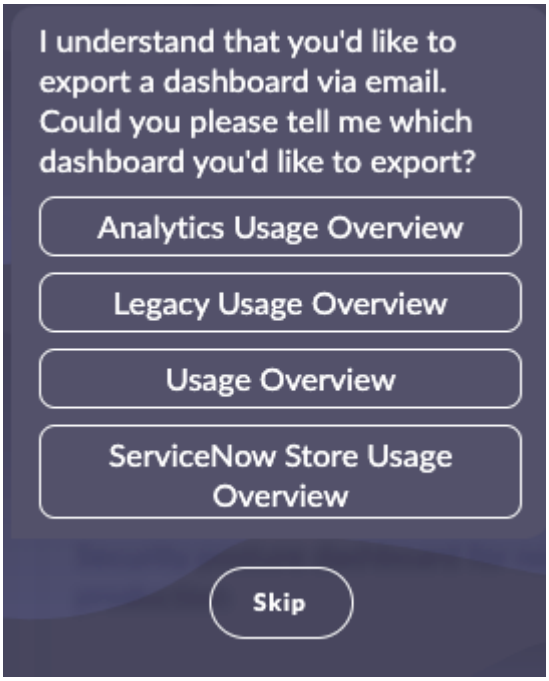
Export visualization Asset lifecycle by state to PPT

If you do not have the dashboard or visualization open, either specify its name or choose it from the list. Always specify whether you want to export a dashboard or a visualization.

Export and email Usage Overview dashboard

As there are several dashboards with Usage Overview in the name, you are asked which one to export.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Export to PowerPoint the Reports Usage tab of the Analytics Usage Overview dashboard

You can export an entire dashboard or a selected tab to PowerPoint. You can only export entire dashboards to PDF.

Export this dashboard to PowerPoint with applied filters

In this case, you export the open dashboard and apply any filters on the dashboard as a whole and on any tabs. If you export a dashboard tab with applied filters, you apply only the top-level dashboard filters and the filters on that tab. You can apply filters only when exporting to PowerPoint.

Reference for dashboard and visualization skills

Information about the roles, tables, and scheduled jobs included with the data visualization generation and dashboard and visualization export skills.

Data visualization generation roles

Several types of components are installed with activation of the plugin, including tables, user roles, and scheduled jobs.

Roles installed

Role name	Description	Contains roles
now_assist_analytics_generation	In combination with now_assist_panel_user, allows the holder to generate data visualizations in the Now Assist panel.	sn_query_gen.user

Tables installed

Data visualization generation does not include any tables of its own. However, it relies on the Query Generation back end, which does include several tables. For more information, see Query Generation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query Generation

Query Generation is a shared backend that Now Assist in Platform Analytics applications use to translate plain language user questions into database queries.

Important:

- Not all model providers are available for customers with in-country SKUs, and some Now Assist products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some Now Assist products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base . Be sure to check for availability updates in future releases.
- Some Now Assist products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect information from tables and indicators that will be used to generate analytics. For example,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

information from the Incident table or the Number of open incidents indicator could be collected for requests for incident data visualizations. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the Now Assist documentation.

Exploring Query Generation

Query Generation is an AI-powered service that translates user questions into an executable query and returns the results. An executable query contains the data source, filter, aggregation, and visualization instructions that best answer the user's question. The results include a textual summary, a data visualization, and suggestions for follow-up.

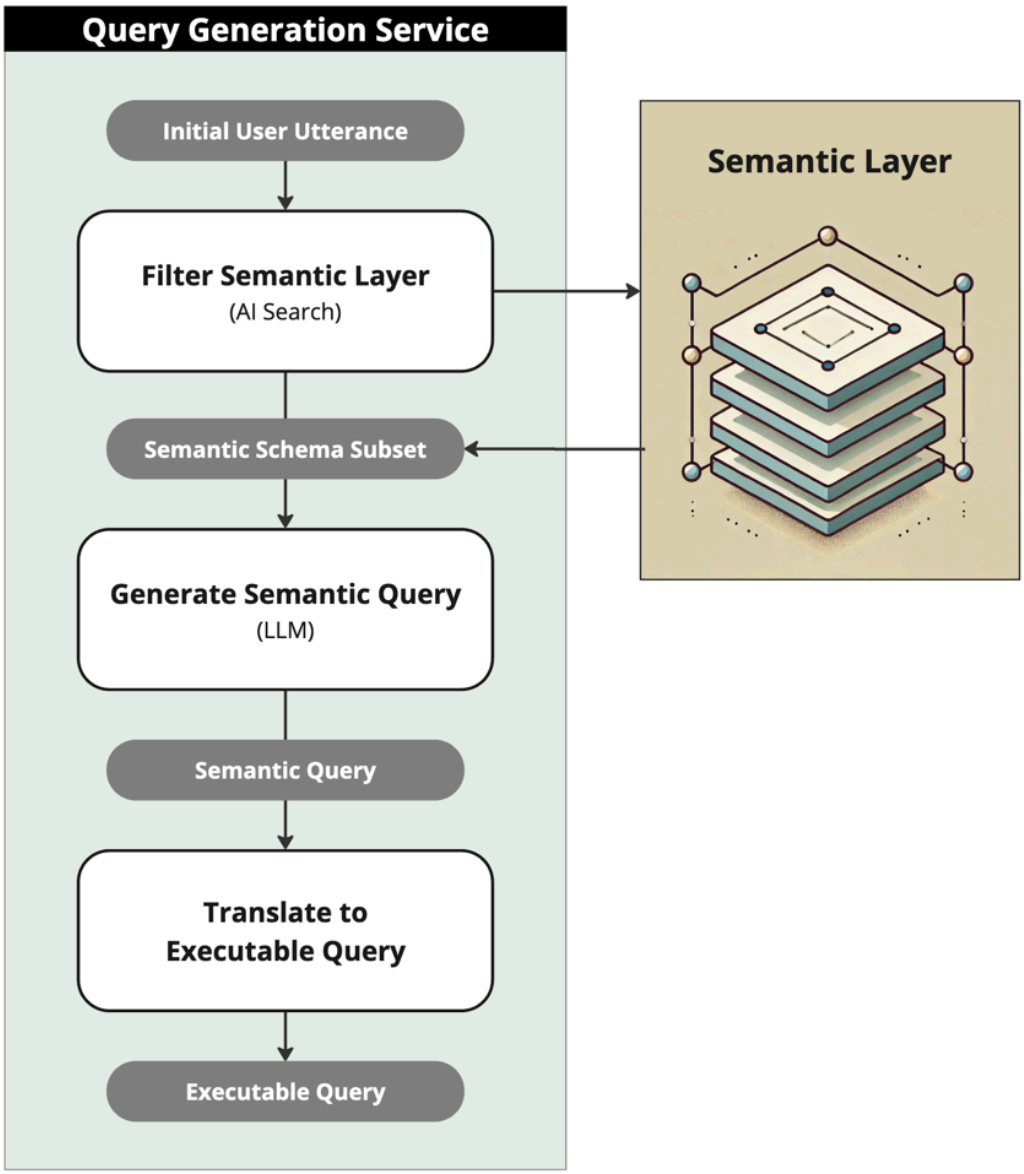
Query Generation overview

Query Generation relies on a semantic data layer to generate queries. The semantic data layer is a flat representation of tables and table columns that the Query Generator uses to find the actual facts tables and columns related to a user utterance. Specifically, facts tables are represented by Entity records and their columns by Dimension records.

Not all facts tables are included in Query Generation, as this would overload an instance. To see which facts tables are included, open the Semantic Tables Configurations list [sn_query_gen_table_config_list], and note which tables are present and have Enable Semantic Generation = true. You can add more tables to the list, but be careful of possible performance impacts. For more information, see Add a table to the semantic data layer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How Query Generation works



Before Query Generation can call the LLM, it has to filter the instance schema down to only the relevant entities and dimensions needed to answer the user's question. This filtration serves two critical purposes:

- It provides the LLM with precise grounds for truth about available tables and columns, preventing hallucination of non-existent data structures.
- It maintains a focused context window, which improves LLM performance and accuracy compared to processing the entire schema.

Query Generation uses a semantic filter to narrow the entities (facts tables) to the 2 closest matches to the user's question. Then from those entities, it narrows the dimensions (columns) to the 30 most similar to the user's question. Query Generation passes these results to the LLM, which generates a semantic query. A constitutor takes this semantic query and translates it into an executable query.

Query Generation users

Users

User	Description
ServiceNow AI Platform administrators responsible for Now Assist in Platform Analytics [admin]	Administrators can add or remove tables from the semantic data layer. Only users with the admin role can read or change Query Generation records.
Users of Now Assist in Platform Analytics applications	Users of the Now Assist in Platform Analytics applications call Query Generation through those applications, although Query Generation is not visible to them. They should have the required Query Generation user roles through the roles granted to them to use the intermediary application.

What to explore next

To learn more about configuring and using Query Generation, see:

- Configuring Query Generation
- Query Generation reference

Configuring Query Generation

Select the tables that are subject to Query Generation.

Configuration overview

You must activate the Query Generation skills for it to be used. You may also change which tables are included and have semantic generation enabled.

Query Generation skills

Query Generation skills enable users to ask questions in Now Assist in Platform Analytics applications and receive answers.

Before you begin

Query Generation is included in Generative AI Controller, which is included with Now Assist applications from the ServiceNow® Store.

Role required: admin

About this task

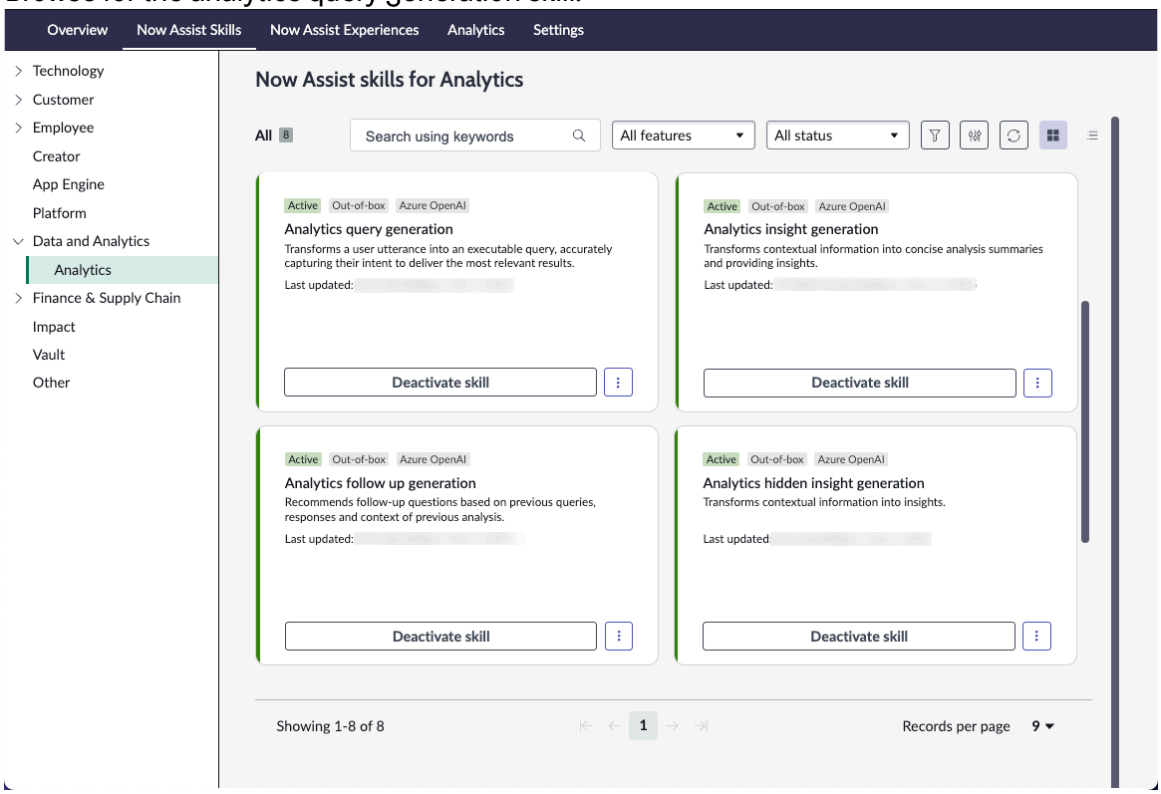
Important: This Now Assist skill is turned on by default. The skill will be automatically available to appropriate role users for the application. For more information, see Now Assist skills, agents, and agentic workflows on by default.

Procedure

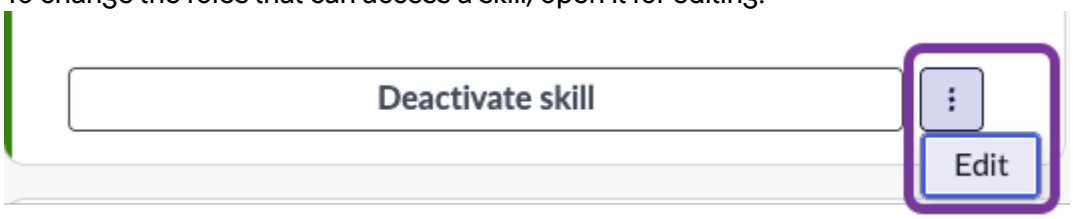
1. Navigate to **All** > **Application Manager** and verify that the Generative AI Controller plugin is activated.
   It is likely to already be active, especially if you installed and activated a Now Assist application and plugin that has Now Assist for Platform as a dependency.
2. Navigate to **All** > *Now Assist Admin* > **Skills**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the product area pane, select **Data and analytics** > **Analytics**.
4. Browse for the analytics query generation skill.



5. To deactivate a skill, select **Deactivate skill**.
   Features that require the skill, such as AI Data Explorer, will no longer function.
6. To change the roles that can access a skill, open it for editing.



> **Warning:** Be careful when selecting the roles that can access a skill. The default role is sn_query_gen.user, which the default roles for other Now Assist in Platform Analytics skills contain. Users of these other skills must be able to access Query Generation skills.

Add a table to the semantic data layer

Add more tables to the Query Generation semantic layer so that users can use Now Assist in Platform Analytics applications to ask questions about the data in those tables.

Before you begin

https://player.vimeo.com/video/1196364060?h=7f3083a3e3&badge=0&autopause=0&player_id=0&app_id=58479

Semantic table configuration supports regular tables, database views, and Workflow Data Fabric tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Warning: Adding a table to the semantic data layer and enabling semantic generation on that table can negatively impact both initial load time and runtime performance of Query Generation.

Role required: sn_query_gen.admin or higher

Procedure

1. Navigate to **All** > **Query Generation** > **Administration** > **Semantic table config**.
   If you do not have this navigation path despite having the correct roles, you may be missing a required entitlement.
2. In the Semantic Tables Configurations list, select **New**.
3. Set your session application scope to be the same as the scope you want for the table.

   Important: To add a database view, you must select the same scope as that database view.

4. Select a table from the **Table Name** list.
5. Select whether to enable semantic generation for the table.
   By default, semantic generation is enabled. For more information, see Enable semantic generation for tables in the semantic layer.
6. Select whether to include the hierarchy of child tables.
   By default, child hierarchies are included.
7. Select **Submit**.

Result

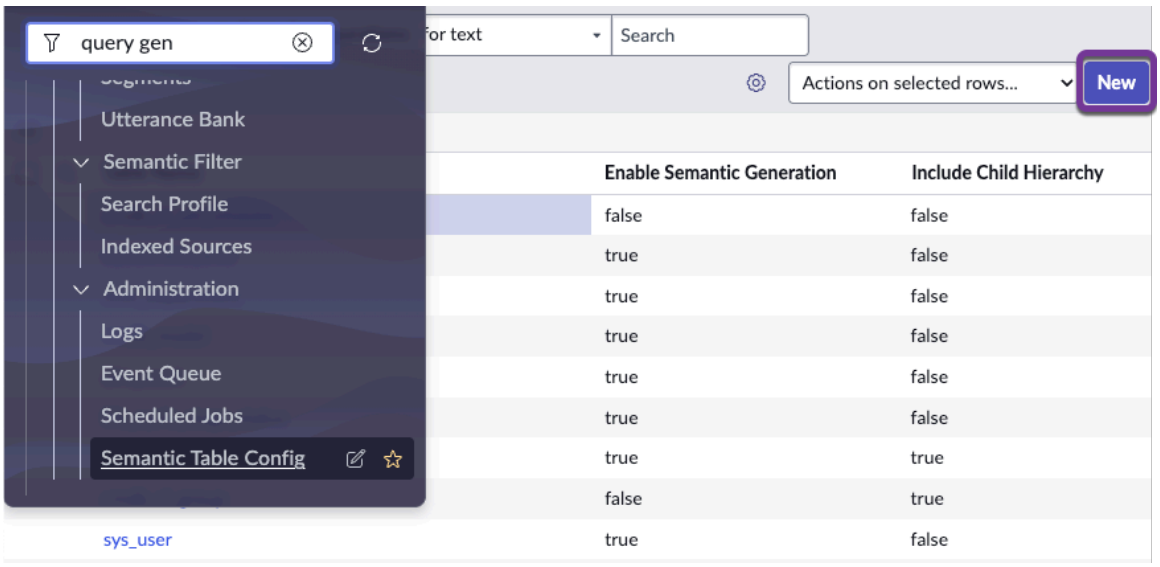
Your table is added to the list. If you enabled semantic generation, records for the table and its child tables, if included, are generated in the Entities [sn_query_gen_entities] table. Records for the table columns are generated in the Dimensions [sn_query_gen_dimensions] table.

Example: Adding the Contract table hierarchy to the semantic layer

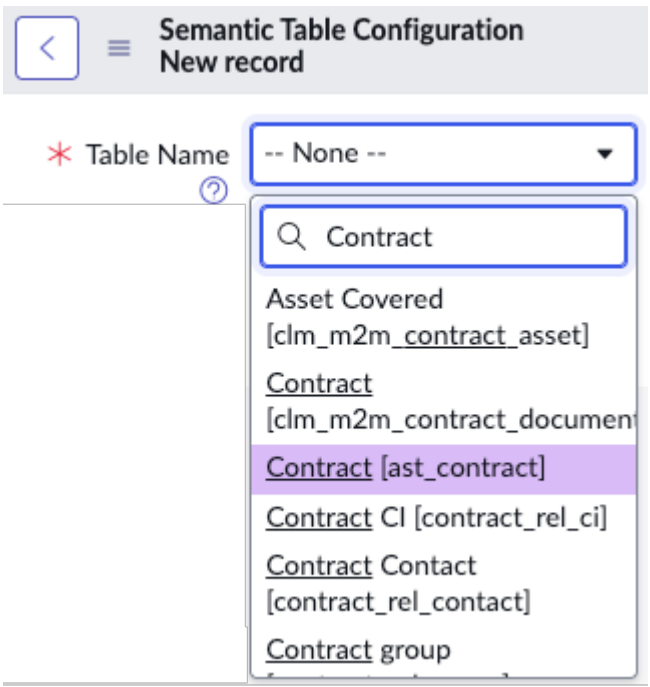
If you have users who need to explore and discuss data relating to asset contracts, you need to add the Contract [ast_contract] table to the semantic layer. This table hierarchy is not supported by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. First, you open the Semantic Table Configuration list [sn_query_gen_table_config_list] and press the **New** button.

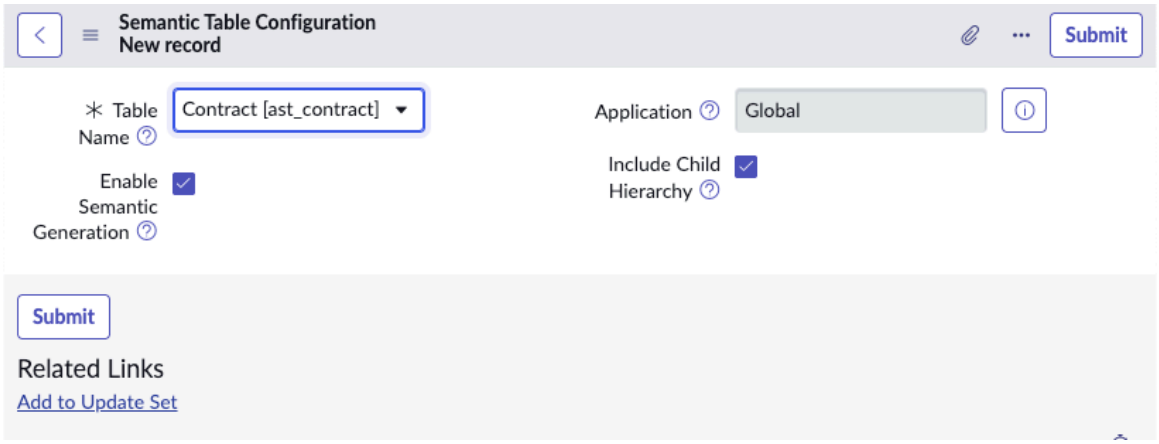


2. Now you are in the form for creating a new Semantic Table Configuration record. You search for the Contract [ast_contract] table and select it.



3. You want to enable semantic generation on the entire Contract table hierarchy, so you leave the **Enable Semantic Generation** and **Include Child Hierarchy** checkboxes selected and press **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. You see that the Contract [ast_contract] table has been added to the Semantic Table Configurations table, and that semantic generation is enabled on its hierarchy.

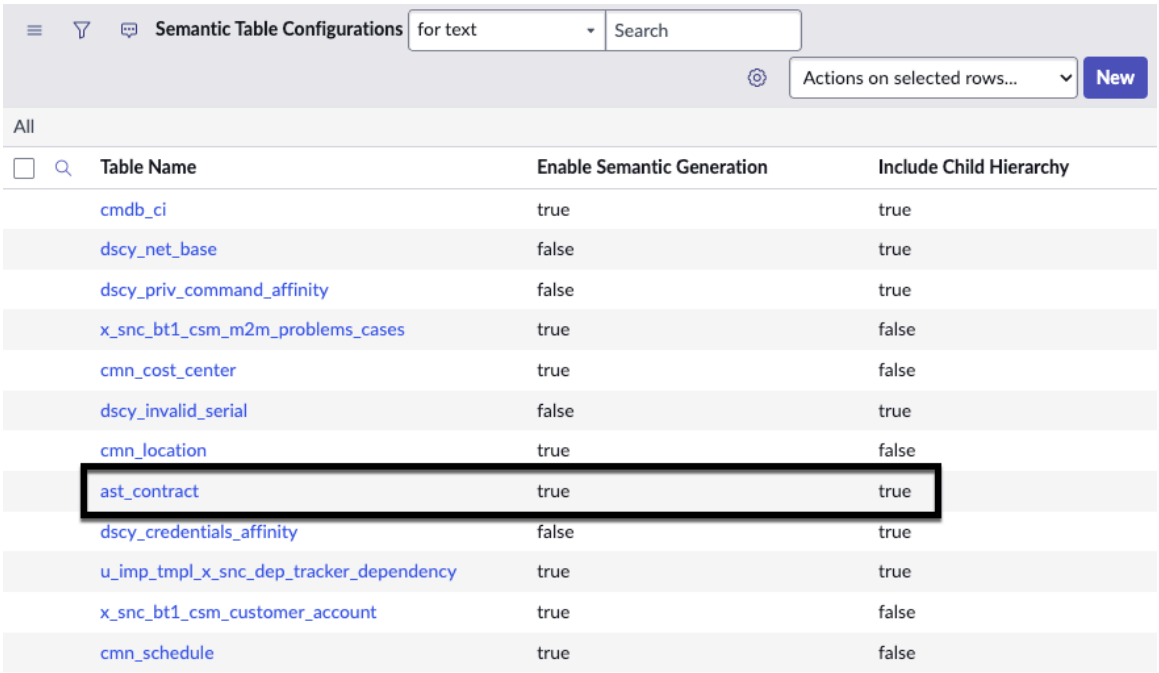


Table Name	Enable Semantic Generation	Include Child Hierarchy
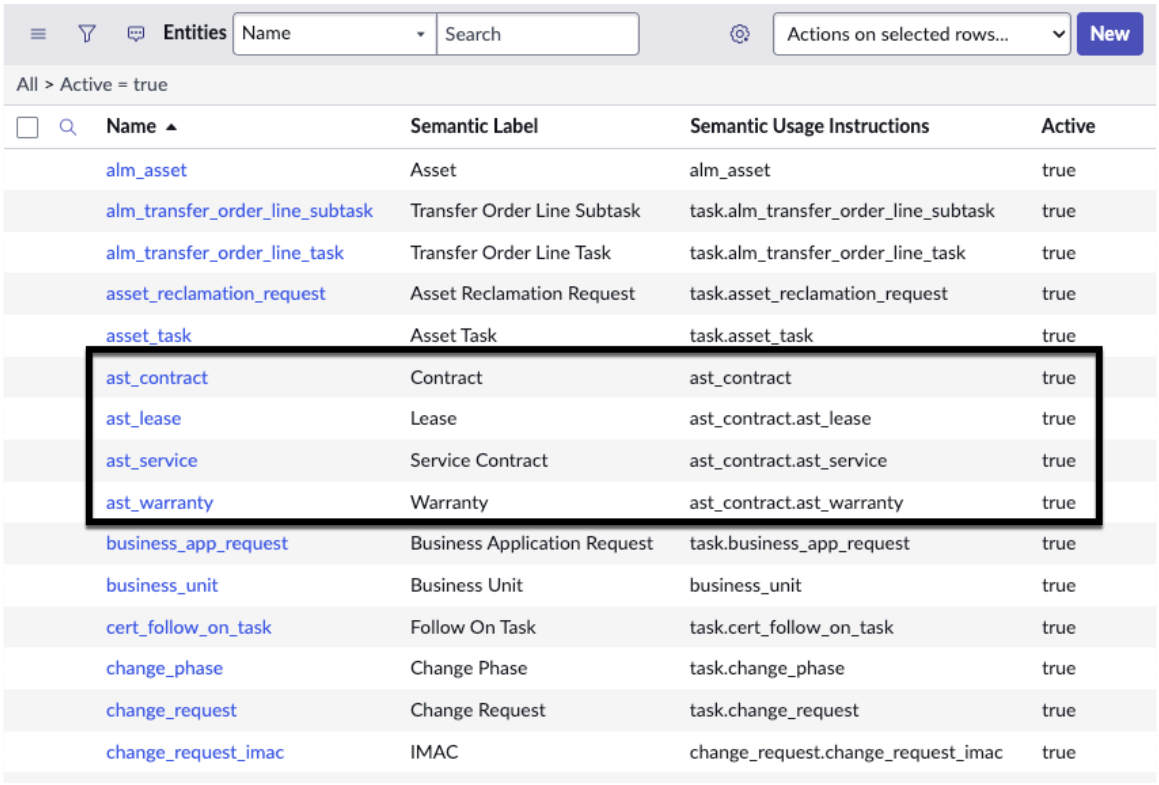
cmdb_ci	true	true
dscy_net_base	false	true
dscy_priv_command_affinity	false	true
x_snc_bt1_csm_m2m_problems_cases	true	false
cmn_cost_center	true	false
dscy_invalid_serial	false	true
cmn_location	true	false
ast_contract	true	true
dscy_credentials_affinity	false	true
u_imp_tmpl_x_snc_dep_tracker_dependency	true	true
x_snc_bt1_csm_customer_account	true	false
cmn_schedule	true	false

5. When you open the Entities list [sn_query_gen_entity_list], you see that the Contract table and all its children are represented by Entity records, and all the records are active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

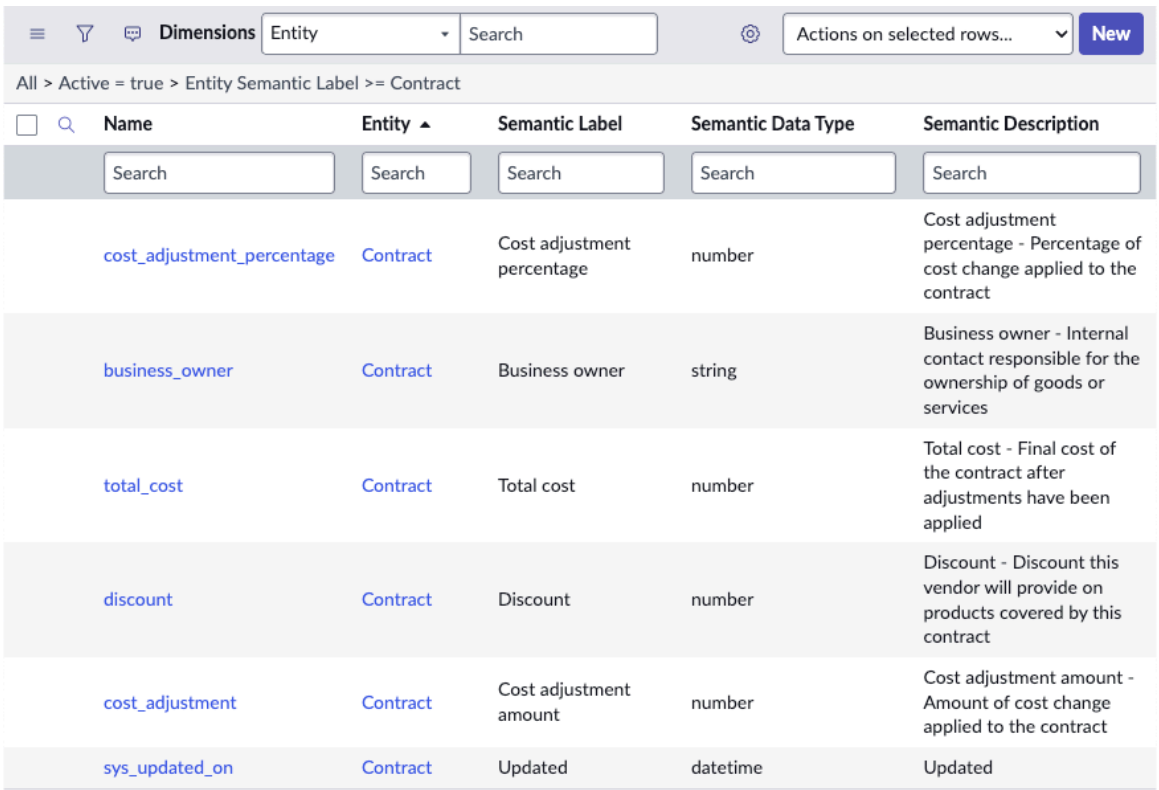


Entities | Name | Search | Actions on selected rows... | New

All > Active = true

Name	Semantic Label	Semantic Usage Instructions	Active
alm_asset	Asset	alm_asset	true
alm_transfer_order_line_subtask	Transfer Order Line Subtask	task.alm_transfer_order_line_subtask	true
alm_transfer_order_line_task	Transfer Order Line Task	task.alm_transfer_order_line_task	true
asset_reclamation_request	Asset Reclamation Request	task.asset_reclamation_request	true
asset_task	Asset Task	task.asset_task	true
ast_contract	Contract	ast_contract	true
ast_lease	Lease	ast_contract.ast_lease	true
ast_service	Service Contract	ast_contract.ast_service	true
ast_warranty	Warranty	ast_contract.ast_warranty	true
business_app_request	Business Application Request	task.business_app_request	true
business_unit	Business Unit	business_unit	true
cert_follow_on_task	Follow On Task	task.cert_follow_on_task	true
change_phase	Change Phase	task.change_phase	true
change_request	Change Request	task.change_request	true
change_request_imac	IMAC	change_request.change_request_imac	true

6. Looking in the Dimensions list [sn_query_gen_dimension_list], you see that many columns of the Contract table are represented, and you are confident that you have successfully added the table hierarchy to the semantic layer.



Dimensions | Entity | Search | Actions on selected rows... | New

All > Active = true > Entity Semantic Label >= Contract

Name	Entity	Semantic Label	Semantic Data Type	Semantic Description
cost_adjustment_percentage	Contract	Cost adjustment percentage	number	Cost adjustment percentage - Percentage of cost change applied to the contract
business_owner	Contract	Business owner	string	Business owner - Internal contact responsible for the ownership of goods or services
total_cost	Contract	Total cost	number	Total cost - Final cost of the contract after adjustments have been applied
discount	Contract	Discount	number	Discount - Discount this vendor will provide on products covered by this contract
cost_adjustment	Contract	Cost adjustment amount	number	Cost adjustment amount - Amount of cost change applied to the contract
sys_updated_on	Contract	Updated	datetime	Updated

Add a batch of tables to the semantic layer

Instead of adding individual tables or database views to the semantic layer, you can select multiple ones from a list and enable Query Generation for them together.

Before you begin

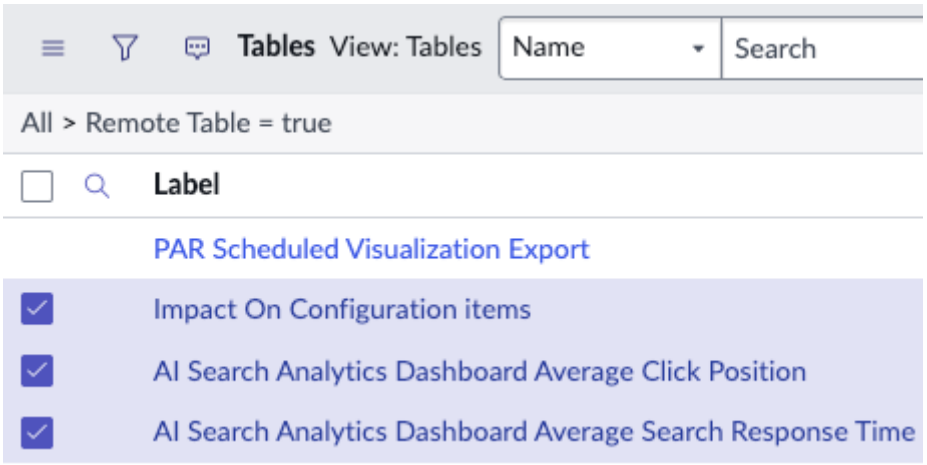
Role required: admin, now_assist_explorer_admin, sn_query_gen.admin

Procedure

1. Navigate to the Tables list [sys_db_object_list], the Database Views list [sys_db_view_list], or a subset of one of those lists, such as Remote Tables.
2. Set your session application scope, which will be reflected in the scopes of the Semantic Table Configuration records you create.

   Important: To add a database view, you must select the same application scope as that database view.

3. Select the checkboxes for the desired tables or database views.



4. Expand **Actions on selected rows...**
5. Select **Enable for Query Generation**.

   When successful, a banner says `Selected tables have been successfully added to Query Generation semantic layer. View.`

6. Select **View** to see a list of the tables or database views you just added to Semantic Table Configurations.
   You can disable semantic generation for any of the tables/database views or add support for their child hierarchies. You can also remove the tables/database views from Semantic Table Configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enable semantic generation for tables in the semantic layer

Tables can be included in the semantic table configuration but have semantic generation turned off. Enable semantic generation to include that table in Query Generation. Deactivate irrelevant data to improve results.

Before you begin

Query Generation must be activated, and the desired table must have a Semantic Table Configuration record. For more information, see Query Generation skills and Add a table to the semantic data layer.

Important: If you want to add a database view to the semantic layer, you must be working in the same application scope as the database view.

Role required: sn_query_gen.admin or higher

About this task

When a query is generated, the system searches for tables and table columns by looking through the Entities [sn_query_gen_entity] and Dimensions [sn_query_gen_dimension] tables. It selects a limited set to provide as context for the language model that creates your query. By turning off unused Entities or Dimensions, you help the system focus on the most important data, which makes your queries more accurate and useful.

On the other hand, sometimes a table or table hierarchy is included in the Semantic Table Configuration [sn_query_gen_table_config] table, but semantic generation is deactivated. For example, some CMDB tables are supported by default but have semantic generation disabled. In this case, the performance impact of including these tables can be significant, and you have the option of turning semantic generation on for these tables only if you're sure that you want to. You could also turn semantic generation on and off for a table to test its performance impact, for example.

You can control semantic generation at different levels of granularity depending on whether you control it through the Semantic Table Configurations, Entities, or Dimensions tables, as follows:

- Semantic Table Configuration: Changes to semantic generation enablement affect the Entities for the main table and all child tables, if included. Changes also affect all Dimensions for those tables.

  Note: After you disable semantic generation for a Semantic Table Configuration record, you can reactivate individual Entities in the affected table hierarchy. Doing so reactivates the Dimensions for that Entity and only that Entity.

- Entity: If you activate or deactivate an Entity record, the change affects only that table but not its parent or sibling tables. However, all of its associated Dimensions are activated or deactivated.
- Dimension: If you deactivate a Dimension record, only that record is affected.

Procedure

1. Navigate to **All** > **Query Generation**.
   If you do not have this navigation path despite having the correct roles, you may be missing the entitlement.
2. Open one of the following tables:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To disable or enable semantic generation for an entire table hierarchy, navigate to **Administration** > **Semantic Table Config**.
- To disable or enable semantic generation for a single table and all its columns, navigate to **Semantic Layer** > **Entities**.
- To disable or enable semantic generation for individual columns of a table, navigate to **Semantic Layer** > **Dimensions**.

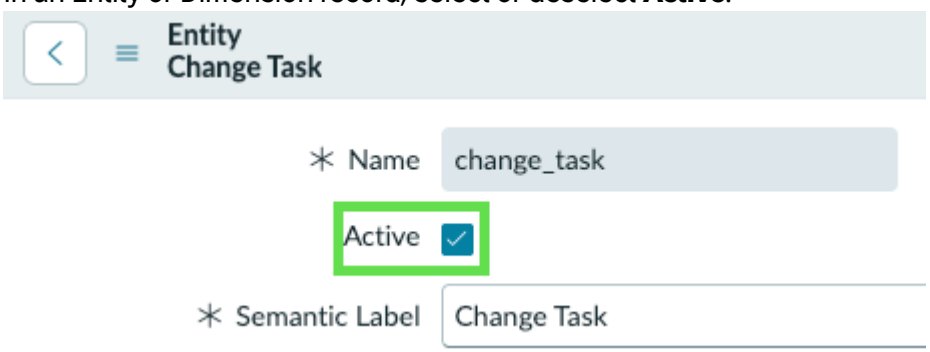
3. Locate the table or column of interest.

Tip:

- If you're in the Semantic Table Configurations table and the table is not listed, consider adding it as described in Add a table to the semantic data layer.
- If you're searching for a deactivated Entity or Dimension, ensure that you have removed the Active = true condition from the list filter.
- If you're searching for an Entity that represents a child table in a hierarchy, look for the Semantic Usage Instructions entries that begin with the parent table.
- If you're looking for a Dimension record that is associated with a particular Entity, consider searching for that Entity value.

4. Open the table record.
5. Toggle semantic generation.
   - In a Semantic Table Configuration record, change to the correct application scope and select or deselect **Enable Semantic Generation**.

   - In an Entity or Dimension record, select or deselect **Active**.



6. Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enabling access to protected scope applications for AI Data Explorer and Query Generation

AI Data Explorer and Query Generation require additional security configuration to access tables in protected scopes such as Human Resources or Employee Profile scopes.

Protected scopes in ServiceNow restrict access to sensitive data, ensuring that only authorized users can view or interact with specific tables. When AI Data Explorer and Query Generation attempt to access tables within these protected scopes, additional security measures must be configured to enable proper functionality.

Outside of protected scopes, AI Data Explorer and Query Generation use standard Access Control Lists (ACLs) shipped with the plugin. These ACLs are sufficient for unprotected scopes where normal security rules apply. However, protected scopes introduce additional restrictions that help prevent even administrators from accessing certain data without explicit authorization.

When a table is linked to a protected scope, the scope takes ownership of security decisions for that table. This means that the standard ACLs shipped with AI Data Explorer and Query Generation are no longer sufficient. The protected scope requires its own set of ACLs that mirror the functionality that the plugin's standard ACLs provide.

Additionally, when Query Generation attempts to fetch data from protected scope tables through API calls, the system creates Restricted Caller Access (RCA) records. These records must be approved by administrators with appropriate scope permissions before the data access can proceed. This approval process ensures that cross-scope data access is explicitly authorized and monitored.

Without proper ACL configuration, users cannot create or read records in AI Data Explorer for protected scope tables. Without approved RCA records, Query Generation cannot fetch data or generate insights for protected scope tables, resulting in error messages and limited functionality.

The security configuration process involves two main components: creating scope-specific ACLs that call a public script include provided by the AI Data Explorer plugin, and approving RCA records that enable Query Generation to access protected scope data through API calls. Both components are necessary for full functionality with protected scopes.

Create ACLs for AI Data Explorer and Query Generation protected scope access

Create Access Control Lists (ACLs) in protected scopes to enable AI Data Explorer and Query Generation to access tables within those scopes.

Before you begin

You must have administrator access to the protected scope where you want to enable AI Data Explorer and Query Generation functionality.

Role required: admin or scope-specific administrator role

About this task

Protected scopes require their own ACLs that mirror the functionality provided by AI Data Explorer and Query Generation standard ACLs. These ACLs must call a public script include provided by the AI Data Explorer plugin to verify proper access control.

Note: For simplicity, the following steps use the Insert and Stay feature on existing paai_canvas_component ACLs. You can also use the information in this procedure to create the four necessary ACLs from scratch.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Switch your current scope to the protected scope where you want to enable AI Data Explorer and Query Generation access.
   For example, switch to the Human Resources Core scope or Employee Profile scope.
2. Navigate to **System Security** > **Access Control (ACL)**.
3. Filter the list of access controls on the **Name** field for paai_canvas_component.
4. Create four ACL records for your application scope: one each for read, write, delete, and create operations.

   a. Open the paai_canvas_component record for the write operation.
   Ignore the warning that you're in the wrong scope to edit it.

   b. Expand the Additional Actions menu.

   c. Select **Insert and Stay**.
   A new Access Control record opens. It has the same field values as the original record, but it is in your current application scope.

   d. Add security checks, roles, or data conditions as required by your organization's security policies.

   e. In the Advanced Condition section, change the script as follows:

   - Change the name of the script that is called from `AICanvasACLUtil()` to `AICanvasACLUtilPublic()`.
   - Change the parameter of the `canEditCanvas` method call to only pass the component `(current)`, not to call `toString()`.

   The script should be:

```
answer = new
 sn_pa_ai_canvas.AICanvasACLUtilPublic().canEditCanvas(curren
t);
```

   f. Repeat the process for the other operations, using these scripts:

Operation	Script
read	`answer = new sn_pa_ai_canvas.AICanvasACLUtilPublic().canReadComponent(curr`
create	`answer = new sn_pa_ai_canvas.AICanvasACLUtilPublic().canEditCanvas(current` (Same as write)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operation	Script
delete	`answer = new sn_pa_ai_canvas.AICanvasACLUtilPublic().isRecordOwner(current`

These scripts check whether the user has read access, has edit access, or is the component owner, respectively.

5. Confirm that each ACL is active and properly configured.

Result
AI Data Explorer and Query Generation can now access tables within the protected scope, subject to the security restrictions defined in the ACLs. Users with appropriate permissions can create and read AI Data Explorer records for tables in the protected scope.

What to do next
You must also create and approve Restricted Caller Access (RCA) records to enable Query Generation to fetch data from protected scope tables through API calls.

Approve RCA records for AI Data Explorer and Query Generation protected scope access

Approve automatically generated Restricted Caller Access (RCA) records to enable AI Data Explorer and Query Generation to fetch data from tables in protected scopes through API calls.

Before you begin
You must have administrator access to the protected scope where you want to enable Query Generation data access.

The necessary ACLs for the protected scope must be created and active.

Role required: admin or scope-specific administrator role

About this task
When Query Generation attempts to fetch data from protected scope tables through API calls, the system automatically creates Restricted Caller Access (RCA) records. These records must be approved by administrators to enable data access. RCA records are created on a per-table basis and must be approved for each table that Query Generation needs to access.

Procedure
1. Use AI Data Explorer or Query Generation with a table in the protected scope to trigger RCA record creation.
   You can add a table to AI Data Explorer or ask Query Generation a question about data in the protected scope. This action creates the necessary RCA records automatically.
   The system creates RCA records for the scripted REST resource and generative AI validator operations needed to access the table data.
2. Navigate to **System Security** > **Restricted Caller Access**.
3. Filter the records to show only those related to Query Generation.
   Look for records that reference Query Generation operations or the specific table you want to access.
4. Review each RCA record.
   Each record shows the source scope, target scope, and the specific operation that requires access. Confirm that these operations align with your intended use of AI Data Explorer and Query Generation.
5. Set the **State** field to **Allowed** for each approved RCA record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query Generation can now access the specified table data through API calls for the approved operations.

6. **Optional:** Create RCA records manually for additional tables.
   You can create RCA records manually if you know which tables will be accessed and want to avoid the initial error messages that users might encounter. However, you have to know whether Query Generation or AI Data Explorer is the source scope. If the source scope is AI Data Explorer, set the source type as Script include and choose a script include that is part of AI Data Explorer. Regardless of source, you must know the specific script references and operations that Query Generation or AI Data Explorer uses to access each table. Consider creating some RCA records through requests first, then using those as models to create others manually.

Result

Query Generation can now fetch data from the approved tables in the protected scope. Users can successfully add tables to AI Data Explorer and ask questions about the data without encountering access errors.

Trouble?

If you encounter error messages such as "Error accessing table data" or "Scope access not granted," check that the ACLs and RCA records are properly configured and approved. Each table requires its own set of approved RCA records.

If RCA records are not being created automatically, confirm that the ACLs are active and that users have the necessary permissions to trigger the Query Generation operations.

Tuning the semantic layer

The semantic layer maps natural language questions to ServiceNow AI Platform® tables and fields. Tune the semantic layer to improve AI Data Explorer accuracy for your organization's terminology and data structure.

The semantic layer identifies the best matching entities (tables), dimensions (fields), and segments (filters) when users ask questions in AI AI Data Explorer. Tuning improves these matches so users consistently get the right table, field, and filter.

How the semantic layer works

When a user asks a question, the system identifies the best matching components and passes that context into query generation. The semantic layer has three building blocks:

Entities

Represent tables such as Incident [incident], Change Request [change_request], or CMDB Class Information [cmdb_class_info].

Dimensions

Represent fields on those tables such as Priority, Assigned to, or State. Dimensions can follow reference fields across tables. For example, caller_id.department traverses from an incident's caller to their department.

Segments

Pre-defined filter conditions such as "Open incidents" = active=true.

When to tune the semantic layer

Before you tune, verify that the issue is repeatable. The LLM occasionally makes incorrect decisions. Try the same question or a similar one multiple times first. Only tune if the problem is consistent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tune the semantic layer when:

- The system selects the wrong table or cannot find one
- A field is missing or the wrong field is selected
- Your organization uses different terminology than the auto-generated labels
- The right table or field is selected, but the query is constructed incorrectly
- Special terminology of your organization is not translated accurately to filter conditions

Validation and iteration process

1. Capture the utterance and expected result.
2. Classify the failure as entity, dimension, segment, or ACL.
3. If results are wrong for only some users, verify read ACL access to the intended table and fields before retuning.
4. Apply one targeted tuning change.
5. Retest the same utterance.
6. Check **Query Generation** > **Logs** and confirm the improved match path.
7. Repeat only if still incorrect.

Query Generation Health page

The health page shows the state of the Now LLM and AI Search, along with the states of Query Generation system properties, enabled products, and dependency plugins.

Health page overview

Navigate to **All** > **Query Generation** > **Health page** to see the state of Query Generation dependencies. Role required: sn_query_generation.admin or higher

Guide to sections

Health page sections and corresponding actions

Section	Description	Action
Entitlement status	Whether all the product entitlements for Query Generation and related products are present	If the status is not `Active`, contact Now Support about your licensing.
LLM and AIS status	The state of Query Generation skills and the LLMs they use. Also the state of AI Search	For Query Generation skills, if any are inactive, navigate to Now Assist Admin. Activate skills there as described in Query Generation skills. If you have error messages, contact your Generative AI Controller administrator or Now Support. For AI Search, consult your organization's AI Search administrators.
Query Generation - Semantic Layer status	The health of the various Query Generation components	If there are no components present, run the Generate Semantic Layer job. If requests fail with `No entities and dimensions` errors, but the components are present in the entities and dimensions table and active, re-index the components. For more information about keyword and semantic ingestion, see Indexing content from AI Search indexed sources.
Plugins	State of the plugins that are required to operate Query Generation	You might have to reinstall a plugin.
Query Generation enabled products	Installed products that use Query Generation and their status The Now Assist Explorer entry refers to AI Data Explorer.	You might have to reactivate the skill or upgrade the product.
System properties	The state of relevant system properties that can be modified by an administrator and that exist on the sys_properties table	Navigate to the Properties [sys_properties] table and change the value of the property in question. Update only the required properties that start with sn_query_gen. **

Customizing semantic metadata

Semantic metadata — descriptions, labels, and usage instructions — control how Query Generation interprets natural language questions. Customize these metadata to improve accuracy for your organization's terminology and data.

Both entities (tables) and dimensions (fields) in the semantic layer have three metadata fields that Query Generation uses when processing a question:

Semantic Label

A short name or alias for the entity or dimension. Functions as a search keyword that helps AI search identify the correct table or field when a user's question does not match the default field label.

Semantic Description

A natural-language description of what the entity or dimension represents in business terms. Provides context that helps the system distinguish between similar tables or fields.

Semantic Usage Instructions

Instructions injected directly into the LLM prompt when the entity or dimension is selected. Teaches the system how to query the data — for example, which operators to use, how to handle abbreviations, or how to expand hierarchical values.

When to customize

Metadata is auto-generated and works well in its baseline state. Customize it only when you observe consistent, repeatable problems:

- The system selects the wrong table or cannot find one — edit descriptions and labels
- The wrong field is selected or a field is missing — edit descriptions and labels
- Your organization uses different terminology than the auto-generated labels — edit labels
- The right table or field is selected but the query is constructed incorrectly — edit usage instructions

Note: There are thousands of dimensions. Do not try to review them all. Focus on fields that appear in failing queries.

Two methods for customizing metadata

Two methods are available. Editing the configuration tables is considered the default approach.

Metadata customization methods

Method	Tables	When to use
Edit records on the Semantic Table Configuration and Semantic Column Configuration tables	Semantic Table Configuration [sn_query_gen_table_config] and Semantic Column Configuration [sn_query_gen_column_config]	Update set compatible. Customizations can be included in update sets and transferred between instances. Overrides values set in the Entity and Dimension tables. Supports entity and dimension descriptions and dimension usage instructions. Doesn't support entity labels or usage instructions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metadata customization methods (continued)

Method	Tables	When to use
Edit records on the Entity and Dimension tables	Entity [sn_query_gen_entity] and Dimension [sn_query_gen_dimension]	Simpler. Suitable for testing on a single instance. These customizations cannot be transferred between instances. However, this is the only method for changing entity labels and entity-level usage instructions. Could be overridden by an update to the table from an upgrade.

Note: Both methods require the sn_query_gen.admin role or higher.

Writing effective descriptions

Follow these guidelines when writing semantic descriptions:

- Keep descriptions to 1–2 sentences focused on how users refer to this data
- Include common synonyms and abbreviations your users would say
- Avoid full paragraphs. Concise descriptions match better than verbose ones

Writing effective usage instructions

Follow these guidelines when writing semantic usage instructions:

- Be specific and structured. Include rules, examples, and edge cases
- Use numbered steps or labeled sections if the logic is complex
- Include example user questions and what the query should look like
- For free-text fields, specify matching strategy (CONTAINS, exact match) and expansion rules
- Keep instructions focused on one entity or field's needs

Usage instructions vs. Segments

Usage instructions teach the LLM how to query a field dynamically, allowing the LLM to handle many scenarios based on your rules. Segments hard-code specific filter values. For fields like free-text location, usage instructions are the correct approach because you cannot predefine every possible location query. Segments are better for fixed business terminology such as "Sev1" = priority 1.

Example: Semantic description

For an Incident entity, instead of using just "Incident table", use a description like "IT incidents, outages, service disruptions, and IT support tickets" to include terminology your users actually say.

Example: Data conventions in usage instructions

For a State field that stores abbreviations:

```
"Values in this field may be full state names or two-letter
 abbreviations (for example, 'California' or 'CA'). Always query
 for both forms. For country names, also include common aliases
 (for example, 'United Kingdom' OR 'UK')."
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Complex query logic in usage instructions

These usage instructions are for a free-text Approximate Location field with hierarchical expansion and synonym handling:

Field: Approximate Location - Usage Instruction

The Approximate Location field is a non-normalized, free-text string. All queries must use case-insensitive CONTAINS matching and handle hierarchical expansion.

Core Query Logic

1. Identify the geographic entity (Neighborhood, City, State, Country, Region, or Continent).
2. Expand broader entities into explicit lists of sub-entities before querying.
3. Use OR logic for all expanded terms and synonyms.

Expansion Rules

- Continents: Expand to a list of all major countries within that continent.
- Regions: Expand to relevant states or countries (for example, "Atlantic Coast" -> NC, VA, FL, etc.).
- States/Provinces: Include both full names and standard abbreviations (for example, "North Carolina" OR "NC").
- Countries: Include common aliases (for example, "UK" OR "United Kingdom").

Implementation Pattern

1. Extract geographic intent.
2. Classify entity level.
3. Expand downward (Continent > Country) or include synonyms (State > Abbreviation).
4. Construct a single query string using OR-based CONTAINS filters.

Notice the pattern: the instruction defines rules and examples, and the LLM can handle many related queries dynamically based on the rules you provide. You teach the logic once, and the model applies it to any input.

Examples of user questions converted to queries

- User: "Show me things in Japan" → Query: location CONTAINS "Japan"
- User: "Show me things in Asian countries" → Decomposition: Asia -> [Japan, China, Indonesia...] → Query: location CONTAINS "Japan" OR location CONTAINS "China" OR location CONTAINS "Indonesia"...
- User: "Show me things in North Carolina" → Query: location CONTAINS "North Carolina" OR location CONTAINS "NC"
- User: "Show me everything in Europe" → Decomposition: Europe > [UK, Spain, France, Germany...] → Query: location CONTAINS "UK" OR location CONTAINS "United Kingdom" OR location CONTAINS "Spain" OR location CONTAINS "France"...

Customize entity descriptions for the semantic layer

Create custom entity descriptions in the Semantic Table Configuration table so that customizations can be transferred between instances via update sets.

Before you begin

Role required: sn_query_gen.admin or higher

About this task

The Query Generation semantic layer uses natural-language descriptions to help AI understand what each table represents. By default, descriptions are auto-derived from the Field Label [sys_documentation] table, but you can override these descriptions with custom descriptions that better explain the business purpose of your tables. When you clear a custom description, the system falls back to the Field Label value.

This procedure uses the Semantic Table Configuration table. Customizations made this way can be transferred between instances via update sets and override descriptions set directly in the Entity table. For simpler, single-instance testing, you can edit the Semantic Description field directly in the Entity [sn_query_gen_entity] table instead.

Note: Entity labels and entity-level usage instructions can only be set in the Entity [sn_query_gen_entity] table. The Semantic Table Configuration table supports entity descriptions only.

Procedure

1. Navigate to **Query Generation** > **Semantic Table Configuration**.
2. Open the record for your table, or create a record if one does not exist.

   If creating a new record, set **Table Name** to your table name and **Enable Semantic Generation** to selected. For more information, see Add a table to the semantic data layer.
3. In the **Entity Semantic Description** field, enter your custom description.

   Maximum 4,000 characters. Write the description in plain business language that explains what the table represents, who uses it, and its business purpose.
4. Select **Update**.
   The system automatically syncs the custom description to the entity record in the semantic layer.

Result

The custom entity description is active and will be used by Query Generation when processing queries for this table. Because this customization is stored in the Semantic Table Configuration table, it can be included in an update set and transferred to other instances. For more information, see System update sets.

Example: Entity descriptions

This example shows the difference between auto-generated and custom descriptions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Entity description examples

Table	Auto-generated (poor)	Custom (good)
incident	Incident table	IT incidents, outages, service disruptions, and IT support tickets
`alm_ai_digital_asset`	Tracks records for AI digital assets.	Base inventory table for all AI-related digital assets within the AI Control Tower (AICT) governance framework. Each record represents an AI artifact — model, prompt, dataset, skill, agent, or tool — tracked for governance, compliance, and lifecycle management. Governance teams, product managers, and AI platform owners use this table for centralized AI inventory oversight, audit readiness, and traceability.

What to do next

Test your custom description by asking questions about the table in Query Generation and verifying that the correct table is selected.

Customize column descriptions and usage instructions

Create custom column descriptions and usage instructions in the Semantic Column Configuration table so that customizations can be transferred between instances via update sets.

Before you begin

Role required: sn_query_gen.admin or higher

About this task

The Query Generation semantic layer uses column descriptions and usage instructions to help AI understand what each field represents and how to query it. You can override the auto-generated descriptions from the `sys_documentation` table and add usage instructions that guide query construction.

This procedure uses the Semantic Column Configuration table. Customizations made this way can be transferred between instances via update sets and override descriptions and usage instructions set directly in the Dimension table. For simpler, single-instance testing, you can edit the Semantic Label and Semantic Usage Instructions fields directly in the Dimension [sn_query_gen_dimension] table instead. Such changes might be overridden by changes to the Dimension table included in a plugin upgrade.

Use column configuration when you want to provide custom descriptions, add usage instructions for query guidance, or deactivate specific columns without removing the entire table from the semantic layer.

Procedure

1. Navigate to **Query Generation** > **Semantic Column Configuration**.
2. Select **New**.
3. In the Semantic Column Configuration form, fill in the following information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Semantic Column Configuration form

Field	Description
Table Name	The table the column belongs to. Must have an active entity in the semantic layer.
Column Name	The column to configure. Use the database column name, not the display label.
Semantic Description	Custom description of what the column represents in business terms. Overrides the auto-generated description from `sys_documentation`. Maximum 2,000 characters.
Semantic Usage Instructions	Guidance to AI on how to use this column during query generation. Include preferred operators, expected value formats, and filtering behavior. Maximum 2,000 characters.
Active	Whether the column configuration is applied. When cleared, the column falls back to auto-generated state.

4. Select **Submit**.
   The system automatically syncs the configuration to the corresponding dimension record in the semantic layer.

Result

The custom column configuration is active and will be used by Query Generation when processing queries that involve this column. Because this customization is stored in the Semantic Column Configuration table, it can be included in an update set and transferred to other instances. For more information, see System update sets.

Example: Column configurations

The following examples show effective column descriptions and usage instructions:

Column configuration examples

Column	Type	Semantic Description	Usage Instructions
`creation_type`	Choice	Indicates how the dataset was produced. Values: 'Curated' (hand-selected), 'Derived' (transformed from existing datasets), 'Synthetic' (artificially generated).	Leave empty — choice values are auto-populated by the system
`dataset_creation_date`	Date	The date the dataset itself was originally created or compiled, independent of when the asset record was added to the instance.	Use date operators (>=, <=, BETWEEN) with YYYY-MM-DD format.
`base_datasets`	Reference	A list of other AI dataset assets this dataset is derived from or built upon, representing dataset lineage.	Reference field. Use IS EMPTY to find original/root datasets. Use IS

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column configuration examples (continued)

Column	Type	Semantic Description	Usage Instructions
			NOT EMPTY to find derived datasets.

What to do next

Test your column configuration by asking questions that involve this field in Query Generation and verifying that the correct filters are generated.

Database views for cross-table data

Database views combine fields from multiple tables into a single queryable entity. Add views to the semantic layer to answer cross-table questions in one query instead of requiring separate questions.

Database views in the semantic layer enable you to answer questions that join data across tables in a single query instead of requiring separate questions or complex queries.

When to use database views

Use database views when:

- Users ask questions that join data across tables, such as incidents and changes.
- A cross-table report already exists as a database view.
- The same fields from different tables keep appearing together in user questions.

Implementation requirements

When working with database views:

- You must be in the same application scope as the database view.
- Add database views to Semantic Table Configuration the same way as regular tables. You need the sn_query_gen.admin role or higher.
- Dimension names include a source-table prefix, such as inc_number or chg_priority.
- Entity descriptions are auto-generated from the source tables and update automatically.
- The Include child hierarchy setting has no effect for database views.

Related topics

Add a table to the semantic data layer

Segments in the Query Generation semantic layer

Segments are predefined filter conditions that map business terminology to specific query filters, helping the semantic layer translate natural language questions into accurate database queries.

Segments provide non-obvious context to assist the semantic layer in selecting the correct entity, dimension, and values. For example, in the utterance "How many open emergency change requests are there?", a segment identifies that "open" means "active=true" and "emergency" is a Type, not a Priority.

When a user asks a question, the Query Generation engine searches for matching segments and includes their filters in the LLM prompt so the model can reuse them to construct accurate queries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

There are two types of segments:

Automated Segments

System-generated from reports, dashboards, filters, modules, and indicator sources. Names are often technical—for example, "Incidents.Open".

Manual Segments

Created by admins via the Manual Segment Config table. Names are user-friendly—for example, "Critical Open Incidents". Manual segments use a two-table data model with automatic synchronization and can be shipped with applications via plugins.

Comparison: Manual vs automated segments

	Manual Segments	Automated Segments
Created by	Admin, shipped via update set	System-generated from reports, dashboards, filters, modules
Name quality	User-friendly, tuned for search	Often technical—for example, "Incidents.Open"
Search priority	5% boost over automated (adjustable in *sn_query_gen.segments.manual_segment_scale_factor*)	Standard scoring
LLM treatment	Retain all filters unless irrelevant	Critique each filter individually
Prompt label	`user_defined_segment`	`automated_segment`
Lifecycle	Fully controlled by admin	Tied to source record activity/ usage
Shipped with app	Yes (update set)	No (generated at runtime)

How segments work

The system uses AI search to find segments that are semantically similar to the user's query. AI search indexes the Name, Description, Entity, and Filter fields in the Segments table, comparing them to the user's query to produce a subset of relevant segments.

In the LLM call, the system passes the Name, Description, Entity, and Filters. The LLM uses the segments as building blocks for generating a new query. For example, if a user asks "Unassigned Incidents located in San Diego" and the segment "Unassigned Incidents" is passed to the LLM, the LLM uses the segment's filter as the starting point and attaches the location filter "San Diego" on top of the segment.

Segment process summary

Step	Purpose	Output
1: Input	Capture user's natural language query	Raw query text
2: Search	Find semantically similar prebuilt segments	Subset of relevant segments
3: Scoring	Rank the set of relevant segments based on their semantic similarity scores	The subset of relevant segments, now ranked and sorted
4: Context	Provide segment metadata to LLM	Structured segment data

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Segment process summary (continued)

Step	Purpose	Output
5: Generate	Combine segment logic with new conditions	Complete executable query

How manual segments work

Manual segments serve two roles at query time:

Entity discovery

On first-time queries with no previous context, segment matches can add or boost entities in the entity list. A match against a manual segment name helps identify the intended entity by adding or boosting it in the candidate list. If a user asks "Show me critical open incidents" and a manual segment named "Critical Open Incidents" exists on the Incident [incident] table, the `incident` entity gets boosted in the results.

Filter provision

Matching segments are formatted into the LLM prompt context. The LLM sees:

```
**Related Segments**:
- **Critical Open Incidents** (user_defined_segment)
  - description : High priority incidents that are open
 and unresolved
  - entity : incident
  - filter : { conditions :
 [{"field":"incident.priority","operator":"=","value":"
1"}, ...] }
```

The LLM then decides whether to reuse the segment's filters fully or partially when constructing the query. Manual segments are labeled `user_defined_segment` in the prompt, which tells the LLM to retain all filters unless completely irrelevant.

Manual segment scoring boost

Manual segments receive a priority boost. When the engine searches for relevant segments, it scores each result by semantic similarity—how closely the segment's name and description match the user's question. By default, manual segments receive a 5% boost applied on top of their raw similarity score.

The boost factor is configurable via the system property *`sn_query_gen.segments.manual_segment_scale_factor`*. Increasing it, for example to `1.10`, elevates manual segments more strongly. Setting it to `1.0` removes the boost entirely.

In practice, automated segments often have names that partially match user utterances. For example, a report called "Open Incidents" may score similarly to a manual segment called "Critical Open Incidents". The boost ensures that your handmade, domain-tuned segments surface ahead of system-generated ones when both are close matches.

How segment scoring works

1. AI Search returns a raw semantic similarity score (0.0–1.0) for each candidate segment.
2. Segments below the match threshold (default `0.70`) are discarded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Manual segment scores are multiplied by the scale factor (default `1.05`).
4. Results are sorted by boosted score and capped at the result limit.

Automatic segment sources

The system auto-generates segments from existing data sources on a schedule. The Query Generation Sync Segments job creates segments automatically, running at installation and then weekly by default.

Automatic segment sources

Source	What it pulls
Saved Reports (sys_report)	Report filters from recently viewed reports
Report Sources (sys_report_source)	Analytics data source filters
PA Indicators (pa_cubes)	Performance Analytics indicator conditions
Saved Filters (sys_filter)	Global saved filters only (excludes user-specific and group-specific filters)
App Modules (sys_app_module)	Module-level list view filters

Automated segment rules

To reduce noise from outdated and irrelevant segments, the job follows specific rules. Segments based on reports, report sources, or indicator sources are active only if the records meet certain criteria:

- Reports must be shared, created by a user with an analytics manager role (admin, dashboard_admin, report_admin, pa_admin, or viz_admin), and have run recently (within 180 days by default).
- Report sources must be included in a data visualization or used in a report that has run recently.
- Indicator sources must be linked to indicators with scores that have recently changed.

Important: Segments cannot be created from indicator sources or modules on domain-separated instances.

For reports, "run recently" is defined by the *sn_query_gen.segments.reports.last_viewed_threshold_days* system property. The default value is 180 days.

For indicator sources, the time span for "recently changed" depends on the indicator frequency:

- Daily: last 7 days
- Weekly: last 30 days
- Bi-weekly: last 30 days
- Monthly: last 90 days
- Four weeks: last 90 days
- Bi-monthly: last 90 days

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Quarterly: last 180 days
- Fiscal quarterly: last 180 days
- Six months: last 12 months
- Yearly: last 24 months
- Fiscal yearly: last 24 months

You can change the time spans for indicator sources by applying a multiplier using the *sn_query_gen.segments.indicator.inactivity_threshold_multiplier* system property. The value must be an integer, meaning you can only lengthen the periods, not shorten them.

Disabling segment sources

You can disable segment creation altogether, or for individual source types. You might disable segment generation to troubleshoot, or if segments from a source are "noisy." Each source type has a corresponding *sn_query_gen.segments.disable.** system property. Disable segments for that source by setting the corresponding system property to **true**. All existing segments created from sources of that type are excluded from AI Data Explorer search results. No new segments of that type are created. During the next Sync Segments job, all segments of that type are deactivated. For more information, see Query Generation properties.

Create a manual segment

Manual segment data model and sync behavior

Shipping manual segments via plugins

Guidelines for segments

Roles, tables, and scheduled jobs included with Query Generation

Query Generation properties

Guidelines for segments

Follow these suggestions to help you use segments in the semantic layer effectively.

General guidelines for segments

- Test segments by asking natural language questions that should match them. The segment should appear in **Query Generation** > **Logs**.
- Monitor query logs to verify segments are being matched correctly and to identify the most valuable segments.
- Disable noisy auto-generated segments rather than trying to overfit with multiple manual ones.
- Use natural phrasing that matches how your users actually speak.
- Keep one segment per concept to avoid confusion.
- Refine segment names and descriptions based on user feedback and usage patterns
- Consider creating manual segments for recurring questions that are not handled well by the existing segments.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guidelines for manual segments

Manual segments are the recommended way to ship domain-specific saved searches with your application. They receive a priority boost over automated segments during search, and the LLM is instructed to retain all their filters unless completely irrelevant.

Start with high-value, high-traffic tables

Focus manual segments on the tables your users ask about most. A handful of well-crafted segments on incident, sc_req_item, or your application's primary table will have more impact than broad coverage across rarely-queried tables.

Pair every choice-heavy filter with a clear name

If your segment filters on choice values—for example, `state=6^priority<=2`—the segment name must translate those codes into business language. The LLM matches on the name, not the filter. "Resolved Critical and High Incidents" is searchable, but `state=6^priority<=2` is not.

Use descriptions to disambiguate similar segments

If you ship multiple segments for the same table—for example, "Open Incidents" and "Open Critical Incidents"—descriptions are what help the LLM pick the right one. Without descriptions, the LLM may arbitrarily choose between two close matches.

Keep filters focused

A segment with 15 filter conditions is hard for the LLM to reason about and likely to be truncated. If you have a complex use case, split it into multiple segments with simpler filters. The LLM can combine filters from different segments when constructing a query.

Complement semantic descriptions with segments

Manual segments and semantic descriptions (entity/column config) work together. Descriptions help the LLM understand what a table and its columns represent. Segments help the LLM understand how users typically filter that table. For best results, ship both.

Avoid duplicating automated segments

Before creating a manual segment, check whether an automated segment already covers the same filter. If one does but has a poor name, consider whether improving the source—for example, renaming the report—is a better approach than creating a duplicate manual segment.

Review after deployment

After shipping, monitor which segments are being matched and whether the generated queries are correct. If a segment is matching but producing wrong results, the issue is usually the name being too generic or the filter being too broad. Iterate on the name and description first before adjusting system properties.

Property tuning suggestions

Use these suggestions to adjust system properties when segments are not performing as expected. For a complete list of all segment properties and their defaults, see Query Generation properties.

Segments are not matching user questions

Lower *`segments_match_threshold`* (For example, set it to `0.60`). The default `0.70` can be too strict for domain-specific terminology where the user's phrasing differs from the segment name. Start lower and tighten once you have enough segments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manual segments are being overshadowed by automated ones

Increasing *manual_segment_scale_factor* gives manual segments a stronger edge, but a higher boost does not necessarily mean better results. A poorly named manual segment boosted above a genuinely relevant automated segment will degrade query quality. Before adjusting the boost, first check whether the manual segment's name and description are well-written. That is usually the real fix. Only increase the factor if you're confident your manual segments are high quality and still losing to weaker automated matches.

Too many irrelevant segments in the LLM prompt

Lower *segments_result_limit* (for example, 6 or 8). Fewer segments in the prompt means less noise for the LLM, but also less coverage. Find the balance for your domain. Alternatively, raise *segments_match_threshold* if you're seeing low-quality matches slip through.

Long filters getting truncated

Increase *max_filter_length* if your segments require complex filters. Be aware that longer filters consume more of the LLM's context window and may reduce overall generation quality. Consider splitting a complex segment into multiple focused segments instead.

Batch search is disabled and manual segments are not surfacing

Enable the AI Search property *segments.ais_batch_fetch_enabled*. Without batch search, manual and automated segments compete for the same result slots. Batch search gives each type a dedicated search, significantly improving manual segment coverage.

Manual segment data model and sync behavior

Shipping manual segments via plugins

Create a manual segment

Manual segments are admin-created saved searches with friendly names that bridge natural language questions and database filters for the Query Generation semantic layer.

Before you begin

Role required: sn_query_gen.admin or higher

About this task

Use manual segments to ship domain-specific saved searches with your application. They receive a priority boost over automated segments during search. This boost is set in *sn_query_gen.segments.manual_segment_scale_factor*. The LLM retains all their filters unless irrelevant, whereas automated segment filters are critiqued individually.

Create manual segments in the following circumstances:

- Your organization has standard terminology that maps to specific filters (for example, "Sev1", "VIP", "overdue")
- Users repeatedly ask the same filtered question and the system does not automatically pick up the right filter
- You want to encode business logic that cannot be inferred from field values alone (for example, "at-risk accounts" = combination of multiple conditions)
- The special terminology of your organization is not translated accurately to filter conditions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip: The name and description are what AI search matches against. Use natural phrasing your users would say. Keep one segment per concept. Test by asking the question and checking if the segment appears in the logs.

When creating segment names, use the same language a user would use when asking a question. The name is the primary field the LLM matches against during semantic search. Avoid abbreviations, internal codes, or technical jargon. Think about how a user would phrase the question that this segment answers.

Naming guidelines

Follow these guidelines when creating segment names and descriptions:

Use plain language

Write names in the same language users would use when asking questions. Avoid technical abbreviations or internal codes that users would not recognize.

Think like your users

Consider how users would phrase questions about this data. The segment name should match their natural language patterns.

Be specific but clear

Names should be descriptive enough to distinguish from similar segments while remaining understandable to your audience.

Use descriptions for context

When segment names might be ambiguous, use the description field to provide additional context using commonly-used terms.

Procedure

1. Navigate to **Query Generation** > **Administration** > **Manual Segment Config**.
2. Press **New**.
3. In the Manual Segment Config form, fill in the following information.

Manual Segment Config form

Field	Description
Table Name	The table (entity) the segment applies to. Must have an active entity in the semantic layer. The system looks for the entity table first, then the segment within that table.
Name	User-friendly name describing the segment in plain language a user would use when asking a question. Use the same language a user would use when asking a question. Avoid abbreviations, internal codes, or technical jargon. Maximum 255 characters. Examples: "Critical Open Incidents" (good) instead of "P1_OPEN_INC" (poor), "Active Benefits HR Cases" (good) instead of "HR Cases — Active, Cat=Benefits" (poor).
Description	Optional but strongly recommended. Gives the LLM additional context to decide whether a segment is relevant. Use commonly-used terms and explain what the segment captures. Helps disambiguate similar segments. Maximum 4,000 characters. Example: "High priority incidents that are currently open and unresolved. Includes all assignment groups. Useful for executive dashboards and escalation reporting." (good) instead of "Filters for priority 1." (poor).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Filter	Encoded query defining the segment's filter conditions. Uses the condition builder (v2). Maximum 4,000 characters, although filters longer than 2,000 characters may be truncated in the LLM prompt.
Active	Whether the system uses the segment. Defaults to selected. When cleared, the segment is deactivated and excluded from search.

4. Press **Submit**.
   A business rule fires asynchronously and syncs the record into the `sn_query_gen_segment` table, which is queried at search time.

Result

The manual segment is active and available for Query Generation searches.

Example: Manual segments for the incident table

The following examples show well-crafted manual segments for the `incident` table:

Example manual segments

Name	Description	Table	Filter
Critical Open Incidents	High priority incidents that are currently open and unresolved. Includes all assignment groups.	`incident`	`priority=1^state!=7^state!=8`
My Team's Overdue Incidents	Incidents assigned to the current user's group that have passed their SLA due date.	`incident`	`assignment_group=javascript:getMyGroups()^sla_due=7`
Recent P1 and P2 Escalations	Priority 1 and 2 incidents escalated in the last 7 days.	`incident`	`priority<=2^escalation=1^sys_updated_on>=javascri`

Guidelines for segments

Query Generation properties

Manual segment data model and sync behavior

Manual segments use a two-table data model with automatic synchronization between the configuration table and the runtime table used for search operations.

Data model overview

Manual segments use a two-table architecture that separates configuration from runtime data. This design ensures that the configuration table remains the single source of truth while the runtime table is optimized for search performance.

configuration table: `sn_query_gen_segment_table_config`

This is where you define manual segments. Each record represents one segment configuration that administrators create and maintain.

Synced table: `sn_query_gen_segment`

You do not write to this table directly. When a manual segment config is created or updated, a business rule automatically syncs it into this table, which is queried at search time.

Configuration table fields

The `sn_query_gen_segment_table_`configuration table contains the following fields for defining manual segments:

Manual segment configuration table fields

Field	Column Name	Max Length	Required	Purpose
Table Name	*table_name*	—	Yes	The table (entity) the segment applies to. Must have an active entity in the semantic layer.
Name	*name*	255 chars	Yes	User-friendly name that the LLM matches against during semantic search.
Description	*description*	4,000 chars	No	Optional clarification using commonly-used terms. Helps the LLM understand when to apply the segment.
Filter	*filter*	4,000 chars	Yes	Encoded query defining the segment's filter conditions. Uses the condition builder (v2).
Active	*active*	—	No	Defaults to **true**. When **false**, the segment is deactivated and excluded from search.

Synced table fields

The `sn_query_gen_segment` table contains the runtime data used for search operations:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Synced segment table fields

Field	Source
name	Copied from manual segment config
description	Copied from manual segment config
filter	Copied from manual segment config
table	From *table_name*
entity	Resolved reference to `sn_query_gen_entity`
source_table	Always `sn_query_gen_segment_table_config`
source_id	Sys_id of the manual segment config record
active	`manual_segment.active AND entity.active`

Sync behavior

Manual segments are synced automatically between the configuration and runtime tables. You do not need to trigger synchronization manually.

Sync triggers

Trigger	When	What Happens
Business rule on config	Insert or update on `sn_query_gen_segment_table_config`	Syncs the individual record into `sn_query_gen_segment` (async)
Entity insert/update	When an entity is created or updated with *active=true*	Re-syncs all segments (including manual) for that entity
Weekly scheduled job	Saturdays at midnight	Full sync of all 6 segment sources; cleanup of orphaned records

During sync, a manual segment is eligible if:

1. *active = true* on the config record
2. The referenced table has an active entity in `sn_query_gen_entity`

If either condition is not met, the synced segment is deactivated (not deleted).

Activation and deactivation

A synced segment's active status is: `manual_segment.active AND entity.active`.

Activation and deactivation events

Event	Result
Manual segment config *active* → **false**	Synced segment deactivated
Manual segment config *active* → **true**	Synced segment reactivated (if entity is also active)
Entity *active* → **false**	All segments for that entity deactivated

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activation and deactivation events (continued)

Event	Result
Manual segment config deleted	Synced segment deleted
Entity deleted	Orphaned segments cleaned up by scheduled job

Deactivated segments are excluded from search results.

ACL protections

The synced segment table has strict ACLs so that the configuration table remains the single source of truth:

- **Create:** Blocked (*admin_overrides = false*) — segments can only be created via sync
- **Write to *name*:** Blocked — must be changed on the config record
- **Write to *description*:** Blocked — must be changed on the config record

Filter length considerations

While the *filter* field supports up to 4,000 characters, the system property *sn_query_gen.segments.max_filter_length* defaults to 2,000. Filters longer than this threshold are truncated when included in the LLM prompt.

Tip: Keep filters concise for best results. Consider splitting complex segments into multiple focused segments instead of creating one segment with many conditions.

Domain separation

Manual segments support domain separation. When creating a segment config record with a specific *sys_domain*, the synced segment inherits that domain. At search time, segments are filtered by the user's domain context.

If domain separation is not enabled on your instance, this field is inactive and can be ignored.

Guidelines for segments

Query Generation properties

Shipping manual segments via plugins

Business unit application developers can ship manual segments with their applications to provide domain-specific saved searches that work from the moment the app is installed.

Shipping overview

Manual segments are the recommended way to ship domain-specific saved searches with your application. They receive a priority boost over automated segments during search, and the LLM is instructed to retain all their filters unless completely irrelevant—whereas automated segment filters are critiqued individually.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Shipping manual segments with your plugin ensures that users can immediately ask natural language questions about your application's data using business terminology, without waiting for automated segments to be generated from usage patterns.

How to ship manual segments

1. Create your manual segment config records in a development instance.
2. Verify they sync correctly and produce expected search results.
3. Include the `sn_query_gen_segment_table_config` records in your app's update set.

Plugin installation behavior

Understanding how manual segments behave during plugin installation is important for setting proper expectations:

- Business rules are **bypassed** during plugin installation—the async sync will not fire automatically at install time.
- The records will be synced into `sn_query_gen_segment` the next time the **Generate Semantic Layer** scheduled job runs (post-install) or when the weekly **Sync Segments** job runs.
- Ensure your plugin does not ship duplicate records. There is no unique constraint at the database level—admins must ensure no duplicate names per entity.

Important: Manual segments shipped via plugin will not be immediately available for search after installation. They become active after the next scheduled sync job runs.

Example: Full configuration for a table

The following example shows manual segments for the `incident` table that could be shipped with an ITSM application:

Prerequisite: The `incident` table must have a record in `sn_query_gen_table_config` with *`enable_semantic_generation = true`* and an active entity.

Example manual segments for incident table

Name	Description	Table	Filter
Critical Open Incidents	High priority incidents that are currently open and unresolved. Includes all assignment groups.	`incident`	`priority=1^state!=7^state!=8`
My Team's Overdue Incidents	Incidents assigned to the current user's group that have passed their SLA due date.	`incident`	`assignment_group=javascript:=7`
Recent P1/P2 Escalations	Priority 1 and 2 incidents escalated in the last 7 days.	`incident`	`priority<=2^escalation=1^sys`

Best practices for shipping segments

Focus on high-value, high-traffic tables

Concentrate manual segments on the tables your users ask about most. A handful of well-crafted segments on your app's primary tables will have more impact than broad coverage across rarely-queried tables.

Use business language, not technical codes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Segment names should match how users naturally speak about your domain. "Critical Open Incidents" is better than "P1_OPEN_INC".

Provide descriptions for disambiguation

If you ship multiple segments for the same table, descriptions help the LLM pick the right one. Without descriptions, the LLM may arbitrarily choose between similar matches.

Test before shipping

Verify in a test environment that segments sync correctly and appear in search results for relevant utterances. Check the query logs to confirm matching behavior.

Avoid duplicating automated segments

Before creating a manual segment, check whether an automated segment already covers the same filter. If one exists but has a poor name, consider improving the source rather than creating a duplicate.

Checklist before shipping

Verify the following before including manual segments in your plugin:

- Each target table has an active entity in the semantic layer (`sn_query_gen_table_config` with *`enable_semantic_generation = true`*)
- Segment names are written in plain user language, not technical shorthand
- Descriptions are provided for segments where the name alone may be ambiguous
- Filters are valid encoded queries and under 2,000 characters for optimal LLM prompt inclusion
- No duplicate records (same name + table combination) exist in your update set
- All `sn_query_gen_segment_table_config` records are included in your app's update set
- You have verified in a test environment that segments sync correctly and appear in search results for relevant utterances

Monitoring after deployment

After shipping manual segments with your application:

- Monitor which segments are being matched in the query logs
- Verify that generated queries are correct for the intended use cases
- Collect user feedback on query accuracy and coverage
- Iterate on segment names and descriptions based on usage patterns

If a segment is matching but producing wrong results, the issue is usually the name being too generic or the filter being too broad. Refine the name and description before adjusting system properties.

Query Generation reference

A list of Now Assist applications that come with Query Generation and the tables, jobs, and logs included in Query Generation.

Supported chart types

Query Generation and the applications that use it to generate data visualizations support these visualization types.

- Scores: single score, dial, gauge
- Bar: horizontal and vertical bars
- Donut, pie, and semi-donut
- Time series: area, line, column, scatter, spline, step
- List

Supported query operations

The following encoded query operators are supported for creating context objects.

- ">="
- "!="
- "<="
- "="
- ">"
- "<"
- "IS_NOT_NULL"
- "ISNOTEMPTY"
- "NOT_CONTAINS"
- "EMPTYSTRING"
- "STARTSWITH"
- "ANYTHING"
- "ENDSWITH"
- "ISEMPTY"
- "IS_NULL"
- "CONTAINS"
- "NOT LIKE"
- "BETWEEN"
- "LIKE"
- "DYNAMIC"
- "NOT_IN"
- "IN"
- "ON"
- "INSTANCEOF"

Query Generation logs

Every call to a Query Generator and its results are logged in the Query Generation Log [sn_query_gen_log] table.

Using the logs

Go to **Query Generation** > **Administration** > **Logs** to inspect failed or incorrect queries.

1. Find the entry by user, date, or utterance.
2. Check **Semantic Entities/Dimensions/Segments Count**
3. Open **Query Constitutor Output** to see what was selected.
4. Compare with **Semantic Filter Result** for raw semantic matches.

AI Data Explorer troubleshooting guide

Symptom	Likely cause	Fix
"Unable to understand" response	System cannot find a matching table	Improve entity description; rephrase with table name; verify AI search is running; verify that all Indexed Sources are fully processed.
Wrong table selected	Similar table names, no disambiguation	Add semantic usage instructions to differentiate.
Wrong table selected (permissions)	User lacks read access to the intended table or fields.	Verify and grant table and field read ACLs for the intended data.
"Error accessing table data" or "Scope access not granted" response	Some data is in protected application scopes that AI Data Explorer cannot access.	Create ACLs granting access to the scope for AI Data Explorer. Approve the subsequently generated Restricted Caller Access (RCA) records. For more information, see Enabling access to protected scope applications for AI Data Explorer and Query Generation.
Missing field in results	Dimension turned off, unclear label, or field not in semantic layer	Check dimension is active; update label.
Related fields not pulled in	Referenced table missing from semantic layer or reference dimension turned off	Add and enable the referenced table entity; enable the reference dimension.
Wrong filter applied	Bad segment match	Fix segment name and description; disable the segment.
No filter when expected	No matching segment; phrasing too vague	Create a manual segment; rephrase question.

AI Data Explorer troubleshooting guide (continued)

Symptom	Likely cause	Fix
Segment from report is wrong	Auto-generated segment has stale or irrelevant filter	Disable the report segment source or the specific segment.

Query Generation log columns

Column	Description	Shown by default?
Created	Timestamp of the call to Query Generation	Yes
User	The user from the User [sys_user] table who made the call. If this is blank, try Created by.	Yes
Utterance	The plain language question asked by the user	Yes
Status	The success or otherwise of the call	Yes
Error message	If the status is "error," this is the error message that is returned to the user.	Yes
Total time	Time in milliseconds it took for the AI to process the query and return the response	Yes
"X" time	Time in milliseconds each component X spent processing the query	Yes
Semantic Filter Results	Fields in the semantic layer tables that the query references, in JSON	Yes
Utterance Bank Results	Questions similar to the user's question (Utterance) that were found in the Utterance Bank and used to interpret the user's question, in JSON	Yes
Response	The JSON response to the query	Yes
Entities	The records in the Entities table that are referenced by the query. Each record corresponds to a facts table.	Yes
Query Constitutor Output	JSON of the query that is generated	Yes
Source	The application from which the question was asked. If the question was asked from the Now Assist panel when it was open in a page that is not part of an application, the UUID of that page is shown instead.	Yes
Response	The response that the LLM returns	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query Generation log columns (continued)

Column	Description	Shown by default?
Generative AI Log	The LLM used for the query	Yes
Conversation	Unique chat conversation ID, such as in a Now Assist Panel to Query Generation conversation	Yes
ACL Time	Time it took to validate the Access or Security of the user for the underlying table	No
Additional info	Start time, total calls, and other metadata about the AI Search run	No
Created by	Person who created the query. Includes ServiceNow® staff members logged on as maint.	No
Domain	Domain in which the query was created	No
Dot walked	Whether the query included dot walking between tables (true/false)	No
Entity has usage score	Whether the entity has a usage score (true/false)	No
Entity source	Whether the Source was in ENTITIES, USER SENSE, or SEGMENTS	No
Error code	The error code, if there was an error	No
Follow Up Generated	The number of follow-up questions that the LLM generated in response to the query	No
Follow Up Returned	How many of the generated follow-up questions are actually returned. The questions must refer to tables that the querying user can access and are in the semantic layer, for example.	No
LLM Time	Time spent by the large language model (LLM) on the query	No
Query Constructor Time	Time spent by the query constructor on the query	No
RAG time	Time spent by the retrieval-augmented generation (RAG) on the query	No
Semantic Dimensions count	Number of table records (dimensions) examined for the query	No
Semantic Entities Count	Number of tables (entities) examined for the query	No
Semantic Filter Results	Results of running the semantic filter	No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query Generation log columns (continued)

Column	Description	Shown by default?
Semantic Filter Time	Time spent by the semantic filter	No
Semantic Segments Count	Number of segments examined for the query	No
Source Table	Name of table corresponding to Source Id	No
Tags	Any tags that you add to the log	No
Updated	Date stamp when log entry was last updated	No
Updated by	User responsible for last log entry update	No
Updates	Count of updates to the log entry	No
Utterance bank results	Similar examples extracted from utterance bank	No
Utterance bank time	Amount of time spent searching the utterance bank	No

Common AI Data Explorer issues and fixes

Roles, tables, and scheduled jobs included with Query Generation

Several types of components are installed with Query Generation, including tables and scheduled jobs.

Roles included

Role name	Description	Contains roles
sn_query_gen.user	Allows the person with the role to call the Query Generation service through the app they are using.	None, but applications that call Query Generation should contain this role in their own user roles.
sn_query_gen.admin	Allows the user to access the Query Generation tables like an admin user. Can access the Health Page. Can customize semantic metadata and create manual segments.	• sn_nowassist_admin.nsa.admin • ais_admin • sn_query_gen.user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled jobs installed

Scheduled job	Description	Default frequency
Generate Semantic Layer	Generates entities, dimensions, and segments. Cleans up unused segments and Entity and Source records. Segment generation works like the Sync Segments job.Runs when Query Generation is first installed and then on demand.	When first installed, then on demand
[Query Generation] Sync Segments Job	Generates segments from report sources, reports, indicator sources, modules, and filters. Synchronizes manual segments with segment table. Cleans up unused segments. Cleans up segments based on unused or otherwise ineligible reports, report sources, and indicator sources.	When first installed, then weekly, on Sundays
[Query Generation] Semantic Entity Auto-Scaling Job	Synchronizes entity activation states and helps with semantic entity scaling.	When first installed, then daily, at 20:23:00

Tables installed

All tables require the admin role for access and are available under Query Generation in the Navigator.

Table	Description
Entity [sn_query_gen_entity]	Representations of the tables that have semantic generation enabled for them (explicitly or through their parent tables) on the Semantic Table Configuration [sn_query_gen_table_config] table. Each Entity record corresponds to one supported table. Entity records are generated automatically, and this table is read-only.
Dimension [sn_query_gen_dimension]	Representation of queryable columns for every table that an Entity record references. Each record corresponds to one column. Dimension records are generated automatically, and this table is read-only.
Segments [sn_query_gen_segment]	Reusable definitions that provide non-obvious context, to assist the semantic layer or LLM to select the correct entity, dimension, and values. For example, in the utterance "How many open emergency change requests are there?", a segment identifies that "open" means "active=true" and "emergency" is a Type, not a Priority. Admins can add new segments, delete existing segments, or edit segment names and descriptions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Manual Segment Configs [sn_query_gen_segment_table_config]	Manually created segments. The [Query Generation] Sync Segments job syncs this table up to the Segments table.
Utterance bank [sn_query_gen_utterance_bank]	Predefined sentences and phrases mapped to database contexts and queries. User questions are compared to the utterance bank to see if a predefined mapping can apply. Admins can create, edit, and delete utterance banks.
AI Search Search Profile [ais_search_profile]	A container for all search experience configurations. A search profile is mapped to a specific experience you would like to expose in your app. Search Profile is#linked to a search box and can be used across applications. Admins can create, clone, and publish search profiles.
AI Search Indexed Sources [ais_datasource]	Records on this table reflect what content users can search on. The content can be tables on the instance or external tables. You have the necessary indexed sources by default. The sn_query_gen.admin role or higher is necessary to edit this table. The most likely use case is if the system cannot find the correct table and not all the indexed queries are fully applied. For more information, see Common AI Data Explorer issues and fixes.
Logs [sn_query_gen_log]	A log of every call to Query Generation. For more information, see Query Generation logs.
Semantic table configurations [sn_query_gen_table_config]	List of tables that Query Generation can search, whether semantic generation is enabled for that table, and whether child tables are included. Admins can create, edit, and delete these records. For more information, see Add a table to the semantic data layer.
Semantic column configurations [sn_query_gen_column_config]	Records for setting the domain, active status, and custom semantic descriptions and usage instructions for table columns. Must reference a table in sn_query_gen_table_config. For more information, see Customize column descriptions and usage instructions.

Query Generation properties

The properties included with Query Generation apply to segments. They define whether the record or indicator that is the basis for a segment has been recently used or changed.

These properties are available for Query Generation.

Note: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Properties for Query Generation

Property	Description
sn_query_gen.hidden_insights.groupby.min_fields	The target number of group-by fields for extended analysis in AI Data Explorer. These group-by fields are taken from the default list view of the relevant table. When this list view contains fewer eligible fields than the property value, the system looks for more eligible fields on the table to try to reach this count. • Type: Integer • Default value: 5 • Location: System Property [sys_properties] table • Learn more: Extended analysis
sn_query_gen.segment_enabled	When set to true, segments are created and used. When false, no segments are created, and all existing segments are excluded from AI Data Explorer search results. During the next Sync Segments Job, all segments are deactivated. • Type: Boolean (true/false) • Default value: true • Location: System Property [sys_properties] table • Learn more: Segments in the Query Generation semantic layer
sn_query_gen.segments.disable.filter	When set to true, excludes all segments from sys_filter from AI Data Explorer search results. During the next Sync Segments Job, all segments of that type are deactivated in the Segment table. • Type: Boolean (true/false) • Default value: false • Location: System Property [sys_properties] table • Learn more: Segments in the Query Generation semantic layer
sn_query_gen.segments.disable.manual_segment	When set to true, excludes all segments from sn_query_gen_segment_table_config

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for Query Generation (continued)

Property	Description
	(manual segments) from AI Data Explorer search results. During the next Sync Segments Job, all segments of that type are deactivated in the Segment table. **Note:** The ability to disable manual segments is intended for testing and troubleshooting purposes. • Type: Boolean (true/false) • Default value: false • Location: System Property [sys_properties] table • Learn more: Segments in the Query Generation semantic layer
sn_query_gen.segments.disable.pa_cubes	When set to true, excludes all segments from indicator sources (pa_cubes) from AI Data Explorer search results. During the next Sync Segments Job, all segments of that type are deactivated in the Segment table. • Type: Boolean (true/false) • Default value: false • Location: System Property [sys_properties] table • Learn more: Segments in the Query Generation semantic layer
sn_query_gen.segments.disable.report	When set to true, excludes all segments from sys_reports from AI Data Explorer search results. During the next Sync Segments Job, all segments of that type are deactivated in the Segment table. • Type: Boolean (true/false) • Default value: false • Location: System Property [sys_properties] table • Learn more: Segments in the Query Generation semantic layer

Properties for Query Generation (continued)

Property	Description
sn_query_gen.segments.reports.last_viewed_threshold_days	Defines how many days ago a report can have run for that report to be considered "recently run." The [Query Generation] Sync Segments job deactivates segments based on reports that have not run recently. It also deactivates report sources whose reports have not run recently. • Type: Integer • Default value: 180 • Location: System Property [sys_properties] table • Learn more: Segments in the Query Generation semantic layer
sn_query_gen.segments_search_limit	The maximum number of results that can be requested from AI Search per search for segments. • Type: Integer • Default value: 12 • Location: System Property [sys_properties] table • Learn more: Segments in the Query Generation semantic layer
sn_query_gen.segments_result_limit	The maximum number of segments that AI Search can return after filtering. • Type: Integer • Default value: 12 • Location: System Property [sys_properties] table • Learn more: Segments in the Query Generation semantic layer

Now Assist in Platform Analytics terms

Now Assist in Platform Analytics uses terms that describe AI-assisted data exploration, query generation, and the semantic layer that connects natural language questions to instance data.

Analytics Assist

A set of Now Assist skills in the Now Assist panel that let users generate data visualizations and export dashboards and visualizations through conversational interactions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

automated segment

A segment generated automatically by the system from existing data sources such as reports, dashboards, saved filters, app modules, and indicator sources. Automated segments are created and maintained by the Query Generation Sync Segments scheduled job.

dimension

A semantic layer record that represents a column on a database table. Dimensions can follow reference fields across tables. Query Generation uses dimensions to identify the correct fields when processing a natural language question.

entity

A semantic layer record that represents a database table. Query Generation uses entities to identify the correct facts table when processing a natural language question.

executable query

A query produced by Query Generation that contains the data source, filter conditions, aggregation method, and visualization instructions needed to answer a user's natural language question.

exploration

An editable, collaborative document in Now Assist Explorer where users analyze data with AI assistance. An exploration contains questions, AI-generated data visualizations, summaries, and participant commentary.

exploration creator

A user who creates a new exploration in Now Assist Explorer. The creator sets the exploration goal, generates the initial data visualizations, and controls sharing rights. Requires the now_assist_explorer_user role or higher.

exploration goal

A statement of intent that describes the outcome a user wants to achieve from a data exploration. The goal guides the AI to generate queries and summaries that move the exploration toward that outcome.

exploration participant

A user with whom an exploration has been shared with editing rights. Participants can generate additional data visualizations, add commentary, and may be able to share the exploration further. Requires the now_assist_explorer_user role or higher.

exploration viewer

A user with read-only access to a shared exploration. Viewers can read the exploration content but cannot ask questions of the AI or add text. A user becomes a viewer when shared an exploration without editing rights or without the now_assist_explorer_user role.

extended analysis

A deeper level of AI analysis in Now Assist Explorer that aggregates records related to a response to reveal additional insights. Extended analysis examines Choice, Reference, and Boolean columns and drills down automatically to avoid repeating the same findings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

facts table

A database table included in the Query Generation semantic layer as a data source. Query Generation searches facts tables to answer user questions. Not all instance tables are included; administrators control which tables are added.

LLM (large language model)

An AI model trained on large volumes of text data to understand and generate natural language. Query Generation uses an LLM to interpret user questions and produce semantic queries.

manual segment

A segment created by an administrator to map user-friendly business terminology to specific query filter conditions. Manual segments receive a scoring boost over automated segments and can be shipped with applications via update sets.

Now Assist Explorer

An AI-powered application in Platform Analytics that lets users ask natural language questions about data, receive data visualizations and summaries, and collaborate with others in shared explorations.

Query Generation

A shared backend service used by Now Assist in Platform Analytics applications to translate natural language user questions into executable database queries. Query Generation relies on a semantic layer to identify the correct tables, fields, and filters for each question.

segment

A predefined filter condition in the Query Generation semantic layer that maps business terminology to specific query filters. Segments help the system translate natural language questions into accurate database queries. Segments can be automated or manual.

semantic description

A natural-language description of what an entity or dimension represents in business terms. Query Generation uses semantic descriptions to distinguish between similar tables or fields when processing a user question.

semantic label

A short name or alias for an entity or dimension in the semantic layer. Functions as a search keyword that helps AI search identify the correct table or field when a user's question does not match the default field label.

semantic layer

A flat representation of database tables and columns used by Query Generation to identify the correct data sources when processing a natural language question. The semantic layer consists of entities (tables), dimensions (columns), and segments (filter conditions).

semantic usage instructions

Instructions associated with an entity or dimension that are injected directly into the LLM prompt when that entity or dimension is selected. Semantic usage instructions teach

the system how to query the data — for example, which operators to use, how to handle abbreviations, or how to expand hierarchical values.

utterance

A natural language question or input submitted by a user to an AI system. Query Generation processes utterances to identify the correct entities, dimensions, and segments needed to construct an executable query.

Performance Analytics (Indicator data sources)

ServiceNow® Performance Analytics is an in-platform process optimization solution that utilizes indicators (KPIs) to answer key business questions. Performance Analytics can help increase quality and reduce the costs of service delivery.

Get started

Performance Analytics tools including KPI Composer, KPI Details, and Spotlight, empower administrators and other stakeholders with real-time data to address current status and accurately evaluate trends.

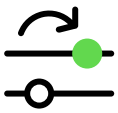
Explore Performance Analytics

Learn about Performance Analytics concepts and features such as indicators, breakdowns, and data collection.

Configure Performance Analytics fundamentals

Learn how to design your Performance Analytics solution, configure indicators and breakdowns and apply aggregations.

Configure advanced Performance Analytics



Delve into advanced features such as Spotlight, diagnostics, and logging.

Exploring Performance Analytics

Review the use cases, components, and architecture for indicator data sources and begin to implement indicators.

Indicators drive business transformation by enabling businesses to set, track, and analyze progress against goals. They connect more people with better data in less time and help them focus on the things that really matter. Watch this five-minute video to learn how you could use Performance Analytics indicators to solve a sample business scenario.

https://player.vimeo.com/video/1056082790?h=c51d5ad62a&badge=0&autopause=0&player_id=0&app_id=58479

Note: These days, Performance Analytics refers to the indicator data sources for Platform Analytics. Previously, Performance Analytics was its own independent product, with its own front end consisting of Performance Analytics widgets. That front end is deprecated, and instead indicators are shown in universal Platform Analytics data visualizations. The name Performance Analytics is retained for historical reasons.

For a video about how different dashboards with indicator data sources can help different personas in the ITSM department of your organization, see ITSM Success Dashboard indicators.

Indicator data sources improve performance and accelerate continual service improvement by:

- Tracking critical process metrics and trends.
- Measuring process health and behavior against organizational targets.
- Identifying process patterns and potential bottlenecks before they occur.
- Continually visualizing historical and real-time process health statistics in role-based dashboards enabling individual stakeholders to make informed decisions.

Benefits of using Performance Analytics indicators can include:

Delivering insights in an instant

Your people can get relevant, personalized insight by clicking a button instead of exporting data from databases and spreadsheets. You no longer manually create reports that quickly become stale and outdated.

Establishing a single version of truth

By defining visualizations and ensuring they are based on consistent, accurate data, you provide a single version of reality that teams can use to drive positive change.

Accelerate time-to-value

Implement Performance Analytics within weeks instead of months and quickly take advantage of data insights.

Drive toward continual improvement

Performance Analytics can help you pinpoint areas for improvement. Act based on key indicators, mobile-enabled scorecards, time charts, drill-downs, and dashboards.

Tip: For an introduction to using Performance Analytics, take the Platform Analytics Overview course.

Performance Analytics concepts

Performance Analytics uses terms and concepts that can differ from industry norms due to the unique nature of the ServiceNow platform.

Note: Performance Analytics is used by other applications, such as Benchmarks. The information below describes the core Performance Analytics functionality. For information about other applications that use Performance Analytics, refer to the documentation for those applications.

Performance Analytics includes the following concepts and components:

Key components

Indicators

(KPIs) define a performance measurement taken at regular intervals of a business service, an activity, or organizational behavior. These performance measurements result in a series of indicator scores over time. Businesses track these scores to measure current conditions and to forecast trends.

Technically, an indicator combines a data set and a data aggregate, such as Count, along with optional conditions.

Key characteristics of indicators include:

- Indicator scores can be generated automatically from a set of records defined in an indicator source, entered manually, or calculated from other indicators.
- Indicator scores can be viewed or analyzed in Platform Analytics data visualizations and KPI Details. In the Core UI, view them in the Analytics Hub or in widgets on dashboards.

For convenience, you can organize indicators thematically into an indicator group.

Synonyms: Metrics, business metrics, KPIs

Breakdowns and elements

enable you to group or filter indicator scores by a qualitative attribute such as Priority, Category, or Assignment Group. You can apply a breakdown on the Analytics Hub, in KPI Details, and on dashboards.

For example, you can look at the Number of Open Changes by Assignment Group. Or you can see the Number of New Changes by Priority.

The values for each breakdown are called breakdown elements. For example, the Priority breakdown may have the elements Critical, High, and Low. Breakdowns are categorized as automated, manual, or external, depending on where these elements come from. Automated breakdown elements are specified in breakdown sources. Manual breakdowns have their elements entered manually to define an organization. Lastly, an external breakdown specifies the JDBC data source and SQL statement for retrieving breakdown elements.

You cannot apply more than two levels of breakdown to an indicator.

Synonyms: dimensions, drill-downs

Data collector

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

is the engine that takes periodic snapshots of your process tables and stores them in the Scores and Snapshots tables. You can set up data collector jobs to run automatically according to a schedule. Usually set a job schedule to match the frequency in the indicator source. One job usually generates scores for multiple indicators that use the same indicator source. You can also set up jobs that run manually, such as historical jobs, which you run only when collecting data for a new indicator.

Other concepts

Aggregate/Aggregation

can refer to either of the following functions:

- The Performance Analytics function of aggregating, or collecting, indicator scores over time. The indicator configuration includes the frequency with which indicator scores are collected.
- Statistical functions applied to collected indicator scores over a time period. For example, you can apply a 3-month SUM to indicator scores. Aggregation functions can be added either in the indicator form or later in the the Analytics Hub or widget. Aggregation functions in the Analytics Hub or widget are named time series.

Breakdown mappings

specify the relationships, or 'map,' breakdowns to indicator sources. A breakdown mapping either specifies a field on the indicator source or specifies a script that queries the indicator source. The latter is sometimes called a scripted breakdown mapping, and a breakdown with such a mapping is called a scripted breakdown.

Breakdown sources

specify which unique values, called breakdown elements, a breakdown contains. A breakdown source is defined as a set of records from a table or database view or as a bucket group. Multiple breakdowns can use the same breakdown source. For example, instead of seeing ALL assignment groups for the Number of Open Changes indicator, you can limit the element list to just those groups that are part of the change process by configuring the Breakdown Source.

Bucket groups

are used to recategorize data so it can be used as a breakdown, for example by grouping a range of values into discrete buckets.

To work with a bucket group, create a breakdown source that uses Bucket [pa_buckets] as the facts table and specifies the bucket group in a condition. If a breakdown built on this source uses a breakdown mapping with a script, the breakdown groups the values that the script returns into buckets. If the breakdown mapping specifies a field instead of using a script, the breakdown groups the values of the mapped field into buckets.

In the data architecture, bucket groups are defined in Bucket Group [pa_bucket_groups] records and buckets in Bucket [pa_buckets] records. Each Bucket [pa_buckets] record contains a Bucket Group field that is a reference to a Bucket Group [pa_bucket_groups] record.

Day

A day in Performance Analytics is always defined as 24 hours. Performance Analytics does not use the concept of 'business days.'

Indicator sources

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

are data sets consisting of filtered records from one table or database view. An indicator source configuration specifies a table, such as Incident [incident], conditions for filtering records from that table, and a frequency that you base on the conditions. An indicator source cannot specify a rotated table. Multiple indicators can use the same indicator source. Data collection jobs query the database once for each indicator source. Thus, all indicators that use the same indicator source get data from the same point in time.

Typically, an indicator tracks the situation on a certain date. The indicator source conditions usually include a date-related filter, such as **[Opened][on][Today]**. Indicators collected less frequently might specify a larger date range, such as **[Closed][on][This month]**.

Scripted breakdown

is a breakdown that uses a script to query the indicator source as its breakdown mapping.

Snapshots

are the lists of records (sys_ids) that are collected at the time that the scores for those records are collected. A snapshot is made only for automated indicators with **Collect records** selected.

The snapshot/list of records can be retrieved in the Analytics Hub or KPI Details.

Snapshots are kept for the main indicator and for first-level breakdowns. Second-level breakdown snapshots are derived as an intersection of the two first-level breakdown snapshot lists.

Put a Spotlight on records

Use the Spotlight feature to illuminate records that you might overlook.

You can define weighted criteria to identify and rank records that require attention, such as when triaging incidents or performing lead scoring. You can rank records based on multiple dimensions, instead of by a single field value such as priority. While most organizations address high-priority items in a timely manner, lower priority items sometimes are not addressed for an extended period of time. Spotlight helps you focus on items based on business need.

Try out Complimentary Performance Analytics for Incident Management

Complimentary Performance Analytics for Incident Management is a limited version of Performance Analytics that is included in the base system, enabling you to become familiar with the functionality. Subscribe to Performance Analytics for complete functionality.

Note: As an alternative to using Complimentary Performance Analytics for Incident Management, you can activate a plugin with the full features of Performance Analytics without a subscription on a non-production instance.

Complimentary Performance Analytics for Incident Management has the following features and limitations:

- Includes the Performance Analytics Admin Console, which you can use to activate the full set of Performance Analytics features.
- Indicators cannot be added or deleted
- A maximum of 180 days of historic scores are visualized, counting from today's date.
- Is usable only in the global domain

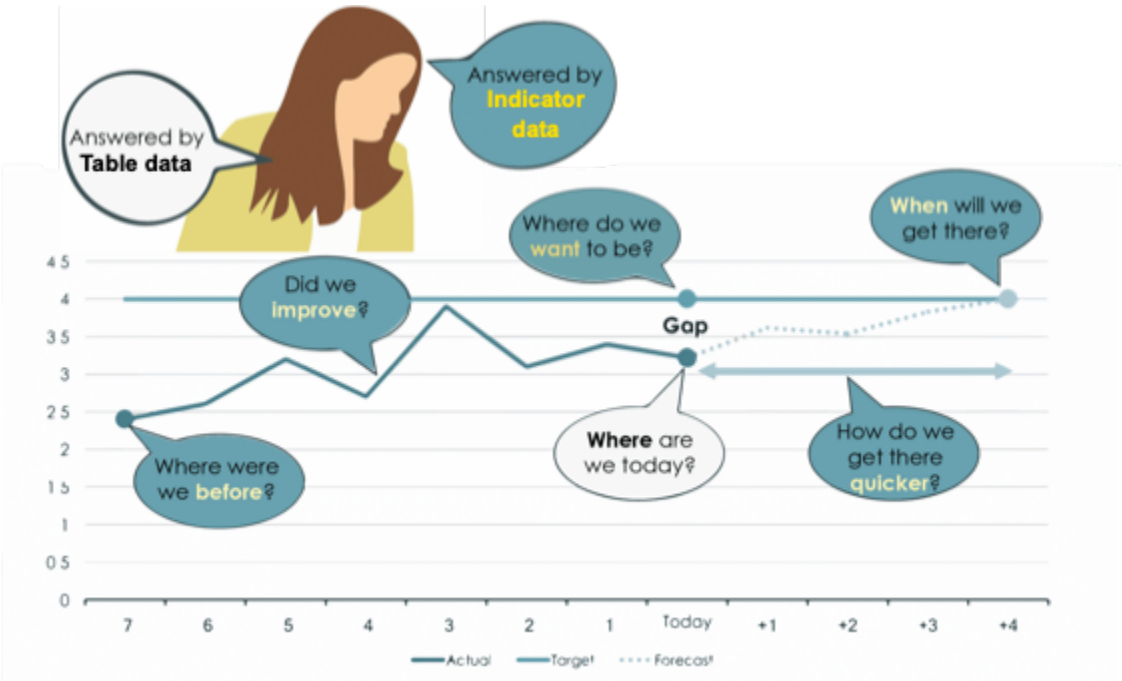
Performance Analytics indicators compared to table data

Indicator data sources address a different set of use cases than table data sources.

Generally speaking, table data shows current state and indicators show trends. Visualizations of table data are more suitable for managing records. Performance Analytics indicators focus on managing processes. You need both.

Performance Analytics is able to generate accurate historical trends by capturing continuous snapshots on a regular schedule. As illustrated by the following diagram, table data answers the question of "Where are we today," while indicators answer questions of what is happening over time.

Common process insight questions for table data and for Performance Analytics indicators



In addition to calculating trends from snapshots, Performance Analytics is able to:

- Track performance against Targets.
- Alert when Thresholds are met.
- Forecast future performance.
- Compare performance at different points in time.
- Accelerate time to value with best practice metrics.

Finally, while you can develop table data visualizations through trial and error, Performance Analytics requires background knowledge in how the feature works. You should carefully plan your Performance Analytics solutions and test them before implementing in a production environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Do not try to configure Performance Analytics without training. A poorly-designed Performance Analytics solution can severely impact performance and even destabilize your instance. The initial training, Performance Analytics Essentials, is available free of charge.

Implement Performance Analytics

Follow these steps to begin using Performance Analytics to improve your service levels.

A properly implemented Performance Analytics solution results in a set of dashboards tailored for the needs of specific people in your company. For an example, see the video linked from ITSM Success Dashboard indicators.

Plan and Prepare

Define goals and measurements to assess and drive improvement.

1. Identify the business processes you want to measure and improve.
2. Determine factors and behaviors which affect the health of these business processes.
3. Decide on the metrics to measure.

For a tool to help you plan and prepare your Performance Analytics solution, see Design your Performance Analytics solution with KPI Composer.

Start with Platform Analytics Solutions

Before you create new indicators, try out the built-in dashboards and indicators available in Platform Analytics Solutions.

Important: Set up and test Platform Analytics Solutions on a non-production instance before enabling them in production.

1. Check your license entitlement.
2. Verify that your indicator and breakdown sources refer to the correct tables.
3. Customize your indicators and breakdowns to meet the needs of your organization.

.

Collect data

Collection jobs need to be configured to run with the desired frequency and activated.

1. Schedule and activate data collector jobs.
2. Run historical data collector jobs as a one-off to populate empty indicators.

Share results

Display actionable KPIs that tell the story of your business process and display the right level of information to their intended viewers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Explore the available pre-configured content to get a feel for your data and decide on any dashboard customizations.
2. Grant dashboard access to stakeholders.
3. Empower everyone to take action with embedded, real-time analytics.

Planning your indicators

Before creating an indicator, clarify what goals you wish to attain with the indicator.

Ask these questions before you create an indicator:

- What
  - What do you want to measure? Are you basing what you want to measure on progress towards a business goal? Consider starting with a business goal and then deciding what to measure. You can use KPI Composer to help you.

    Do you want a simple count, like the number of open incidents, or something more sophisticated, like the average age to close an incident?
  - Is more better or is less better?

    For example, you would want the number of open incidents to be as low as possible, but the number of sales to go up.
  - What factors contribute the most to this number?
  - What factors would skew this number?

    Seasonality? A shift in staffing numbers or composition?
  - What will you do if the number goes from good to bad?
- Who
  - Who is responsible for this indicator?

    A request fulfiller? A manager?
  - Who should not see this information?
- Why
  - What is the next question you will ask?

    For example, once you know the number of open incidents, you may want to know what percentage of them has been open for more than 30 days.
  - Does this number predict what will happen or show what did happen?
- How
  - Do you measure this today?
  - If Yes, what do you do with it?
  - If No, why not?
- When

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- How fast does the data change?
- What is a meaningful period to look at?

  Are daily changes meaningful or too noisy? How much time does it take to establish a real trend?

- Is there already an indicator that matches my use case, or do I have to build my own?
  - Has the Platform Analytics Solution for the subject area been installed? These solutions contain indicators for many common use cases.
  - In the indicator list, is there an indicator that matches, or comes close to matching, your requirements? Can I duplicate an existing indicator and tweak it?
  - Can I create a formula indicator from existing indicators that will meet my requirements?

Related topics

Design your Performance Analytics solution with KPI Composer

Performance Analytics data flow

Before you get started with Performance Analytics, understand how the data flows through the platform, ultimately resulting in your ability to visualize process improvements.

1. Daily business operations and interactions generate data and populate the respective business process tables.

   Example: Submitting a new incident creates a record in the Incident table.

2. Active scheduled jobs run regularly to take periodic snapshots of process behavior. Each job calculates indicator (KPI) scores, based on metadata in PA indicators and breakdowns. Over time, this continuous stream of scores builds a trend.

   Example: A collection job counts the number of incidents in the Incident table daily. After one month, a trend containing about 30 data points can be viewed.

3. Data snapshots and scores are stored in Performance Analytics data tables. These tables are the source of all Performance Analytics visualizations.
4. Widgets present indicator scores in a specific format, such as a trend line or a bar chart.

   Example: The Number of new incidents is an indicator you may want to track. This indicator can be visualized as a single score or a trend of daily readings over time by configuring the appropriate widget.

5. Multiple Performance Analytics widgets are presented in a single Dashboard view, allowing stakeholders to view all relevant business process information in a single place.

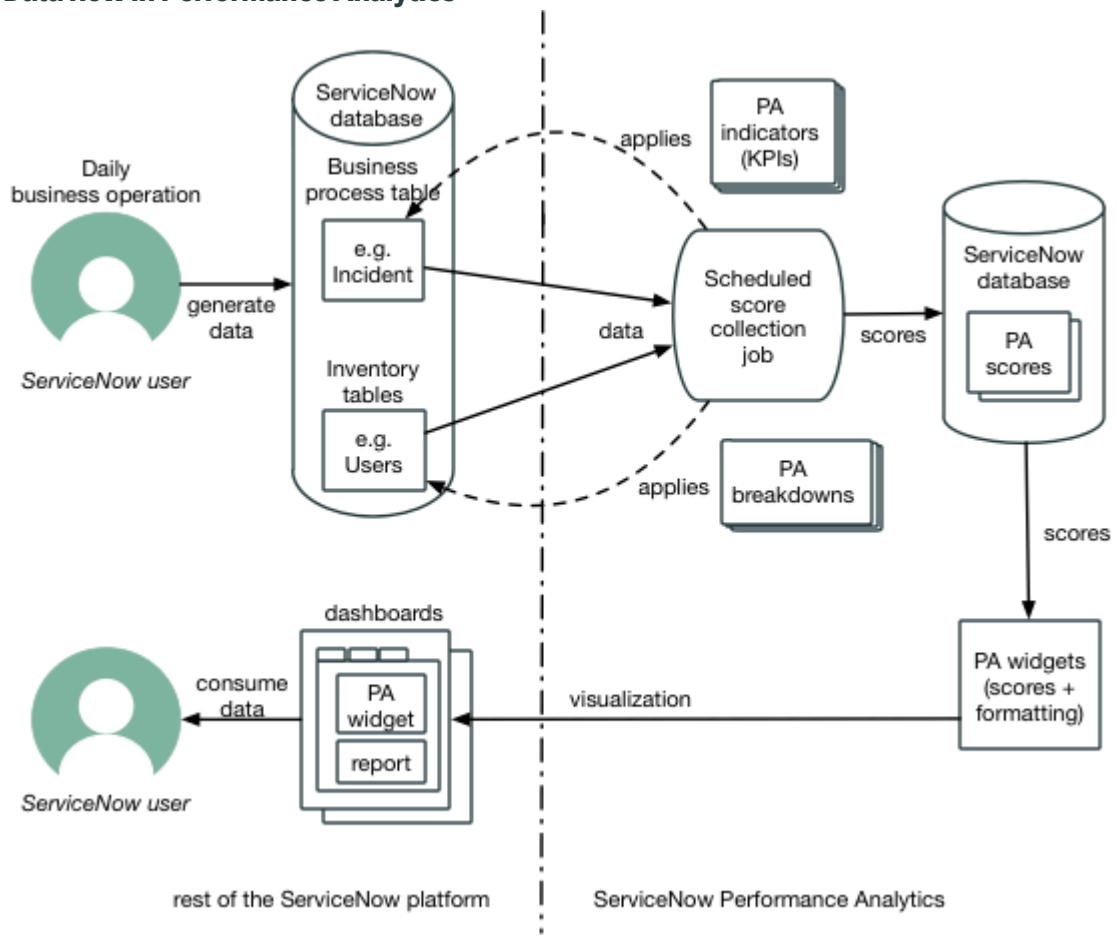
Data flow in Performance Analytics



Performance Analytics architecture

Before using Performance Analytics, familiarize yourself with how the layers of architecture take you from raw database entries to insightful visuals on dashboards.

Le	Component	Description	Creator persona
0	ServiceNow database tables	Business process tables, containing the raw data that you want to analyze to evaluate performance. Examples: Incident [incident], Problem [problem] Inventory tables, containing the information you need to filter, categorize, or break down data from the business process tables. Examples: User [sys_user], Choice [sys_choice]	N/A
1	Indicator sources	Metadata objects, each one of which can serve as the data source for multiple indicators. Indicator sources contain the following:	Performance Analytics Technical Expert, with at least the pa_data_collector role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Le	Component	Description	Creator persona
		• Reference to a business process table • Reference to a field on the table with unique values for every record • Conditions for filtering the records of the table • The indicator frequency for which this source is valid. An indicator frequency is the frequency for which data is collected for an indicator. The frequencies of the indicator and the indicator source must match.	
1	Breakdown sources	Metadata objects, each one of which can serve as the data source for multiple breakdowns. Breakdown sources contain the following: • Reference to an inventory table • Reference to a field on the table with unique values for every record • Conditions for filtering the records of the table	Performance Analytics Technical Expert, with at least the pa_data_collector role.

Configure Performance Analytics fundamentals

Create and configure indicators and breakdowns. Collect data. Display calculated indicator scores.

For an overview of the essential use of Performance Analytics, take the free training Platform Analytics Overview.

Note: In all visualizations, high scores are abbreviated following the metric system. Thus scores in the millions are abbreviated with an M and scores in the (US) billions with a G.

Design your Performance Analytics solution with KPI Composer

KPI Composer ensures that your performance management strategy aligns with business goals and has support from executive sponsors. Use KPI Composer to bridge the gap between defining your performance measurement strategy and the realization of that strategy from within Performance Analytics. Start with your business goals and plan all your components through indicators up to the final dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

KPI Composer helps you elicit performance management requirements and drive stakeholder alignment by visualizing implementation objectives, desired business outcomes, and required technical deliverables in a concise visual summary. This holistic approach ensures that stakeholders are completely aligned on the desired outcomes and requirements before implementers spend time working on any technical deliverables. When ready, Performance Analytics implementers get a task list of exactly what they need to create — indicators, breakdowns, reports, and dashboards — to support the goals, and you can even use KPI Composer to track the progress of the implementation.

A free training in KPI Composer is available at NOW Learning. You can also see examples of how a properly designed Performance Analytics solution can help different people in your organization at ITSM Success Dashboard indicators.

Activating KPI Composer

KPI Composer is available on the ServiceNow Store. Navigate to **System Applications** > **Search ServiceNow Store**, or point a browser to https://store.servicenow.com/sn_appstore_store.do#!/store/home. Search for the application named KPI Composer. If you are downloading the application to a production instance, you need a Now Support account.

After you download the application, navigate to **System Applications** > **All Available Applications** > **All**. Search for the KPI Composer application and install it. For an example, see Activate a ServiceNow Store application.

Note: To get full use of KPI Composer, you should have the appropriate entitlement to use Performance Analytics.

Performance Analytics roles

Access to KPI Composer

The level of access to KPI Composer determines whether a user can create, edit, or only view a KPI Composer project. It also determines which projects a user can access and whether they can access the underlying records or only the UI.

Access to KPI Composer depends on the following things, singly or in combination:

- User role
- Responsibility
- Access granted during sharing

Role-based access

An admin can grant a user the role of a KPI Composer admin or user. A KPI Composer admin has the same privileges as a ServiceNow AI Platform admin for KPI Composer. A KPI Composer user does not automatically have access to all projects and cannot associate indicator or breakdown definitions with actual Performance Analytics entities.

User roles for KPI Composer

Role	Contains	Description
sn_kpi_composer.admin or admin	pa_viewer	• Full access to all components of KPI Composer, including records. • Full access to all projects.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User roles for KPI Composer (continued)

Role	Contains	Description
		• Can share or assign responsibility for projects. • Can associate indicator and breakdown definitions with Performance Analytics indicators and breakdowns.
sn_kpi_composer.user	None	• Can access only projects that they have created. • Can share or assign responsibility for projects they create. • Can access only the design tabs, artifact properties, indicator definitions, and breakdown definitions of those projects. • Cannot add Performance Analytics indicators or breakdowns to the respective definitions. A user with this role may have access to more projects based on responsibility or on projects being shared with them.

The appropriate Performance Analytics roles are also necessary to implement KPI Composer designs in Performance Analytics.

Responsibility for projects

A responsible user has the following access to the projects they are responsible for:

- Can view and edit the projects.
- Can share or assign responsibility for the projects.
- Can access only the design tabs, artifact properties, indicator definitions, and breakdown definitions of those projects.
- Cannot add Performance Analytics indicators or breakdowns to the respective definitions.

This level of access is equivalent to what the sn_kpi_composer.user role grants. It is also equivalent to having a project shared with edit rights. Responsibility differs first in being independent of any role. The second difference is procedural, not technical: Responsible users are understood to be in charge of oversight and implementation of the project. Even the creator of a project is therefore not automatically responsible for it.

Responsible users are named in the project properties. Any user with edit rights can name responsible users. For more information about naming responsible users, see Define properties for a project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Shared projects

Any user with edit rights can share a project. When you share a project, you grant one of two levels of access:

Edit access

This level of access is technically the same as the access of a responsible user, or a user with the sn_kpi_composer.user role. The first difference is that no role is required. The second difference is that there is no implication of responsibility to oversee or implement the project.

View access

A user with view access can read the design tabs, artifact properties, indicator definitions, and breakdown definitions of the shared project. They can use all viewing utilities, like search and filter. However, they cannot change anything in the project. The only thing they can add is a journal entry.

For more information, see Share a KPI Composer project.

KPI Composer projects

KPI Composer is based on projects. Each project in KPI Composer consists of Key Performance Indicator (KPI) trees and the functional and technical definitions of all artifacts within those trees. You can create multiple projects.

The KPI Composer project UI provides you with a sequence of four tabs, each corresponding to a phase in your project:

Analysis

In this phase, you create a hierarchical tree of Business Goals, Critical Success Factors, and Measurements (or KPIs). Conceptually defining KPIs and mapping them to Goals and Success Factors produces a detailed functional specification of all required Performance Analytics configurations. This specification is vetted by the business sponsors and provides a clear direction to the technical implementers.

Dashboard Design

In this phase, you create a design specification for one or more Performance Analytics dashboards. Use the Dashboard Visualization tab in presentations early in your implementation to get timely feedback, so when your project is complete, the dashboard viewers get the visualizations they expect.

Data Definition

In this phase, you provide technical specifications for Performance Analytics Indicators that match the KPIs that you defined during Analysis. You can link the KPIs to appropriate Performance Analytics indicators that already exist or that you create later.

Review

In this phase, verify the design components in your project, run a system definition health check, and generate a task list for implementing the project in Performance Analytics.

Create a KPI Composer project

As the first step in using KPI Composer, create a project.

Before you begin

Role required: sn_kpi_composer.user, sn_kpi_composer.admin, admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

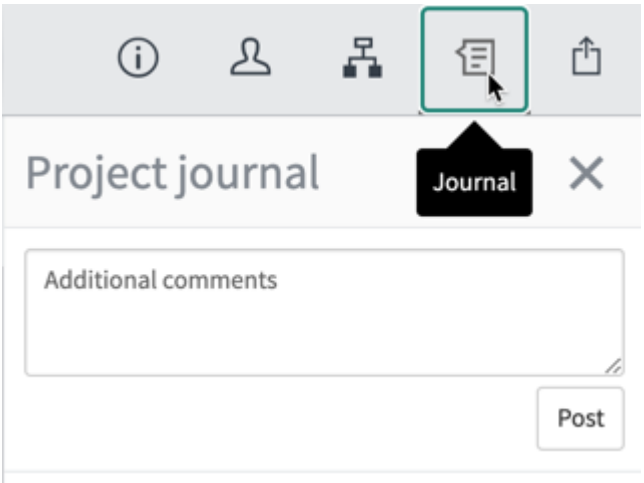
1. Navigate to **All** > **KPI Composer** > **Projects** and click **New**.
2. In the Create new project dialog, give the project a meaningful name and click **Save**.

Result

Your project is created and is visible in the **Projects** page.

What to do next

As you work on the project, keep track collaboratively in the Project Journal.



Define properties for a project

In the Project Properties, you can associate knowledge articles, owners, and contact persons with the project.

Before you begin

Note: Project Properties are similar to the Info tab of Artifact Properties. Only the scope is different.

Role required: sn_kpi_composer.user (own project), sn_kpi_composer.admin (any project), admin. No role required for responsible user or user with edit access from project sharing.

Procedure

1. Navigate to **All** > **KPI Composer** and create or open a project.
2. In the Analysis tab, click the Information icon ( ) at the top right of the screen.
3. Give the project a meaningful name.
4. Add a detailed description of the project, so other users can understand its purpose.
5. Specify the business objective you hope to reach with this project.
6. Specify any of the following details:
   - Knowledge articles that contain information relevant to the project. You can link any number of knowledge articles.
   - Responsible users. A responsible user has full editing privileges but also is expected to be responsible for implementing the project. This responsibility distinguishes a responsible user from a user with whom the project has been shared with editing rights.
   - Contact persons

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add personas to a project

Each project has several personas with different roles in the Performance Analytics solution that you are designing. A persona is a role within your company, such as service desk manager or service owner.

Before you begin

Role required: sn_kpi_composer.user (own project), sn_kpi_composer.admin (any project), admin. No role required for responsible user or user with edit access from project sharing.

Prerequisites

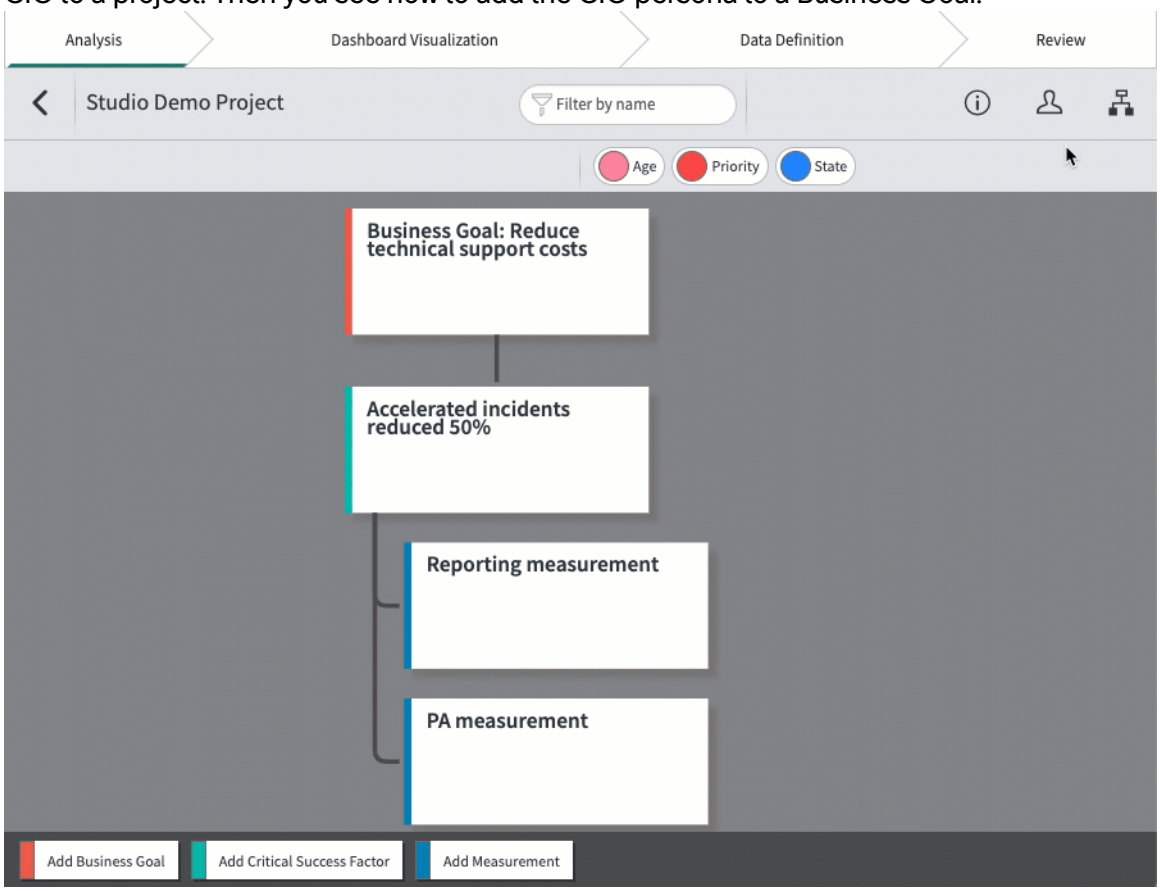
Create a KPI Composer project

Procedure

1. Navigate to **All** > **KPI Composer** and create or open a project.
2. In the Analysis tab, click the persona icon ( ) at the top right of the screen.
3. In the Persona dialog, click **Add item**.
4. Type the name of the new persona and click outside the text box.
   The persona appears in the header of the KPI tree canvas. Each persona automatically gets a 2-letter identifier, which is based on the first two words (or first two letters if only one word) that are in the name.
5. Repeat these steps to add more personas.

Example: Adding personas to a KPI Composer project

In the following short animation, you see how to add the personas Agent and CIO to a project. Then you see how to add the CIO persona to a Business Goal.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Drag personas onto existing artifacts on the canvas to add them to those artifacts. You can add an unlimited number of personas to any artifact. If an artifact has more than three personas, the full names of the personas are hidden. To see the full names, point to the personas.
By holding down the Ctrl/Command or Alt/Option key while dropping a persona onto an artifact, you activate the following advanced functions:

Hold Ctrl while dropping

Add the persona to the artifact on which it is dropped and to all child artifacts of that artifact.

Hold Alt while dropping

Remove the persona from the artifact on which it is dropped.

Hold Ctrl and Alt while dropping

Remove the persona from the artifact on which is dropped and from all child artifacts of that artifact.

Group data by breakdown definitions

Each project can have a set of breakdown definitions that you can use to group the data in KPIs. These breakdown definitions provide the specifications for Performance Analytics breakdowns that you eventually create.

Before you begin

Role required: sn_kpi_composer.user (own project), sn_kpi_composer.admin (any project), admin. No role required for responsible user or user with edit access from project sharing.

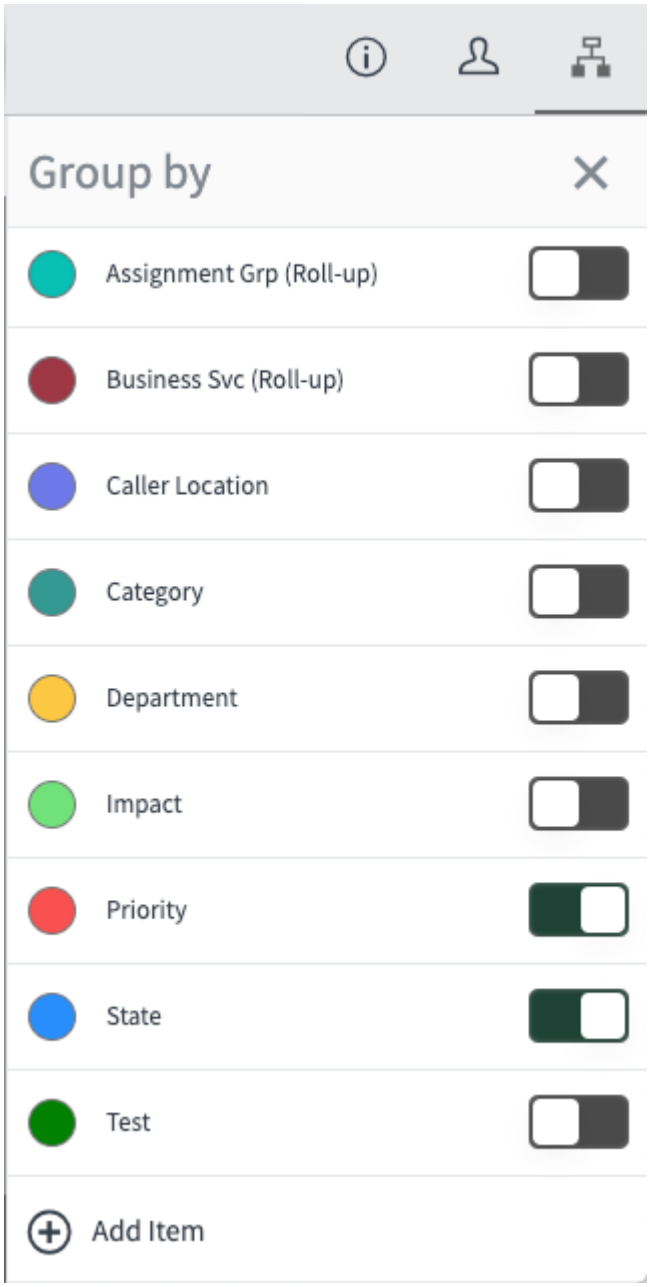
Prerequisites

Create a KPI Composer project

Procedure

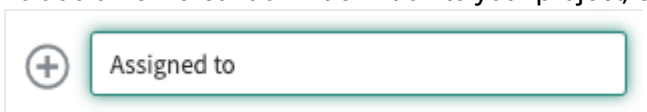
1. Navigate to **All** > **KPI Composer** and create or open a project.
2. In the Analysis tab, click the 'Group by' icon ( ) at the top right of the screen.
3. In the 'Group by' dialog, use the sliders to select which breakdown definitions to include in your project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The selected breakdown definitions appear in the header of the KPI tree canvas. From here, you can drag them onto artifacts.

4. To add a new breakdown definition to your project, click **Add Item** and enter the term.



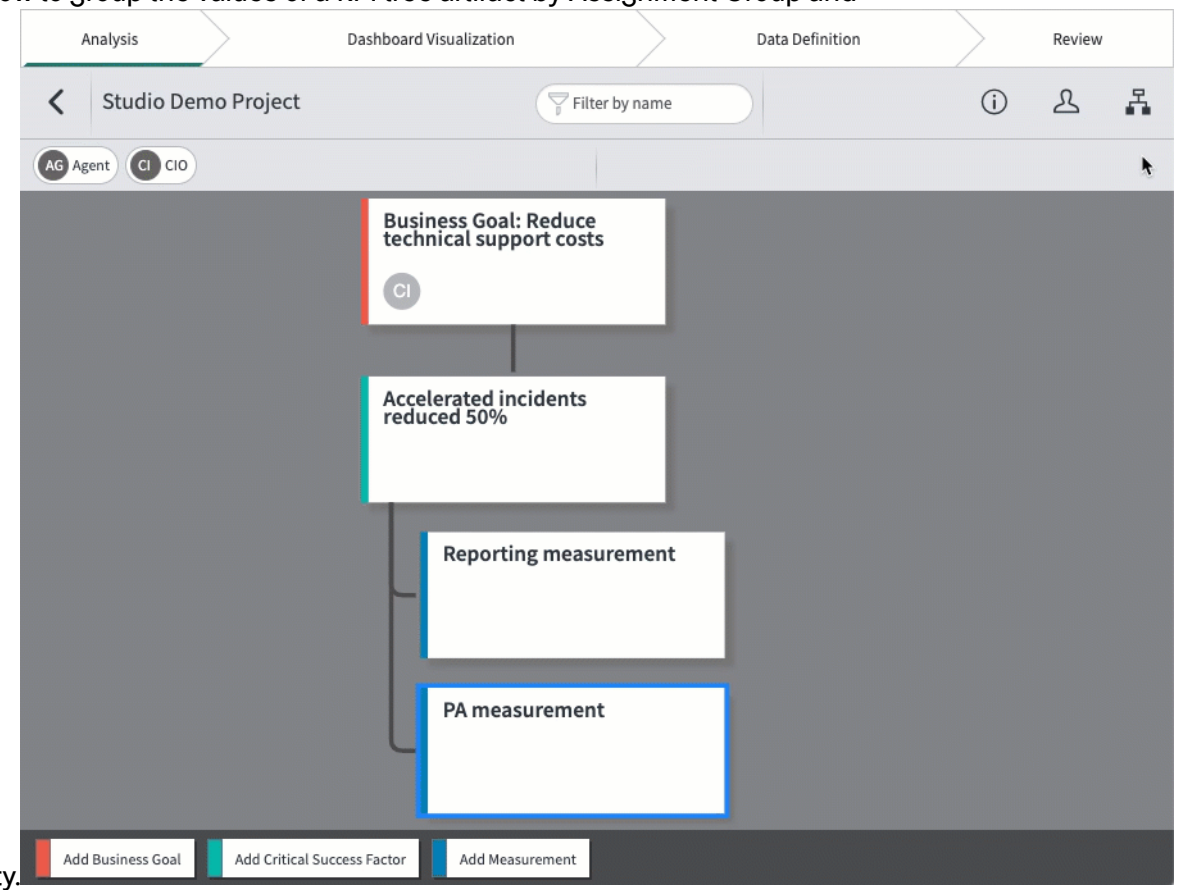
The new item appears in the 'Group by' list, and a matching breakdown definition record is created.

Example: Selecting breakdown definitions for a KPI Composer project

In the following short animation, you see how to select the breakdown definitions Assignment Group, Impact, and Priority to a project. Then you

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

see how to group the values of a KPI tree artifact by Assignment Group and Priority.



What to do next

Drag breakdown definitions ('Group by' items) onto existing artifacts on the canvas. You can group the data associated with an artifact by any number of breakdown definitions. The colored dots on an artifact show which breakdown definitions the artifact is grouped by. To see the names of these breakdown definitions, point to any of the colored dots on the artifact.
By holding down the Ctrl/Command or Alt/Option key while dropping a breakdown definition onto an artifact, you activate the following advanced functions:

Hold Ctrl while dropping

Add the breakdown definition to the artifact on which it is dropped and to all child artifacts of that artifact.

Hold Alt while dropping

Remove the breakdown definition from the artifact on which it is dropped.

Hold Ctrl and Alt while dropping

Remove the breakdown definition from the artifact on which is dropped and from all child artifacts of that artifact.

Define a breakdown

Provide the functional description of how to build an actual Performance Analytics breakdown in a breakdown definition. Once an appropriate Performance Analytics breakdown exists, you can link to it in the breakdown definition.

Before you begin

Role required: sn_kpi_composer.user, sn_kpi_composer.admin (to link to Performance Analytics breakdown), admin. No roles required for responsible user or user with edit access, except to link to link to Performance Analytics breakdown.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The breakdown definitions that you add to KPI Composer projects are not actual Performance Analytics breakdowns. They are only placeholders that describe what the Performance Analytics breakdown should be. In KPI Composer breakdown definitions, you provide either or both of the following pieces of information:

- The details that a Performance Analytics expert needs to create the actual breakdown.
- A reference to an existing Performance Analytics breakdown that meets your requirements.

Procedure

1. In the Analysis tab, click the 'Group by' icon ( ).
2. Click the name of the breakdown you want to define.
3. Fill in the following information:

Field	Description	Notes
PA Breakdown (Restricted to sn_kpi_composer.admin and admin roles)	A Performance Analytics breakdown that exists on this instance.	If a breakdown definition does not have a reference to a Performance Analytics breakdown, consider creating that breakdown.
Facts Table	The table that the breakdown source for the Performance Analytics breakdown has to reference.	Key information for creating a breakdown.
Conditions	The filter conditions to apply to the facts table either in the breakdown source or in the breakdown itself.	

Write journal entries for a project

Keep track of your KPI Composer project with journal entries

Before you begin

Role required: Anyone with access to a KPI Composer project, including view access, can write a journal entry.

Prerequisites

Create a KPI Composer project

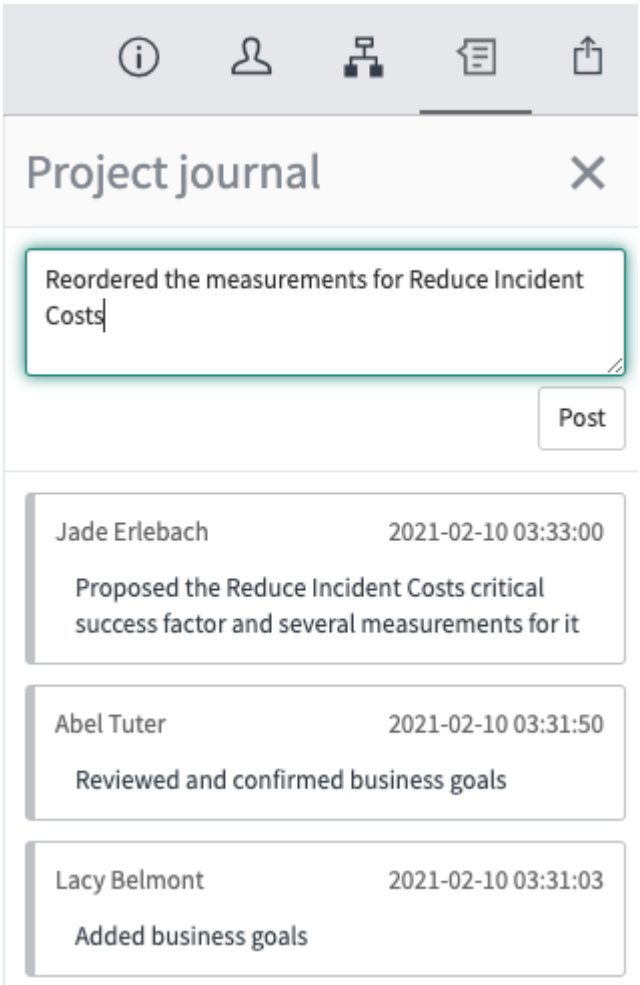
Procedure

1. Click the journal icon ( ).
2. Write a journal entry.
3. Click **Post**.

Result

All posted journal entries appear in descending chronological order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Share a KPI Composer project

You can share a KPI Composer project that you own or that you are responsible for. You can provide the user with either read-write or read-only access.

Before you begin

Role required: sn_kpi_composer.user (own project), sn_kpi_composer.admin (any project), admin. No role required for responsible user or user with edit access from project sharing.

Prerequisites

Create a KPI Composer project

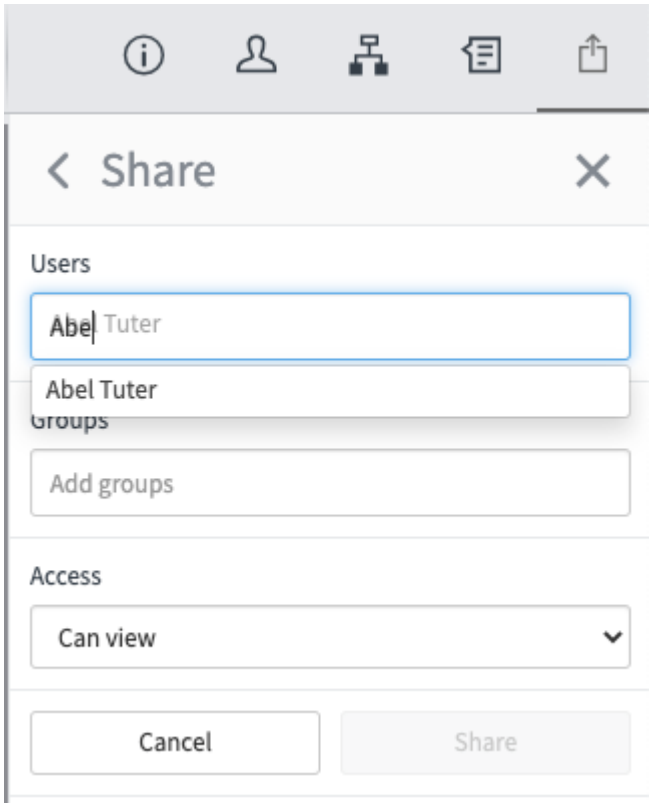
About this task

When you share a project with the right to edit, that user has the same rights technically as a responsible user. The difference has to do with project management: A user who has had a project shared with them simply can edit the project, whereas a responsible user is responsible for the successful implementation of the project.

Procedure

1. Navigate to **All** > **KPI Composer** and create or open a project.
2. Click the Sharing icon on the toolbar ( ).
3. Click **Add groups and users**.
4. Type to search for either a group or a user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Select either **Can view** or **Can edit** access.
6. Select **Share** or **Cancel**.

Export a KPI Composer project

To copy a KPI Composer project between instances, first export the project as a JSON file.

Before you begin

Role required: sn_kpi_composer.admin

Prerequisites

Create a KPI Composer project

About this task

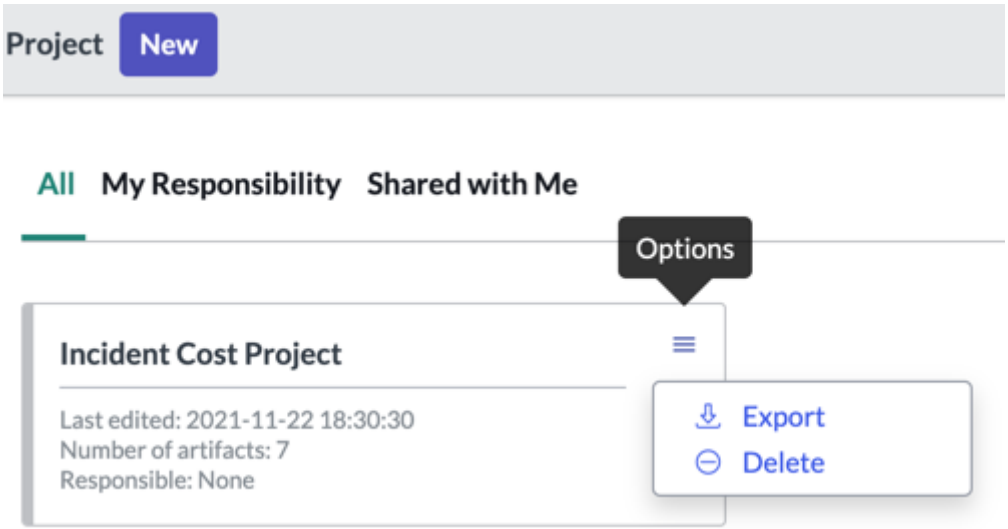
The following fields are not exported with a project:

- Responsible users
- Contacts
- Project journal entries
- References to knowledge articles

Procedure

1. Navigate to **KPI Composer**.
   The page of project cards opens.
2. From the **Options** menu of the project you want to export, select **Export**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Read the notice about which fields are not exported.
4. Click **Download**.

Result

The KPI Composer project is saved in a JSON file in the download destination of your computer. The file name has the format `ProjectExport.[Project_name].[Timestamp].json`. For example, for a project named Incident Cost Project, the export file name is `ProjectExport.Incident_Cost_Project.2021-11-22_19_13_20.json`.

Import a KPI Composer project

If you have an exported KPI Composer project, you can import it to your instance.

Before you begin

Role required: sn_kpi_composer.admin

Prerequisites

Create a KPI Composer project

Procedure

1. Navigate to **All** > **KPI Composer** > **Import project**.
2. Select **Choose file** and navigate to the exported project in your file system.
3. Select **Import**.
   If you already have a copy of the same project, the import overwrites it.

Result

You now can open the project in KPI Composer.

Analysis and the KPI tree

In the Analysis tab of KPI Composer, design your KPI tree. Specify your business goals, their associated critical success factors, and the measurement related to those factors. Chart the logical relationship between these factors and the personas who are responsible for them.

A KPI tree contains the following hierarchically related artifacts:

Business goals

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Typically, you put a business goal at the top of your KPI tree. This goal represents what you want to achieve with the dashboards coming forth from this project. A business goal can be something like "Cost Efficiency" or "Quality Assurance."

Critical Success Factors

Put these factors under your business goals to identify what your organization needs to do to achieve the business goal. Critical success factors can be placed under a business goal or under other critical success factors.

Measurements

Decide how to measure the performance of a critical success factor. Measurements are the most 'indicator-like' artifact in the KPI tree. They contain the functional description of how to make the measurement. Additionally, you can store who is responsible for the measurement and who to contact in case this measurement is used in different projects.

The KPI tree has a header and a footer with the following drag-and-drop icons:

- Artifacts, on the left of the footer
- Breakdown definitions, on the right of the header (See Group data by breakdown definitions)
- Personas, on the left of the header (See Add personas to a project)

Filtering

The following filter options are available on the Analysis tab:

- Filter by persona. Select a Persona icon in the header to highlight the artifacts that are linked to the persona. You can select multiple personas. In this case, any artifact that is linked to at least one of the selected personas is highlighted.
- Filter by breakdown definition. Select a Breakdown definition icon in the header to highlight the artifacts that are linked to the breakdown. You can select multiple breakdowns. In this case, any artifact that is linked to at least one of the selected breakdowns is highlighted.
- Filter on text. Enter text in the filter field, then leave the field. All artifacts that contain the text are highlighted.

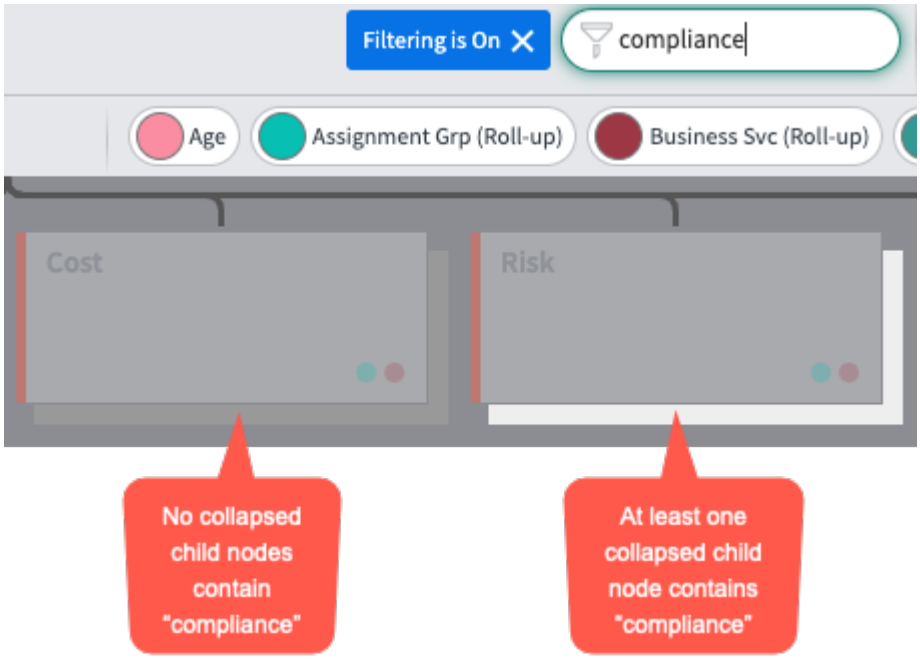
All filter functions can be used with each other.

Expanding and collapsing tree nodes

When working with large KPI trees, you can close those parts of the tree that you are not currently working with. To collapse part of a tree, click the minus - icon on an artifact that has child artifacts. Collapsed nodes appear as a shadow under the top-level node. To expand collapsed nodes, click the plus + icon.

When a filter or a search matches a collapsed, hidden artifact, the tree does not expand. Instead, the "shadow" turns white although the top-level element remains grey.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Add artifacts to a KPI tree

Add artifacts to the KPI tree by using the drag-and-drop tiles at the bottom of the project canvas.

Before you begin

Think about your business goal and critical success factors before you begin to work on a project.
Role required: sn_kpi_composer.user (own project), sn_kpi_composer.admin (any project), admin. No role required for responsible user or user with edit access from project sharing.

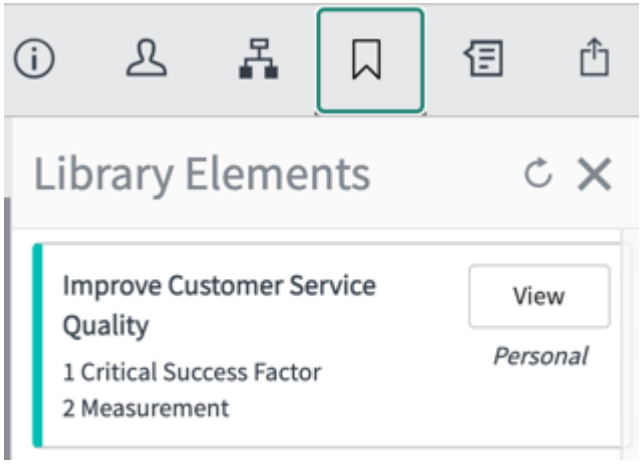
Procedure

1. Navigate to **KPI Composer** and open or create a project, then navigate to the Analysis tab.
2. Locate the KPI tree artifacts at the bottom of the screen.
3. Drag a Business Goal icon to the top of your project.
   To keep your planning simple, usually you have one business goal for each project, but you can have business goals as children of other business goals.
4. Set the Business Goal properties as described in "Artifact properties."
   You can edit these properties later by clicking the Edit icon ( ) on the artifact tile.
5. Repeat this process with Critical Success Factors and Measurements.
   Drop an artifact on top of another artifact to have the new artifact displayed as a child of the existing artifact. Critical Success Factors can be children of Business Goals or other Critical Success Factors. A Measurement can be a child of any artifact.
6. As an alternative to creating and configuring all your artifacts, you can add an existing Library Element.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the bookmark icon to open the **Library Elements** list.

b. Drag an appropriate library element into your KPI tree.



For more information, see Cross-project library elements.

What to do next

If you change your mind about the relationships in a tree, you can select and drag an existing artifact to a different artifact. You can also change the ordering of artifacts. Drag a child artifact onto its parent to move it into the top position among its siblings.

Artifact properties

Each artifact in a KPI tree can reference knowledge base articles, personas, or breakdown definitions.

Property	Description	Example
Name	A unique, meaningful name	High-quality cost-effective business resolution (for a business goal artifact) Total incident resolution cost (for a measurement artifact)
Description	A detailed description of the artifact to help others understand its purpose and to avoid redundancy	Total monetary cost from when an incident is raised until it is resolved, including estimated salary and opportunity costs
Target	The future performance improvement you want from Performance Analytics. If you do not yet have a quantitative target score for an indicator, describe the target qualitatively.	A 10% reduction every month until a final value of 40 is reached.
Add this element to the library link	Adds this artifact and any child artifacts in the KPI tree	For more information, see Cross-project library elements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description	Example
	to a multi-project, reusable library element.	
Info	Specify any of the following details: • Knowledge articles that contain further explanation about the artifact. You can link any number of knowledge articles. • Artifact owners • Contact persons	This short animation shows a knowledge article being added to an artifact. Persona	The personas currently linked to the project. In the artifact properties, you can only add and remove personas to the artifact. For information about adding personas to the project, see Add personas to a project.	In this image, the Agent and CIO personas are linked to the project. The CIO persona is linked to the artifact and the Agent persona is not. Group by	Group the data associated with an artifact by one or more of the breakdown definitions selected for the project. For information about adding breakdown definitions to the	In this image, the Assignment Group, Impact, and Priority breakdown definitions are available for the artifact. The data in the artifact is

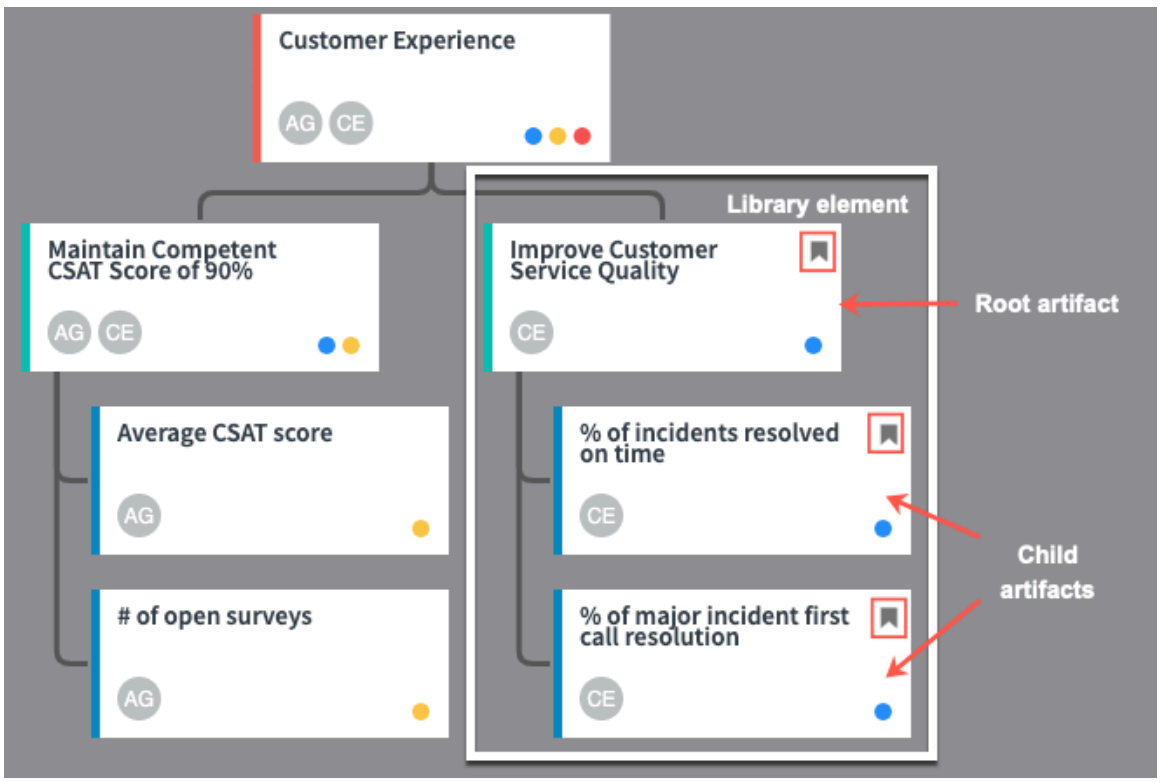
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description	Example
	project, see Group data by breakdown definitions.	grouped by only Assignment Group. 
Cross-project library elements

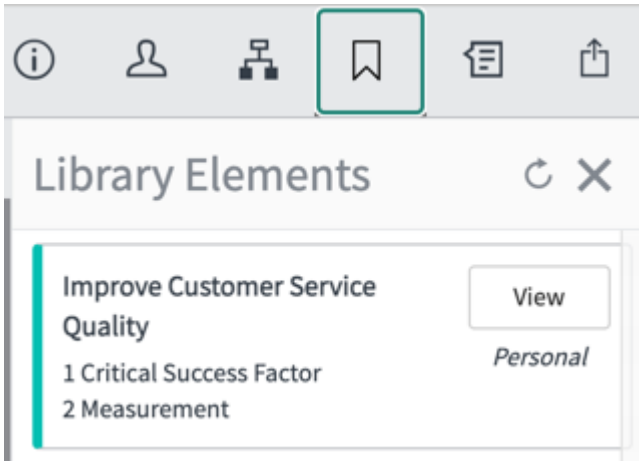
Library elements are single artifacts or trees of artifacts that you can reuse in multiple projects.

Each library element has a single root artifact. All child artifacts of that artifact are included in the library element. The following image shows a library element based on the Improve Customer Service Quality critical success factor. The two measurement artifacts that are its children are included automatically in the library element.



You can drag a library element into a KPI Tree from the **Library Elements** menu on the Analysis tab of any project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Create a library element

Convert an artifact and its children in a KPI tree into a KPI Composer cross-project library element.

Before you begin

You need an existing project with a KPI tree with at least one artifact.
Role required: sn_kpi_composer.user (own project), sn_kpi_composer.admin (any project), admin. No role required for responsible user or user with edit access from project sharing.

About this task

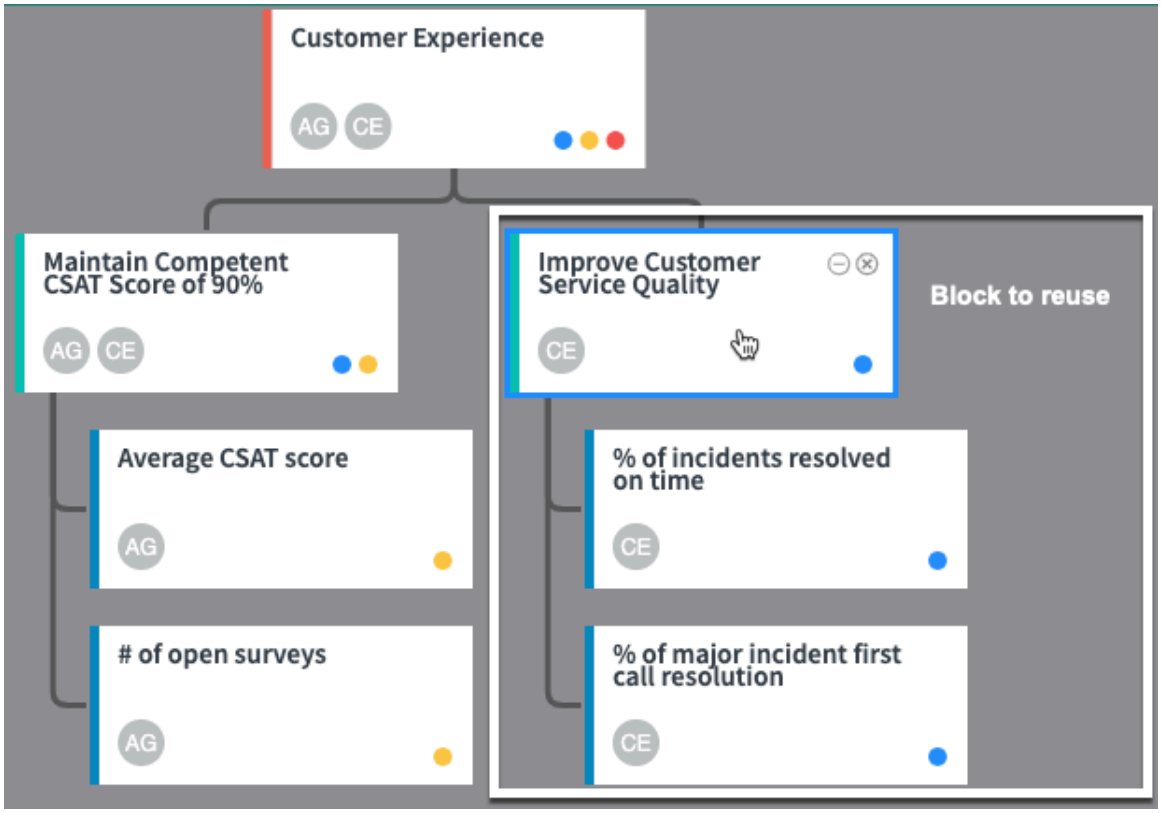
Note: You can nest library elements. In other words, you can create a library element from an artifact that includes another library element among its descendants. The elements of the original library element are included in the new, higher-level one. The original library element still exists and can be included in a KPI tree on its own.

Procedure

1. Open the Analysis tab of a KPI Composer project.
2. Select an artifact in the tree.
   Select an artifact that you want to be able to reuse in other projects. If you want to reuse a group of artifacts, select the root artifact. All descendant artifacts of the root artifact will be included in the library element.

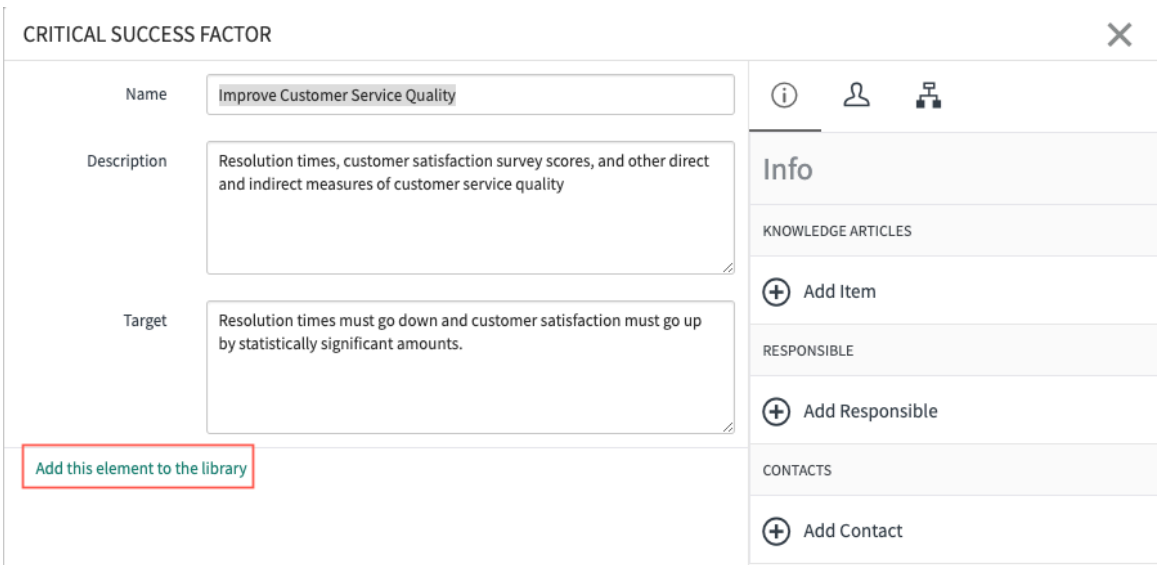
   Example
   In this example, you want to reuse the "Improve Customer Service Quality" critical success factor. You want to use it with its two child measurements "% of incidents resolved on time" and "% of major incident first call resolution."

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. In the properties window of the artifact, select **Add this element to the library**.

Example
In this example, you have opened the properties of the "Improve Customer Service Quality" artifact and are about to click **Add this element to the library**.

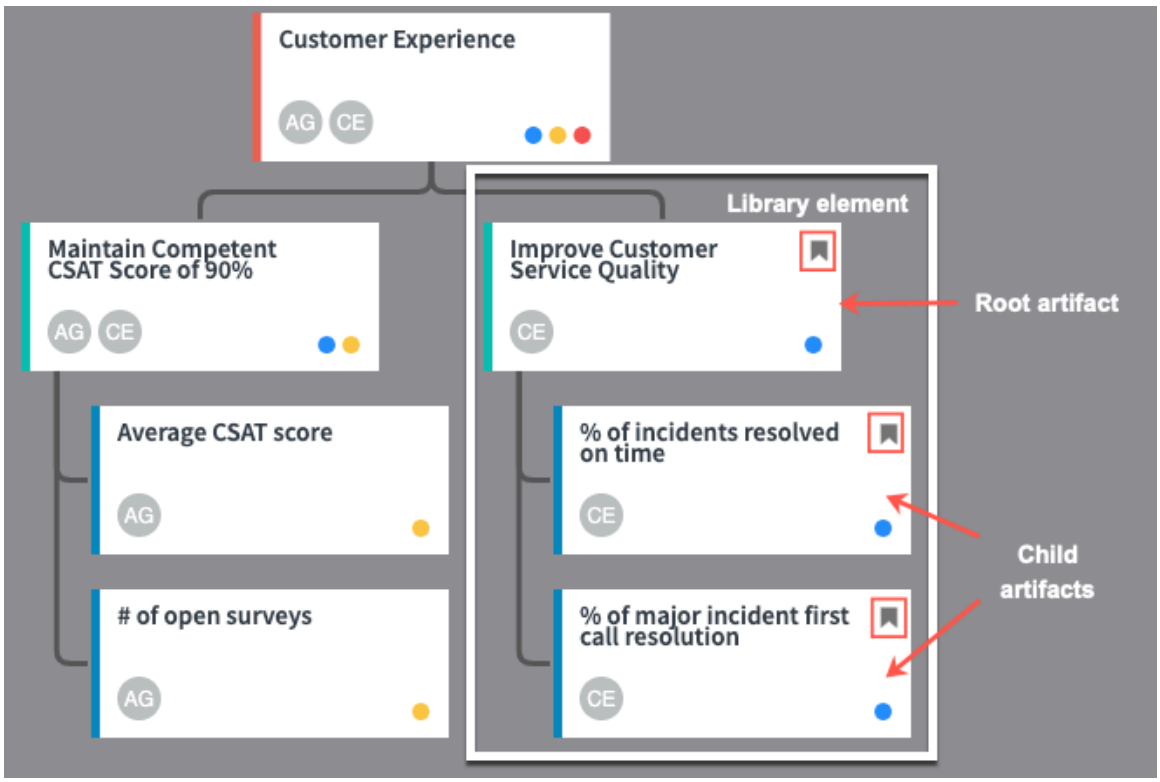


Result
The selected artifact and its descendants are converted to a library element. A bookmark icon is added to each of their tiles to identify them as belonging to a library element. You can no longer edit them in the original project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: "Improve Customer Service Quality" library element

This example shows the library element that results from the procedure steps. The root artifact is "Improve Customer Service Quality." The library element consists of it and the two measurements "% of incidents resolved on time" and "% of major incident first call resolution".



What to do next

A library element starts out as Personal in scope. Only the user who created it can add it to a KPI tree. If you have the admin or sn_kpi_composer_admin role, you can change the scope of a library element to Global. All users can add Global library elements to their KPI trees.
You cannot edit a library element from inside a project.

Use a library element

Add a library element to a KPI tree in any KPI Composer project.

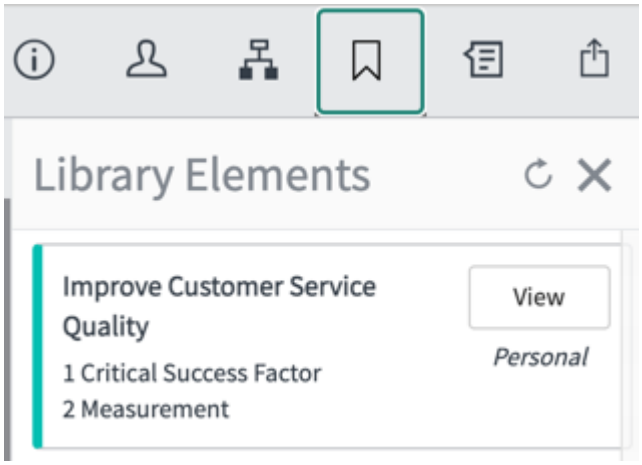
Before you begin

You must have at least one library element you can use.
Role required: sn_kpi_composer.user (own project), sn_kpi_composer.admin (any project), admin. No role required for responsible user or user with edit access from project sharing.

Procedure

1. Navigate to **All** > **Application** > **Module**.
2. Select the bookmark icon to open the **Library Elements** list.
3. Drag an appropriate library element into your KPI tree.
   The tile for a library element lists the number and type of artifacts included in the element. The following image shows the tile for a library element with one critical success factor and two measurements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. To remove a library element from a KPI tree, delete the root artifact.
   You do not have the delete option from any other artifacts in the library element.

What to do next

You can add as many library elements as you want to a KPI tree. You can add the same library element as many times as you want.

Edit or delete a library element

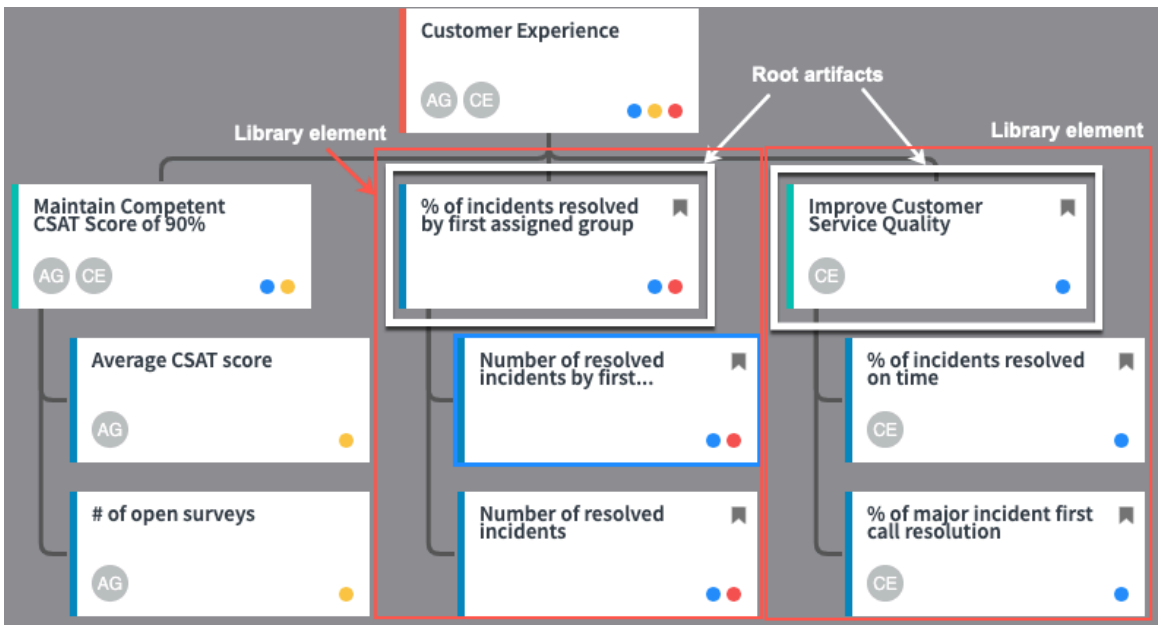
You can add artifacts to a library element, or convert a library element back to project-based artifacts. You can also edit the data definitions of artifacts in a library element.

Before you begin

Role required: sn_kpi_composer.admin or admin for full editing functions

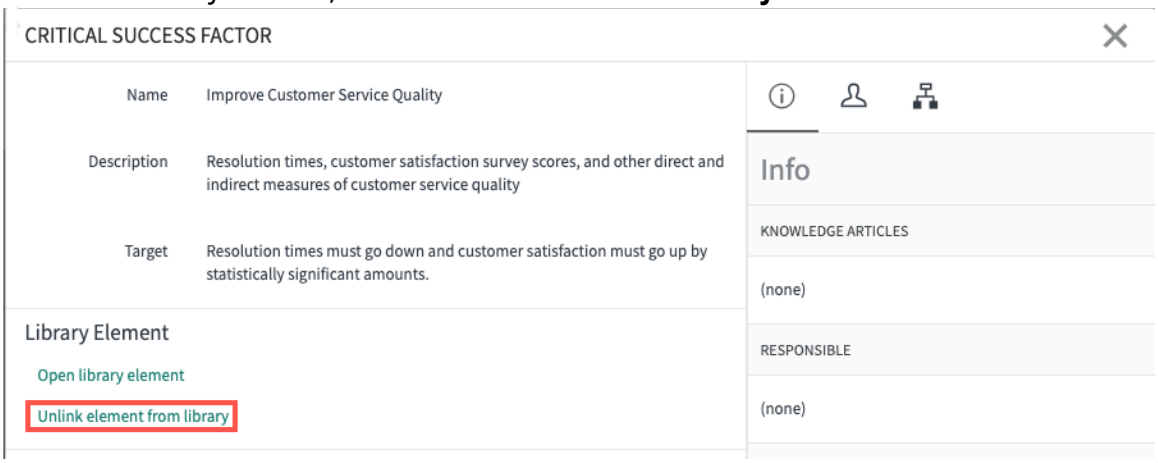
Procedure

1. Open the Analysis tab of a KPI Composer project.
2. Select the root artifact of one of the library elements in the KPI tree to open its properties.
   Bookmark icons ( ) identify the artifacts that are in a library element. The root artifacts, or parent artifacts, are the most top-level artifacts in each library element.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. To delete a library element, select **Unlink element from library**.



The artifacts are no longer members of that library element. However, every KPI tree that contained that library element still contains those artifacts, only now they are a separate set of ordinary artifacts in each tree.

4. To edit a library element, select **Open library element**.

Note:

- You can open a library element from any artifact in that element, not only the root artifact.
- If you have the sn_kpi_composer.admin or admin role, you can instead navigate to **KPI Composer** > **Library** and open a library element from a set of library element tiles.

5. To add an artifact to the library element, follow the instructions in Add artifacts to a KPI tree.

Note:

- You do not need to click **Add this element to the library** in the properties of the new artifact. If you click this link, you add the new artifact to a new library element that is nested inside this library element.
- Instead of adding a new artifact, you can add another library element, which is then nested inside this library element. For more information, see Use a library element.

6. To add indicator and report definitions to the artifacts in a library element, open the Data Definition tab and follow the instructions in Defining indicators and reports.
7. Select the information icon ( ) to view or edit the library element properties, such as whether the library element is global or personal in scope.
You need the sn_kpi_composer.admin or admin role to edit properties. Otherwise, they are read-only.

Library element properties

Each KPI Composer library element has the following properties. You need the sn_kpi_composer.admin or admin role to edit them.

Property	Description	Example
Name	A unique, meaningful name	By default, the name is the same as the name of the root artifact, such as Improve Customer Service Quality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description	Example
Description	A detailed description of the artifact to help others understand its purpose and to prevent redundancy	Total monetary cost from when an incident is raised until it is resolved, including estimated salary and opportunity costs
Objective	The future performance improvement you want from Performance Analytics. If you do not yet have a quantitative target score for an indicator, describe the target qualitatively.	A 10% reduction every month until a final value of 40 is reached.
Global Yes | No	When Yes, all users can add this library element to their KPI trees. When No, this library element is personal and only the user who created it can use it. Default: No	N/A
Knowledge Articles	Articles in the knowledge base that contain further explanations about the library element.Specify any of the following details: • Knowledge articles that contain further explanation about the artifact. You can link any number of knowledge articles. • Artifact owners • Contact persons	KB0000006 Dealing with Spyware and Viruses
Responsible	A responsible user has full editing privileges but also is expected to be responsible for maintaining the library element. For more information, see Access to KPI Composer.	Abel Tuter
Contacts	A person who is not responsible for the library element but is an interested party or a relevant subject matter expert to consult.	Abraham Lincoln

Designing dashboards

In the Dashboard Visualization tab, you can create mock-ups of multiple dashboards with visualizations corresponding to artifacts in the Analysis tab. You can link widgets in this mock-up to Performance Analytics widgets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This feature supports only Core UI dashboards and is in the process of deprecation. If you install KPI Composer 4.2.8 from the ServiceNow® Store, only users with the pa_admin role will be able to use the Dashboard Visualization tab on new projects.

The final outputs of your project are Performance Analytics dashboards, with perhaps separate dashboards or separate tabs corresponding to your Critical Success Factors and widgets displaying the measurements. In Performance Analytics, you cannot create these dashboards until all of the underlying indicators and breakdowns are created. Designing the widgets for these indicators is also somewhat technical, requiring at least a pa_power_user role. When you share the final dashboards, too often the viewers who need the dashboards send feedback that your designs did not quite meet their needs or expectations.

The KPI Composer Dashboard Visualization tab lets you start dashboard design much earlier in the workflow. You can start work on the visualization when you have only a conceptual tree of your success factors and measurements on the Analysis tab. Furthermore, you can involve other stakeholders earlier in the process. Use KPI Composer in presentations early on to get timely feedback, so when your project is complete, the dashboard viewers get the visualizations they expect.

Add a dashboard

As the first step in designing your dashboards, add an empty dashboard to the KPI Composer Dashboard Visualization tab.

Before you begin

You have an existing KPI Composer project with a complete draft of the KPI tree in the Analytics tab.

Role required: sn_kpi_composer.user (own project), sn_kpi_composer.admin (any project), admin. No role required for responsible user or user with edit access from project sharing.

Procedure

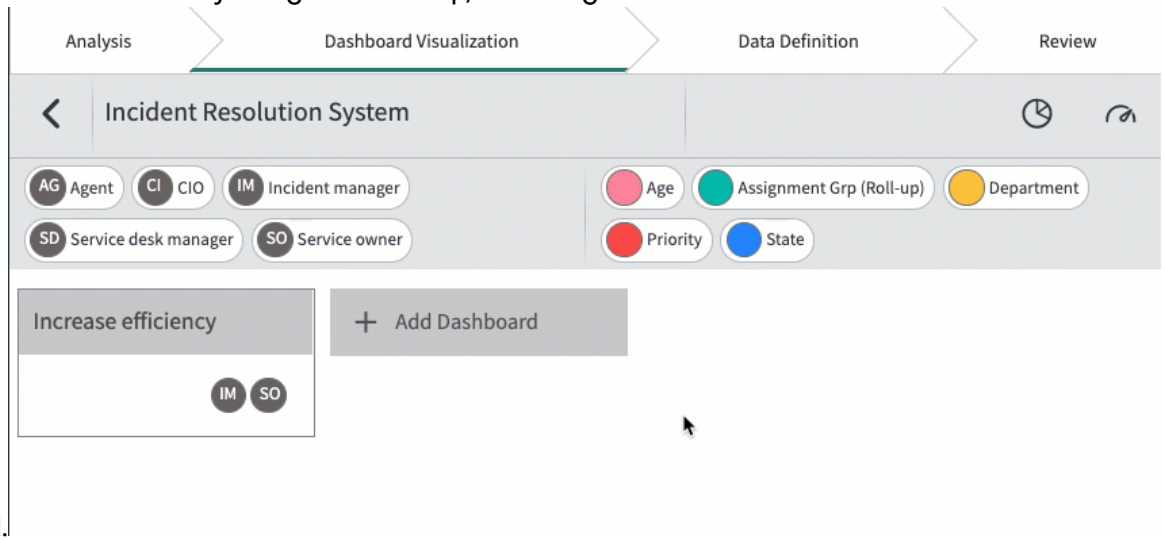
1. Navigate to **All** > **KPI Composer** and open the project.
2. Navigate to the Dashboard Visualization tab.
3. Click **+ Add Dashboard**.
4. Give the Dashboard a meaningful name, probably corresponding to a Business Goal or a higher-level Critical Success Factor in the KPI tree.
5. **Optional:** Click the Edit Item icon ( ) in the Dashboard artifact to edit dashboard properties.
6. Repeat this process for all Business Goals or Critical Success Factors for which you want to create dashboards.

Example: Add a Customer Experience dashboard to the Design tab

In the following short animation, you see the user create a dashboard named Customer Experience, after a Critical Success Factor. The user adds the Agent and CIO personas, who are expected to view the dashboard. The user groups all the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

widgets on the dashboard by Assignment Group, intending to create a breakdown dashboard.



KPI Composer dashboard details

Each KPI Composer dashboard mock-up can reference project personas or 'Group by' categories, or an existing Performance Analytics dashboard.

Detail	Description	Example
PA Dashboard	Link to an existing Performance Analytics dashboard. This can be an older dashboard that corresponds to your use case, or a new dashboard that you create based on this KPI Composer design. By linking dashboards as you create them, you can keep track of the state of your project.	In this image, you see the existing Performance Analytics dashboards being filtered by the word "Incident". Persona	The personas you expect to view the final dashboard. Choose from the personas currently linked to the project. For information about adding personas to the project, see Add personas to a project.	In this image, the Agent, CIO, and Incident Manager personas are linked to the project. The Agent and CIO personas are linked to the dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Detail	Description	Example
	After you link personas to a dashboard mock-up, only the artifacts from the Analytics tab that are associated with those personas are available.	The Incident Manager is not. Group by	Group all the widgets you place on a dashboard by one or more breakdown definition. (The resulting design is for a Performance Analytics breakdown dashboard.) Choose from the breakdown definitions currently selected for the project. For information about adding breakdown definitions to the project, see Group data by breakdown definitions.	In this image, the Assignment Group, Impact, and Priority breakdown definitions are available to dashboards in the project. The data in the dashboard is grouped by Impact only. 
Related topics

Using breakdowns on dashboards

Add tabs and rows to a dashboard

A dashboard mock-up in KPI Composer requires you to lay out the tabs and rows before adding visual components.

Before you begin

You have an existing KPI Composer project with a complete draft of the KPI tree in the Analytics tab. You also have at least one dashboard defined in the Dashboard Visualization tab.

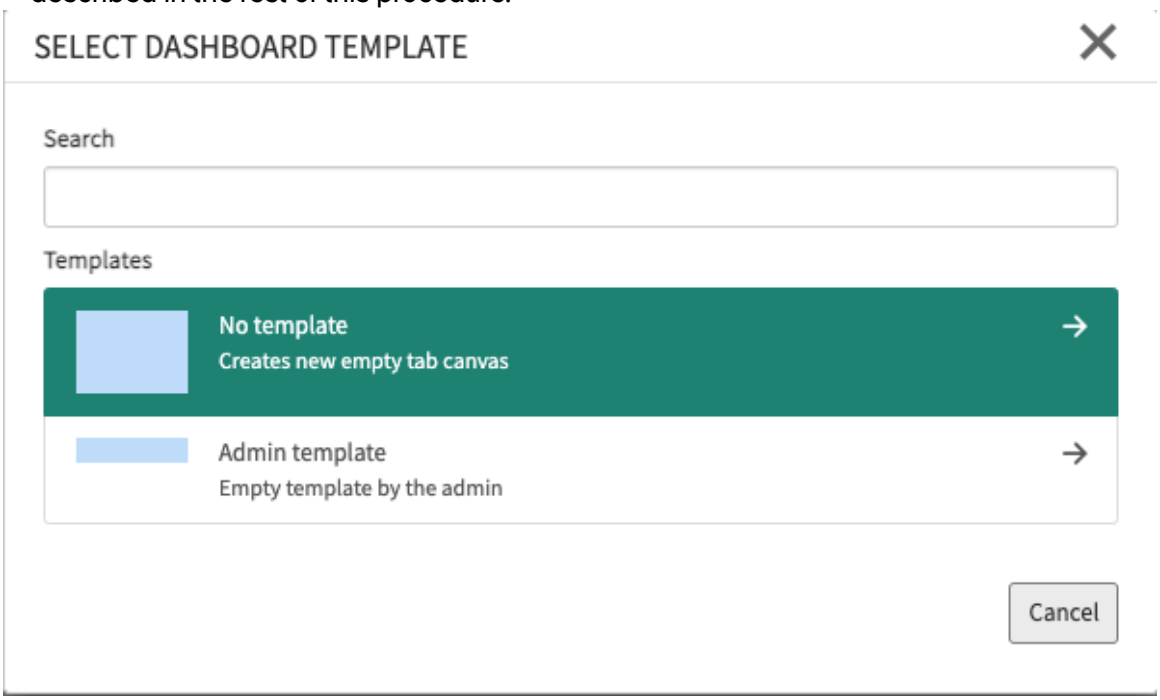
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: sn_kpi_composer.user (own project), sn_kpi_composer.admin (any project), admin. No role required for responsible user or user with edit access from project sharing.

Procedure

1. Open a **KPI Composer** project and navigate to the Dashboard Visualization tab.
2. Select one of the dashboards in the tab.
3. Click the + icon underneath the dashboards.

4. Either:
   - Select a tab template. The tab is created with a name, rows, and canvases inherited from the template. You do not have to add rows or canvases, but you can edit the ones you have.
   - Select **No template**. You create an empty tab and populate it with rows and canvases, as described in the rest of this procedure.

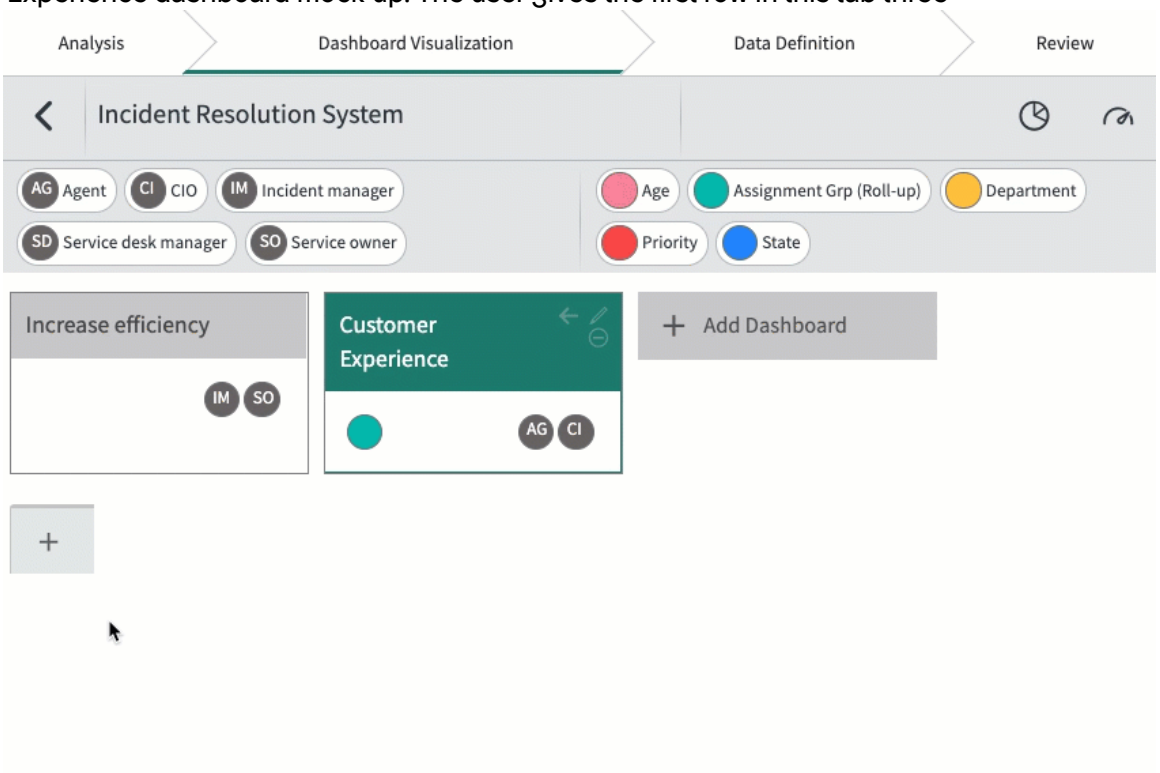


5. Give the tab a meaningful name, probably matching a lower-level Critical Success Factor.
6. Click **Add Row**.
   A row is a horizontal design area. Add at least one row to each tab.
7. In the Row details dialog, select the number of canvases in the row.
   The term 'canvases' here refers to spaces that hold widgets and refer to artifacts. Decide how many canvases you want placed horizontally in the row. You can select up to three canvases. You can change this number or move the row later.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Adding a tab and a row to a dashboard

In the following short animation, you see a user adding the Quality of service tab to the Customer Experience dashboard mock-up. The user gives the first row in this tab three



canvases.

What to do next

Add more rows or tabs following this procedure. Or, you can add canvases to the rows you have created and come back and add more tabs and rows later.

Add canvases to a dashboard tab

Combine analytics artifacts and widgets to create visual components, called canvases, on a KPI Composer dashboard mock-up. "Widgets" include reports, interactive filters, Spotlight, and content blocks.

Before you begin

You have an existing KPI Composer project with a complete draft of the KPI tree in the Analytics tab. You also have at least one dashboard defined in the Dashboard Visualization tab. Lastly, one of these dashboards has at least one tab, containing at least one row.

Role required: sn_kpi_composer.user (own project), sn_kpi_composer.admin (any project), admin. No role required for responsible user or user with edit access from project sharing.

Prerequisites

Add a dashboard

Procedure

1. Open a **KPI Composer** project and navigate to the Dashboard Visualization tab.
2. Select one of the dashboards in the tab.
   Select a dashboard with at least one tab and a row with empty canvas slots.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the upper right of the Dashboard Visualization tab, expand the Artifacts icon ( ).
4. Select an artifact that you want to represent in a canvas slot, and drag the artifact to the slot. You previously defined these artifacts in the KPI tree in the Analysis tab.

   You can drop multiple artifacts into the same canvas slot. You can even drop artifacts onto a canvas slot after you have added a widget to that slot. However, you cannot drop artifacts onto a canvas slot that contains a content block or an interactive filter widget.

   When you drag an artifact onto an unnamed canvas, you give the name of the artifact to the canvas. Dragging additional artifacts onto the canvas does not change the name.

   If you have selected any personas in the dashboard properties, only the artifacts that are linked to those personas are available.

5. In the upper right of the Dashboard Visualization tab, expand the Widgets icon ( ).
6. Decide which widget represents the data in the artifact you previously selected, and drag it to the same canvas slot.
   Widget designs use static images and not actual data visualizations.

   Interactive Filter widgets only affect Report widgets that are on the same dashboard.

   Spotlight "widgets" represent Spotlight interactive analysis, which is usually accessed through a shared URL instead of a report on a dashboard. For more inforrmation, see Spotlight interactive analysis.

   To replace a widget on a canvas, drag another widget onto it. The title of the original widget remains, unless you replace it with a Content Block. Replacing widgets does not affect artifacts associated with a canvas.

   After you drag a widget, the Canvas Details dialog opens.
7. Fill in the Canvas Details, as follows:

Note: To change the Canvas Details of an existing widget, click the pencil icon (

) on the canvas. This icon appears when you point to the top-right corner of a canvas.

Canvas Detail options for all widgets

Field	Contents
Widget type	Select the type of widget that represents the artifact. If you have already selected a widget type, you can change that type. The other fields depend on which widget type you select.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Contents
Title	Enter a meaningful title, such as `Percent of incidents per assignment group`.
Description	Information about the widget for internal use, such as `Widget based on formula indicator % open incidents by assignment group` . This entry is not visible in the widget.

Canvas Detail options for Performance Analytics widgets

Field	Contents
Visualization type	Decide which visualization best illustrates the element.
Follow element	Set whether this widget follows the breakdown element that a viewer selects on a Performance Analytics breakdown dashboard.
Time Series	Show results in daily, weekly, or monthly increments.
Measurement	The artifact measured in this widget. You can select any artifact in this field, not only Measurements.
PA Widget	Select an existing Performance Analytics widget that matches this mock-up widget. For more information, see Performance Analytics widgets.

Canvas Detail option for Content Block widgets

Field	Contents
Content block	Select from an existing content block. For more information, see Content blocks.

Canvas Detail options for Interactive Filter widgets

Field	Contents
UI control type	Choose the UI style for the interactive filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Contents
Interactive filter	Select an existing interactive filter. For more information, see Interactive Filters

Canvas Detail options for Report widgets

Field	Contents
Visualization type	Decide which visualization best illustrates the element.
Follow interactive filter	Set whether the report can be filtered by an interactive filter on the dashboard. If you select Yes, also include an interactive filter widget.
Measurements	Select the Measurements artifact that this report shows.
Report	Select an existing Report. For more information, see Creating reports

Canvas Detail options for Spotlight widgets

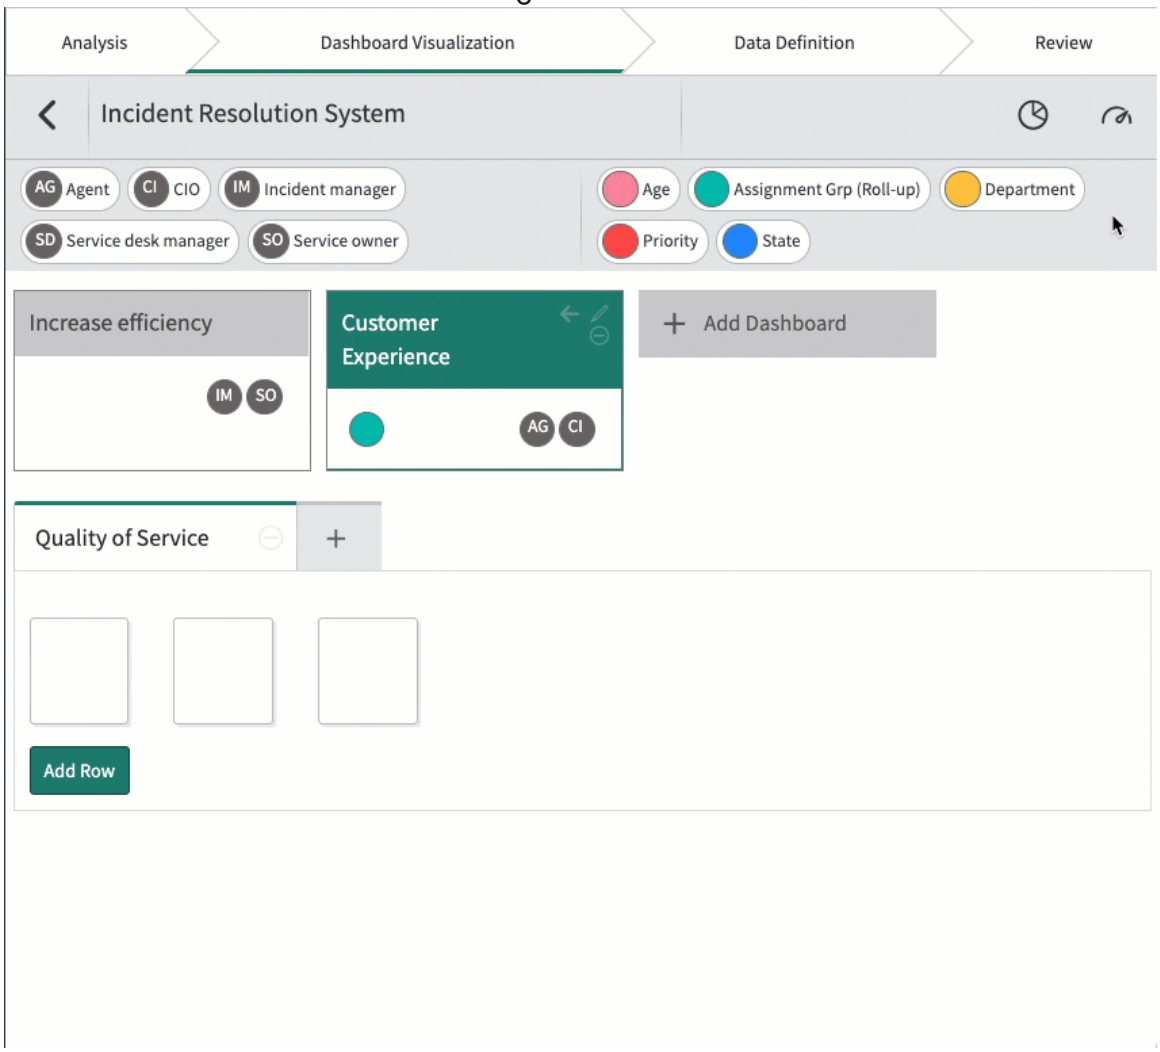
Field	Contents
Measurements	Select the Measurements artifact that this report shows.
Spotlight group	Select an existing Spotlight group. For more information, see Ranking records with Spotlight.

Result
You have an artifact from your analysis and a visualization to illustrate that artifact on your dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Adding a canvas to a dashboard

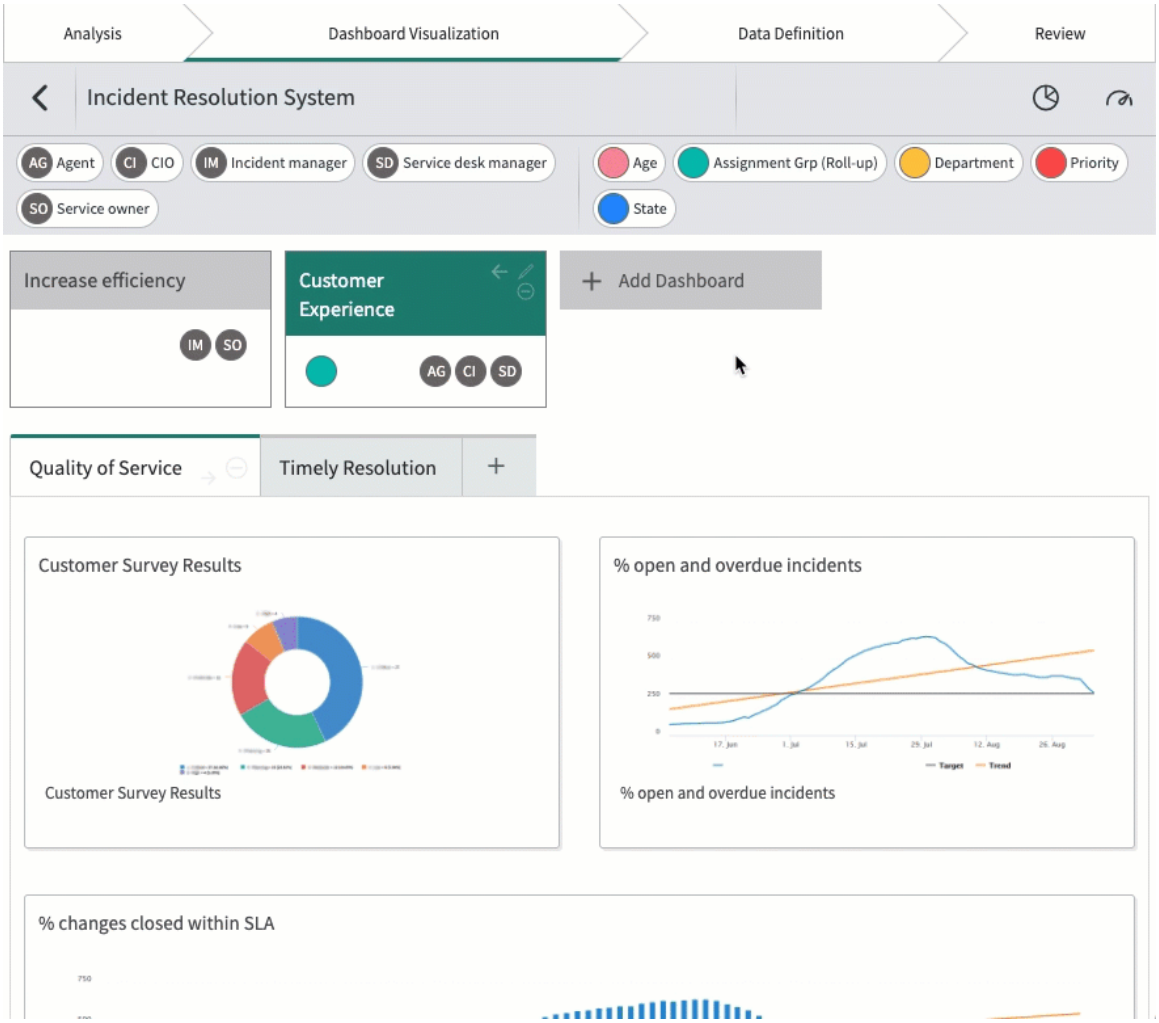
Note: In this short animation, a canvas is added to the Quality of Service tab of the Customer Experience dashboard. The user first picks an artifact from their KPI Tree and then selects a widget to illustrate that artifact.



What to do next

When you have populated a dashboard, you can change the row order, widget order, or widget title in the artifact banner. The following short animation demonstrates how to move dashboard components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Create a dashboard tab template

To reuse a dashboard tab design, create a template from that tab.

Before you begin

Create a dashboard with a tab populated with canvases.
Role required: sn_kpi_composer.user (own project), sn_kpi_composer.admin (any project), admin. No role required for responsible user or user with edit access from project sharing.

Prerequisites

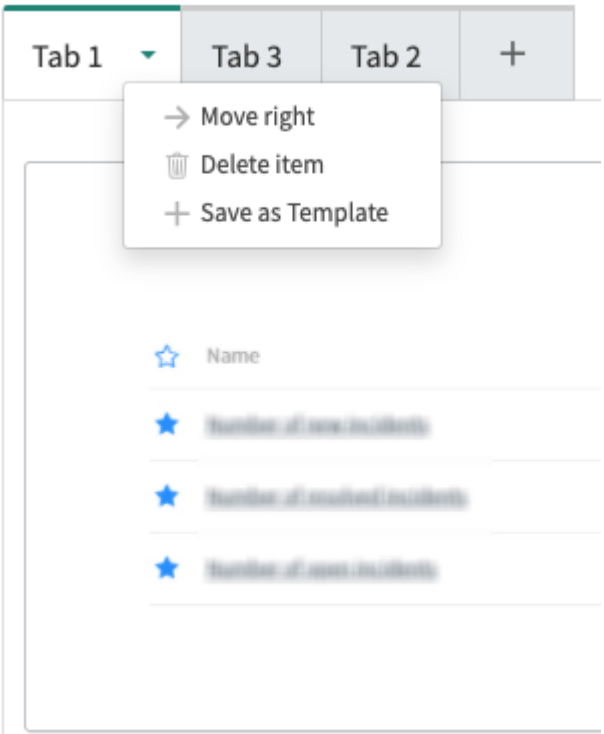
Add a dashboard

Add tabs and rows to a dashboard

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the menu on the dashboard tab and select **Save as Template**.



2. Give the template a meaningful title and description.
3. Select **Save**.

Result

You have a personal template that you can use to create new tabs on dashboards. You cannot edit this template.

What to do next

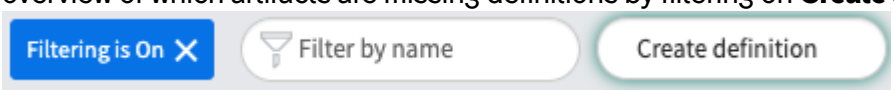
For this template to be available to other users, ask a KPI Composer admin to set the **Template global** value to `true` in **KPI Composer** > **Dashboard tab templates**.

Defining indicators and reports

On the KPI Composer Data Definition tab, you further specify the artifacts you defined during analysis and link them to indicator and report definitions.

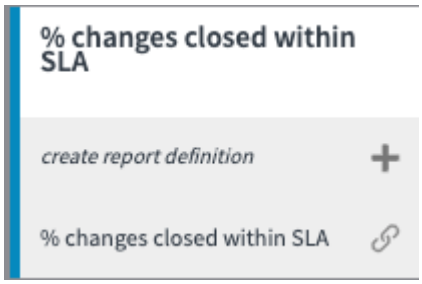
After you open the Data Definition tab, you see the same KPI tree that you defined in the Analysis tab. The header with personas and breakdown definitions and the footer with new artifacts are gone.

Each artifact that is associated with a Performance Analytics widget on the Dashboard Visualization should reference an indicator definition. Each artifact that is associated with a Reporting widget should reference a report definition. An artifact can be associated with both an indicator and a report definition. If a definition is missing, a clickable plus sign + appears with a message to create the definition. If the artifact is linked to any definitions, there is a hyperlink to open each definition. You can quickly get an overview of which artifacts are missing definitions by filtering on **Create definition**.



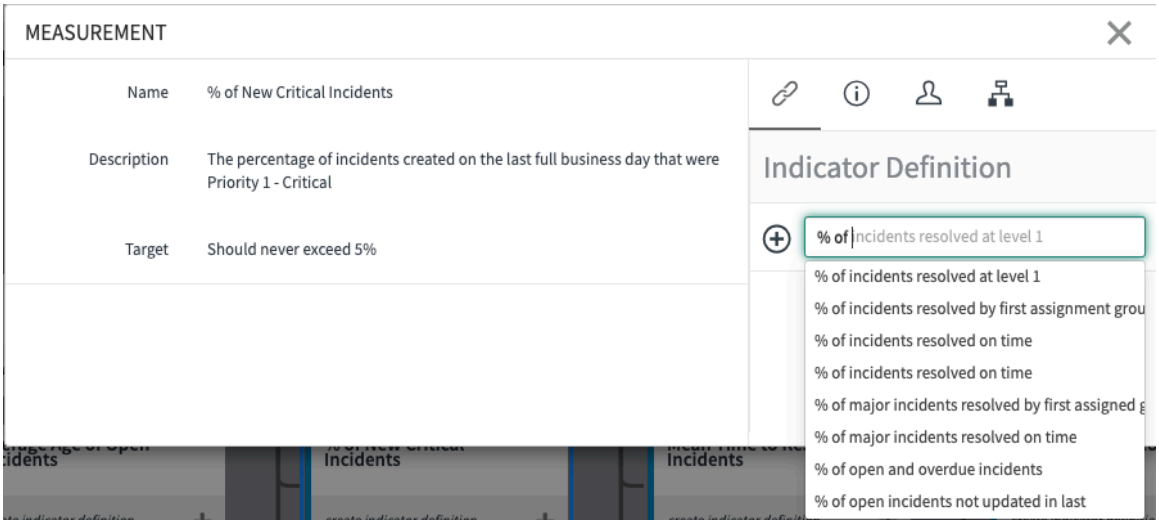
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following illustration shows a measurement artifact that needs both a report and an indicator definition. An artifact definition named "% changes closed within SLA" is linked. The artifact still needs a report definition.



Before you create a new definition, see if a suitable definition already exists. Click on an artifact to open its properties. You see a read-only view of the properties you set on the Analysis tab, with one addition: You can link the artifact to an existing indicator and/or report definition. Start typing to populate the list of matching definitions. Linking existing definitions is simpler in the properties dialog than in the indicator or report definition records.

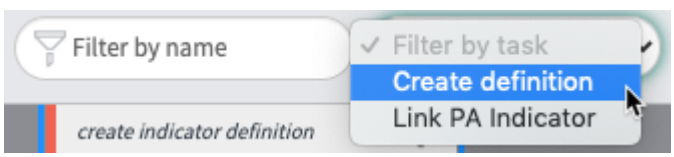
Measurement artifact in data definition tab



Filtering

The following filter options are available on the Data Definition tab:

- Filter by name, for filtering by one or more words that appear in the artifact name
- Filter by task
- Create definition, for filtering by whether an indicator or report definition is needed
- Link PA Indicator, for filtering by artifacts with indicator definitions that are not linked to Performance Analytics indicators



Indicator definitions

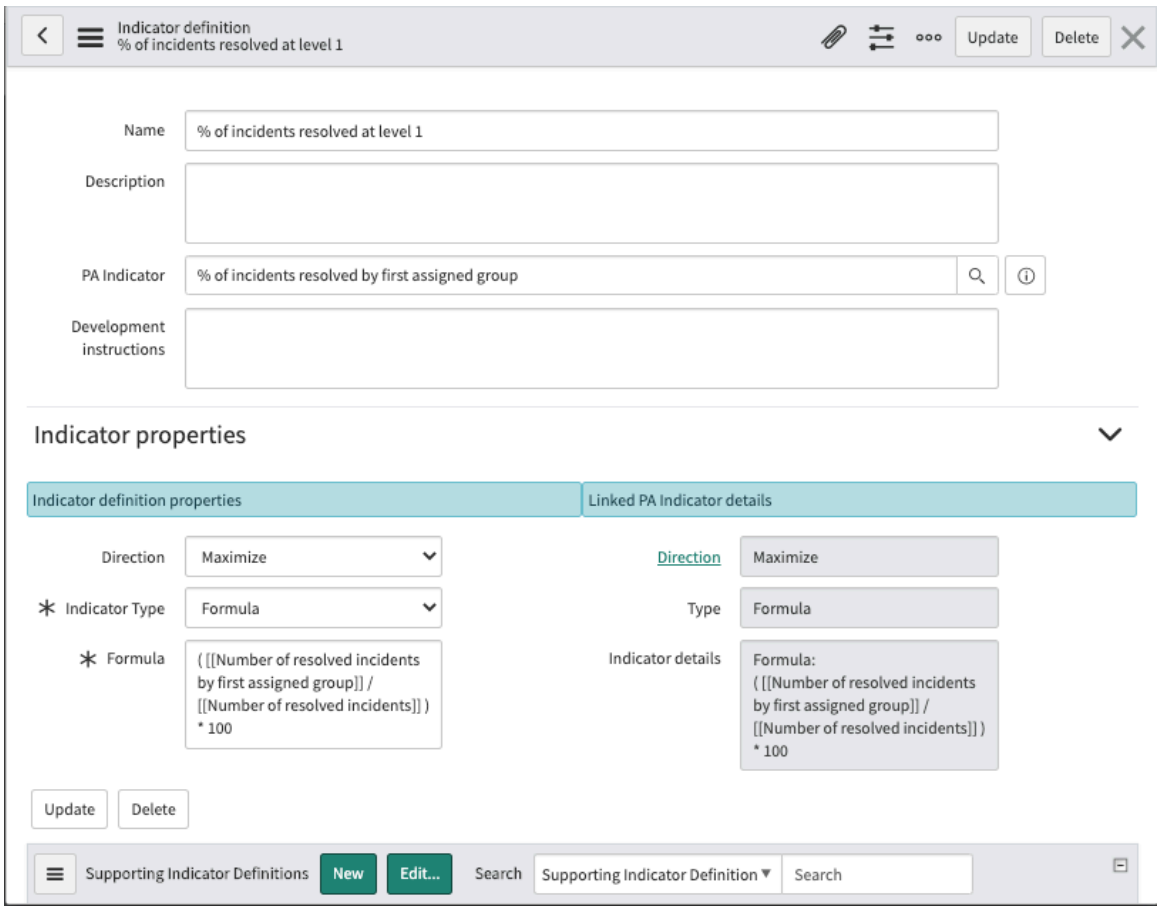
An indicator definition contains the description of how to develop a specific Performance Analytics indicator. The indicator definition itself is not a Performance Analytics indicator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The indicator definition bridges the function-oriented artifact in the KPI tree and the technical implementation of the indicator in Performance Analytics.

If a suitable indicator definition does not exist, click the **create indicator definition** link in the artifact tile. Specify the required properties of the indicator. Also write any development instructions in the field provided for them. If you are defining an automated indicator, specify the facts table for the indicator source. Also describe any conditions, either on the indicator itself or on the indicator source. You can describe the conditions qualitatively, not following condition builder format. If you are defining a formula indicator, add definitions of its contributing indicators.

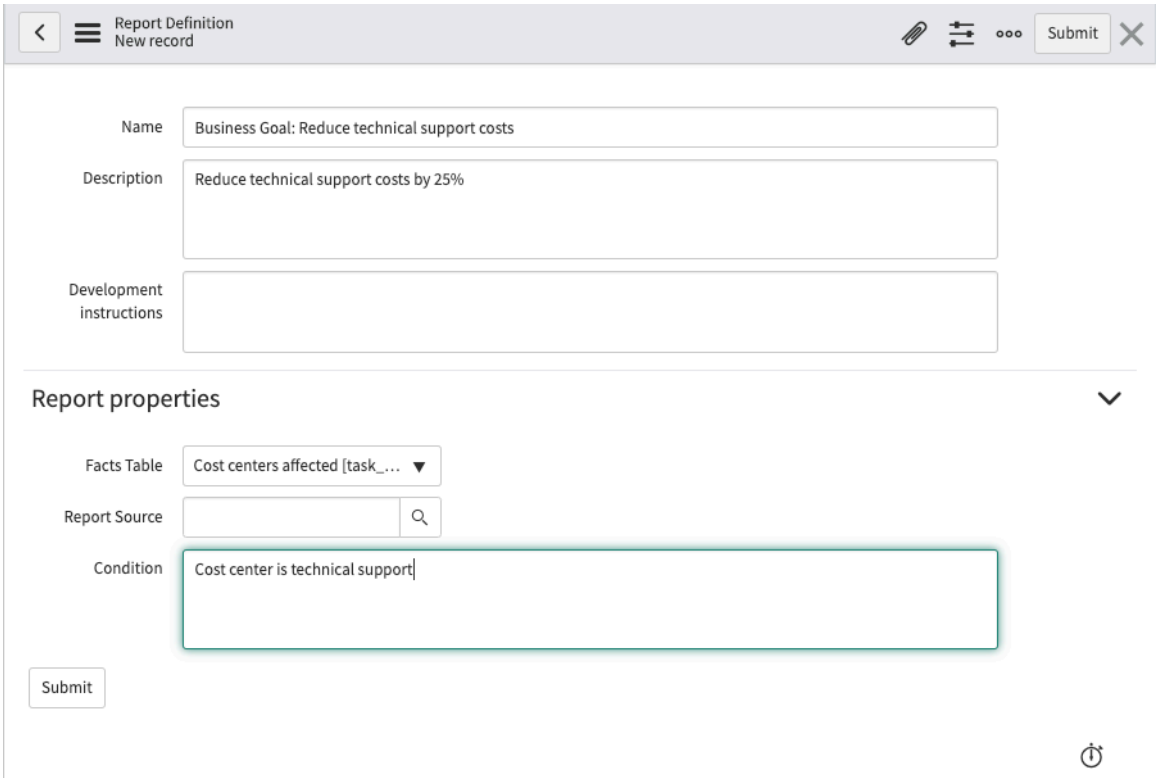
When a suitable Performance Analytics indicator exists, you can add a link to it in the indicator definition. You can see the technical details of the linked indicator. Reproduce the Performance Analytics indicator exactly or specify a modified version.



Report definitions

A report definition contains the description to create a report. The key information is the facts table or the report source, along with any conditions. You do not have to follow a technical format when writing the conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Create an indicator definition

You can create a new KPI Composer indicator definition directly from the relevant artifact in the Data Definition tab. Fill the indicator definition with the necessary information for creating a Performance Analytics indicator.

Before you begin

You have an existing KPI Composer project with a complete draft of the KPI tree in the Analytics tab. You also need technical knowledge of Performance Analytics indicators.

Role required: sn_kpi_composer.admin or admin to link to a Performance Analytics indicator, sn_kpi_composer.user for other functionality. No roles are required for responsible users or users with edit access, except to link to a Performance Analytics indicator.

About this task

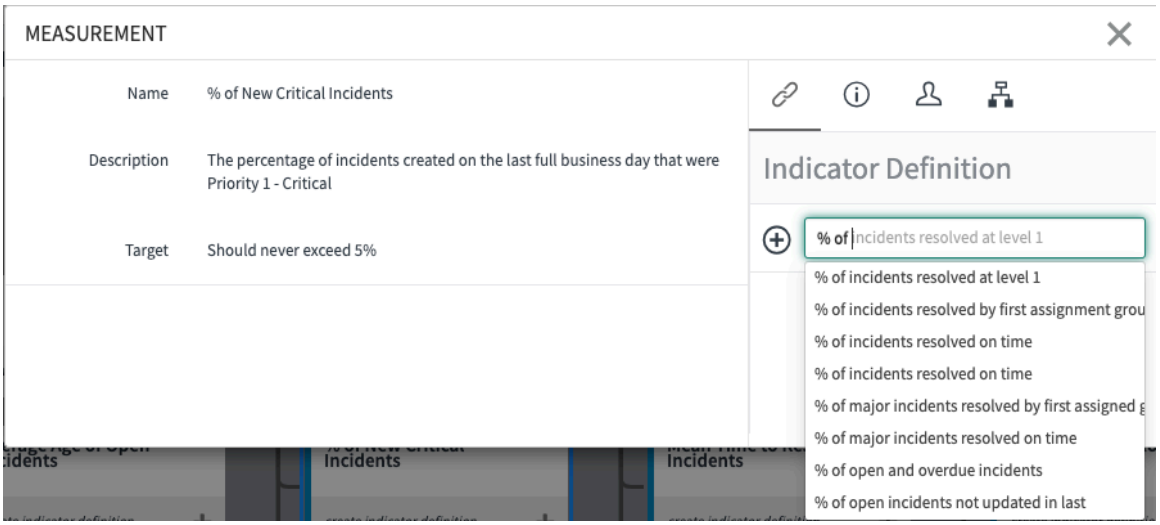
You can create an indicator definition for every artifact in your project, whether or not it is associated with a Performance Analytics widget. You cannot add more than one indicator definition for an artifact. However, if you link an artifact to a formula indicator, you automatically link it to all the contributing indicators in the formula.

Procedure

1. Navigate to **All** > **KPI Composer** and open the relevant project.
2. Navigate to the Data Definition tab.
3. Locate an artifact, probably a Measurement, that you want to define an indicator for.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip: Before you continue to create an indicator definition, check whether any suitable indicator definitions already exist. Click the artifact to open its properties. Then browse the list of available indicator definitions.

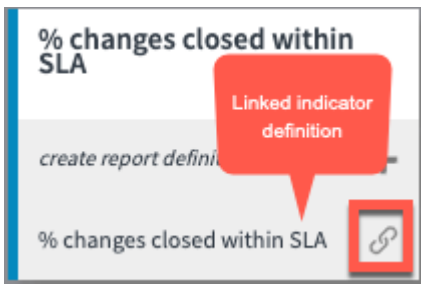


4. Select the plus sign, +.
5. In the **PA Indicator** field, you can search the existing Performance Analytics indicators on this instance to see if any match this indicator definition.
   If you select a Performance Analytics indicator, its properties appear read-only in the "Linked PA indicator details" column. This information is there to help you base the indicator definition on the linked indicator.

   Note: Requires the sn_kpi_composer.admin or admin role.

   You can only search the indicators by name.

   A link icon appears in artifacts next to the name of an indicator definition that is linked to a Performance Analytics indicator.



6. Fill in the **Development instructions** field with any information for your developers that is not in the rest of the form.
   The information in **Development instructions** is for your internal developers use only. You can also provide details about the indicator in the **Description** field. The information in the **Description** field should be replicated in the **Description** field of the resulting Performance Analytics indicator.
7. Decide on the **Direction** of the indicator.

Value	Use case
Maximize	Select if an increase in this indicator score is desired. For example, consider selecting **Max**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Value	Use case
	imize for an indicator that shows revenue. An alytic tools and graphic elements reflect that an increase in this indicator score is good and a decrease is bad.
Minimize	Select if a decrease in this indicator score is desired. For example, consider selecting **Min imize** for an indicator that shows costs. Analyt ic tools and graphic elements reflect that a de crease in this indicator score is good and an increase is bad.
None	Select if the direction of change in this score doesn't matter to your business.

8. Decide whether an Automated, Formula, or Manual indicator best represents the information in the artifact.

Indicator Type	Description
Automated	An automated indicator uses an indicator source as its data set. The indicator source specifies a table or database view, conditions for filtering records from that source, and the frequency at which you expect to display the data. The indicator applies an aggregator and optional conditions to this data.
Formula	Create a formula indicator to produce a new computed score from one or more other indi cators. Besides indicator scores, the formula can include calculations such as the gap be tween an indicator score and the indicator tar get.
Manual	Manual indicators are not associated with an indicator source. Scores for manual indicators are not generated automatically by a data col lection job. Instead, populate these indicators by adding scores to the scoresheet manually. Manual indicators are typically used for data that cannot be retrieved from the ServiceNow instance because it comes from an outside system, such as customer data from a third-party sales system.

9. Fill in any remaining fields.
   - If you are defining a Manual indicator, you do not have to add any more information.
   - If you are defining a Formula indicator, clearly describe to a Performance Analytics administrator how to build the formula. You do not have to use actual formula indicator JavaScript syntax.
   - If you are defining an Automated indicator, include the following information:

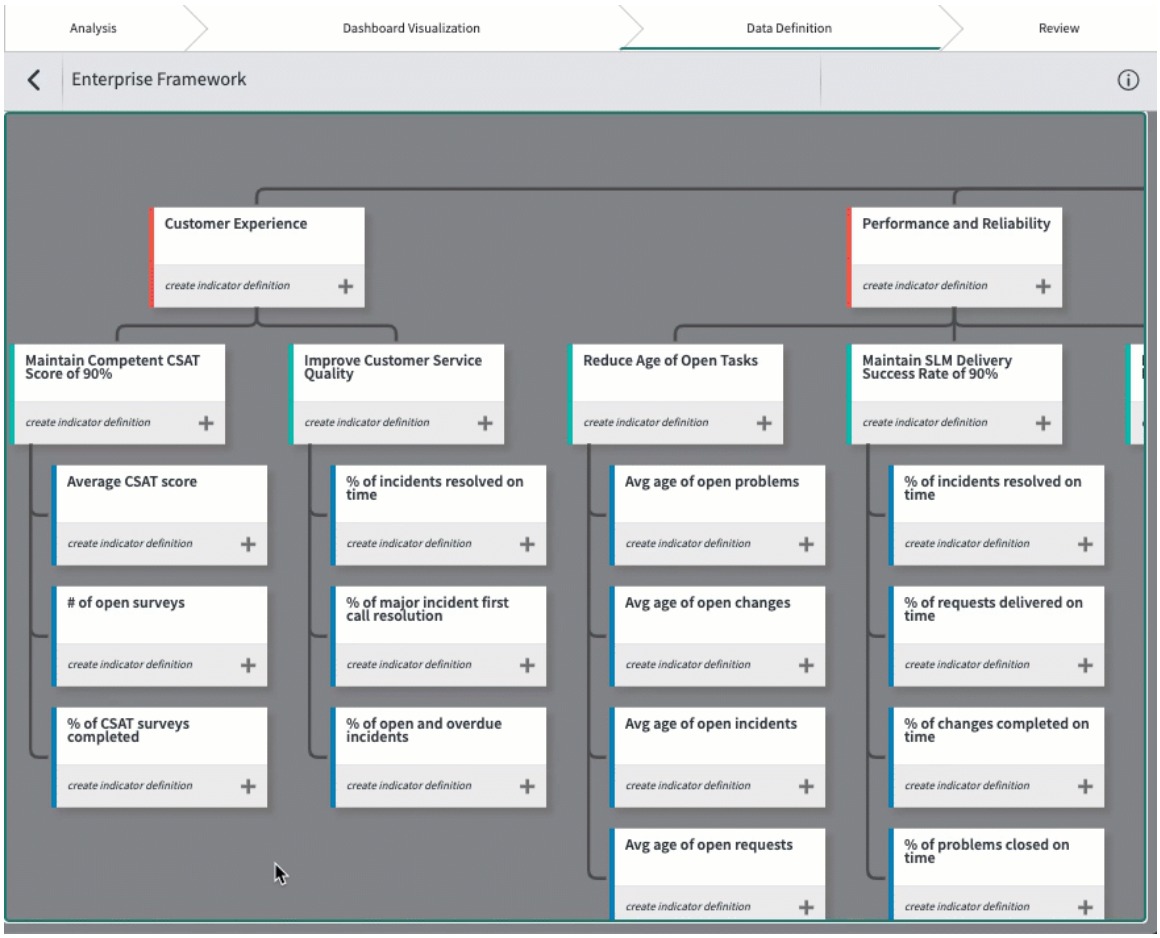
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Aggregation	The aggregate function to apply to the data from the indicator source.
Frequency	Expected periodicity for collecting data. Usually the indicator Frequency matches the indicator source Valid for frequency value.
Facts table	The table that the indicator source references.
Condition	Textual description of the conditions for filtering records from the facts table. You do not have to use condition builder syntax.

10. Either click **Submit**, or, if you want to define supporting indicators, open the context menu and click **Save**.

Example: Creating an indicator definition

In the following short animation, the user defines a formula indicator for the measurement "% of major incident first call resolution." The indicator is based on an existing PA indicator that calculates a similar percentage but does not filter on Priority.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add contributing indicators

After you create an indicator definition in KPI Composer, you can add contributing indicators to that definition. Formula indicator definitions, where the formula includes one or more other indicators, require contributing indicators to be complete.

Before you begin

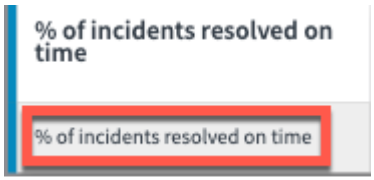
You have an existing KPI Composer project with a complete draft of the KPI tree in the Analytics tab. This project has at least one indicator definition that requires references to other indicators.

You need technical knowledge of Performance Analytics indicators.

Role required: Same as creating an indicator definition

Procedure

1. In the relevant artifact on the Data Definition tab, click the indicator definition name to open the indicator definition.



2. In the Supporting Indicator Definitions related list, click one of the following buttons:
   - Click **New** to create a new indicator definition. Follow the same procedure as in Create an indicator definition.
   - Click **Edit** to open a list of existing indicator definitions in this project. You can select as many indicators as you need.

   Search the existing indicator definitions before you create new ones, so as not to duplicate indicators.

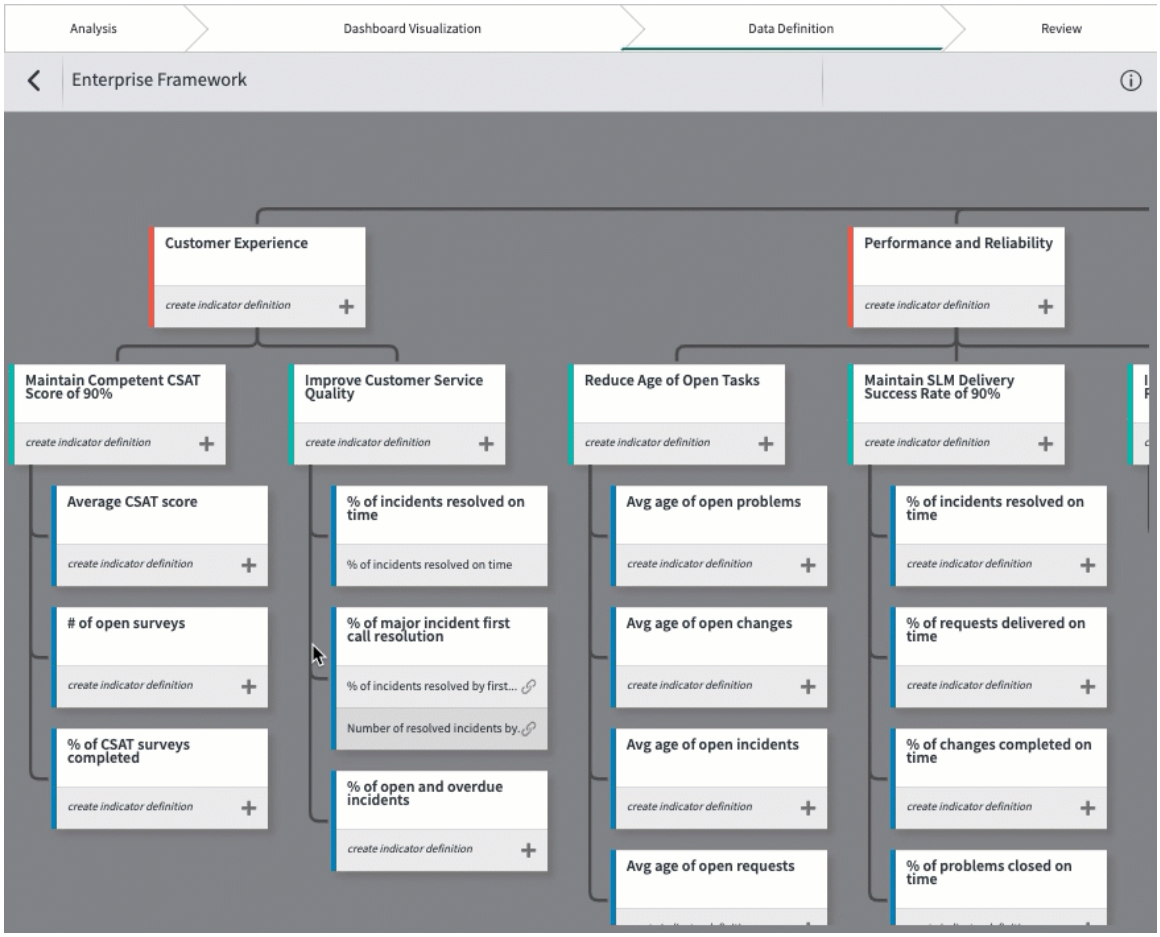
Result

After saving the changes, the artifact in the Data Definition tab shows the contributing indicator definitions under the main indicator definition, with a darker background.

Example: Adding a contributing indicator

In this example, the contributing indicator Number of resolved incidents is added to the % of major incident first call resolution artifact. This indicator matches an existing indicator definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Create a report definition

You can create a new KPI Composer report definition directly from the relevant artifact in the Data Definition tab. Fill the report definition with the necessary information for creating a report.

Before you begin

You have an existing KPI Composer project with a complete draft of the KPI tree in the Analytics tab. You also need technical knowledge of Reporting.

Note: This feature supports only Core UI reports on Core UI dashboards. If you install KPI Composer 4.2.8 from the ServiceNow® Store, only users with the pa_admin role will be able to use the Dashboard Visualization tab or create report definitions on new projects.

Role required: sn_kpi_composer.admin or admin to link to an existing report, sn_kpi_composer.user for other functionality. Responsible users and users with edit access also can use any functionality other than linking to an existing report.

Procedure

1. Navigate to **All** > **KPI Composer** and open the relevant project.
2. Navigate to the Data Definition tab.
3. Locate an artifact that has a **create report definition** link and open that link.
   Only artifacts associated with Report widgets in the Dashboard Visualization tab have links for creating report definitions.
4. Provide a name and a description for the report.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, the report definition has the same name as the artifact that contains it. This default name is the same as the default for an indicator definition for that artifact, so consider differentiating them.

5. In the **Development instructions** field, provide the developer with any technical information they need besides the report properties.
   The **Description** field should contain information for the user. The **Development instructions** field should contain internal information for the developer.
6. Select either a **Facts Table** or a **Report Source**.
7. In the **Condition** field, describe the filtering conditions for the report.
   You can write the conditions in plain text instead of the condition builder syntax.

Reviewing your project

Summarize both the created KPI Composer project artifacts and the planned Performance Analytics components. Validate the contents of your project. Generate the tasks to build the planned Performance Analytics components.

Navigate to the Review tab at any time for an up-to-date account of completed design work and pending Performance Analytics configurations.

The review tab shows four boxes of information:

Summary

Sums up the number of artifacts and personas defined on the Analysis tab. Click an item type to open a list of those items.

PA Artifacts

Shows the number of Indicator Definitions and Breakdown Definitions in the project. Click an artifact type to open a list of those artifacts.

Project validation

Click **Refresh Data** after adding new or editing existing definitions. The following levels of issues are identified:

- Warning: A Critical Success Factor is not linked to an Indicator Definition.
- Error: A Measurement is not linked to an Indicator Definition, or an Indicator or Breakdown definition is not linked to a facts table.

Tasks

Generate and list the tasks to create the Performance Analytics and Reporting elements you have defined in your project. For more information, see Generating tasks in KPI Composer.

Generating tasks in KPI Composer

For each KPI Composer artifact in your project, you can generate a task to create an equivalent Performance Analytics element. All tasks are created with one action. The tasks are assigned automatically to the responsible group for implementing analytics.

Tasks can be generated to create the following Performance Analytics and Reporting elements based on the definitions in your KPI Composer project. The tasks are generated for each type of element in this order:

- Breakdowns
- Reports
- Interactive Filters

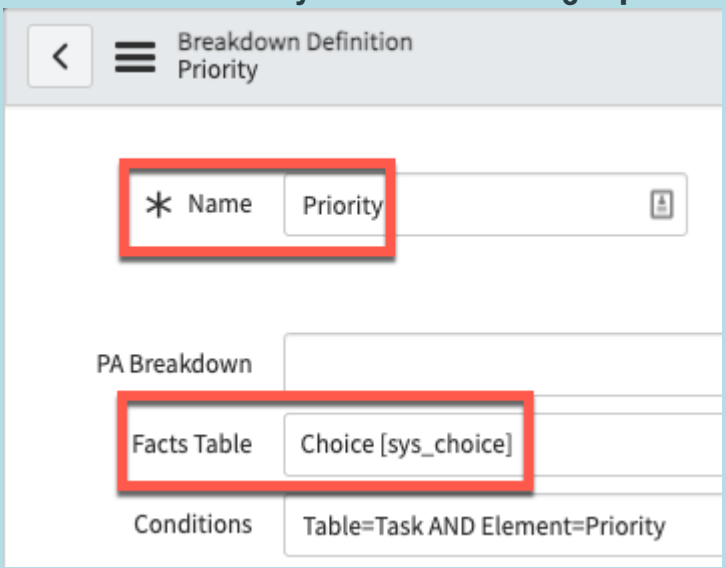
- Dashboards

Important: To generate a task to create an element, the associated KPI Composer artifact definition must include all the required information. For example, to generate a task to create a breakdown or an automated indicator, the Name and the Facts Table must be specified in their definitions.

Definition of the Priority breakdown showing required information for tasks



Assign KPI Composer tasks

Assign the tasks in a KPI Composer project to a group. By default, tasks are assigned to the Analytics Implementers assignment group. You can add users and groups to this group, or you can select a different assignment group.

Before you begin

Role required: sn_kpi_composer.user, sn_kpi_composer.admin, admin

About this task

All tasks in a KPI Composer project are assigned to the same assignment group. After you generate tasks, the group handles them through its normal workflow.

By default, tasks are assigned to the Analytics Implementers group, which is provided with KPI Composer. This group includes the pa_admin role by default. Any users whom you add to this group are granted this role. Access this group from **User administration** > **Groups**, or follow the **Analytics Implementers** link on the Tasks tile in the Review tab. You need the user_admin role to edit this group. For more information about adding and removing users from this group, see Create a user group.

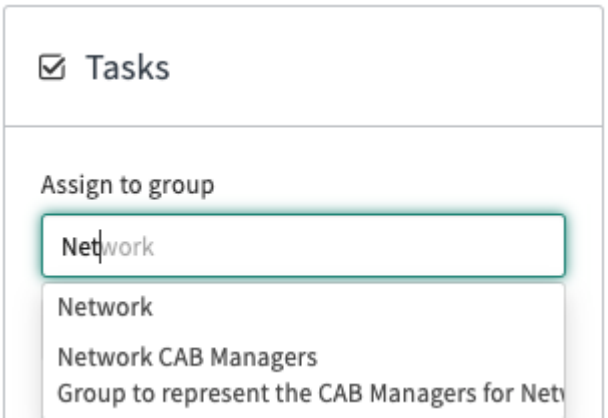
To change the assignment group, follow this procedure:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open your KPI Composer project.
2. Open the **Review** tab.
3. Locate the **Tasks** tile.
4. Find and select the **Clear** icon next to the name of the current assignment group.

5. Confirm that you want to clear the assignment group.
6. Begin typing the name of the assignment group you want.
KPI Composer gives you a list of predicted matches.



7. Select a group.

What to do next
Generate tasks to assign them to the selected group.

Generate tasks

Generate tasks for all sufficiently defined KPI Composer artifacts with a single action.

Before you begin

- Populate the Analytics Implementers group with users.
- Complete designing your KPI Composer project. The necessary artifacts should all be defined. However, if you change something later, you can regenerate the tasks. Regenerating tasks is a good way to track their completion.

Role required: sn_kpi_composer.user, sn_kpi_composer.admin, admin

Procedure

1. Navigate to KPI Composer and open your fully defined project.
2. Open the Review tab.
3. Locate the Tasks tile.
4. Select **Generate tasks**.

Result
You generate tasks for creating Performance Analytics and Reporting artifacts. These tasks are assigned automatically to the Analytics Implementers assignment group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

View the tasks you have created. In the Tasks tile, you have links to active tasks, tasks on hold, and completed tasks. The links take you to the Task Definitions [sn_kpi_composer_task_definition] table.

Task Definition records

KPI Composer tasks are defined in Task Definition [sn_kpi_composer_task_definition] records. When you generate tasks, you create these records or update their statuses.

You can access any existing Task Definition records from links on the Tasks tile of the Review tab. These links take you to a filtered list of records, as follows:

Link	Filter
Active Tasks	• Project CONTAINS <Your project name> • Status in (Create, Update) • Waiting on dependencies = false
Tasks on hold	• Project CONTAINS <Your project name> • Status in (Create, Update) • Waiting on dependencies = true
Completed tasks	• Project CONTAINS <Your project name> • Status = OK

Task statuses

When you run the task generator, it determines the status of all tasks. Task generation uses the following logic to create tasks and set their statuses:

1. Does the KPI Composer artifact still exist? If not, the status is Deleted.
2. Does the existing KPI Composer artifact have a valid definition? If not, the status is Incomplete.
3. Does the valid KPI Composer artifact definition link to an existing ServiceNow AI Platform element, such as a Performance Analytics indicator or CMS content block? If not, the status is Create.
4. If the linked element exists and the status was previously set to OK, was the artifact definition subsequently updated? If so, the status is Update.
5. Otherwise, if the linked element exists, the status is OK.

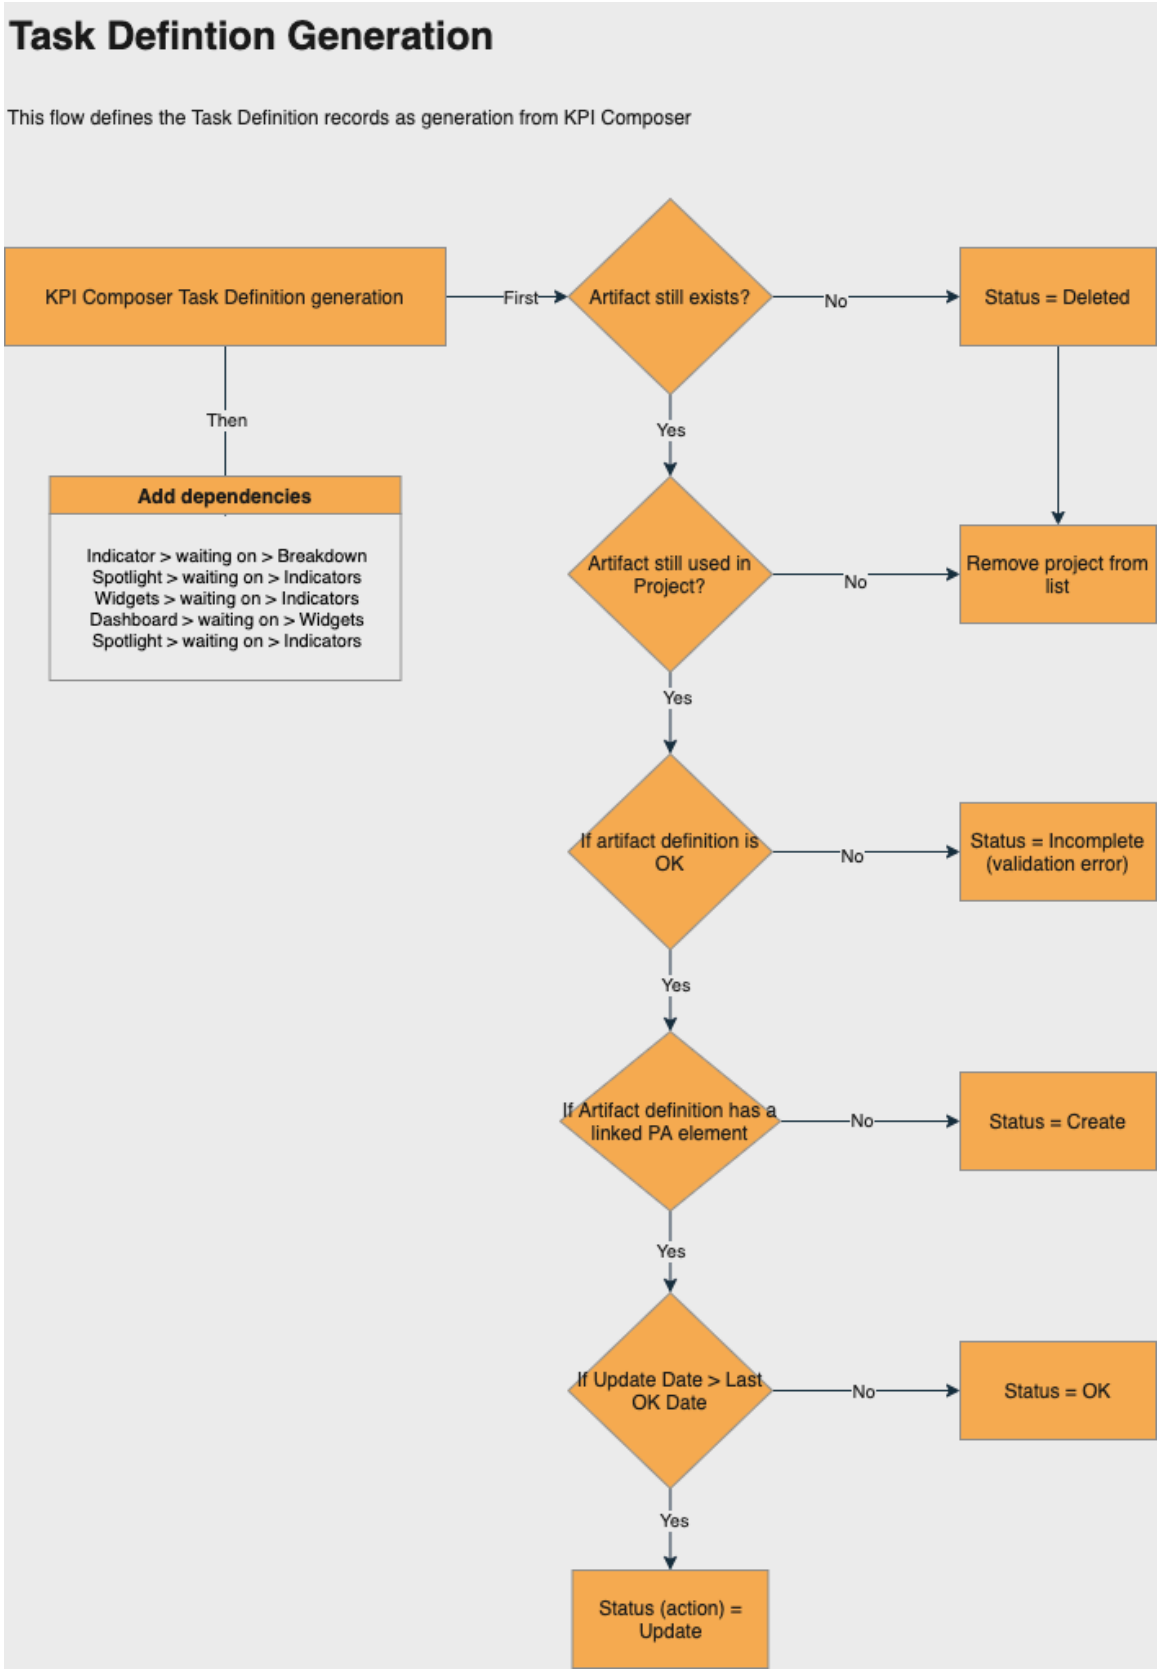
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Artifact update tracking

Task generation checks all task definitions, including those with the status OK. If the artifact definition has changed since the task status was set to OK, the next task generation job changes the task status to Update. The fields in the artifact definition that are checked for changes

© 2026 ServiceNow, Inc. All rights reserved.

Task flows

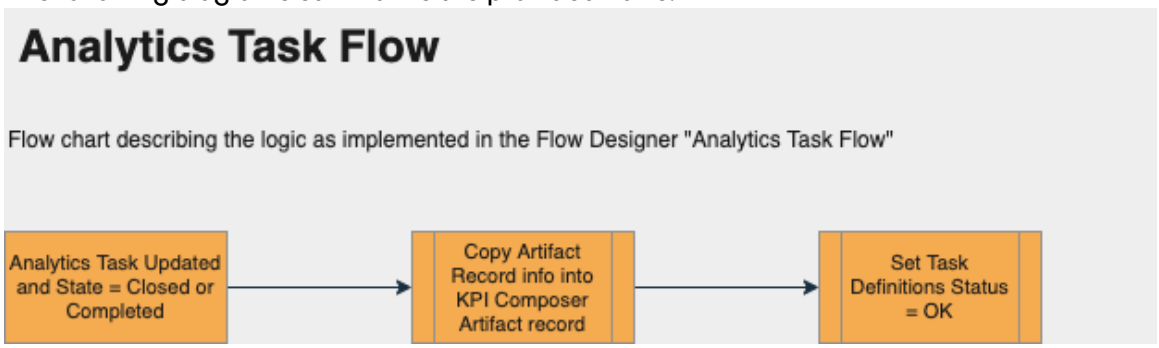
KPI Composer tasks utilize flows created with the ServiceNow AI Platform® Flow Designer.

KPI Composer provides two flows to manage the transition between task states:

- KPI Composer - Analytics Task flow
- KPI Composer - Task Definition flow

You can modify either of these flows in the Flow Designer. However, rather than modifying them directly, you should copy the flows and modify the copies. Make the copies active and deactivate the provided flows. The reason to do this is that updates to KPI Composer may include updates to the flows. If you change the provided flows, updates to them may fail. Instead, after an update, you can examine the provided flows for changes. Incorporate these changes in your copied flows.

The following diagrams summarize the provided flows:



© 2026 ServiceNow, Inc. All rights reserved.

Performance Analytics indicators

Indicators (KPIs) define a performance measurement taken at regular intervals of a business service, an activity, or organizational behavior. These performance measurements result in a series of indicator scores over time.

https://player.vimeo.com/video/995194468?badge=0&autopause=0&player_id=0&app_id=58479

Watch this six-minute video to learn more about the different kinds of indicators and how to create them.

Key characteristics of indicators include:

- Indicator scores can be generated automatically from a set of records defined in an indicator source, entered manually, or calculated from other indicators.
- Indicator scores can be viewed or analyzed in Platform Analytics data visualizations and KPI Details. In the Core UI, view them in the Analytics Hub or in widgets on dashboards.

Indicators that are based directly on indicator sources are the most common type of indicator. These indicators are named automated indicators. Indicators that are calculated in a formula from the scores of other indicators are called formula indicators. Indicators whose scores are entered manually are called manual indicators. Manual indicators are meant to be used primarily for testing purposes. Lastly, as an advanced feature, you can create an indicator from an external data source.

For an example of an indicator, see the Number of open incidents automated indicator that is provided in the base system. This indicator measures the number of incidents that are open each day and saves these numbers over time. You can examine its indicator scores in KPI Details or the Core UI Analytics Hub. If you have the pa_power_user role, you can see the indicator record under Automated indicators and navigate from that record to the indicator source.

Using Performance Analytics with external data

Workflow for creating indicators

Start with ServiceNow AI Platform tables and work your way up to a completed indicator with score collection that you can share on a dashboard.

Before you begin

Design your KPIs before trying to create them. Using KPI Composer, start by deciding on the business goals you want to achieve with Performance Analytics. For each business goal, determine the critical success factors for that goal. Finally, decide what measurements you need to make to see your progress on those critical success factors. These measurements correspond to the KPIs you need to implement. For more information about designing your Performance Analytics Solution, see Design your Performance Analytics solution with KPI Composer.

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When you know what KPIs you need, you can begin to create indicators and breakdowns and, if necessary, their data sources. The following workflow applies to automated indicators, which are the implementation of KPIs that collect scores from ServiceNow AI Platform database tables. (Remember that you can combine and apply operations to automated indicators in formula indicators. You can also have manual indicators and external indicators, which do not refer to the ServiceNow AI Platform database at all.)

Important: Performance Analytics should be implemented by qualified personnel. Several training courses are available, as described in this ServiceNow Community article. This documentation is not meant to substitute for training.

Whereas designing KPIs for Performance Analytics is a top-down process, the technical implementation of indicators is a bottom-up process:

Procedure

1. Identify the table with the data you want to analyze.

   Minimum Role: pa_data_collector.

   What tables do your KPIs refer to? For example, if your KPI is about incidents, the information is in Incident [incident]. If the KPI is about change requests, the table is Change Request [change_request]. If you use KPI Composer to design your KPIs, you already have this information.

2. Determine the subsets of records that are relevant to your KPIs.

   Minimum Role: pa_data_collector.

   Almost certainly you do not have a KPI that refers to all the records of a table. Instead you have KPIs that refer to subsets of the records, such as Number of Open Incidents, Open Incidents That Have Been Reassigned at Least Once, or Incidents That Were Resolved on the Day They Were Opened. For each table, note the conditions that you can use to define relevant subsets of records, such as 'open,' 'reassigned at least once,' 'resolved,' 'status > resolved on the day it was opened'.

   Again, if you use KPI Composer to design your KPIs, you already have this information.

3. Decide which indicator sources you need, based on the conditions that define the subsets of records that are relevant to your KPIs.

   Minimum Role: pa_data_collector.

   An indicator source is a data source that refers to a ServiceNow table and one or more conditions that filter the records on that table. You want as few indicator sources as possible. The main reason for this parsimony is efficiency. Data collection involves querying the database for sets of indicators that share an indicator source, not for each indicator. Minimizing the number of indicator sources also helps maintain a single source of truth across indicators. If you need to change a condition, you can change it on the indicator source and propagate this change automatically to all associated indicators.

   Look for common conditions that you can apply to multiple indicators when you are designing indicator sources. Consider the following KPIs:

   - Number of incidents that are open.
   - Number of open incidents that have been reassigned at least once.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Incidents that have been open for more than 30 days.
- Incidents that are marked ‘resolved’.
- Incidents that were resolved the day they were opened.

You could create two indicator sources that would get scores collected for all these KPIs:

- One on the Incidents table, filtering for incidents that are open.
- Another one on the Incidents table, filtering for incidents that have been resolved.

4. Search for existing indicators and indicator sources that match your needs.

   Minimum Role: pa_data_collector, pa_power_user (indicators only).

   Redundant indicators and indicator sources are a common problem. Only when you have verified that no suitable indicators or indicator sources exist, create the indicators and indicator sources.

   If you can find indicator sources that meet your needs, see if there are already indicators on those sources that match your designed KPIs.

   Note: KPI Composer incorporates a search for suitable existing Performance Analytics indicators into the design process.

5. Create any missing indicator sources that you need.

   Minimum role: pa_data_collector.

6. Create any missing automated indicators that match the KPIs you need.

   Minimum role: pa_power_user.

   After you have the indicator sources, someone with the pa_power_user role, such as a business analyst, can create automated indicators.

   When you create the indicators, add any additional conditions. These conditions apply only to one or two indicators and are not efficient to apply at the level of the indicator source. If you have efficiently divided your conditions between indicator sources and indicators, some indicators on an indicator source will have no additional conditions. These indicators are simply aggregations on a column in the indicator source.

7. Associate and map any relevant breakdowns with the new indicators.

   Minimum role: pa_power_user.

   When you designed your indicators, you also should have designed any breakdowns to apply to the indicators. Breakdown design is included in KPI Composer. You may need to create new breakdowns or breakdown sources, but that is outside the scope of this workflow.

8. Collect and manage a matrix of breakdowns.

   Minimum role: pa_power_user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you want to collect more than one level of breakdown, such as breaking down by both Priority and Category, set up the breakdown matrix. Be sure to exclude unnecessary or nonsensical breakdown combinations.

9. Edit a job for the indicator.

   Minimum role: pa_data_collector.

   Add one scheduled and (usually) one unscheduled data collection job to the indicator. Run an unscheduled job to collect historical data for the indicator, if historical data exists. Usually you only run this job when you create an indicator and never again. Activate the scheduled job to collect periodic data moving forward, usually following the frequency of the indicator. Collect only for one period. For example, when you have an indicator with the Daily frequency, set the scheduled job to collect every day for the previous (last completed) day.

Result

At the end of this workflow, you have an automated indicator that is populated with data. This automated indicator corresponds to a measurement, a critical success factor, or a supporting indicator that you designed in KPI Composer.

What to do next

You can include this indicator in a formula indicator. You can also design widgets to visualize the indicator and create dashboards to share these visualizations with the appropriate stakeholders.

Indicator sources

Indicator sources are data sets consisting of filtered records from one table or database view.

An indicator source configuration specifies a table, such as Incident [incident], conditions for filtering records from that table, and a frequency that you base on the conditions. An indicator source cannot specify a rotated table. Multiple indicators can use the same indicator source. Data collection jobs query the database once for each indicator source. Thus, all indicators that use the same indicator source get data from the same point in time.

Typically, an indicator tracks the situation on a certain date. The indicator source conditions should include a date-related filter, such as `[Opened][on][Today]`. Indicators collected less frequently might specify a larger date range, such as `[Closed][on][This month]`.

Create indicator sources carefully. Since multiple indicators may be linked to an indicator source, it is not easy to change the indicator source after you created it. Furthermore, changing an indicator source can cause a disjoint with scores that you have already collected.

Note: Indicator sources must be created before you can create an indicator.

Define an indicator source

To provide a filtered data set of records that you can evaluate with one or more indicators, create an indicator source.

Before you begin

Look at the list of indicator sources, for these reasons:

- An indicator source that meets your requirements may already exist. To help maintain your instance, you should not create duplicate indicator sources.
- Ensure that you give a unique name to any indicator source that you create. Giving the same name to different indicator sources can be confusing.

Role required: pa_data_collector or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Use one of the following navigation paths:
   - If you are on an upgraded instance that has not migrated to Platform Analytics, navigate to **All** > **Platform Analytics Administration** > **Data Sources** > **Indicator Sources** and select **New**.
   - If you are on a new instance or have migrated to Platform Analytics, navigate to **All** > **Platform Analytics Administration** > **Data Sources** > **Indicator Sources** and select **New**.
2. Enter a unique **Name** by which you can easily see what the indicator source is used for, such as **Incidents.Open**.
3. Add a detailed **Description** to help others understand the use and purpose of this indicator source and to help them avoid creating duplicates.
4. In the **Calendars** field, select either the standard calendar or a business calendar that is defined on the instance.

   Warning: If you use a business calendar and later alter that business calendar's entries, you invalidate your Performance Analytics data. The scores you collected before changing the entries will not be compatible with the scores you collect after you change the entries. This warning also applies to fiscal calendar schedules.

   If you use a business calendar, you can create data collection jobs that run on the Business Calendar: Entry start or Business Calendar: Entry end times.
5. Fill either the **Valid for frequency** or **Calendar Frequency** field.
   - If you select the standard calendar, you have the **Valid for frequency** field. This field gives you a choice of standard indicator frequencies. The default choice is **Daily**.
   - If you select a business calendar, you have the **Calendar Frequency** field. This field is required. The business calendar you selected determines the range of frequencies that are available.

   Indicators based on this indicator source use the value of this field as the indicator **Frequency**. By default, the score collection periods on the indicators follow this frequency. You can override this behavior on the indicator record.

   If you are uncertain about the frequency to set, base the frequency on your business cycle.
6. Select a facts table, either directly or by reusing a report source.

Field	Description
Facts table	Specify the facts table and any conditions for filtering the records of that table. You can specify a database view as the facts table. Remote tables and Workflow Data Fabric tables are not supported.
Report source	Specify an existing report source to reuse. A report source specifies a facts table and filtering conditions. If the report source changes, a warning appears when you view the indicator source to inform you about the change. To update the indicator source, click the refresh button next to the **Report source** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Warning:

- Performance Analytics does not support remote tables.
- Performance Analytics does not support Workflow Data Fabric tables.
- Do not change the facts table for a source after you have started collecting data. If you change the facts table, you lose all historical scores for the associated indicators at the next score collection.

7. If you select a facts table directly, add **Conditions** that must be fulfilled before the data is included in the subset.

   Example
   For example, set the conditions `[Active] [is] [true]` or `[Created] [at or before] [date]`.

   Tip:

   - Indicator source conditions on text fields are not case-sensitive.
   - Conditions set on indicator sources and indicators all apply.
   - For an indicator to display real-time scores, set a condition either on the indicator or the indicator source.
   - Due to the reusability of indicator sources, use only high-level criteria to define indicator source conditions. Use the advanced filters on individual indicators to go deeper into the data.
   - Indicator sources should have at least one date condition, such as [Created][on] [Today].
   - Usually, your date conditions should refer to the same time period as the indicator frequency. For example, conditions about the number of days should only be on daily indicators. Conditions about the number of months should only be on monthly indicators.
   - Avoid dot-walking to the sys_id or display value of a table. Instead, use the reference field by itself, to avoid creating unnecessary joins.
   - If you design the indicator source conditions well, at least one of the indicators on that source does not have any additional conditions of its own.

   For general information about building conditions, see Condition builder.

8. **Optional:** Define **RELATED LIST CONDITIONS** to include a relationship with another table in the filter.
   For more information, see Add related list conditions.
9. To see how many records this indicator source would return, click **Preview**.

Warning:

You may exceed the maximum limit of collected records despite what the Preview function shows. The Preview function shows you a lower number of records than the number that the data collector actually fetches. The Data Collection job ignores ACLs and business rules when fetching records, but the Preview function follows them. For more information, see KB0756238.

10. In the Records View tab, in **List view**, select the default view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The default view applies on Workbench widgets and to the lists of records collected for this indicator source on the Analytics Hub and KPI Details. The available views vary depending on the facts table.

11. **Optional:** In the Records Collection tab, override the maximum number of records that a job can collect for a single indicator source, for this indicator source only.
Select **Override record collection**, then enter a value in **Maximum number of records collected**. You are overriding the default value set on the property *com.snc.pa.dc.max_row_count_indicator_source*. For more information, see Performance Analytics properties.
12. Expand the context menu and click **Save**.
13. **Optional:** If you have configured this indicator source to use a business calendar, set the number of periods for retaining scores and snapshots and for finding seasonal patterns. These settings apply to all indicator sources and indicators that use the same calendar frequency. The owner of an indicator can override these settings for that indicator. If you do not set these values in the indicator source, the first time someone creates an indicator using this calendar frequency, they are prompted to set these values.

    a. In the Related Links, click **Configure retention periods**.
    A PA Business Calendar Retention Period record opens.

    b. In the **Number of entries to establish seasonality** field, enter the number of time periods, as defined in the business calendar or schedule entries, that are necessary to find seasonal patterns.
    For more information about business calendar entries, see Creating business calendars.

    c. Set the number of time periods, as defined in the business calendar or schedule entries, to retain scores and snapshots.
    A default value of one is provided, but you should consider changing it.

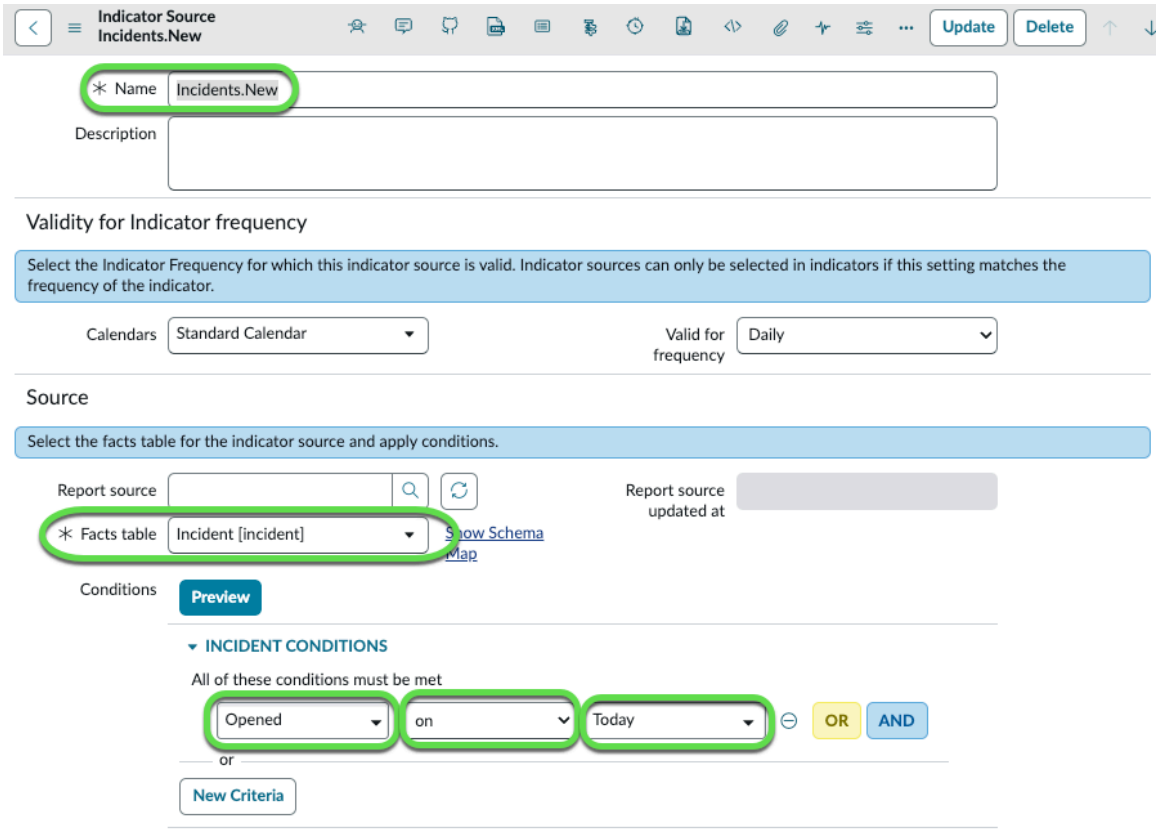
Example: Simple indicator source

The following settings create an indicator source that collects new incidents daily:

- **Name**: `Incidents.New`
- **Frequency**:`Daily`
- **Facts table**:`Incident [incident]`
- **Condition**:`[Opened] [on] [Today]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create indicator sources



What to do next

After you create an indicator source, you can define text index configurations in a related list on the record. Use these configurations to create Performance Analytics text widgets with word clouds. For more information, see Set up text analytics.

If you are reusing a report source and the report source changes, a warning appears on the indicator source record. To update the indicator source to match the report source, click **Update report source**. You can also click the refresh button next to the **Report source** field.

The read-only **Report source updated at** field displays the last time the report source was updated. This date and time always appear in the GMT time zone.

- Report sources
- Creating business calendars

Use a database view in an indicator source

You can select a database view as the facts table in an indicator source. Database views enable you to combine data from tables in your ServiceNow instance that are not connected by default.

Before you begin

Role required: pa_admin

About this task

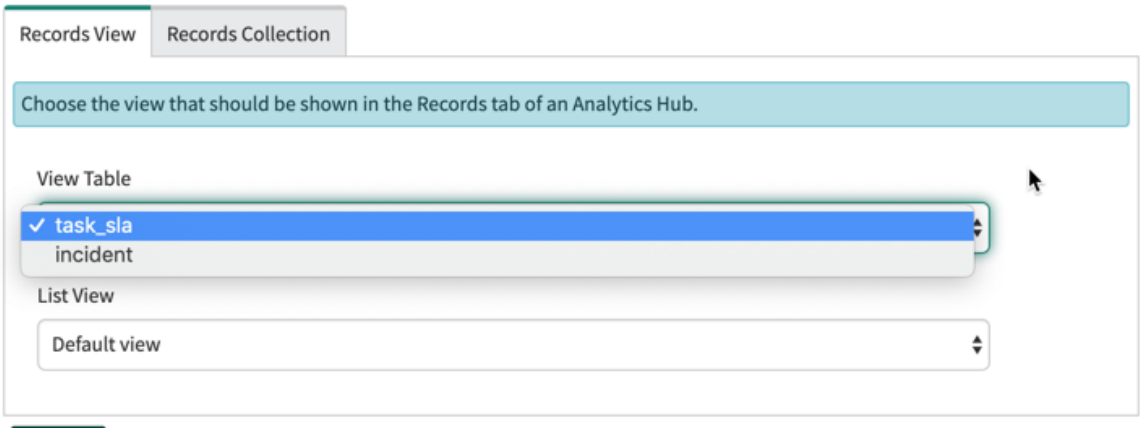
By joining tables in a database view, you can easily access them by calling up the view. Then you can select fields from any of the tables included in the view. For example, if you want to report on the number of SLAs breached, you need fields from both the SLA and the Incident tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

If you select a database view as the facts table for an indicator source, provide additional configuration in the **Records view** section of the Indicator Source form.

Records View section on the indicator source form



Field	Description
View Table	A snapshot of records is collected from only one table in the database view. Select which table has its records collected. **Important:** If you change this value, you effectively remove all earlier snapshots. This change takes effect the next time that the data collection job runs. This change does not affect historical scores.
List View	Select the list view used to display collected record sets. **Default view** is suggested, but you can select any defined view, such as **Workspace**.

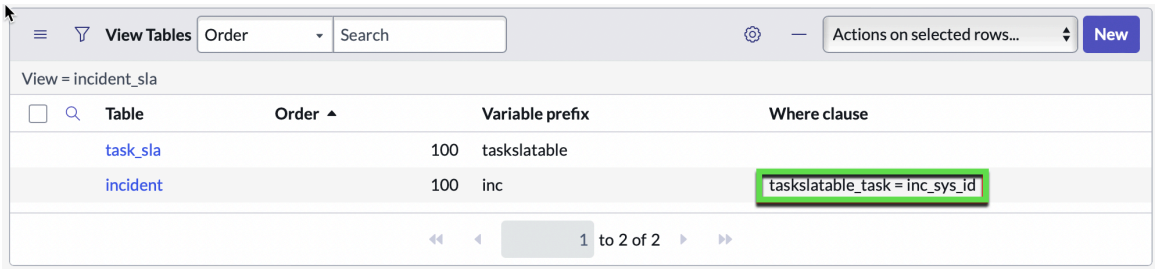
Note: If you collect second-level breakdowns on a view table that does not generate unique system IDs, the score and the number of records may disagree. If these values disagree, the score is correct. The record count is wrong because it is an artifact of non-unique sys_ids.

Example: Indicator source from database view

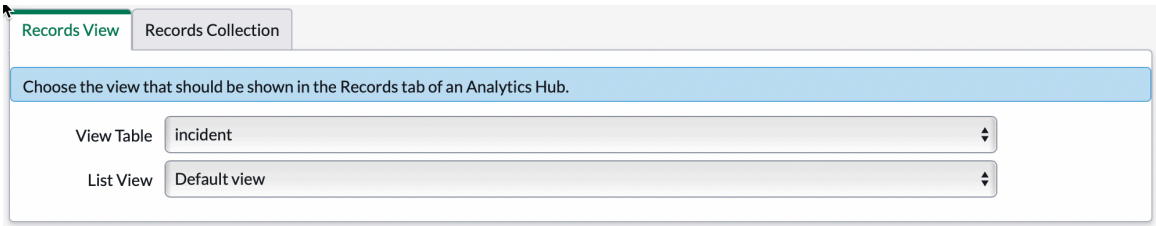
Let's say you want to create some indicators tracking the number of incidents that violate SLAs. You already have a database view included in your base system called incident_sla, which joins the Task SLA [task_sla] and Incident [incident] tables. Therefore, you create a new indicator source using this database view.

Looking at the database view, you see that it gets the records where the task on the Task SLA table matches the unique sys_id value on the Indicator table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You can only take snapshots from one table, and it is generally better to take snapshots of the table with a field with unique values. Therefore, you select Incident [incident] as the View table on the indicator source.



Related topics

Database views

Automated indicators

An automated indicator uses an indicator source as its data set. The indicator source specifies a table or database view, conditions for filtering records from that source, and the frequency at which you expect to display the data. The indicator applies an aggregator and optional conditions to this data.

Automated indicators are the most frequently used type of indicator and are perhaps the most fundamental component of Performance Analytics. Use an automated indicator to calculate scores on a set of records from a table that stores information about a business process, such as change requests or HR cases. You have the score calculated automatically in a scheduled data collection job, which follows the same periodicity as the frequency in the indicator source. You also set one or more data collection jobs that you run manually, for example to collect a span of historical data when you first create the indicator.

You can associate the indicator with any number of breakdowns to slice or filter the indicator scores. For example, if you have an indicator for the number of open incidents, you can associate this indicator with the Priority breakdown to see how many Critical priority incidents you have. You can also associate the indicator with the Category breakdown to compare the number of Hardware and Software incidents.

If you have an indicator source to use and want to create a fairly straightforward automated indicator, you can use the wizard. If you need to specify the indicator more fully, use the form that is described in this section. For more information about creating an indicator from a wizard, see Create an automated indicator with a wizard. Before creating an indicator through either means, plan out your indicator as described in Planning your indicators. Also see whether an appropriate indicator is already available in one of the baseline Performance Analytics Solution content packs.

You can use automated indicators as inputs to a formula indicator, for example to calculate the percentage of open incidents that are new incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an automated indicator

To analyze the performance of a business process that is recorded in a ServiceNow table, use an automated indicator. If a suitable indicator is not provided in a Platform Analytics Solution, create a new one.

Before you begin

You must have a suitable indicator source, as explained in Automated indicators. You also should design your KPIs as part of a business strategy before you create them, as described in Design your Performance Analytics solution with KPI Composer and Planning your indicators. Also familiarize yourself with the Workflow for creating indicators.

Note:

- You must have a subscription for Performance Analytics to create indicators.
- If you're using domain separation, the indicator is created in the domain that you're currently in.

Role required: pa_power_user, pa_admin, or admin

About this task

This form provides all the many options for creating an automated indicator. To create a simple automated indicator quickly, see Create an automated indicator with a wizard. However, for deeper information about indicator options and for tips, read this topic first.

Procedure

1. Use one of the following navigation paths:
   - If you are on an upgraded instance that hasn't migrated to Platform Analytics, navigate to **All** > **Performance Analytics** > **Indicators** > **Automated Indicators** and select **New**.
   - If you are on a new instance or have migrated to Platform Analytics, navigate to **All** > **Platform Analytics Administration** > **Indicators** > **Automated Indicators** and select **New**.
2. In the **Name** field, give the indicator a descriptive name, such as Number of Critical Incidents.
3. Add a meaningful **Description** to help other users understand the purpose of this indicator.
4. Scroll to Indicator properties.
5. If you prefer that the score of this indicator increases or decreases over time, select **Maximize** or **Minimize** in the **Direction** field.
   Analytical tools and graphic displays use this **Direction** with this indicator.

   Tip: Set a direction whenever you can. All key indicators should be set to Maximize or Minimize.

Value	Use case
Maximize	Select if an increase in this indicator score is desired. For example, consider selecting **Max imize** for an indicator that shows revenue. An alytic tools and graphic elements reflect that an increase in this indicator score is good and a decrease is bad.
Minimize	Select if a decrease in this indicator score is desired. For example, consider selecting **Min imize** for an indicator that shows costs. Analyt ic tools and graphic elements reflect that a de

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Value	Use case
	crease in this indicator score is good and an increase is bad.
None	Select if the direction of change in this score doesn't matter to your business.

6. Scroll to the **Source** tab and select an **Indicator Source**.
   Entering a partial name in the field filters the list of available indicator sources accordingly.

   If you are using domain separation, you can select only indicator sources to which you have visibility.

7. In the **Aggregate** field of the **Source** tab, select the aggregate function to apply to the data from the indicator source.

   Count counts the number of records. **Count distinct** counts the number of unique values rather than the total number of records. For example, if the name of a user appears more than once in a list, the user is only counted once. Other choices perform the specified aggregate operation, such as summing the values in a field across records.

   If you select a Sum, Minimum, or Maximum aggregate, consider excluding some types of time series from being applied to the indicator. For more information, see Exclude time series from an indicator.

   Tip: Try to avoid using the Average aggregate, because that aggregate can complicate the use of time series. Instead, create a Sum automated indicator and a Count automated indicator. Then create a formula indicator that divides the Sum indicator by the Count indicator to calculate the average.

8. Complete any remaining fields in the Source tab.
   If the **Aggregate** is set to **Count**, only the **Collect records** and **Value when nil** fields are available.

Source tab fields

Field	Description
Collect records	Check box to indicate if the individual record sys_ids are stored when the indicator is collected. Selecting this check box enables you to drill down to those details in the Analytics Hub and widgets. When available, collected records appear on the **Records** tab. **Tip:** Generally avoid collecting records with aggregates other than Count and Sum. Users rarely want to see the records that go into a Min or Max, and the number of records in a Count Distinct may differ from the score. Consider collecting records for indicators with these other aggregates only if a user asks for them.

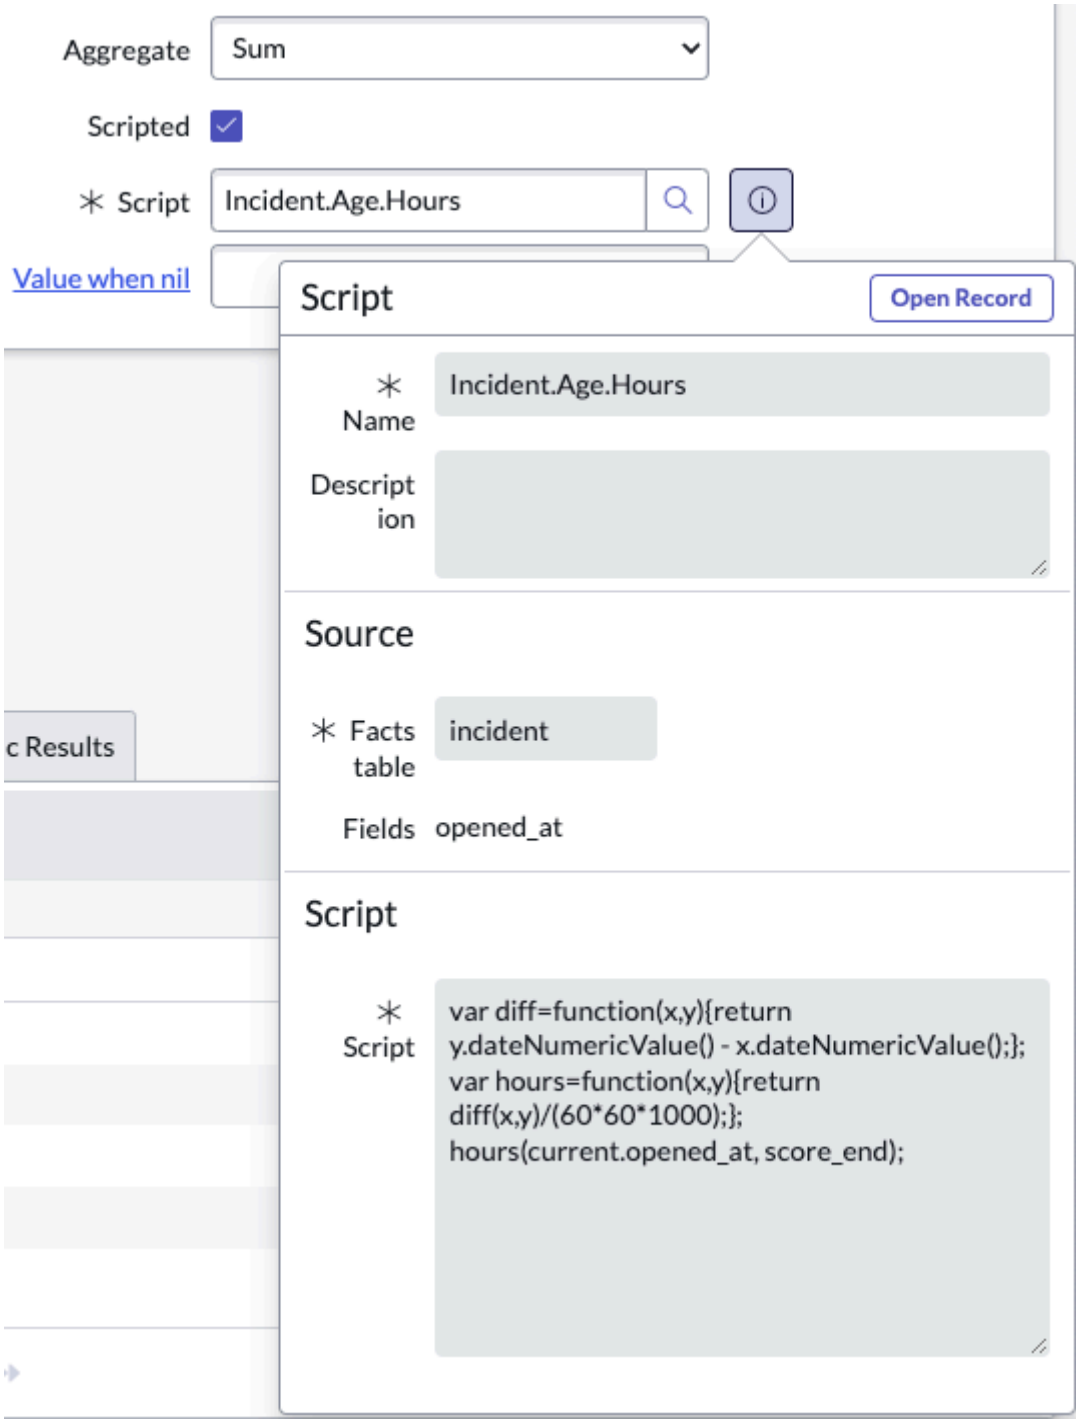
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	You must enable this option for the main indicator of a Spotlight group. Otherwise, the Spotlight group can't evaluate a snapshot of collected records. For more information, see Evaluating a snapshot or platform data.
Scripted	A check box to indicate if the value should be aggregated based on a script. This option is available only if **Aggregate** isn't set to **Count**. Clear the **Scripted** check box to aggregate the values in a field.
Field	The field to perform the aggregate operation on. This field appears only if **Aggregate** isn't **Count** and **Scripted** isn't selected.
Script	Select a script or create a script for the aggregation. This option is available only if the **Scripted** check box is selected. For more information, see Scripting in Performance Analytics.
Value when nil	The value that is inserted as the score when no value is collected. This value is inserted whether or not breakdowns are applied. This value isn't used to calculate formulas or aggregates, such as an average.

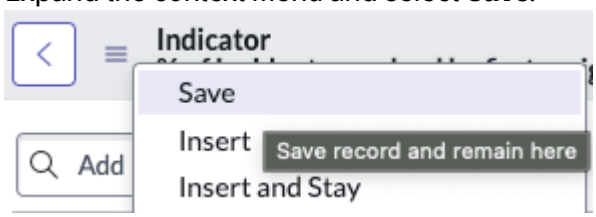
Example

For example, the indicator Summed age of open incidents uses the Sum aggregate. Because it uses this aggregate, it must have either a field or a script specified. In this case, it's scripted and uses the Incident.Age.Hours script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



9. Expand the context menu and select **Save**.



10. Set the periodicity of the indicator if you're prompted to do so after saving.

    You're prompted to set the periodicity only in the following circumstances:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The indicator source for this indicator uses a business or fiscal calendar.
- This indicator is the first one that uses that calendar.

These settings apply to all indicators with the same calendar frequency, unless you override the settings in the **Collection periods** tab. For more information, see the section "Indicators with business calendars."

a. In the Related Links section, select **Configure periodicity**.
A PA Business Calendar Retention Period record opens.

b. In the **Number of entries to establish seasonality** field, enter the number of time periods, as defined in the business calendar or schedule entries, that are necessary to find seasonal patterns.
For more information about business calendar entries, see Creating business calendars.

c. Set the number of time periods, as defined in the business calendar or schedule entries, to retain scores and snapshots.
A default value of one is provided, but you should consider changing it.

11. In the **Jobs** related list, select jobs that support your indicator source.
Usually you have one Historic job and one update job that matches the indicator frequency, such as [PA Incident] Historic Data Collection and [PA Incident] Daily Data Collection. These jobs support the Incidents.* data sources.

12. Perform one of the following procedures:

- If no prompts appear to take further action and the indicator meets your requirements, press **Manage Breakdowns** to add breakdowns to your indicator. For more information, see Assign and map breakdowns
- If you are prompted to take further action or you have designed a more elaborate indicator, complete the advanced indicator settings.

Related topics

Create an indicator group

Collect and manage a matrix of breakdowns

Advanced indicator settings

After you create an automated indicator with the required settings, you can configure optional, advanced settings.

Before you begin

You have created and saved an automated indicator.
Role required: pa_power_user

Procedure

1. Optional: Under Indicator properties, specify any of these properties:

Field	Description
Key	Identifies the indicator as a key indicator. Used only to filter the list of indicators in **Performance Analytics** > **Analytics Hub**. Not used in Platform Analytics experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Unit	The unit of measurement for the score, such as number, days, or percentages. (Optional) To collect scores in the system reference currency on a Price, Currency, or FX Currency field, select **Use reference currency**. For more information, see Indicator scores in reference currency. If you select % or a time period as the unit, consider excluding some types of time series from being applied to the indicator. For more information, see Exclude time series from an indicator. If you select Time as the unit, the time is given as Days, Hours, and Minutes. If the system property `glide.ui.duration.seconds.enabled` exists and is true, seconds are also displayed. In this case, seconds are also displayed for all-time fields on the instance and are included in exports to Microsoft Excel.
Precision	The number of digits behind the decimal separator. For more information, see Rounding and precision in indicators. This field isn't available when the unit is **Use reference currency**. In this case, the precision is inherited from the reference currency.
Number format	The abbreviations used for large numbers, thousands through quintillions. For more information, see Rounding and precision in indicators.

2. In the **Additional Conditions** tab, add conditions to limit the set of records that the indicator evaluates.
   The conditions in the indicator apply in addition to the conditions in the indicator source.

   For real-time scores to be displayed, a condition must be set in the indicator or indicator source.

   For more information, see Conditional filters and operators for indicators and breakdowns.

3. In the **Access control** tab, set whether to save this indicator to the library and whether to limit the visibility of the indicator by user, group, or role.
   Activating **Show in library** means that the indicator will be available in the following places:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The Platform Analytics indicator library
- KPI Details
- Analytics Hub, but only on upgraded instances that haven't fully migrated to Platform Analytics

4. **Optional:** In the **Other** tab, set various miscellaneous properties.

'Other' tab fields

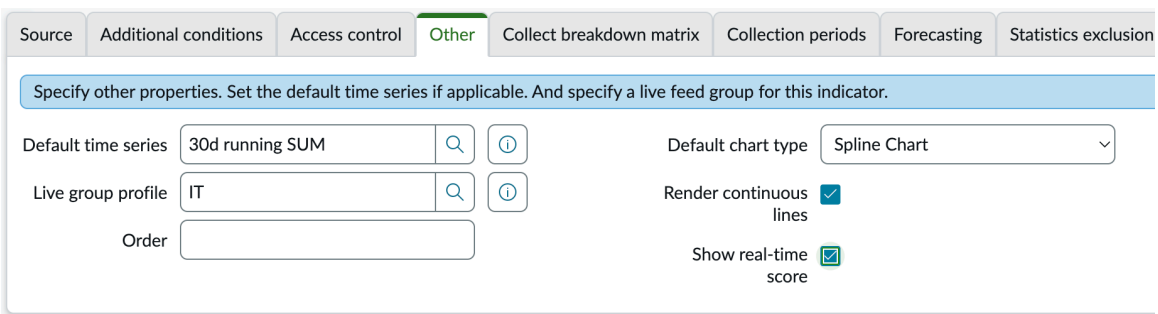
Field	Description
Default time series	(Optional) A predefined analytical function, like a 7-days running average, to apply to the indicator instead of showing the raw scores of the indicator. For more information, see Applying time series aggregations. **Note:** You can't set the default time series for an indicator that uses a business or fiscal calendar. These calendars do not support time series aggregations.
Live group profile	(Optional) Live Group Profile [live_group_profile] record for a Live Feed group. Specify a group profile to cause that group to get notifications about this indicator. For more information about this social application on the ServiceNow AI Platform, see Live Feed.
Order	(Optional) Number indicating the order in which indicators are displayed in the Analytics Hub. Indicators with the lowest value are displayed at the top of the list. If no values are provided in the **Order** field, indicators are displayed from a to z using the **Name** field. To use the order field, you must enter order numbers for all indicators. If you put in numbers for only a few indicators, the order in which indicators are displayed reverts to a to z. Not used in Platform Analytics experience.
Default chart type	(Optional) Set a default chart type (line, column, spline, or area) for this indicator. When opening the Analytics Hub or KPI Details for this indicator for the first time, the default chart type is used. If the chart type is

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	changed in the Analytics Hub or KPI Details, that preference is remembered.
Render continuous lines	(Optional) When selected, the Analytics Hub and KPI Details show unbroken data lines for this indicator, even when there's no data for a specific date. This behavior may be useful when displaying datasets with varied starting dates or for data that aren't regularly updated, such as stock information. Continuous lines aren't rendered when a time series is set on the indicator or the Analytics Hub or KPI Details.
Show real-time score	(Optional) When selected, the Analytics Hub and KPI Details can show the score of this indicator in real time, as well as the current state of associated records. Clear this check box when indicator data isn't available in real time, such as in an integration that uses data from a third-party source. For more information, see Real-time scores. Note: A condition must be set on the indicator or the associated indicator source for real-time scores to be displayed.

Example
For example, in the Other tab you can configure an indicator as follows:

- By default, it shows a 30-day running sum of scores in widgets. You can override this default in the Analytics Hub, KPI Details, dashboard widgets, or workspace data visualization.
- The IT Live Group is notified of changes to the indicator.
- The indicator is listed third in the Analytics Hub list of indicators. All other indicators also have their position specified. This setting does not affect the order of indicators on KPI Details.
- The default chart type is Spline on KPI Details.
- Data lines for the indicator are shown unbroken, even when data is missing.
- KPI Details can show the score of this indicator in real time.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** In the **Collect breakdown matrix fields** tab, you can enable second-level breakdowns for the indicator, such as Open Incidents by Category by Priority.
   Enabling second-level breakdowns can significantly impact performance. For more information, see Collect and manage a matrix of breakdowns.
6. **Optional:** In the **Collection periods** tab, override the properties that set the maximum number of periods prior to today for which scores and snapshots are collected and kept.
7. **Optional:** In the **Forecasting** tab, set the forecast method, the number of data collection periods to forecast, the amount of historical data to base the forecast on, and the upper and lower limits of forecast values.
   For more information, see Performance Analytics scores forecasts.
8. **Optional:** In the **Statistics exclusion** tab, select any statistics that you do not want to show on KPI Details or the Analytics Hub.

   Example
   For example, you might not want to show the Change % for an indicator with a percentage unit.
9. Press **Manage Breakdowns**.
   If you also see a button to **Enable data snapshots**, your instance supports unlimited breakdowns. For more information, see Data snapshots and multiple breakdowns.

Indicators with business calendars

Business and fiscal calendars do not have standard periods. Performance Analytics has introduced several innovations to accommodate these custom periods. Your workflow for creating indicators differs accordingly.

Important: The **Create New** indicator creation wizard does not support indicators based on business or fiscal calendars.

Differences in how periods are defined

Unlike the standard calendar, business calendars have custom periods based on business calendar entries. To accommodate this difference, the following properties are defined differently on indicators that use business or fiscal calendars:

- The indicator frequency is derived from the business calendar instead of from a static list of choices. The Frequency column of the indicator record is ignored. Instead, the Calendar frequency column is used.
- For forecasting, you have to specify the number of periods that are needed to find seasonal patterns. This value cannot be determined automatically from the calendar period, like for standard calendars. You set this value for each calendar frequency, in PA Business Calendar Retention Periods [pa_calendars_retention] records.
- You have to set the number of calendar periods to retain scores and snapshots. The system properties that set the default numbers of calendar periods for retaining data are ignored. Instead, set these numbers for each calendar frequency in PA Business Calendar Retention Periods records.

PA Business Calendar Retention Periods records and overriding them

When you first create an indicator that uses a particular calendar frequency, you are prompted to complete a PA Business Calendar Retention Periods record. Any indicators you make in the future with that calendar frequency use the same PA Business Calendar Retention Periods record.

You can override the settings in a PA Business Calendar Retention Periods record for a specific indicator. Override the defaults in the **Collection periods** tab of the indicator record, the same as

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

for standard calendar indicators. However, when you first select **Override retention periods**, you see the default retention periods for a Daily indicator with a standard calendar. These values are display artifacts only and you can ignore them. Put in the values you want, and they will override the PA Business Calendar Retention Periods record values.

Note: You cannot override the **Number of entries to establish seasonality** value from the PA Business Calendar Retention Periods record.

Business calendar groups

When you select an entry in the **Calendar** field other than the standard calendar, you actually select a business or fiscal calendar group. Both business and fiscal calendar groups are listed under **Business calendar** > **Business Calendar Groups**. Each business or fiscal calendar group contains a set of business calendars, which you select under **Calendar frequency**. Each business calendar in turn contains a set of either business calendar or schedule entries, for business and fiscal calendars, respectively.

The process for generating a fiscal calendar automatically creates a fiscal calendar group. For business calendars, the creator of the business calendar must also create the business calendar group, manually. If you have any questions, contact the admin responsible for creating business calendars. For more information, see Create a Business Calendar Group.

Automated indicators in formulas

A formula indicator can include automated indicators that use business calendars. The formula indicator must use the same business calendar as at least one of the contributing automated indicators. For more information, see Create a formula indicator.

Assign and map breakdowns

Select which breakdowns to assign to an indicator. Map which field on the indicator source references the breakdown source. If no appropriate field is available, specify a script to associate the indicator and breakdown sources.

Before you begin

The desired breakdowns must be defined with breakdown sources.

Role required: pa_data_collector, pa_power_user, pa_admin, or admin

About this task

You can create multiple mappings for the same breakdown, enabling you to use that breakdown for multiple indicators.

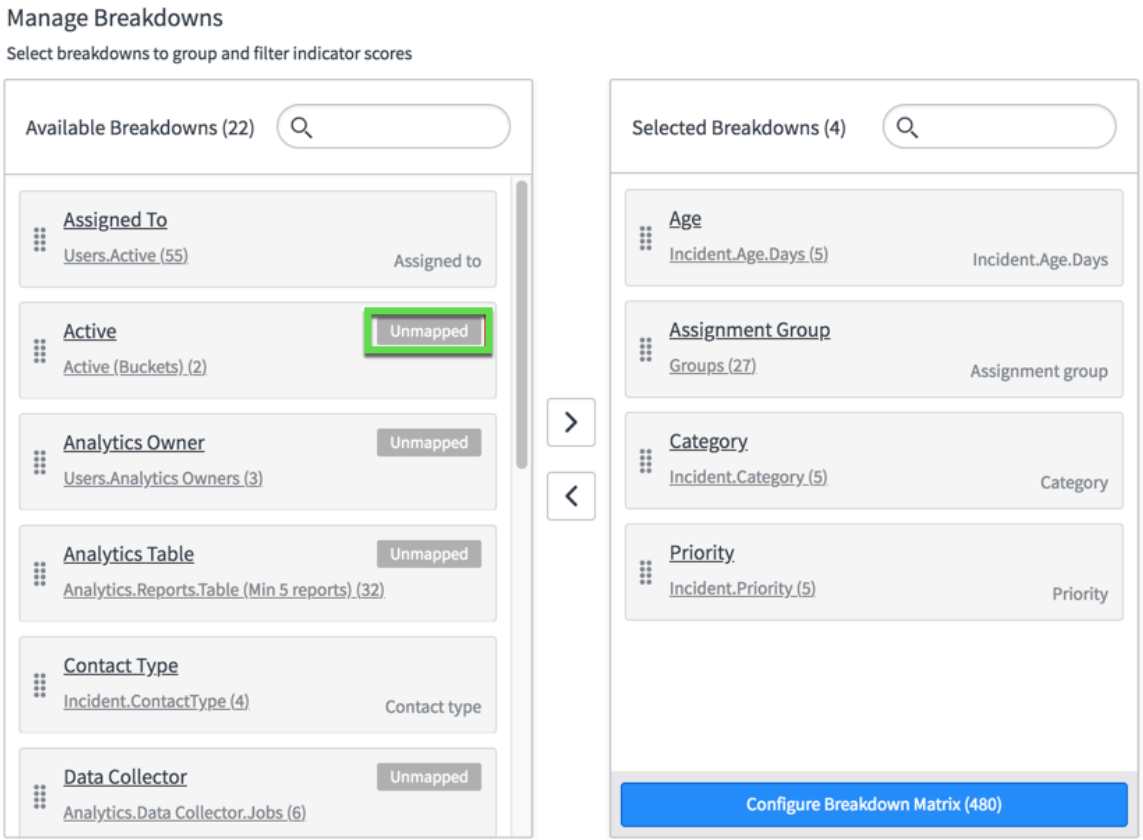
Note:

- You can only map breakdowns to an automated indicator. If you are assigning breakdowns to a formula indicator, try to select breakdowns that are already mapped to the automated indicators in the formula.
- The maximum number of breakdown elements that can be included in data collection is set in the property `com.snc.pa.dc.max_breakdown_elements_limit`. Warnings appear in the tool when this value is exceeded. For more information, see Performance Analytics properties.
- The procedure on this page uses a graphical tool. You can instead select the breakdowns for the indicator in the **Breakdowns** related list on the indicator form. You also can map the indicator fields or queries for the indicator source on the breakdown form. For more information, see Create a breakdown mapping on a breakdown record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

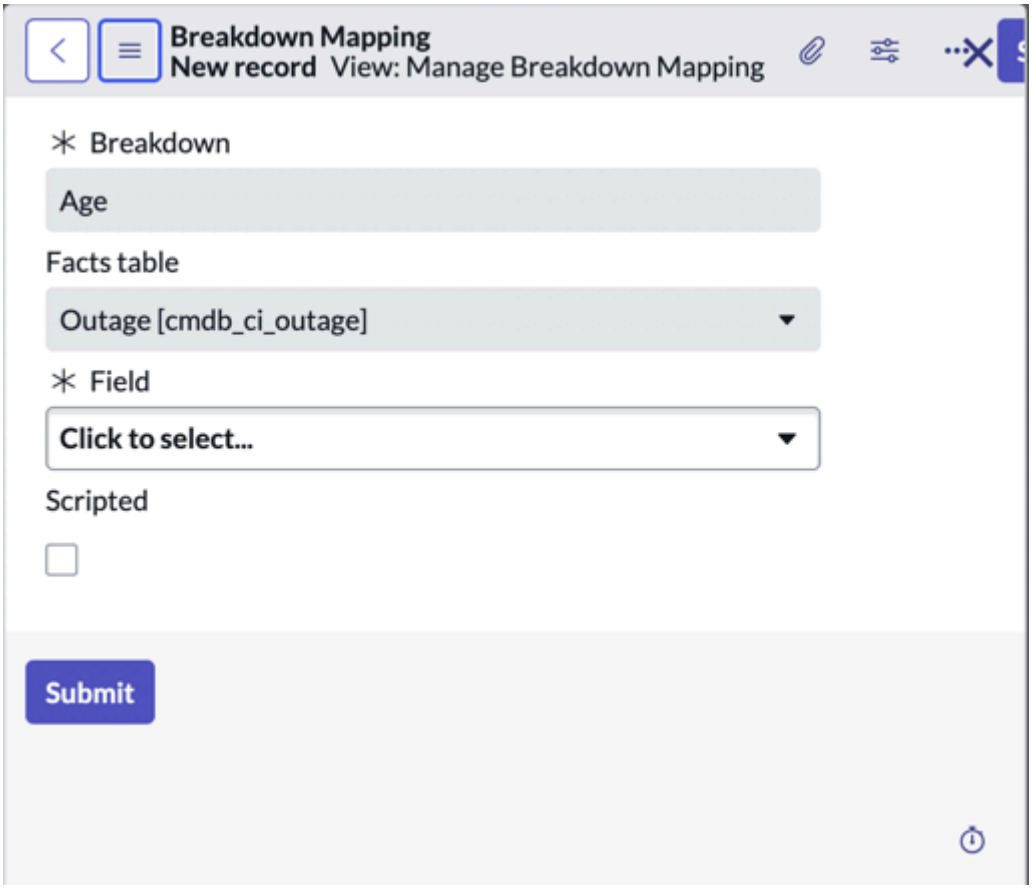
Procedure

1. Navigate to the indicator that you want to assign a breakdown to.
2. Press **Manage Breakdowns**.
   If you also see a button to **Enable data snapshots**, your instance supports unlimited breakdowns. For more information, see Data snapshots and multiple breakdowns.
3. Move the breakdown you want to assign to the indicator from **Available Breakdowns** to **Selected Breakdowns**.



If you add an unmapped breakdown, the **Breakdown mapping** dialog appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: If you are assigning breakdowns to a formula indicator, **Unmapped** icons are not displayed and the **Breakdown mapping** dialog never appears. You cannot map breakdowns to a formula indicator. To apply a breakdown successfully to a formula indicator, check that it is mapped to all automated indicators in the formula. If the formula contains other formula indicators, check the automated indicators in those formulas. Check all the way down, recursively. You do not have to check automated indicators that have been prevented from following breakdowns.

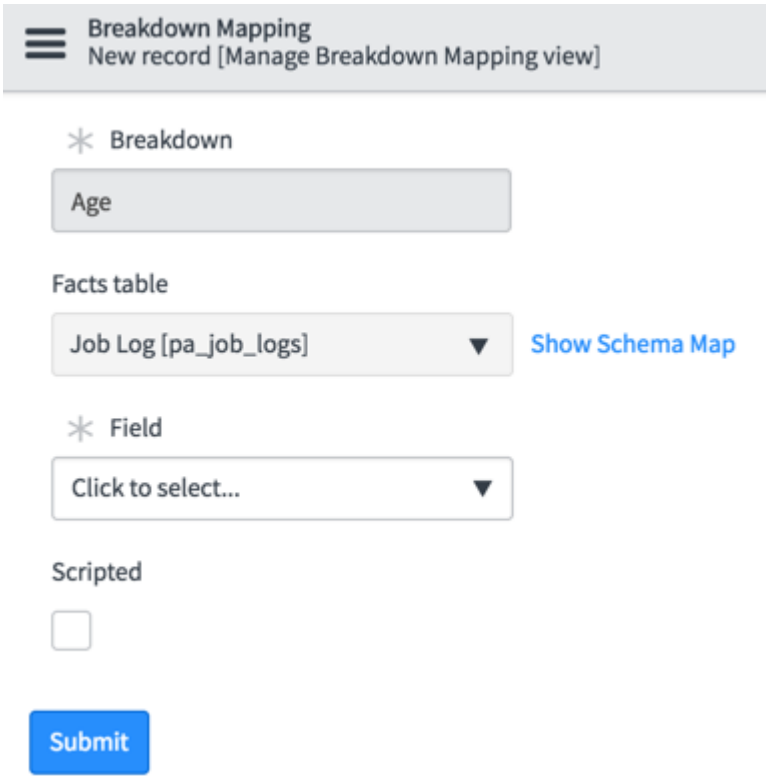
4. Complete the breakdown mapping as follows.

Option	Description
Use a field to map values to elements.	Select the **Field** in the indicator source that maps to records in the breakdown. See the use of the **Category** field in Example: Field mapping.
Use a script to map values to elements.	Select **Scripted**, then select the **Script** that defines the association between indicator records and breakdown elements. Use a script when you do not have the simple use case of a field in the indicator source that maps to a breakdown source table. A script can define a wide range of mapping relation ships. The most common use case is when the breakdown source is a bucket group and the script returns an integer to assign an indi

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	cator score to a bucket. See Example: Script mapping. You cannot show real-time scores for an indi cator that uses a scripted breakdown. **Tip:** Try to implement scripted break down mappings so that [mapping of lev el 1 && mapping of level 2] is equal to the intersection of [mapping of level 1] and [mapping of level 2]. Otherwise, the score and the number of records may not agree for second-level breakdowns. If these values disagree, the score is cor rect. For more details and an example, see KB0748969. Now Support login is required.

Note: If you click the **Facts table** choice list, it opens, but you cannot select a different facts table.



5. Click **Submit**.
6. Repeat steps 2–5 as needed, to define additional mappings.

What to do next

If you have assigned at least two breakdowns to an automated indicator, you can collect the two-breakdown combinations. If you do so, save system resources by excluding meaningless combinations of breakdowns from being collected. See Collect and manage a matrix of breakdowns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: If you enable data snapshots for an indicator, you are not limited to two-breakdown combinations and the indicator does not have a breakdown matrix. For more information, see Data snapshots and multiple breakdowns.

Apply the breakdowns in one of the following ways. In the classic environment:

- On the Analytics Hub
- When configuring a Performance Analytics widget for a dashboard
- On a breakdown dashboard
- In a breakdown widget on a dashboard

In the Platform Analytics experience:

- In KPI Details
- When configuring a data visualization for an indicator data source

Collect and manage a matrix of breakdowns

Collect a matrix of the two-breakdown combinations for an indicator. Exclude unnecessary or meaningless combinations of breakdowns from being collected.

Before you begin

Breakdowns must be assigned to the indicator. See Assign and map breakdowns.

Important: If you enable data snapshots for an indicator, you are not limited to two-breakdown combinations and the indicator does not have a breakdown matrix. For more information, see Data snapshots and multiple breakdowns.

Role required: pa_data_collector, pa_power_user, pa_admin, or admin

About this task

Sometimes, not all breakdown combinations give useful information. For example, the combination [Country, Region] gives the same scores as the breakdown Country. You can prevent the instance from collecting data for these invalid combinations with breakdown matrix exclusions. These exclusions are not shown in the Analytics Hub, in KPI Details, or in the scoresheet. You also cannot select excluded breakdown combinations when you create widgets or data visualizations.

To prevent performance issues, the property *com.snc.pa.dc.max_breakdown_elements_level2_limit* limits the number of elements from breakdown connections that are included in data collection. If you exceed this limit, some of the combinations in your matrix are grayed out. By excluding some breakdown combinations, you can help to avoid exceeding this limit. For more information, see Performance Analytics properties.

Note:

- The scores for individual breakdowns are still collected when the combination of those breakdowns has been excluded.
- Scores that were collected in previous jobs for breakdown combinations are not deleted when those combinations are later excluded. New scores for those combinations are not collected.
- These instructions are for using the graphical tool to manage breakdown matrix exclusions. However, you can also manage them in the **Breakdown matrix exclusion** tab of the indicator form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Automated Indicators**.
2. Select the automated indicator for which you want to configure the breakdown matrix.
3. Under **Indicator properties**, select the **Collect breakdown matrix** tab.
4. Select the **Collect breakdown matrix** check box.
5. Click **Manage Breakdowns**.
6. Click **Configure Breakdown Matrix**.
   The matrix shows the number of element combinations for each breakdown pair, calculated by multiplying the number of elements for the two breakdowns. Breakdown pairs with a higher number of combinations are shown in a darker color, to help you spot possible performance bottlenecks at a glance. By default, all combinations are included in data collection. You can select combinations to exclude from data collection.
7. **Optional:** In the **Breakdown Matrix** pop-up, select breakdown combinations to exclude from Analytics Hub and dashboard widgets.
   Included combinations are shaded in the breakdown matrix. Excluded combinations are white. If the number of breakdown combinations exceeds the value of `com.snc.pa.dc.max_breakdown_elements_level2_limit`, some combinations are grayed

   out.
8. **Optional:** On the indicator form, open the **Breakdown matrix exclusion** tab and see which breakdown combinations have been excluded.
   You can manage which breakdown combinations to exclude in this tab instead of using the graphical tool.

Add a collection job to an indicator

To collect scores for an automated indicator, add a collection job to that indicator.

Before you begin

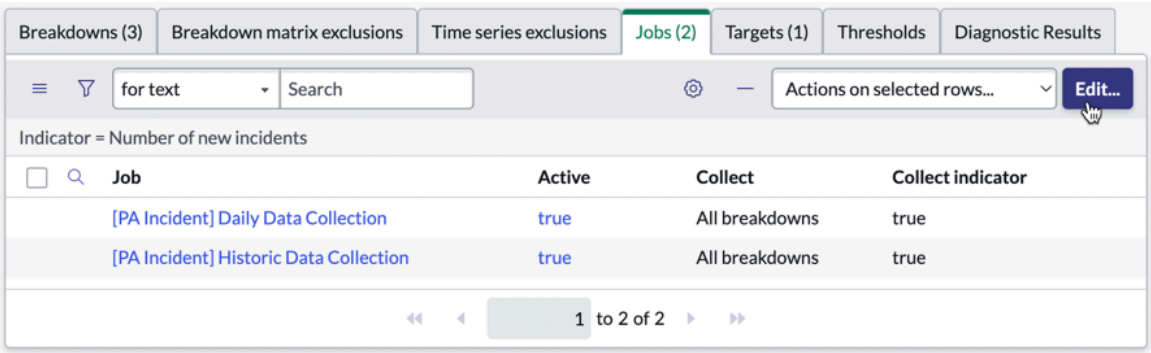
Note: This procedure shows how to add fully configured data collection jobs to an automated indicator, from the indicator side. For information about configuring data collection jobs and adding them to indicators from the job side, see Configure a job indicator. Only persons with the pa_data_collector role, such as Performance Analytics administrators, can configure job indicators.

Role required: pa_power_user, or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open an existing automated indicator.
2. In the **Jobs** related list, click **Edit**.



3. **Optional:** Use **Add Filter** and **Run Filter** to limit the selection of jobs.
4. Select one or more jobs in the **Collections** or **Jobs List**.
   Unless you have a clear use case to do otherwise, help keep your jobs manageable by selecting no more than one scheduled job for your indicator. Select as many unscheduled jobs as are relevant. Generally, add one historical job that you run only once on a new indicator.
5. Use the arrow buttons to move the jobs to the other list.
6. Click **Save**.

Performance Analytics snapshots

Snapshots are the lists of records (sys_ids) that are collected at the time that the scores for those records are collected. Snapshots enable users to drill down into the records from a Performance Analytics indicator visualization.

Only automated indicators can have snapshots. Snapshots are made only for those automated indicators that have **Collect records** enabled. The following features require records to be collected:

- Drilling down into individual records from the scores on a Performance Analytics widget.
- Showing records in Analytics Hub.
- Showing records in KPI Details.

Retention period

By default, snapshots are retained for 183 days. You can change this period either globally or for a specific indicator:

- To change the global snapshot retention period, edit the system property *com.snc.pa.dc.keep_snapshots_for.frequency*. For more information, see Performance Analytics properties.
- To change the snapshot retention period for an indicator, configure **Override collection periods** in the "Collection periods" tab of the indicator form. For more information, see Advanced indicator settings.

Create an automated indicator with a wizard

Quickly create a Performance Analytics automated indicator with breakdowns, widgets, and data collection jobs for that indicator. You still need to be trained in Performance Analytics and to have planned your KPIs to use this wizard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Familiarize yourself with Performance Analytics concepts and create indicators only as part of an analytics strategy. Plan your KPIs with KPI Composer. Study the Workflow for creating indicators.

Ensure that there is at least one indicator source and a data collection job for the indicator source facts table.

Warning: The wizard does not support the creation of indicators with business or fiscal calendars.

Role required: pa_contributor, pa_data_collector, pa_power_user, or pa_admin

About this task

These instructions are for using a wizard to create a simple automated indicator quickly. If you need access to the full range of indicator parameters, see Create an automated indicator.

Note: If you are using domain separation, the indicator is created in the domain that you are currently in.

Procedure

1. Navigate to **Indicators** > **Create New**.
2. Fill in the **General** tab.

General tab fields

Field	Description
Indicator name	A descriptive name, such as `Average number of open incidents`.
Description	An optional text description of the indicator. Can include purpose and internal logic. Descriptions can help you and other users remember the purpose of an indicator.
Direction	Select one of the following: ○ **None**: The indicator has no preferred trend up or down. ○ **Minimize**: The indicator score should decrease over time. ○ **Maximize**: The indicator score should increase over time.
Unit	The unit of the score of the indicator. Possible units include: ○ **#**: Simple number (default) ○ **$**: Dollars ○ **%**: Percent
Group	The indicator group to which the indicator belongs, if any.

3. Click **Next** and fill in the **Data Source** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Source tab fields

Field	Description
Indicator Source	A selection of the available indicator sources. An indicator source is a data source that refers to a ServiceNow AI Platform table and one or more conditions that filter the records on that table. After you select the source, you can select **Preview records for this indicator source**. If you are using domain separation, you can select only indicator sources to which you have visibility.
Aggregate	The aggregate function to apply when calculating the indicator on the indicator source. **Count** counts the number of records. **Count distinct** counts the number of unique values rather than the total number of records. For example, if the name of a user appears more than once in a list, the user is only counted once. Other choices perform the specified aggregate operation, such as summing the values in a field across records.
Field/Script	For any aggregate other than **Count**, you must specify either a field in the table that the indicator source uses, or a script. The aggregate function applies to either the value in the field or the value that the script returns.
Conditions	An optional list of values and operations to apply to fields in the table that the indicator source uses. These conditions stack with any conditions that are specified in the indicator source. Several limitations exist for conditions on indicators. For more information, see the step for adding additional conditions in Create an automated indicator.

4. In the **Breakdowns** tab, select which of the available breakdowns to apply to this indicator. For two levels of breakdown to apply, also select **Collect breakdown matrix**.
5. In the **Data Collection** tab, select the data collection job that will collect scores for this indicator.
   Scores will be collected depending on the schedule of the job. You can also run the job manually.
6. To collect scores from the past and create a trend, select **Collect data from the past** and specify the time period.
   This job runs only once, when you create the indicator. Not all indicators allow retrospective score collection. As an alternative, manually associate a Historical data collection job with the indicator and run it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. In the **Widgets** tab, select any combination of time series, last score, and breakdown widgets to create.
   You can also put the widgets in the tab of an existing dashboard. For more information about creating and displaying widgets from this wizard, see Indicator creation widget options.
8. In the Summary tab, review the changes, then click **Apply**.
   The indicator is created and linked to the selected indicator source, breakdowns, and data collection job. Any widgets associated with the indicator are created and added to the specified dashboard tab.
9. **Optional:** Click **Create another indicator** to restart the process with a new indicator.

What to do next

If the data collection job is configured to collect scores from the past, a temporary data collection job with a **Run** value of **Once** is created. You can delete this job record after the job runs.

Indicator creation widget options

There are several options for creating widgets to display the indicator data when creating an indicator and related records. You can create any or all of the available widget types.

Time series widget options

Field	Description
Time series widget options	
Time series widget	Select this check box to create a time series widget to display the indicator data.
Time series	Runs a function on the indicator scores for a specific time period, such as a 7-day sum or average. For more information, see Applying time series aggregations. **Note:** Business and fiscal calendars do not support time series aggregations. You cannot set a time series aggregation on a widget for an indicator that uses such a calendar.
Visualization	Select the chart type to use to display the data, such as **Line** or **Column**.

Latest score widget options

Field	Description
Latest score widget	Select the check box to create a score widget with a **Visualization** value of **Latest Score** to display the indicator data.
Time series	Runs a function on the indicator scores for a specific time period, such as a 7-day sum or average. For more information, see Applying time series aggregations. **Note:** Business and fiscal calendars do not support time series aggregations. You cannot set a time series aggregation on a widget for an indicator that uses such a calendar.

Latest score widget options (continued)

Field	Description
Periods back	Select the number of periods to compare the score with. For example, if the **Time series** is **By week SUM**, enter a **Periods back** value of **4** to compare the current score with scores from the past 4 weeks.

Breakdown widget options

Field	Description
Breakdown widgets	Select this check box to create a breakdown widget with a scorecard visualization for each breakdown applied to this indicator.

Dashboard display options for widgets

Field	Description
Put the widgets on a new tab on dashboard	Select a dashboard you want to add these widgets to. If you do not select a dashboard, widget records are created but they are not added to any dashboard.
New tab name	Enter a name for the new tab created to display these widgets. This field is required if you select a dashboard.

Performance Analytics widgets

Formula indicators

Formula indicators use data from other indicators to calculate new metrics.

Unlike automated indicators, formula indicators are not based on an indicator source that is populated during data collection. The score of a formula indicator is calculated from a mathematical statement that includes data from one or more other indicators. This data can be the score of an indicator or a `PAFormulaUtils()` calculated value for the indicator. For example, a formula can include the gap, or difference, between the score of an indicator and the indicator target value set in the Analytics Hub or KPI Details.

Important: Formula indicator scores are calculated when a user views the indicator on a dashboard or in KPI Details or the Analytics Hub.

Create a formula indicator in these cases:

- To calculate a score from multiple indicators, such as the average of two indicators.
- To extract a calculated value of an indicator from the `PAFormulaUtils()` API and perform operations on that value.
- To measure the gap to the overall target of multiple, combined indicators (an index indicator).

Tip: Training is available for creating and using formula indicators. See the course Formula Indicators Overview in the NOW Learning Center.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a formula indicator

Create a formula indicator to produce a new computed score from one or more other indicators. Besides indicator scores, the formula can include calculations such as the gap between an indicator score and the indicator target.

Before you begin

Role required: pa_power_user, pa_admin, or admin

About this task

Formulas are often used to:

- Calculate ratios and percentages.
- Combine data from different applications.
- Build predictive indicators based on historic performance.

The fields of a formula indicator are similar to the fields of an automated indicator. However, instead of Source, Additional Conditions, and Collection properties, a Formula Statement is defined. Formulas can consist of other indicators, constants, variables, and time series, or any combination of these elements.

Note:

- You must have a subscription for Performance Analytics to create indicators.
- If you're using domain separation, the indicator is created in the domain that you're currently in.

Procedure

1. Navigate to **All** > **Platform Analytics Administration** > **Indicators** > **Formula Indicators** and select **New**.
2. In the **Name** field, give the indicator a descriptive name, such as Average duration of open incidents.
3. In the **Calendars** field, select either the standard calendar or a business or fiscal calendar group.
4. If you selected a business or fiscal calendar, select the calendar frequency.
   At least one indicator in the formula must match the specified calendar frequency. The choice of calendar frequencies depends on the setting of the business calendar entries or fiscal calendar schedules.

   Example
   For example, the Gregorian calendar has Quarter, Month, Week, and Year frequencies. If you're using the Gregorian calendar, you must choose one of these frequencies.
5. If you prefer that the score of this indicator increases or decreases over time, select **Maximize** or **Minimize** in the **Direction** field.
   Analytical tools and graphic displays use this **Direction** with this indicator.

   Tip: Set a direction whenever you can. All key indicators should be set to Maximize or Minimize.

Value	Use case
Maximize	Select if an increase in this indicator score is desired. For example, consider selecting **Max imize** for an indicator that shows revenue. An

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Value	Use case
	alytic tools and graphic elements reflect that an increase in this indicator score is good and a decrease is bad.
Minimize	Select if a decrease in this indicator score is desired. For example, consider selecting **Min imize** for an indicator that shows costs. Analyt ic tools and graphic elements reflect that a de crease in this indicator score is good and an increase is bad.
None	Select if the direction of change in this score doesn't matter to your business.

6. Define the Formula for this indicator.

   a. To use a calculated value in the formula, tap **Browse for a method** (Repeatable).
   A dialog opens for you to insert a method from *`PAFormulaUtils()`* into the formula. This API returns the calculated value for an indicator. For more information about using this API, see Get analytics methods in formulas.

   b. To put the score of an indicator in the formula, tap the **Browse for an indicator** link and fill in the dialog (Repeatable).

Indicator selection dialog

Field	Description
Indicator	The indicator you're inserting as a contributing indicator into the formula. If you use a business or fiscal calendar for this indicator, at least one indicator in the formula must use the matching calendar and calendar frequency.
Breakdown, Element, second-level Breakdown, second-level Element	Up to two levels of breakdown and element for filtering the scores on the indicator. If you specify a breakdown, you must specify

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	an element of that breakdown. These breakdowns and elements apply only to this contributing indicator and not to the formula indicator as a whole.
Time series	A predefined analytical function, like a 7-days running average, to apply to the indicator instead of showing the raw scores of the indicator. This time series applies only to this contributing indicator and not to the formula indicator as a whole.
Allow breakdowns	Applies breakdowns that apply to the entire formula indicator, as opposed to individual indicators in the formula, to apply to this contributing indicator. Enabled by default. For more information, see Prevent a contributing indicator in a formula from following breakdowns. Breakdowns are added to the entire formula through the **Manage breakdowns** dialog, available after the indicator is saved. See Step 11.
Use in method	Returns a unique identifier instead of the score for this indicator. Select this box when you're specifying an indicator for a method in the formula. These methods get calculated values for the indicator from the Analytics Hub. For more information about using these methods, see Get analytics methods in formulas.

You could add indicators manually. However, by using the **Browse for an indicator** function, you ensure that you have the proper notation for indicators and breakdown elements.

After you save the formula indicator, the indicators in the formula appear in the **Contributing indicators** related list. If you included any formula indicators, their contributing indicators are also listed.

c. Add mathematical operators and symbols to the **Formula** as needed.

Enter any operators or numbers to include in the formula. Use valid operator symbols, such as +, -, /, %, >, <. You can also add more indicators to the formula. For example, to calculate the average age of open incidents based on summed age of open incidents and number of open incidents, use the following formula: `[[Summed age of open incidents]] / [[Open incidents]] / 24`

To specify a data collection period in the formula, you can use the variables `score_start` and `score_end` to refer to the start and end of the data collection period, respectively.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

However, see the caveats in Changes to score_start/end because of different user time zones.

> ⚠ **Warning:** Try not to use `GlideRecords` or `GlideAggregates` in Performance Analytics scripts or formula indicators. While sometimes you must use these operations to get what you want, they are expensive, potentially running hundreds of thousands of times. Be certain that no alternative exists before you use them.

7. In the **Access control** tab, set whether to save this indicator to the library and whether to limit the visibility of the indicator by user, group, or role.
8. In the **Other** tab, set miscellaneous properties.
   These properties apply to the entire formula indicator.

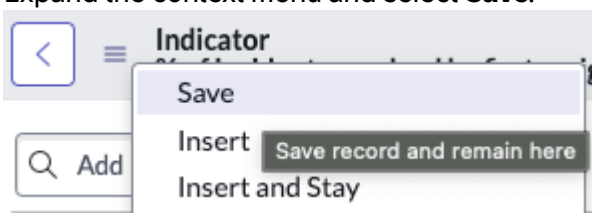
'Other' tab fields

Field	Description
Default time series	A predefined analytical function, such as a 7-day running average. Depending on whether **Apply time series to result** is set, this time series can apply either to each component indicator before the result is calculated, or to the result.
Live group profile	Live Group Profile [live_group_profile] record for a Live Feed group. Specify a group profile to cause that group to get notifications about this indicator. For more information about this social application on the ServiceNow AI Platform, see Live Feed.
Order	Number indicating the order in which indicators are displayed in the Analytics Hub. Indicators with the lowest value are displayed at the top of the list. If no values are provided in the **Order** field, indicators are displayed from a to z using the **Name** field. To use the order field, you must enter order numbers for all indicators. If you put in numbers for only a few indicators, the order in which indicators are displayed reverts to a to z. Not used in Platform Analytics experience.
Render continuous lines	When selected, the Analytics Hub and KPI Details show unbroken data lines for this indicator, even when there's no data for a specific date. This behavior may be useful when displaying datasets with varied starting dates or for data that aren't regularly updated, such as stock information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Continuous lines aren't rendered when a time series is set on the indicator or the Analytics Hub or KPI Details.
Apply time series to result	Applies a time series aggregation to the result of the calculation of the formula instead of to each component indicator before the result is calculated. This option applies to a time series selected for the indicator on a widget or on the Analytics Hub. If a default time series is specified for the indicator, this option also applies to that time series. For more information, see Applying time series to result or to contributing indicators.
Allow formula component to be NULL	Has the formula calculated even when it contains a null score. Useful for troubleshooting. For more information, see Detect indicators with no scores in a formula.
Allow aggregation of multiple breakdown element scores	Enables widgets to show the summed score of multiple breakdown elements on this indicator. If this field is selected, you can select either aggregated or separated values on the form for a breakdown dashboard that uses this indicator. Formulas based on addition, subtraction, or multiplication are generally good candidates for allowing aggregation. Percentages are also supported, provided the percentages total to 100%. On the other hand, the results of aggregating elements on averages, or of percentages that are not related, are usually not meaningful. ⚠ **Warning:** These aggregations are not checked for mathematical validity.

9. **Optional:** In the **Forecasting** tab, set the forecast method, the number of data collection periods to forecast, the amount of historical data to base the forecast on, and the upper and lower limits of forecast values.
   For more information, see Performance Analytics scores forecasts.
10. Expand the context menu and select **Save**.



11. To apply a breakdown to the entire formula indicator, press **Manage breakdowns** at the top of the page.
    By default, you can apply only breakdowns that are configured for every contributing indicator in the formula.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The system property *com.snc.pa.formula_indicator_valid_breakdown* controls this behavior. By default, it is true. Changing it to false allows you to apply a breakdown to a formula indicator when at least one contributing indicator uses that breakdown. Attempts to view scores for unsupported breakdowns in a widget, the Analytics Hub, or KPI Details result in a warning message instead of a value.

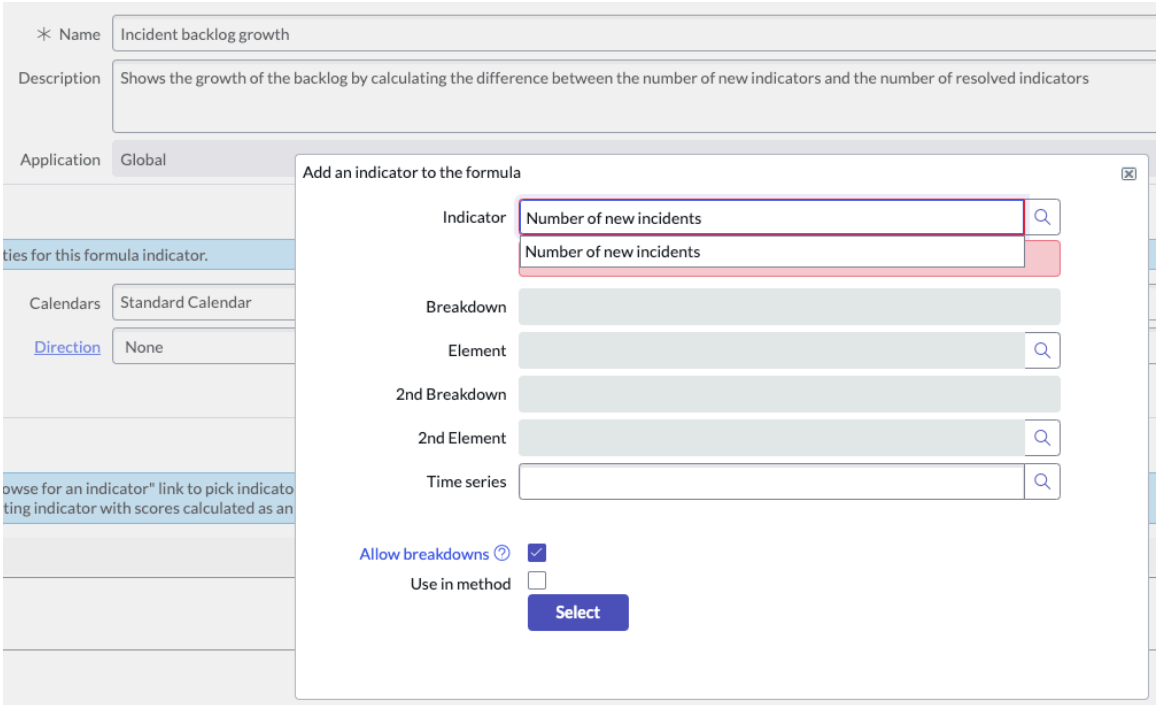
You cannot select a breakdown element in the formula indicator record. The breakdown can only be used interactively, meaning on the Analytics Hub, KPI Details, appropriately configured data visualizations, and dashboards. For information about using the **Manage breakdowns** tool, see Assign and map breakdowns.

Example: Incident Backlog Growth

As an Incident Manager, you want to improve the efficiency of incident resolution. You already track new and resolved incidents as the Number of new incidents and Number of resolved incidents indicators. However, these indicators do not tell you if you're achieving your goal of improving incident resolution.

You need a new Backlog Growth KPI to measure the volume of outstanding incidents. To implement this KPI, you create a formula indicator named Incident Backlog Growth, with the following formula:

```
[[Number of new incident]] - [[Number of resolved incidents]]
```



By turning on **Show in library**, you make the indicator visible in KPI Details. In the information panel on KPI Details, you can see the formula used in the indicator.

Get analytics methods in formulas

To insert a calculated value from the Analytics Hub into a formula, use a method in the formula.

Before you begin

Role required: pa_power_user, admin

About this task

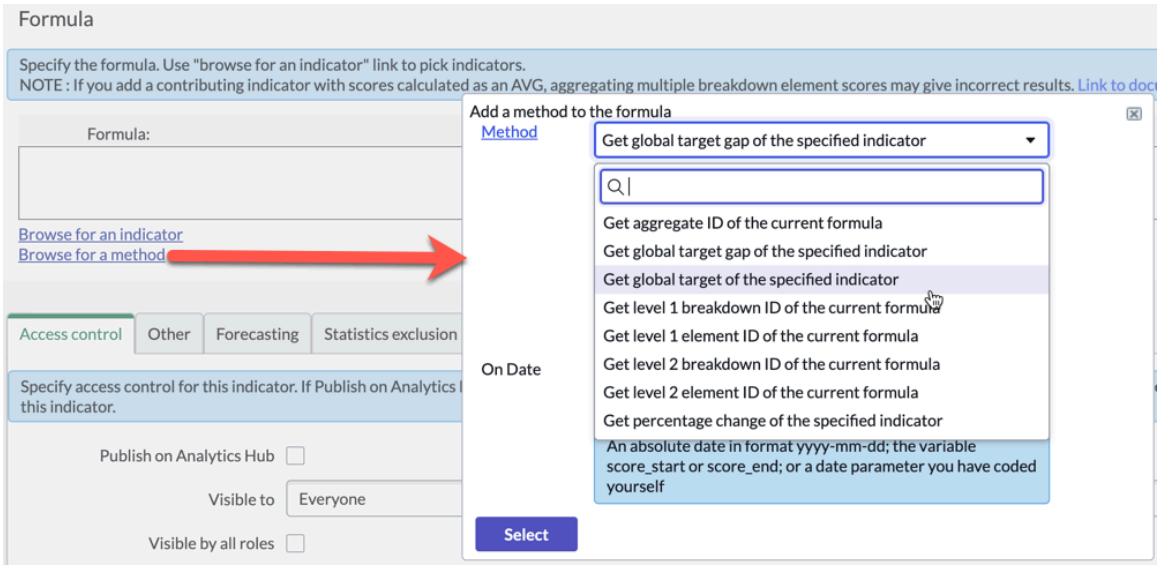
You can use a value that was calculated in the Analytics Hub as input for a formula. That value can be from any indicator, including from the current formula indicator itself.

To get a value from the Analytics Hub, insert a method from *`PAFormulaUtils()`* into the formula. To call one of these methods, use the Performance Analytics variable `pa`. For example, to use the *`PAFormulaUtils.getScore`* method, call `pa.getScore`. For more information, see PAFormulaUtils API.

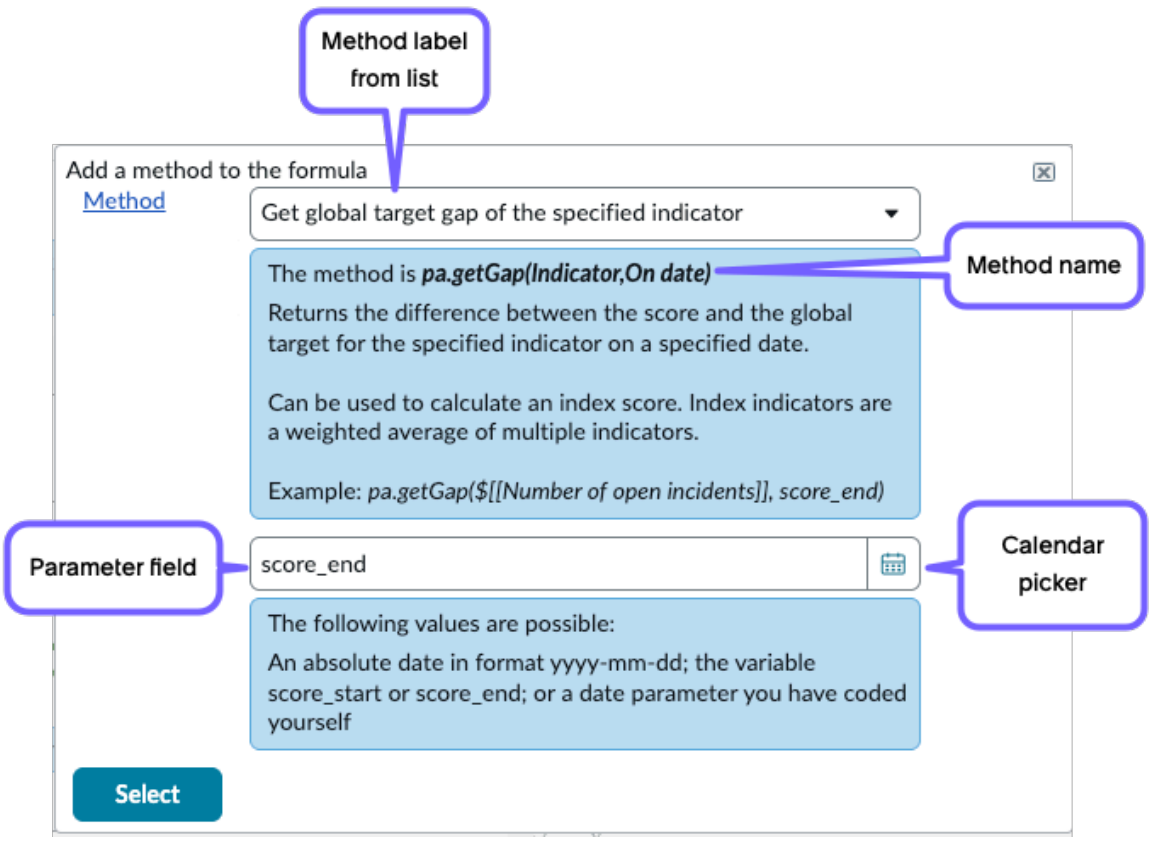
Procedure

1. Open the formula indicator record.
2. Beneath the Formula box, click **Browse for a method**.
   A dialog box opens where you can select a method.
3. Browse for the method that matches your needs.
   Methods refer either to the current formula that you are editing or to a different indicator that you must specify. The list shows a descriptive label for each method instead of the method name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select a method.
   When you select a method, a description opens, including the name of the method and any parameter fields.



Date fields can take the following values:

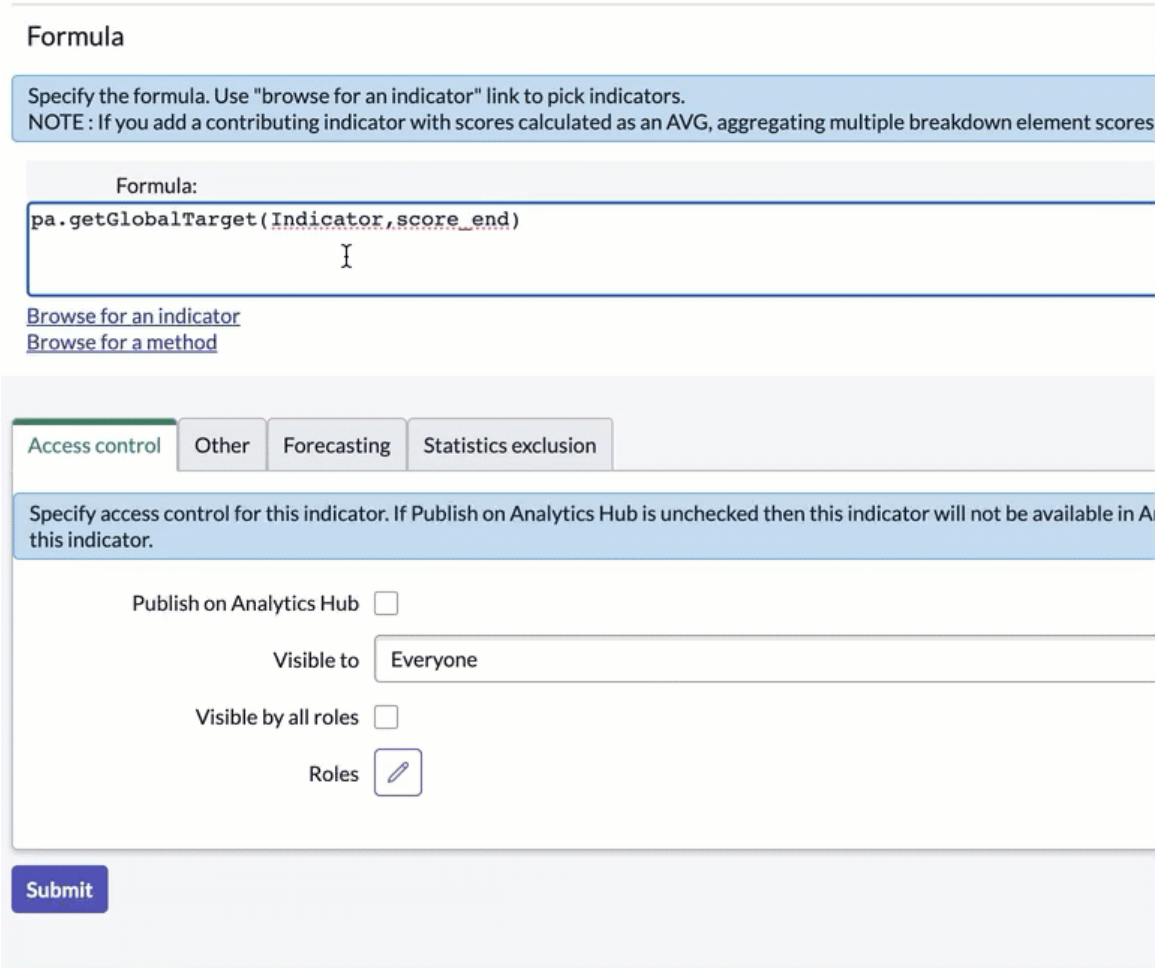
- An absolute date in YYYY-MM-DD format, such as 2018-12-21.
- The variable `score_start` or `score_end`. These variables represent the first and last second of the collection period being calculated for the referenced indicator. The times are calculated from the difference between the time zone of the user and the database server

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

time zone, which is GMT. For more information, see Changes to score_start/end because of different user time zones.

- A date parameter that you have coded yourself using the `GlideDate` or the `GlideDateTime` API.

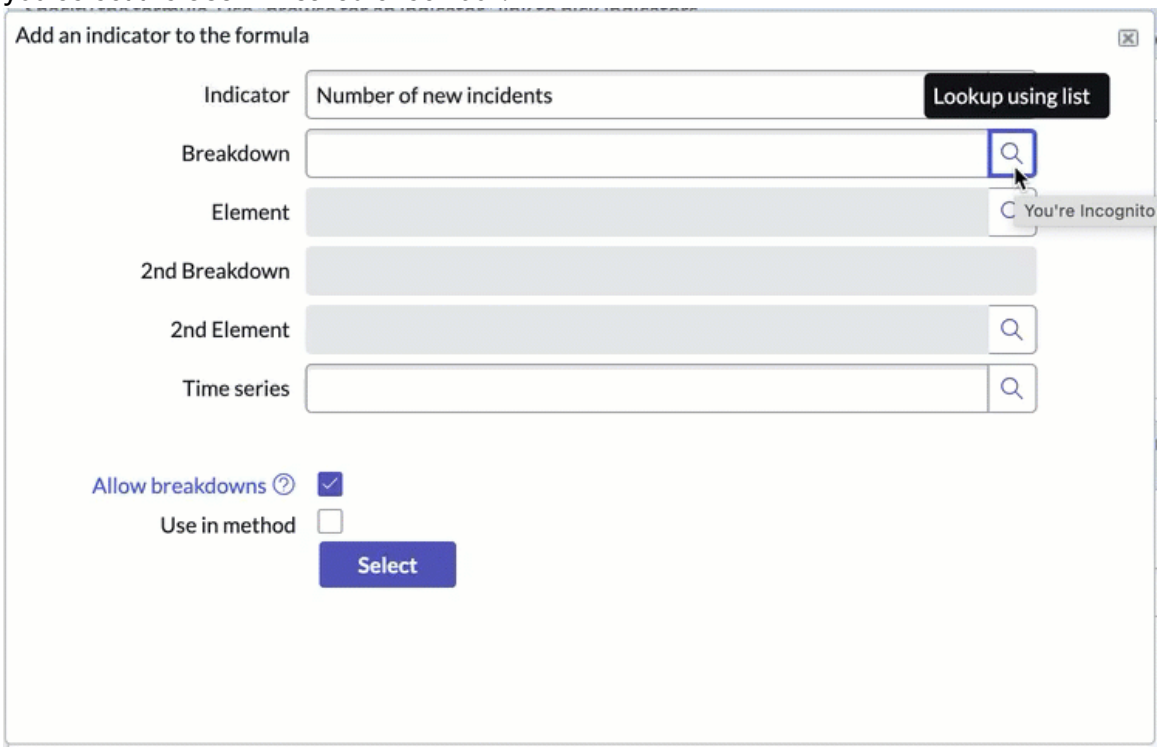
5. Fill in any parameters and click **Select**.
   The dialog closes and the method appears in the formula field of the indicator form.
6. If the method requires you to specify an indicator, select the `indicator` parameter with the cursor and click **Browse for an indicator**.
   The indicator selection dialog opens.



7. Select the indicator.
8. **Optional:** Select any breakdowns or elements and a time series aggregation.
9. Select **Use in method** and click **Submit**.
   The method is complete, with an indicator selected. Note that a dollar sign, $, precedes the indicator. This dollar sign means that the Analytics Hub values for the indicator instead of the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

indicator score are returned. The Analytics Hub values are selected instead of the score when you select the **Use in method** check box.



Example: Index indicator

Index indicators are a use case of formula indicators for generating a single score that represents multiple indicators. In the following example, you want a single index that aggregates the gap between score and global target for the following indicators:

- The percentage of incidents that are overdue.
- The average age of the last update of open incidents.
- The total number of open incidents.

To get this single index, you create a formula indicator with **Direction** set to **Maximize**. All index indicators must maximize. Then you use the **Browse for a method** and **Browse for an indicator** functions to create the following formula:

```
var a = pa.getGap($[[% of open overdue incidents]],
 score_start) / pa.getGlobalTarget($[[% of open overdue
 incidents]],score_start);
var b = pa.getGap($[[Average age of last update of open
 incidents]], score_start) / pa.getGlobalTarget($[[Average age
 of last update of open incidents]], score_start);
var c = pa.getGap($[[Number of open incidents]], score_start) /
 pa.getGlobalTarget($[[Number of open incidents]], score_start);
var res = 100 - (100 * (a + b + c) / 3);
res;
```

Example: Set targets on a change itself

You want to set a target for your teams of a 10% reduction month-on-month in the incident backlog. You create a formula indicator with the following formula, and set a target of -10% for this indicator on the Analytics Hub.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var lastPeriod = new GlideDateTime(score_start.getYearUTC() +
 '-' + score_start.getMonthUTC() + '-01');
lastPeriod.addDaysUTC(-1);
pa.getChangePercentage($[[Number of open incidents]],
 lastPeriod.addDaysUTC(-1), score_start);
```

Example: Filter out scores based on breakdown and element

You want to filter out the scores of incidents where Priority = 1 - Critical.

1. Obtain the unique record identifiers for the Priority breakdown and the 1 - Critical element. Breakdown records are in the Breakdown table. The location of element records varies, but is identified in the Breakdown Source of the breakdown. In this case, the element is a Choice [sys_choice] record. For directions on how to obtain the unique record identifiers, see The unique record identifier (sys_id).

   The unique record identifiers are baec0752bf130100b96dac808c0739ed for the Priority breakdown and 8a4dde73c6112278017a6a4baf547aa7 for the 1 - Critical element.

2. Create an indicator with the following formula:

```
var res = [[Number of open incidents]];
if(pa.getCurrentBreakdownID() ==
 'baec0752bf130100b96dac808c0739ed' && pa.getCurrentElementID()
 == '8a4dde73c6112278017a6a4baf547aa7')
{
res = 0;
}
res;
```

PAFormulaUtils API

The PAFormulaUtils API enables you to obtain a value that was calculated in the Analytics Hub and use that value as input for a formula.

To use the *PAFormulaUtils* API, you must satisfy these requirements:

- Performance Analytics must be enabled.
- The user who creates the formula indicator that uses this API must have the pa_power_user, pa_admin, or admin roles.

A dollar sign, $, precedes indicator names in *PAFormulaUtils* parameters, like the Number of open incidents indicator in this example: `pa.getGap($[[Number of open incidents]], score_end);`. This dollar sign means that the Analytics Hub calculated values for the indicator are returned instead of the indicator score.

Date parameters in *PAFormulaUtils* methods take one of the following forms:

- An absolute date in YYYY-MM-DD format, such as 2018-12-21.
- The variable `score_start` or `score_end`. These variables represent the first and last second of the collection period being calculated for the referenced indicator. The times are calculated from the difference between the time zone of the user and the database server time zone, which is GMT. For more information, see Changes to score_start/end because of different user time zones.
- A date parameter that you have coded yourself using the *GlideDate* or the *GlideDateTime* API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Warning: The *PAFormulaUtils* API can be used only in formula indicators, not in scripts.

The *PAFormulaUtils* API contains the following methods:

getChange(String indicator, Object fromDate, Object toDate)

Returns the change in the score of an indicator between two specified dates.

Parameters

Name	Type	Description
indicator	String	Unique identifier of the indicator for which to calculate the change.
fromDate	Object	Initial date of the comparison.
toDate	Object	End date of the comparison.

Returns

Type	Description
Number	Difference in the specified indicator score between the two dates.

Example: Change from the beginning of the month to the last collection period

In this example, we have the indicator Number of open incidents, whose scores are collected daily. The fromDate parameter is the first second of the current month, constructed by taking the timestamp of the last collection period (`score_start`), extracting the year and the month from the timestamp, and appending the numeral 01 for the day. The toDate parameter is the timestamp of the beginning of the last collection period, which would be the first second of the previous day, depending on timezone differences.

```
pa.getChange($[[Number of open incidents]], new
 GlideDateTime(score_start.getYear() + '-' +
 score_start.getMonth() + '-01'), score_start);
```

Related topics

PAFormulaUtils API

getChangePercentage(String indicator, Object fromDate, Object toDate)

Returns the percentage of change in the score of an indicator between two specified dates.

Parameters

Name	Type	Description
indicator	String	Unique identifier of the indicator for which to calculate the percentage of change.
fromDate	Object	Initial date of the comparison.
toDate	Object	End date of the comparison

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	Percent change of the specified indicator between the two specified dates.

Example:

```
var lastPeriod = new GlideDateTime(score_start.getYear() + '-' +
 score_start.getMonth() + '-01');
lastPeriod.addDaysUTC(-1);
pa.getChangePercentage($[[Number of open incidents]],
 lastPeriod, score_start);
```

Related topics

PAFormulaUtils API

getCurrentAggregateID()

Returns the time series aggregate identifier (sys_id) from the indicator of the current formula. The sys_id is returned dynamically, as the selection in the Analytics Hub changes.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Dynamic time series aggregate ID from the indicator of the current formula as it changes with your selection in the Analytics Hub . If there is no time series aggregate ID, the method does not return a value.

Example:

```
var res = [[Number of open incidents]];
if(pa.getCurrentAggregateID() ==
 '89ea4c11d7001100ba986f14ce6103dc')
  {
    res = 0;
  }
res;
```

Related topics

PAFormulaUtils API

getCurrentBreakdownID()

Returns the level 1 breakdown identifier (sys_id) from the indicator of the current formula. The sys_id is returned dynamically, as the selection in the Analytics Hub changes.

Use this method to obtain the sys_id of the level 1 breakdown when altering the formula for a specific breakdown.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var res = [[Number of open incidents]];
if(pa.getCurrentBreakdownLevel2ID() ==
 'baec0752bf130100b96dac808c0739ed' &&
 pa.getCurrentElementLevel2ID() ==
 '8a4dde73c6112278017a6a4baf547aa7')
  {
  res = 0;
  }
res;
```

Related topics

PAFormulaUtils API

getCurrentElementID()

Returns the level 1 breakdown element identifier (sys_id) from the indicator of the current formula. The sys_id is returned dynamically, as the selection in the Analytics Hub changes.

Use this method when altering a formula for a specific element. For example, use the method when running a query to count different attributes, such as excluding scores for changes from groups that do not change.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Dynamic level 1 breakdown element ID from the indicator of the current formula as it changes with your selection in the Analytics Hub. If there is no level 1 breakdown element ID, the method does not return a value.

Example:

```
var res = [[Number of open incidents]];
if(pa.getCurrentBreakdownID() ==
 'baec0752bf130100b96dac808c0739ed' && pa.getCurrentElementID()
 == '8a4dde73c6112278017a6a4baf547aa7')
  {
  res = 0;
  }
res;
```

PAFormulaUtils API

getCurrentElementLevel2ID()

Returns the level 2 breakdown element identifier (sys_id) from the indicator of the current formula. The sys_id is returned dynamically, as the selection in the Analytics Hub changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use this method when altering a formula for a specific element. For example, use the method when running a query to count different attributes, such as excluding scores for changes from groups that do not change.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Dynamic level 2 breakdown element ID from the indicator of the current formula as it changes with your selection in the Analytics Hub. If there is no level 2 breakdown element ID, the method does not return a value.

Example:

```
var res = [[Number of open incidents]];
if(pa.getCurrentBreakdownLevel2ID() ==
 'baec0752bf130100b96dac808c0739ed' &&
 pa.getCurrentElementLevel2ID() ==
 '8a4dde73c6112278017a6a4baf547aa7')
  {
  res = 0;
  }
res;
```

PAFormulaUtils API

getGap(String indicator, Object onDate)

Returns the global target gap for the specified indicator on the specified date.

The gap is the difference between the score on the specified date and the target. For an indicator with the MAXIMIZE direction, the gap is calculated as the score minus the target. For an indicator with the MINIMIZE direction or no direction, the gap is calculated as the target minus the score.

Parameters

Name	Type	Description
indicator	String	Unique identifier of the indicator for which to provide the gap information.
onDate	Object	Date of the score to use to compare against the target score.

Returns

Type	Description
Number	Difference between the score on the specified date and the global target score.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example:

```
var a = pa.getGap($[[% of open overdue incidents]],
 score_start) / pa.getGlobalTarget($[[% of open overdue
 incidents]],score_start);
var b = pa.getGap($[[Average age of last update of open
 incidents]], score_start) / pa.getGlobalTarget($[[Average age
 of last update of open incidents]], score_start);
var c = pa.getGap($[[Number of open incidents]], score_start) /
 pa.getGlobalTarget($[[Number of open incidents]], score_start);
var res = 100 - (100 * (a + b + c) / 3);
res;
```

getGlobalTarget(String indicator, Object onDate)

Returns the global target associated with the specified indicator for the specified date.

Parameters

Name	Type	Description
indicator	String	Unique identifier of the indicator.
onDate	Object	Date for which to return the global target.

Returns

Type	Description
Number	Global target for the specified date and indicator.

Example:

```
pa.getGlobalTarget($[[% of open overdue
 incidents]],score_start);
```

PAFormulaUtils API

getPersonalTarget(String indicator, Object onDate)

Returns the personal target associated with the specified indicator for the specified date.

Use this method to obtain a personal index score. "Personal" refers to the active user who is looking at the Analytics Hub.

Parameters

Name	Type	Description
indicator	String	Unique identifier of the indicator.
onDate	Object	Date for which to return the personal target.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	Personal target for the specified date and indicator.

Example:

```
var a = pa.getGap($[[% of open overdue incidents]],
 score_start) / pa.getPersonalTarget($[[% of open overdue
 incidents]],score_start);
var b = pa.getGap($[[Average age of last update of open
 incidents]], score_start) / pa.getPersonalTarget($[[Average age
 of last update of open incidents]], score_start);
var c = pa.getGap($[[Number of open incidents]], score_start) /
 pa.getPersonalTarget($[[Number of open incidents]],
 score_start);
var res = 100 - (100 * (a + b + c) / 3);
res;
```

PAFormulaUtils API

Prevent a contributing indicator in a formula from following breakdowns

You can select contributing indicators in a formula to not be broken down. When a user applies a breakdown to the formula indicator, the breakdown does not apply to these indicators.

When you apply a breakdown to a formula indicator, such as on a breakdown dashboard, the breakdown applies to all contributing indicators. You prevent a contributing indicator from being broken down using the syntax {{Indicator}}. You can also prevent a contributing indicator from following breakdowns by clearing the **Allow breakdowns** check box in the **Browse for an indicator** dialog. This dialog opens when you create

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, consider the formula `[[Incidents]] / [[Customers]]`. If you apply a region breakdown to this indicator, and specify EU as the breakdown element, the formula indicator returns scores using the formula `[[Incidents > region = eu]] / [[Customers > region = eu]]`. However, to view the EU incidents divided by the total number of incidents across all regions, you can write the formula as `[[Incidents]] / {{Customers}}`. Using the {{Indicator}} format causes the Customers indicator to ignore breakdowns. This way, when you apply the region breakdown with the EU breakdown element, this formula indicator is equivalent to the formula `[[Incidents > region = eu]] / [[Customers]]`.

You can still specify a breakdown and element for a contributing indicator that does not follow breakdowns for the whole formula indicator. Consider the formula `[[Incidents]] / {{Customers > importance = high}}`. In this example, the formula denominator is always broken down to include only the high-importance customers. Any breakdown applied to the formula indicator, such as the region breakdown, does not apply to the Customers indicator.

Breakdown matrices in formula indicators

Formula indicators inherit breakdown matrices from indicators in the formula.

If all the indicators in the formula collect breakdown matrices, second-level breakdowns are available for the formula indicator. If none of the indicators in the formula collects breakdown matrices, second-level breakdowns are not available for the formula indicator. If only some of the indicators in the formula collect breakdown matrices, only those indicators can be broken down at a second level.

Example: Formula with two contributing indicators where breakdown matrices are calculated for one or both indicators

Consider the case when breakdown matrices are collected for the indicators 'Summed age of open incidents' and 'Number of open incidents.' You now create an indicator with the following formula:

```
[[Summed age of open incidents]]/[[Number of open incidents]]/24
```

On a particular day, the score for this formula indicator is 170, calculated as follows:

```
Summed age of open incidents with Category = Software and
 Priority = 2: 8,152 hours
Number of open incidents with Category = Software and Priority =
 2: 2
Formula: 8152/2/24=170
```

What if the breakdown matrix is calculated only for 'Summed age of open incidents'? In this case, the 'Number of open incidents' is broken down only by Category and not by Priority. The score for the same formula indicator on the same day is 11, calculated as follows:

```
Summed age of open incidents with Category = Software and
 Priority = 2: 8,152 hours
Number of open incidents with Category = Software: 31
Formula: 8152/31/24=11
```

Applying time series to result or to contributing indicators

For a formula indicator, a time series aggregation can apply either to each indicator in the formula individually or to the formula result.

Decide how time series aggregation apply with the **Apply time series to result** option. You can select or disable this option in the **Other** properties tab of a formula indicator record. This option applies to any time series aggregation you apply to the indicator in Core UI Performance

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Analytics widgets and Analytics Hub, or in Data visualizations in Platform Analytics. This option also applies to the default time series if one is set on the indicator.

Note:

- The default time series applies only on the Analytics Hub and KPI Details. If you do not select a time series aggregation on a widget or data visualization, the default time series does not apply.
- For the setting to take effect on the Analytics Hub or KPI Details, you must choose a real aggregate, if the indicator does not have a default time series set. If the time series is just the indicator frequency (daily, weekly, and so on), the**Apply time series to result** setting does not apply.

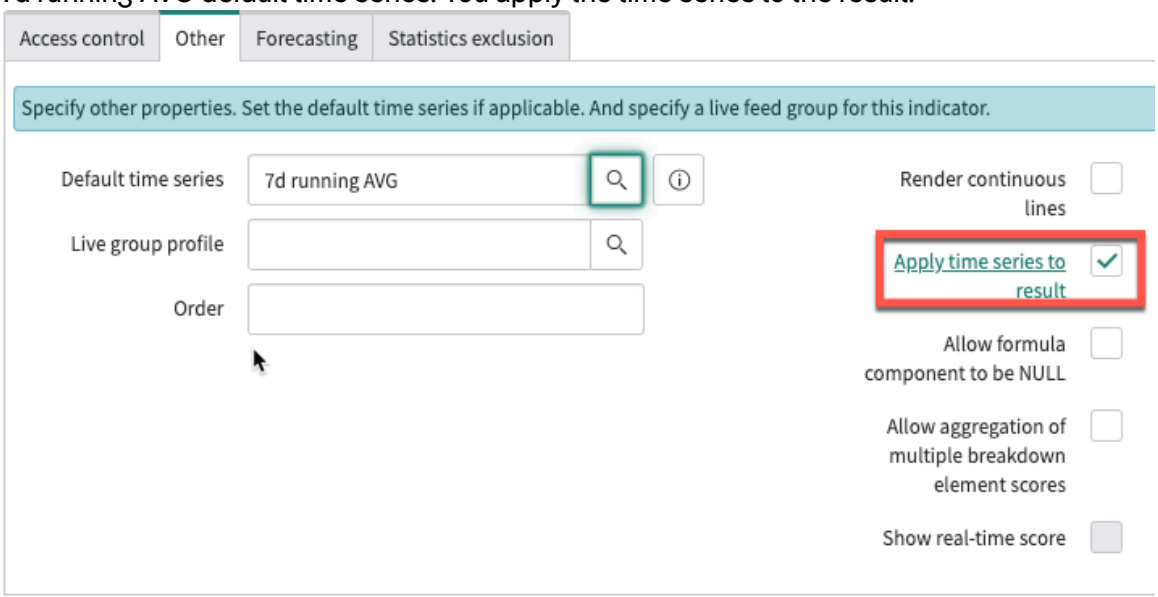
When **Apply time series to result** is checked, first the formula is evaluated and then the selected time series is applied to the final result. When **Apply time series to result** is not checked, each contributing indicator is evaluated and the default time series is applied to it. Then the formula is evaluated. The results between the two settings can differ significantly. Neither setting is wrong, but you have to think carefully about what you are measuring before making your choice.

Example: Applying a time series to result compared to applying it to contributing indicators

Consider the formula indicator "% of new P1 incidents". Every day this indicator calculates the percentage of new incidents that are Priority 1 - Critical:

([[Number of new incidents > Priority = 1 - Critical]] / [[Number of new incidents]]) * 100

You decide that you want the result to display a 7-day running average by default on the Analytics Hub. In the **Other** tab of the indicator record, you select the 7d running AVG default time series. You apply the time series to the result.



In the resulting calculation, the formula is resolved for each day. Then the average of the result is taken for that day and the previous six days:

((New P1/All new$_{Day\ 1}$ * 100) + (New P1/All new$_{Day\ 2}$ * 100)+ … (New P1/All new$_{Day\ 7}$ *100)) / 7

You aren't sure if you want the 7-day average of the final result or the average 7-day average of each indicator. So, you copy the previous formula indicator, with the same time series, but with **Apply time series to result** unchecked. Now, the time series is applied to the `Number of`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`new incidents > Priority = 1 - Critical` and `Number of new incidents` contributing indicators separately before the formula is resolved:

$(\text{New P1}_{\text{Day 1}} + \text{New P1}_{\text{Day 2}} + \ldots \text{New P1}_{\text{Day 7}}) / (\text{All new}_{\text{Day 1}} + \text{All new}_{\text{Day 2}} + \ldots \text{All new}_{\text{Day 7}}) * 100$

You plot both formula indicators in a time series widget to see the difference in outcome between the two settings. Because the default time series only applies on the Analytics Hub, you also add the 7d running AVG time series to the widget:

Applying time series aggregations

Detect indicators with no scores in a formula

As the formula creator, you can handle contributing indicators that have null scores. First set the formula indicator to calculate the formula even when it contains a null score.

Before you begin

Role required: pa_power_user, admin

About this task

The formulas in formula indicators typically contain one or more other indicators. If one of those indicators has no score, by default the formula is not calculated and the formula indicator returns no score. However, several use cases exist for identifying the indicator that has no score instead of having the formula indicator return null. First enable the formula to be calculated when an indicator in the formula has no score. Then you can assign a value to an indicator with no score.

Procedure

1. Open the formula indicator of interest.
2. Select **Allow formula component to be null**.
3. In the **Formula**, add an `if{} else {}` statement that ascribes a value to an indicator when it has no score.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Field indicator with Allow formula component to be null

Consider the following formula indicators for a collection period when there are no closed incidents, so the indicator Number of closed incidents has no score.

Formula 1:

```
[[Number of open incidents]] / [[Number of closed incidents]]
```

Formula 2:

```
[[Formula 1]] + 23
```

Formula 3:

```
if ([[Formula 1]] == null) { 23 } else { 11 }
```

Formula 4:

```
[[Formula 2]] || 64
```

Formula 5:

```
(([[Formula 1]] == null && [[Formula 2]] == null) ? 11 : 18)
```

If **Allow formula component to be null** is not selected for any of the formula indicators, none of them have scores.

If **Allow formula component to be null** is selected for all of the formula indicators, they have the following scores:

- Formula 1 = null
- Formula 2 = 23
- Formula 3 = 23
- Formula 4 = 64
- Formula 5 = 11

Formula 2, Formula 3, Formula 4, and Formula 5 represent four different ways to handle the null score.

Indexing multiple indicators in a formula

You can write a formula to measure what the gap is to the overall target of multiple, combined indicators. Such a formula indicator is called an 'index indicator'.

The performance of processes, services, groups, and other business entities are often tracked and monitored using more than one indicator. When viewing and analyzing performance of these processes, business services, or workgroups, the overall picture can be confusing and ambiguous. For example:

- Although the scores for three indicators improved somewhat, the scores for 2 of them are still below target and 1 is above target.
- The score for one indicator remained more or less the same and is still below target.
- The score for one indicator did significantly deteriorate, but is fortunately just above target.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Looking at this information, the answers to the following questions are not clear:

- Is the overall performance of the process/service/group still at or above the desired level?
- Did the overall performance improve?

An index indicator can answer these questions. With an index indicator, the scores of multiple indicators are aggregated into one score. It is a weighted average of several indicators. If the weighted sum of these indicators is improving, the calculated score of the index formula goes up. As with any other indicator, the index indicator shows if the score is good or not and if the score has improved or not.

The principle behind an index indicator is to calculate a score value indexed to 100 for each indicator. When you have these indexed scores, you are mathematically allowed to calculate an overall average of them.

To be included in an index indicator, an indicator must have a direction and a target. The basic formula to calculate the indexed score for an indicator that has a **Maximize** direction is:

```
100 + (((actual score - target) / target) * 100)
```

For indicators that have a **Minimize** direction, the formula is:

```
100 - (((actual score - target) / target) * 100)
```

If you are weighting the indicators evenly, you can index the final aggregation to 100 instead of indexing the individual indicators to 100.

You can use methods of the *PAFormulaUtils()* API to get the gap between score and target for the indicator from the Analytics Hub. For more information, see Get analytics methods in formulas:

```
pa.getGap(indicator, On date) / pa.getGlobalTarget(indicator, On
 date)
```

Because of the different operator for the different direction, if the score of an underlying indicator is improving (up or down), the index indicator score is increasing. Therefore, always set the direction of the index indicator to **Maximize**.

If no target value is set for an indicator, use a norm value instead. Indicators that have a target or norm value equal to 0 cannot be used in the index indicator, because it would require dividing by 0.

Set a target of 100 for each index indicator. This target is the calculated, overall, indexed score if all underlying indicators have an actual score equal to their target or norm value.

An index indicator is measuring what the gap is to the overall target of multiple, combined indicators. It is measuring the 'Percentage of Target Achievement'.

Example: Index indicator using PAFormulaUtils() methods

In the following example, you want a single index that aggregates the gap between score and global target for the following indicators:

- The percentage of incidents that are overdue.
- The average age of the last update of open incidents.
- The total number of open incidents.

To get this single index, follow these steps to produce an index indicator:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Navigate to **Platform Analytics Administration** > **Indicators** > **Formula Indicators** and select **New**. Index indicators are a use case of formula indicators.
2. Give the indicator a meaningful name, such as **Aggregate incident gap**.
3. Set the **Direction** to **Maximize**.
4. In the **Formula** field, use the **Browse for a method** and **Browse for an indicator** functions to create the following formula:

```
var a = pa.getGap($[[% of open overdue incidents]],
 score_start) / pa.getGlobalTarget($[[% of open overdue
 incidents]],score_start);
var b = pa.getGap($[[Average age of last update of open
 incidents]], score_start) / pa.getGlobalTarget($[[Average age
 of last update of open incidents]], score_start);
var c = pa.getGap($[[Number of open incidents]], score_start) /
 pa.getGlobalTarget($[[Number of open incidents]],
 score_start);
var res = 100 - (100 * (a + b + c) / 3);
res;
```

   The three indicators are weighted equally, so the aggregation is indexed to 100 instead of the individual indicators.

Changes to score_start/end because of different user time zones

For formula indicators, the values of the variables `score_start` and `score_end` are calculated based on the time zone of the user who is executing the formula. If users in different time zones execute the same formula, the values of `score_start` and `score_end` change.

> ⚠ **Warning:** The date value of the `score_start` and `score_end` variables can shift when users from different time zones view the same formula.

Formulas can include `score_start` or `score_end` variables as parameters for indicators that the formula references. These variables represent the first and last second of the specific collection period being calculated for the referenced indicator. The values of the `score_start` and `score_end` variables are calculated from the difference between the time zone of the user executing the formula and the time zone of the database server, which is GMT. A user executes a formula whenever they view the formula indicator in a dashboard widget or on the Analytics Hub. As a result, the date value of the start or end of the collection period can shift when different users view the same formula.

Example: Different values of score_end for different user time zones

Consider a formula indicator with a daily frequency and the following formula:

```
pa.getScore($[[Number of open incidents]], score_end);
```

Three different users view a dashboard widget with this formula indicator on 18 October. The database server considers `score_end` for 18 October to be 23:59:59 GMT on 18 October.

- One user is in the Europe/Berlin time zone. Their `score_end` value is "2019-10-18 21:59:59", and the score for the date 18 October is returned.
- One user is in the US/Pacific time zone. Their `score_end` value is "2019-10-19 06:59:59", and the score for the date 19 October is returned.
- One user is in the GMT time zone. Their `score_end` value matches the database server, "2019-10-18 23:59:59", and the score for the date 18 October is returned.

Related topics

Performance Analytics variables

Manual indicators

Manual indicators do not use scores collected from a database. Manual indicators are typically used for data that cannot be retrieved from the ServiceNow instance because it comes from an outside system, such as customer data from a third-party sales system.

Before you begin

Role required: pa_admin, pa_power_user, or admin

About this task

Manual indicators are not associated with an indicator source. Scores for manual indicators are not generated automatically by a data collection job. Instead, populate these indicators by adding scores to the scoresheet manually.

Note:

- You must have a subscription for Performance Analytics to create indicators.
- If you're using domain separation, the indicator is created in the domain that you're currently in.

Procedure

1. Navigate to **All** > **Platform Analytics Administration** > **Indicators** > **Manual Indicators** and select **New**.
2. In the **Name** field, give the indicator a descriptive name, such as Number of Critical Incidents.
3. In the **Frequency** field, select the frequency at which scores are set.
   The default value is **Daily**.

   Note: The frequency for a manual indicator specifies how to visualize its data. For example, if you set the data points per day or per month in the charts, the setting also affects the scoresheet, so it determines whether you can enter daily or monthly values.

4. If you prefer that the score of this indicator increases or decreases over time, select **Maximize** or **Minimize** in the **Direction** field.
   Analytical tools and graphic displays use this **Direction** with this indicator.

   Tip: Set a direction whenever you can. All key indicators should be set to Maximize or Minimize.

Value	Use case
Maximize	Select if an increase in this indicator score is desired. For example, consider selecting **Max imize** for an indicator that shows revenue. An alytic tools and graphic elements reflect that an increase in this indicator score is good and a decrease is bad.
Minimize	Select if a decrease in this indicator score is desired. For example, consider selecting **Min imize** for an indicator that shows costs. Analyt ic tools and graphic elements reflect that a de crease in this indicator score is good and an increase is bad.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Value	Use case
None	Select if the direction of change in this score doesn't matter to your business.

5. **Optional:** Under Indicator properties, specify any of these properties:

Field	Description
Key	Identifies the indicator as a key indicator. Used only to filter the list of indicators in **Performance Analytics** > **Analytics Hub**. Not used in Platform Analytics experience.
Unit	The unit of measurement for the score, such as number, days, or percentages. (Optional) To collect scores in the system reference currency on a Price, Currency, or FX Currency field, select **Use reference currency**. For more information, see Indicator scores in reference currency. If you select % or a time period as the unit, consider excluding some types of time series from being applied to the indicator. For more information, see Exclude time series from an indicator. If you select Time as the unit, the time is given as Days, Hours, and Minutes. If the system property `glide.ui.duration.seconds.enabled` exists and is true, seconds are also displayed. In this case, seconds are also displayed for all-time fields on the instance and are included in exports to Microsoft Excel.
Precision	The number of digits behind the decimal separator. For more information, see Rounding and precision in indicators. This field isn't available when the unit is **Use reference currency**. In this case, the precision is inherited from the reference currency.
Number format	The abbreviations used for large numbers, thousands through quintillions. For more information, see Rounding and precision in indicators.

6. In the **Access control** tab, set whether to save this indicator to the library and whether to limit the visibility of the indicator by user, group, or role.
Activating **Show in library** means that the indicator will be available in the following places:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The Platform Analytics indicator library
- KPI Details
- Analytics Hub, but only on upgraded instances that haven't fully migrated to Platform Analytics

7. In the **Access Control** tab, set which user is the **Contributor** authorized to populate the indicator scores.
   You can select only a user with the pa_admin, pa_power_user or pa_contributor role.
8. In the **Other** tab, set various miscellaneous properties.

Field	Description
Default time series	A predefined analytical function, like a 7-days running average, to apply to the indicator instead of showing the raw scores of the indicator. For more information, see Applying time series aggregations. **Note:** You can't set the default time series for an indicator that uses a business or fiscal calendar. These calendars do not support time series aggregations.
Live group profile	Live Group Profile [live_group_profile] record for a Live Feed group. Specify a group profile to cause that group to get notifications about this indicator. For more information about this social application on the ServiceNow AI Platform, see Live Feed.
Value when nil	The value that is inserted as the score when no value is collected. This value applies only to the indicator score. It does not impact scores for breakdown elements.
Order	Number indicating the order in which indicators are displayed in the Analytics Hub. Indicators with the lowest value are displayed at the top of the list. If no values are provided in the **Order** field, indicators are displayed from a to z using the **Name** field. To use the order field, you must enter order numbers for all indicators. If you put in numbers for only a few indicators, the order in which indicators are displayed reverts to a to z.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Not used in Platform Analytics experience.
Render continuous lines	When selected, the Analytics Hub and KPI Details show unbroken data lines for this indicator, even when there's no data for a specific date. This behavior may be useful when displaying datasets with varied starting dates or for data that aren't regularly updated, such as stock information. Continuous lines aren't rendered when a time series is set on the indicator or the Analytics Hub or KPI Details.

9. **Optional:** In the **Forecasting** tab, set the forecast method, the number of data collection periods to forecast, the amount of historical data to base the forecast on, and the upper and lower limits of forecast values.
   For more information, see Performance Analytics scores forecasts.

What to do next
Create manual breakdowns and assign them to this indicator. Then, manually add scores.

Related topics
Manual breakdowns

Add or edit indicator scores manually

Delete an indicator

Delete unwanted or unused indicators from your instance. Deleting indicators is risky, so there are several restrictions.

Before you begin
Besides roles, check that you meet the following requirements before trying to delete an indicator:

- Your instance has an active entitlement to the subscription version of Performance Analytics. For more information, see Activating your Performance Analytics subscription.
- If your instance is domain-separated, you have visibility into the same domain as the indicator.
- The indicator that you want to delete is not being used in a formula indicator. If it is so used, see whether you can delete those formula indicators first.
- The indicator is not a benchmark indicator.

Role required: pa_data_collector (requires that the indicator record is visible to this role; cannot delete external indicators), pa_power_user, pa_admin, or admin

About this task

⚠ **Warning:** Deleting an indicator deletes all scores for that indicator. Consider the risk of creating a data gap before you delete an indicator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Platform Analytics Administration** > **Indicators** > **[type of indicator]**, and locate the indicator you want to delete.
2. Open the indicator record.
3. Make sure you are in the same application scope as the indicator.
4. Select **Delete**.
   If you don't see a **Delete** button, check that you meet the requirements for deleting the indicator.
5. Confirm.

Performance Analytics scores forecasts

Performance Analytics enables you to forecast future scores based on past behavior. You can forecast scores on time series widgets, time series data visualizations, KPI Details, and the Analytics Hub. Forecast scores appear as a dotted line.

Forecasting is set up in the **Forecasting** tab of the indicator record. The number of data points included in the forecast depends on the indicator frequency and the number of **Periods to forecast** configured on the indicator. A period is a set number of scores based on the indicator frequency. Regardless of the settings and the forecast method, no more than 2688 forecast data points are generated.

Note: In time series data visualizations on a configurable workspace, you can override the forecast configuration that is set on the indicator. This override applies only to that data visualization.

Also in time series data visualizations, you are not limited to forecasts on Performance Analytics indicators. If you have a subscription version of Performance Analytics, you can generate forecasts for any data source except tables. For more information, see Create time series data visualizations.

Create an automated indicator

Configure forecasts on an indicator

In the record of an automated indicator, configure forecasts as they will appear on the Analytics Hub, Performance Analytics widgets, and time series data visualizations.

Before you begin

Role required: pa_power_user, pa_admin, admin

Procedure

1. Navigate to **Platform Analytics Administration** > **Indicators** > **Automated indicators**.
2. Open the automated indicator that you want to configure forecasts for.
3. Navigate to the **Forecasting** tab.
4. Set the following values:

Field	Description
Forecast method used	The statistical method the system uses to forecast values for this indicator. The default value is Auto, meaning that the system

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	chooses a method that best fits the data. For more information, see Selecting the forecast method.
Periods to forecast	Number of data periods in the future to forecast scores for. **Note:** The length of the periods is based on the indicator frequency. For more information, see Indicator forecast periods.
Forecast lower limit	The lowest meaningful value of a forecast score. If a score lower than this value is forecast, this value is displayed instead.
Forecast upper limit	The highest meaningful value of a forecast score. If a score higher than this value is forecast, this value is displayed instead.

5. Select which scores to base the forecast on.

Option	Description
All scores	All the scores that have been collected for this indicator
Previous periods	The number of data periods before the present to base forecasts on. These data pe riods are the same length as the ones in **Peri ods to forecast**. If you select Previous periods, also specify the number of periods in the **Periods** field.
Fixed start	All scores collected after a start date. If you se lect Fixed start, also specify the **Start date**.

Selecting the forecast method

If you are a statistics expert, you can select a forecast method manually. By default, the instance chooses the best method for you automatically, based on the fit of the method.

To determine the best fitting forecast method, the instance generates forecasts using each forecast method with your historical data. The instance then compares those forecasts with the latest data based on how far ahead you want to forecast. The instance performs this evaluation each time it displays the forecast. Therefore, collecting additional scores or changing the forecast period can alter which forecast method is used.

For example, if you configure an indicator with a daily frequency to forecast ahead two periods, the instance applies each forecasting method to your historical data that is older than two weeks. Then the instance compares those forecasts against the latest two weeks of data. The forecast that most closely fits the latest two weeks of data is then recalculated using the entire data set. The instance shows the results of this final calculation in the Analytics Hub or in KPI Details.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Forecast methods

Performance Analytics can use the following standard forecast methods.

Method	Description
Linear	Generates a linear regression forecast based on the historical scores, using constant and trend as explanatory variables.
Seasonal	Generates a linear regression forecast based on the historical scores, using seasonal dummies as explanatory variables. A 'season' for this analysis is one period.
Seasonal Trend	As Seasonal, but includes a trend as an explanatory variable.
Seasonal Trend Loess (STL)	Generates a seasonal forecast based on a best-fit function. This method fits a trend, a season, and a random noise process to the data using an exponentially weighted moving average approach. The forecast is based on the full data set, with more weight given to more recent observations A 'season' for this analysis is one period.
Random Forest (RF)	Creates a combination of decision trees where the predictions produced by these trees are averaged to get a single prediction. The randomness comes from each tree being built from a random subset of the available data and inputs. For more information about the random forest method, see this Medium article.
Autoregressive (AR)	The autoregressive (AR) model forecasts future values of an indicator by using a linear combination of a trend, seasonal dummies, and past values. Like the Random Forest (RF) model, the AR model checks for the best number of lags. However, the AR model relates current to past values linearly, whereas the RF model is non-linear.

Indicator forecast periods

Depending on the frequency of the score, a different period length is selected. Consult the table to find out the length of the period that is used for your series.

Score frequency	Number of data points per period	Total period length
Daily	7	1 Week
Weekly	13	1 Quarter
Bi-weekly	6	1 Quarter
Four Weekly	13	1 Year
Monthly	12	1 Year
Bi-monthly	6	1 Year
Quarterly	4	1 Year
Fiscal Quarterly	4	1 Year
Half Yearly	2	1 Year
Yearly	4	4 Years

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Score frequency	Number of data points per period	Total period length
Fiscal Yearly	4	4 Years

Forecasting and targets

When forecasting is enabled for an indicator and there is a global target defined, the forecast shows when the target will be reached.

Additionally, the instance sends a notification 14 days before it expects the target to be reached. You can change how many days ahead the notification is sent by setting the *pa.job.forecast.target.days_to_check* property.

This functionality is available only for global targets. Thresholds and personal targets do not interact with forecasts.

Related topics

Performance Analytics targets and thresholds

Forecasting with time series aggregations

If you apply a time series aggregation to an indicator, the forecast period length changes. The change depends on the type of the time series.

Time series aggregation effects on forecast periods

Time aggregate	Effect on forecast period	Example
Running	The number of points in the period is equal to the "range" field value.	For a 7-day running sum, the forecast period has 7 data points. For a 28-day running sum, it has 28 data points.
By period	The selected period is treated as if it were the indicator frequency.	A "By week" time aggregate applied to a daily indicator has 13 data points per forecast period, which is a quarter long. This forecast period is the same as for a weekly indicator with no time aggregate.
To date	The period length matches the time span of the aggregation. The number of data points per period is a product of this time span and the indicator frequency.	See the rest of this section.

For an indicator with the Daily frequency, you have the following number of data points per period for to-date aggregations:

Data points per period for a daily indicator with a to-date time aggregation

Week to date	Month to date	Quarter to date	Year to date
7	30	91	365

With one exception, indicators with non-daily frequencies support only year-to-date among to-date time aggregations. Monthly indicators are the exception. They also support quarter-to-date time aggregations. A monthly indicator with a quarter-to-date aggregation has three data points

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

per period. The number of data points per forecast period for different indicator frequencies with year-to-date aggregations follows:

Number of data points per forecast period for year-to-date time series aggregations

Indicator frequency	Data points per period, year to date
Daily	365
Weekly	52
Four-weekly	13
Biweekly	26
Quarterly (fiscal)	4

Related topics

Applying time series aggregations

Displaying indicator score forecasts

In the classic environment, show the forecasts on a time series widget or the Analytics Hub. On a configurable workspace, show the forecasts on a time series data visualization or KPI Details.

To show the forecast on a time series widget, select **Show forecast** in the **Display Settings** section of the Widget form. You can also show the 95% confidence interval of the forecast, by selecting **Show forecast range**. For more information, see Time series widgets.

To show the forecast on the Analytics Hub, click the chart settings icon ( ) and enable the **Forecast** option. Similarly, in KPI Details, open **Chart options** and enable **Forecast**.

To show the forecast in a time series data visualization, expand the Additional settings and turn on **Show forecast**. You have the option then to show the forecast range. You can override the forecast configuration for the indicator on this specific data visualization by opening **Configure forecast**.

To show the forecast for an indicator on KPI Details, turn forecasting on in the Chart options in KPI Details.

Examining indicators with KPI Details

Create an indicator group

For convenience, you can organize related indicators into an indicator group. When you configure some visualizations that show multiple indicators, you can specify an indicator group instead of individual indicators.

Before you begin

Role required: pa_admin, pa_power_user, or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

By creating indicator groups, you can organize indicators along whatever themes are most useful to you. The indicators do not have to be of the same type or share an indicator source or data collector job. Indicator groups save you the trouble of specifying multiple individual indicators when you configure the following objects:

- List widgets
- Time series widgets with the relative compare visualization
- Email notifications about indicators
- Security Incident Analytics treemaps

After you create an indicator group, you can add indicators to the group or remove them from the group. This change propagates to all objects that use the indicator group, so you do not need to edit the configurations of the objects.

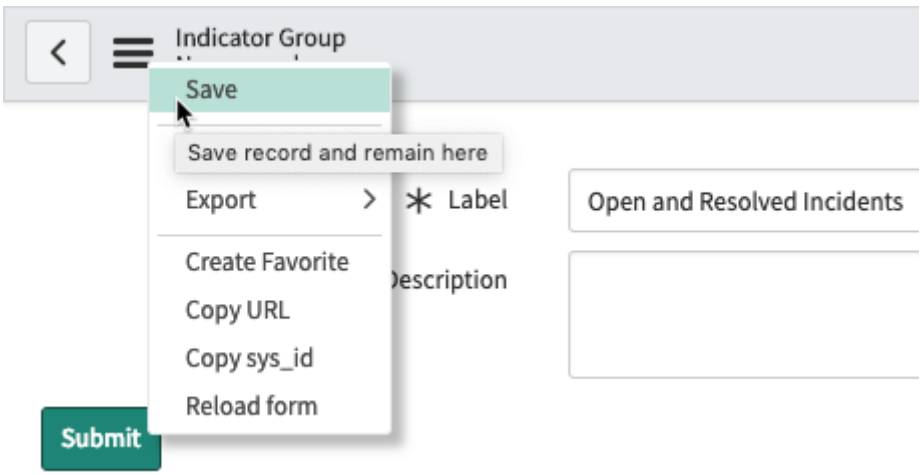
Procedure

1. Navigate to **All** > **Platform Analytics Administration** > **Indicators** > **Indicator Groups**.
2. Select **New**.
3. Enter a **Label** for the indicator group.
4. Open the Additional actions menu ( ) and click **Save**.
   The Indicators related list appears.
5. Select **Edit** on the Indicators related list and add indicators to the group.
6. Select **Save** to finish adding indicators, then **Update** to exit the Indicator Group record.

Example: Creating and using the 'Open and Resolved Incidents' indicator group

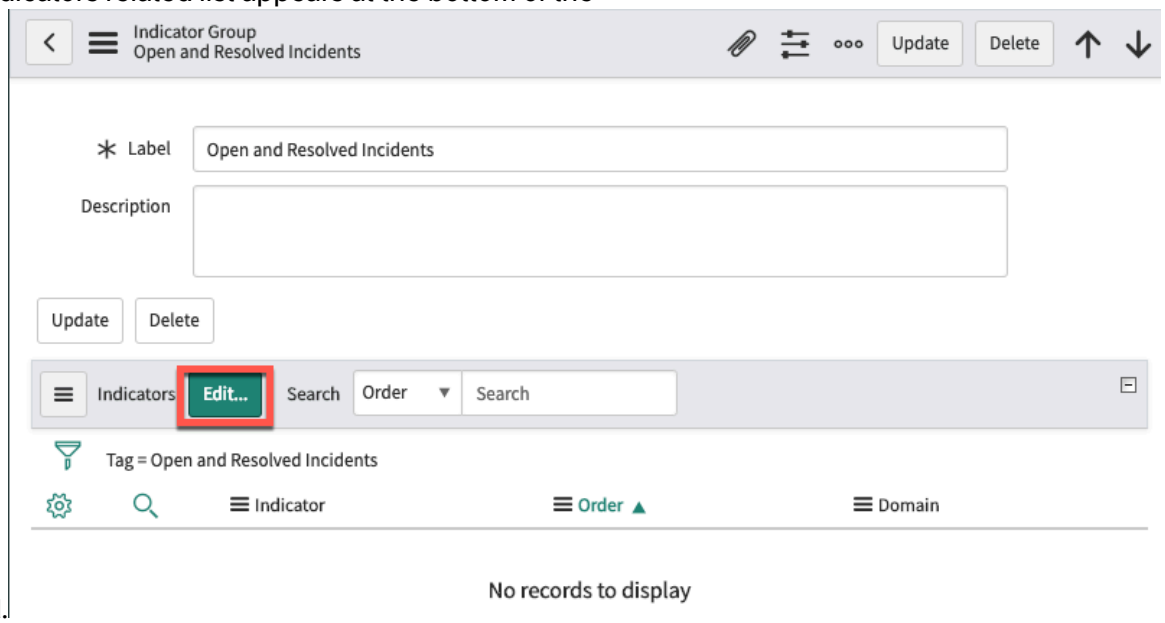
In this example, create an indicator group with all the indicators that refer to either open or resolved incidents. The incidents are all included with the demo data for Performance Analytics. After creating the indicator group, create a list widget that uses the indicator group and add the widget to a dashboard.

1. First, go to **Performance Analytics** > **Indicator Groups** and click **New**. An empty Indicator Group form opens.
2. Give the indicator group the label `Open and Resolved Incidents`, and save the form from the Additional actions menu.

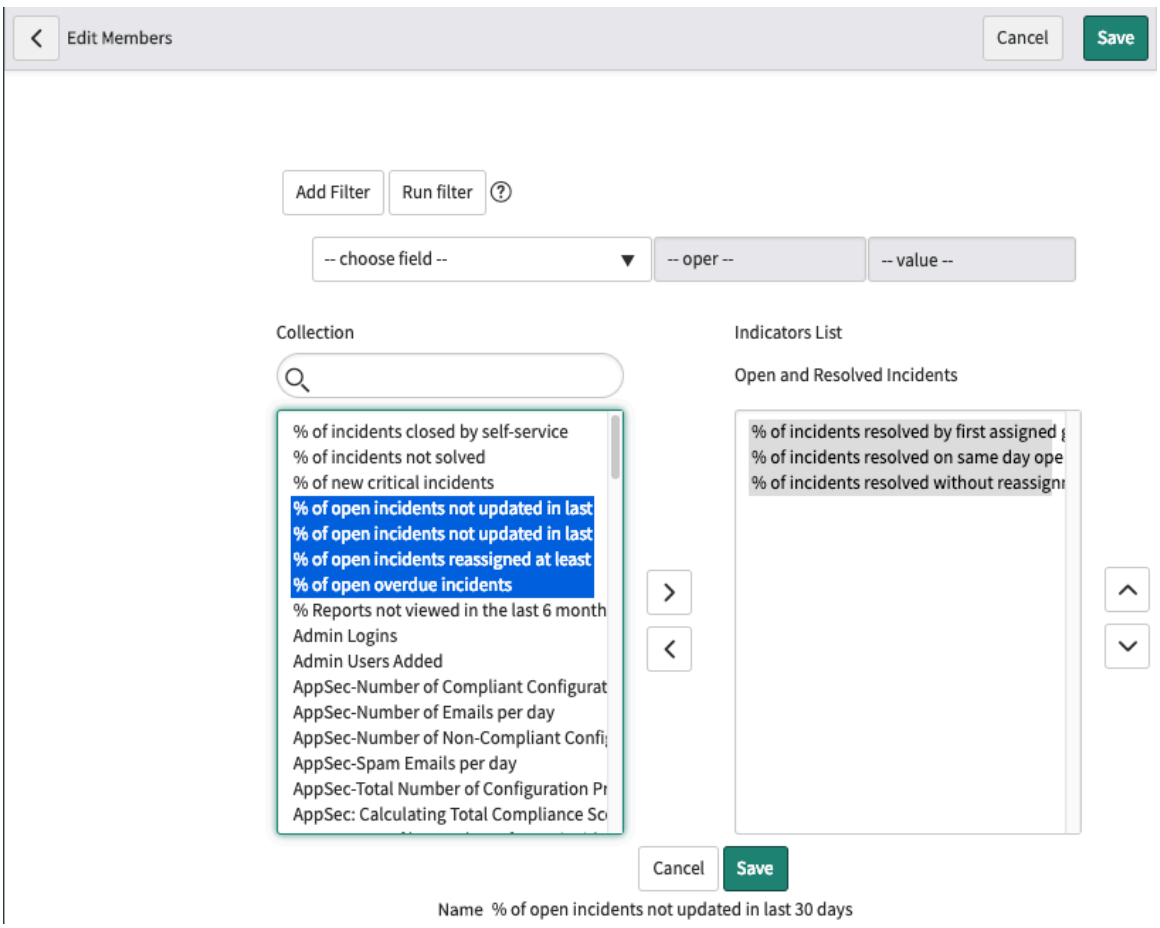


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Indicators related list appears at the bottom of the record.



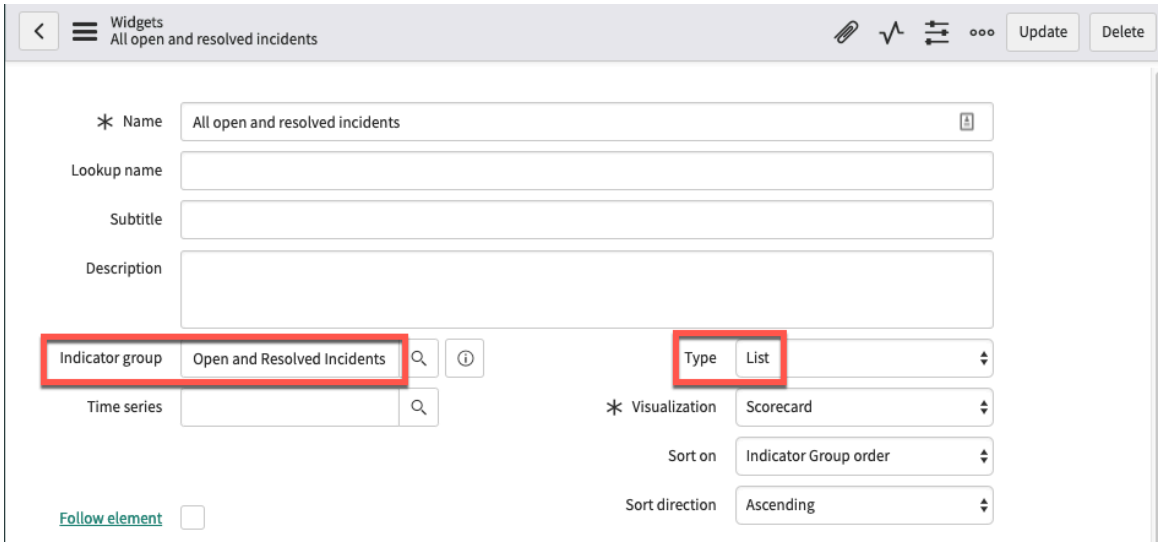
3. Click **Edit**, which opens the Edit Members dialog. To group all the indicators that involve resolved or open incidents, add all the indicators with 'resolved' or 'open' in their name. Also add the Incident backlog growth indicator.



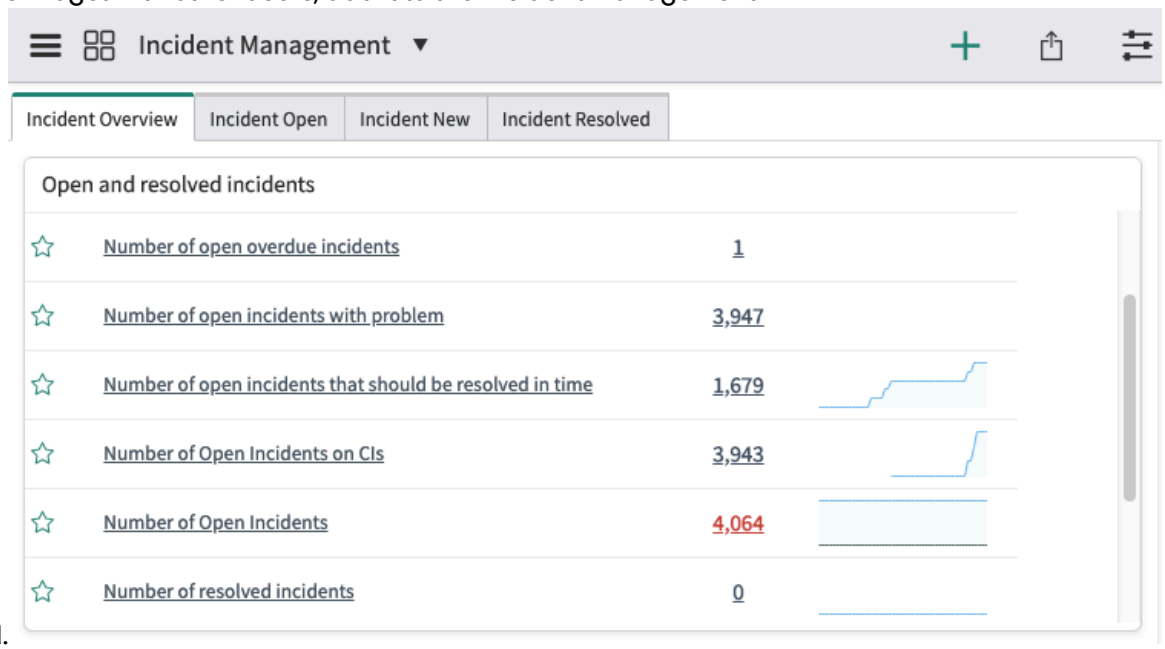
4. The indicator group is complete. Click **Save** in the Edit Members dialog and then **Update** on the indicator group record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Now create a Performance Analytics List widget and specify the Open and Resolved Incidents indicator group.



6. To share the widget with other users, add it to the Incident Management dashboard.



Related topics

- List widgets
- Create a relative compare visualization for a time series widget
- Create an email notification for indicators
- Create or update a treemap category (Security Incident Analytics)

Rounding and precision in indicators

Indicators round fractional results using "Banker's rounding" or mathematical rounding depending on the indicator **Precision**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scores below 10,000

When an indicator has a **Precision** of 0, the indicator rounds the result to the nearest even, whole number. For example, if an indicator with **Precision** 0 calculates the values 7 + (5 / 2), the indicator rounds the result up to 10. However, if the formula calculates 2 + (5 / 2), the indicator rounds the result down to 4.

When an indicator has a **Precision** greater than 0, the indicator rounds to the nearest decimal point for the given precision. For example, an indicator with **Precision** 1 rounds a result of 4.45 as 4.5.

Scores above 10,000

For indicator scores above 10,000, the score is rounded off and displayed with unit abbreviations as follows:

Display of large numbers

Number	Abbreviation	Example, precision=0	Example, precision=1
10,000-999,999	Nearest thousand, k	13,291 displayed as 13 k	13,291 displayed as 13.3 k
1,000,000-999,999,999	Nearest million, M	17,824,391 displayed as 18 M	17,824,391 displayed as 17.8 M
1,000,000,000	Nearest billion, G	2,378,425,321 displayed as 2 G	2,378,425,321 displayed as 2.4 G
1,000,000,000,000	Nearest trillion, T	3,456,398,231,094 displayed as 3 T	3,456,398,231,094 displayed as 3.5 T
1,000,000,000,000,000	Nearest quadrillion, P (for Peta)	18,103,456,398,231,094 displayed as 18 P	18,103,456,398,231,094 displayed as 18.1 P
1,000,000,000,000,000,000	Nearest quintillion, E (for Exa)	7,618,103,456,398,231,094 displayed as 8 E	7,618,103,456,398,231,094 displayed as 7.6 E

Note:

- Unlike numbers under 10,000, large numbers are not rounded off to the nearest even number when precision=0.
- Unit abbreviations are not configurable.

Exceptions

Y-axis values plotted on a line or column chart are not rounded. The score and tooltip displayed when you point to a value on the chart are rounded based on the indicator **Precision**.

Note: In formula indicators, rounding applies only to the formula result. Values within the formula are not rounded.

Indicator scores in reference currency

You can track the trends for monetary fields of the types Price, Currency, or FX Currency. The scores for an indicator based on any of these fields are collected in the Reference Currency values.

To collect these scores, select the unit on the indicator as **Use reference currency**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Warning: If the reference currency for a field changes after you have set up the indicator, scores are no longer collected properly.

Sometimes you need to provide your users with monetary KPIs converted to a standard currency. Consider a global project manager or CFO who deals with project costs in many different original currencies. They need to see all these costs converted to the global company currency so they can make decisions based on global trends. To provide such users with the KPIs they need, you can configure Performance Analytics indicators to collect scores denominated in a reference currency.

To collect indicator scores in a reference currency, create an indicator with the following characteristics:

- The indicator is an automated indicator, not a formula or a manual indicator.
- The aggregate is not **Count** or **Count Distinct** and the indicator is not **Scripted**.
- The selected **Field** to aggregate has the type Price, Currency, or FX Currency.
- The selected **Unit** for the scores is **Use reference currency**.

For the full procedure of creating such an indicator, see Create an automated indicator.

Note:

- A currency administrator must configure FX Currency fields before you use them in indicators.
- The **Precision** field is not available on the indicator form when **Use reference currency** is selected. Instead, the precision is inherited from the FX Currency configuration.

After the scores have been collected, you can explore them more deeply in the Analytics Hub or share them through a widget. The reference currency precision and symbol are used in all visual elements: the score value, change value, target, threshold, and tooltips.

System Reference Currency reference

As a Performance Analytics expert, you do not set up the reference currency. Someone with a currency administrator role performs this task. However, you may still want to know how reference currencies work on the ServiceNow AI Platform. A brief summary with links follows.

For a Price or Currency field, the system reference currency is the value of *glide.system.locale* as set in the localization properties. If this property is not set, the system default based on physical location is used. For more information about setting the reference currency for these fields, see Setting up and operating standard currency fields.

Note: Performance Analytics indicators do not use session currency values.

For an FX Currency field, the indicator scores are based on this hierarchy of configuration settings:

1. If field-level FX Currency configurations are set, these take precedence. If they are not set...
2. The Global FX Currency configuration is used. If the global configuration is not set...
3. The setting in *glide.system.locale* is used. If no value is set in this property...
4. The system default is used.

For more information about configuring FX Currency fields, see Setting up and operating FX Currency fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a unit

You can define units in which Performance Analytics indicator scores are shown. Units can be numbers, percentages, currencies, quantities of time, or any other entity you define. The most commonly used units are provided by default.

Before you begin

Roles required: pa_power_user (without navigation), pa_data_collector, pa_admin, or admin

Important: Do not delete any of the units that are provided by default. For example, if you remove the **Use reference currency** unit, it is not possible to show indicator scores in a reference currency.

Procedure

1. Navigate to **All** and search for `pa_units_list.do` in the **Filter** field.
   This approach works for all permitted roles regardless of Platform Analytics migration status.
2. Select **New**.
3. Enter the **Name** of the unit.

   Example
   For example, `Gallon`.
4. Specify the way the unit must be formatted.

   Example
   For example, {0}Gal gives you the number of gallons with the abbreviation Gal. For currencies, you can place the symbol for the unit in front of the number, such as ${0}.
5. Click **Submit**.
   Units can be used for automated, manual, and formula indicators.

Exclude time series from an indicator

Some time series aggregations are inappropriate to apply to some indicators. You can exclude time series on automated, formula, and manual indicators. Excluded time series are not selectable from the Analytics Hub, KPI Details, or widgets. Other time series remain selectable.

To exclude a time series from an indicator, select the time series in the **Time series exclusions** related list on the indicator form.

One use case for excluding time series is the logical relationship between the indicator aggregation and the time series aggregation. For example, you may not want to allow a time series aggregation that takes a SUM or an AVG of an indicator that itself is an average.

Possible time series exclusions based on indicator aggregation

Indicator aggregate	Consider excluding time series:
Average	All SUM, AVG. All partial periods (+).
Sum	All SUM
Minimum	All SUM
Maximum	All SUM

You may also want to exclude time series based on the indicator unit type. For example, if you have an indicator whose score is a percentage value, you may not want to display any SUMs

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

of these percentages. Similarly, time series aggregations for indicators which themselves are measured in days, weeks, months, quarters, or years may not make much sense.

As a final point, consider the subject matter of the indicator. Some time series aggregations may not be appropriate for an indicator for qualitative reasons.

Control access to an indicator

You can control which user roles grant access to specific indicators. Access to an indicator is regulated in the indicator record.

Before you begin

Role required: pa_admin or admin

Procedure

1. Navigate to **All** > **Platform Analytics Administration** > **Indicators** > **Automated Indicators** or to **Manual Indicators** or **Formula Indicators** if applicable.
2. Select an indicator record.
3. In the **Access control** section, clear the **Visible by all roles** check box.
4. Select the **Roles** that grant access to the indicator.
5. Click **Update**.

Related topics

Control ability to view breakdown elements

Share a responsive dashboard

Create an email notification for indicators

Performance Analytics can automatically generate an email with the score, change %, target, and score-target gap % of one or more indicators.

Before you begin

Enable and configure email notifications before you can use email summaries.

Role required: pa_admin or admin

Procedure

1. Expand **All** and enter `sysauto_indicator_notifications_list.do` into the navigator Search field, then press **Enter**.
2. Click **New**.
3. Enter a **Name** and a **Description** for the email summary.
4. Select the **Active** check box to run a scheduled job that creates the email summary.
5. Select when the job should run.
   - Daily
   - Weekly
   - Monthly
   - Periodically
   - Once
   - On Demand

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Set the time to run the job by changing the hours, minutes, and seconds (using 24-hour notation).
   By default, the job runs at midnight.
7. Select the indicators to include in the summary, either dynamically or manually.

   Dynamically

   Select the **By Condition** check box. Use the condition builder to define the conditions that determine which indicators the email summary includes. For example, you can select all key indicators by setting the condition to [Key] [is] [true].

   Manually

   Clear the **By Condition** check box. After you save the Scheduled Email Summary form, select individual indicators to include in the summary in the **Indicators** related list.
8. Right-click the form header and select **Save**.
   The related lists become available.
9. Select any number of users in the **Users** related list.
10. If you are selecting indicators manually, select them in the **Indicators** related list.

Result

The email summary job runs based on the schedule you configured. You can also run the job manually by clicking **Execute Now**.

Schedule the export and distribution of an indicator

Schedule an indicator to automate its distribution.

Before you begin

This feature requires the licensed version of Performance Analytics.

Note: This feature currently does not support Data snapshots indicators.

Role required: pa_power_user, pa_admin, or admin

Procedure

1. Navigate to **All** > **Platform Analytics Administration** > **Schedules** > **Scheduled Indicators**.
2. Select **New**.
3. Complete the form as follows:

Scheduled Indicator fields

Field	Description
Indicator	Select the indicator that you want to export.
Breakdown	Select a breakdown to filter the indicator scores.
Element	If you selected a breakdown, select a breakdown element to show only scores associated with that element.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Chart	Select this checkbox to include the scores visualization in the PDF. The visualization is the same as displayed on the indicator Analytics Hub.
Breakdowns	Select this checkbox to include the scores for each breakdown and breakdown element in a table at the bottom of the PDF. If you have selected a **Breakdown** and **Element**, the breakdowns displayed at the bottom of the PDF are 2nd-level breakdowns.
Users	Users who should receive the indicator. To receive indicators, users must have an Email address defined and have **Notifications** set to **Enable** in their user records.
Groups	Groups that should receive the indicator.
Email addresses	Email addresses of users who should receive the indicator but who are not in the system.
Active	Check box that enables (selected) or disables (cleared) scheduling for the indicator.
Run	Frequency for exporting the indicator.
Time	Time of day to export the indicator.
Conditional	Check box that displays (selected) or hides (cleared) the **Condition** field, which allows you to specify conditions under which the indicator is exported.
Condition	User-created script that checks for certain conditions to be true before exporting the indicator. This field is visible only when **Conditional** is selected.
Subject	Text that appears in the subject line of the distribution email.
Introductory message	Additional message that is delivered with the indicator.
Include with	Additional scheduled indicators to send.
Orientation	Select the page orientation, Landscape or Portrait.
Zip output	Select this check box to send the indicator as a zip file.

Link an automated indicator to a benchmark

To enable the comparison of indicators to ITSM and ITOM benchmarks, link an automated indicator to the corresponding benchmark KPI. A benchmark KPI can be linked to only one indicator. You can compare the linked indicators in the Analytics Hub.

Before you begin

You must opt-in to the ServiceNow® Benchmarks application.

Role required: pa_data_collector, pa_power_user, admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you have the sn_bm_client.benchmark_admin role, you can link Performance Analytics indicators to benchmark indicators through the Benchmarks Setup interface. For instructions about linking indicators through that interface, see Link or customize a benchmark KPI.

About this task

Used together, benchmarking and Performance Analytics enables you to measure your enterprise ITSM and ITOM against industry standards while driving improvements across all important metrics. For more information, see Benchmarks.

Procedure

1. In the list of automated indicators or the list of formula indicators, identify which benchmark indicator you want to link to which other indicator.
   Benchmark indicator names begin with the word **Benchmark**.
2. Verify that the benchmark indicator and the linked indicator are configured compatibly. Specifically, verify that the following properties match in both indicators:
   - Indicator source
   - Unit
   - Formula (for formula indicators)

   Warning: The indicators in Platform Analytics Solutions are not configured the same as the matching benchmark indicators.
3. Open the benchmark indicator record.
4. In the **Linked indicator** field under **Indicator properties**, select the automated indicator to link to the benchmark.

   Note:
   - The fully licensed version of Performance Analytics must be activated to see the complete list of Performance Analytics automated and formula indicators.
   - To edit the **Linked indicator** field, you may need to change the scoped application that you are working in, at the top of the record.
   - The names of the benchmark indicator and the indicator to link might not match.

Result

After you update the benchmark KPI record, you can compare the benchmark KPI and the automated indicator on the **Compare** tab of the Analytics Hub for the automated indicator. For more information and an example, see Compare scores.

Indicator breakdowns

Breakdowns enable you to group or filter indicator scores by a qualitative attribute such as Priority, Category, or Assignment Group. You can apply a breakdown on the Analytics Hub, in KPI Details, and on dashboards.

The values for each breakdown are called breakdown elements. For example, the Priority breakdown may have the elements Critical, High, and Low. Breakdowns are categorized as automated, manual, or external, depending on where these elements come from. Automated breakdown elements are specified in breakdown sources. Manual breakdowns have their elements entered manually to define an organization. Lastly, an external breakdown specifies the JDBC data source and SQL statement for retrieving breakdown elements.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, you can look at the Number of Open Changes by Assignment Group. Or you can see the Number of New Changes by Priority.

Create a breakdown from a wizard

Create a breakdown, breakdown source, and breakdown mappings, and associate the breakdown with indicators.

Before you begin

Role required: pa_power_user, pa_data_collector, or admin

Note: Users with only the pa_power_user role cannot create breakdown sources.

About this task

Create a simple breakdown based on an existing indicator. To create more advanced breakdowns or breakdown sources, such as to limit data sets with complex filters, create or update breakdown and breakdown source records directly.

Procedure

1. Navigate to **All** > **Performance Analytics** > **Breakdowns** > **Create New**.
2. Select the **Indicator** that you want to create the breakdown for.
   The **Table** field is automatically populated based on the indicator source table. You can apply the new breakdown to other indicators with the same source table on the **Link to indicators** tab.
3. Select the **Field** to base the breakdown on.
   The breakdown uses values from this field as breakdown elements and breaks down collected data based on the value of this field in each record.
4. Click **Next**.
   The **Define the breakdown** tab displays different data depending on if a breakdown, breakdown source, or breakdown mapping exist for the specified indicator, table, and field.
5. Perform one of the following actions.

Option	Description
Create a breakdown, breakdown source, and mapping	If no breakdown or breakdown source exists for the specified table, enter a name for the new breakdown. A breakdown source and mapping for the selected table and field are created automatically. Click **Show filter to make adjustments** to filter the data included in the breakdown source.
Create a mapping using an existing break down source	If at least one breakdown source exists for the specified table and there are one or more breakdowns using the source, select the breakdown to create a mapping for. If a mapping exists between a breakdown with the selected source and a field on a par ent of the indicator table, you can only select an existing breakdown to create the mapping for. If no such mapping exists for a parent ta ble, you can select an existing breakdown or create a new breakdown.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Review existing records	If a breakdown and breakdown source exist for the specified table, and a breakdown map ping exists for the specified breakdown and field, review the settings. You do not need to make any changes.

6. Click **Next**.
7. On the **Link to indicators** tab, select any additional indicators that you want to apply the breakdown to.
   You can apply the breakdown to other indicators with the same source table as the indicator you selected first. If the breakdown already applies to an indicator, that indicator is not displayed.
8. Click **Next**.
9. On the **Data Collection** tab, select how many days of historical, broken-down scores and snapshots to collect, or clear the **Collect data from the past** to skip historical data collection.
10. Click **Next**.
11. Review the settings and confirm that the correct records will be created, then click **Apply**.
    A check mark appears next to each record after it is created. When all records are created the **Create another breakdown** button appears.

Breakdown sources

Breakdown sources specify which unique values, called breakdown elements, a breakdown contains.

A breakdown source is defined as a set of records from a table or database view or as a bucket group. Multiple breakdowns can use the same breakdown source. For example, instead of seeing ALL assignment groups for the Number of Open Changes indicator, you can limit the element list to just those groups that are part of the change process by configuring the Breakdown Source.

Define a breakdown source

Specify a facts table to serve as a data source for breakdowns. Apply conditions to specify the elements for this breakdown source.

Before you begin

Roles required: pa_data_collector, pa_admin, or admin. The breakdown source creator needs access to the table and reference column that the indicator source uses.

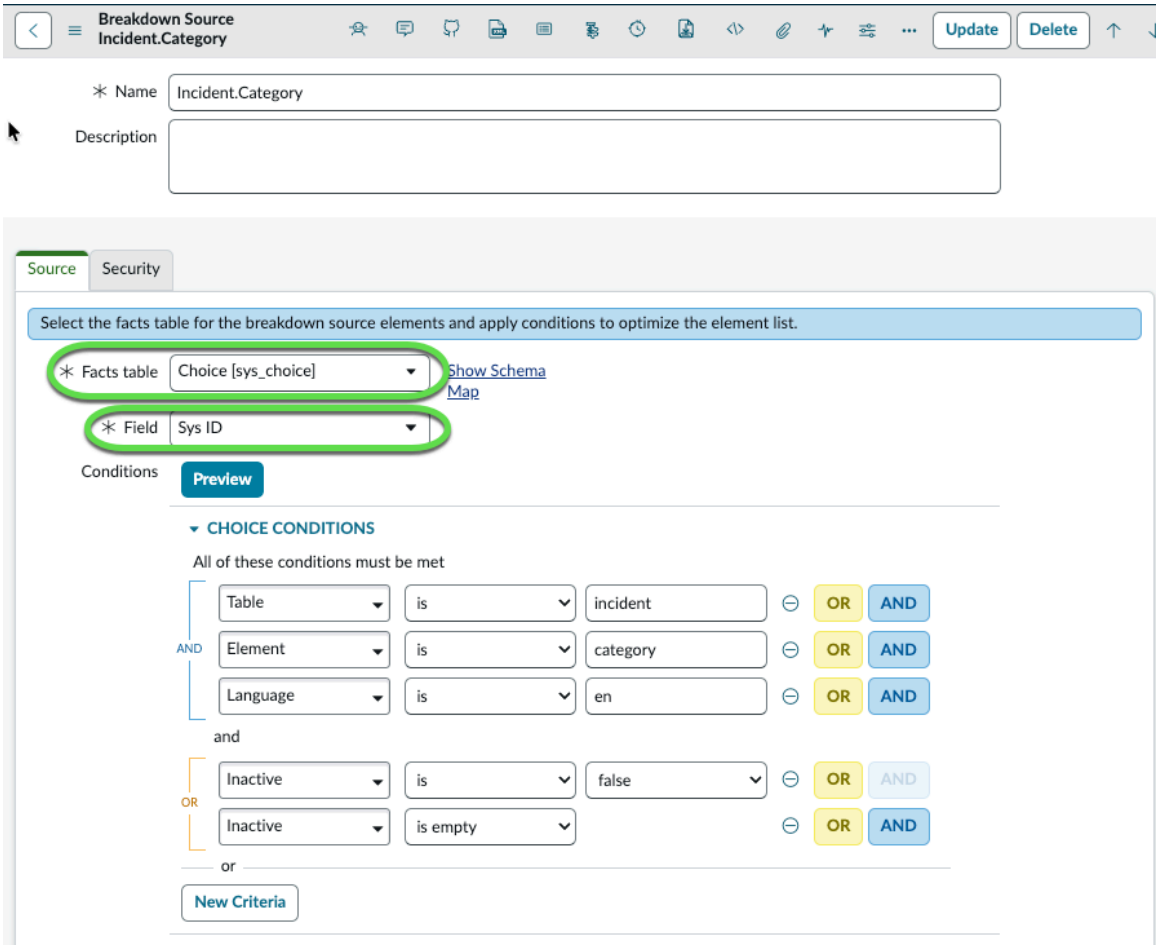
About this task

Always use a facts table with a field that has a unique value for every record, usually **Sys ID**. For example, the Incident.Category breakdown source takes its elements from the **Choice** table. The elements are identified by the **Sys ID** field. The breakdown source filters the choices to those that are on the **Incident** table, in English, and not inactive.

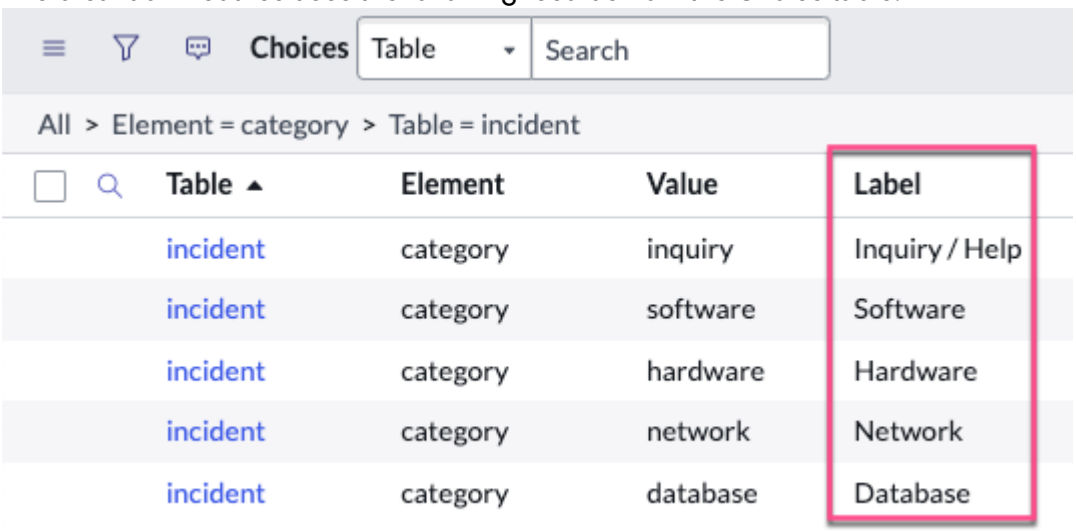
Some tables, such as Workflow Data Fabric tables, are not supported.

Tip: As in this example, if you use Choice [sys_choice] for the facts table, put conditions on the Table, Element, and Language fields. Also filter out Inactive records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The breakdown source uses the following records from the Choice table:



Note: The Choice table includes every possible choice from every table, which is why it has Table and Element columns. Most other facts tables you would use for a breakdown source are simpler.

Procedure

1. Navigate to **All** > **Platform Analytics Administration** > **Data Sources** > **Breakdown Sources**.
2. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Give the breakdown source a meaningful **Name**.
4. Add a detailed **Description** to help others understand the use and purpose of this breakdown source and to help them avoid creating duplicates.
5. For the **Facts Table**, select the table that the breakdown source gets elements from.
   For example, for the breakdown source to specify user groups as elements, select **Group [sys_user_group]**.

   ⚠ **Warning:** Do not change the facts table for a source after you have started collecting data. If you change the facts table, you lose all historical scores for the associated indicators at the next score collection.

6. In the **Field** table, select a field that contains a unique value for every record.
   This field is usually **Sys ID**.
7. Set the **Conditions** to filter out unneeded elements.
   If you set Choice [sys_choice] as the facts table, always filter on table, element, and language, and filter out inactive records. For example:

   [Table] [is] [Incident] and

   [Element] [is] [Category] and

   [Language] [is] [en] and

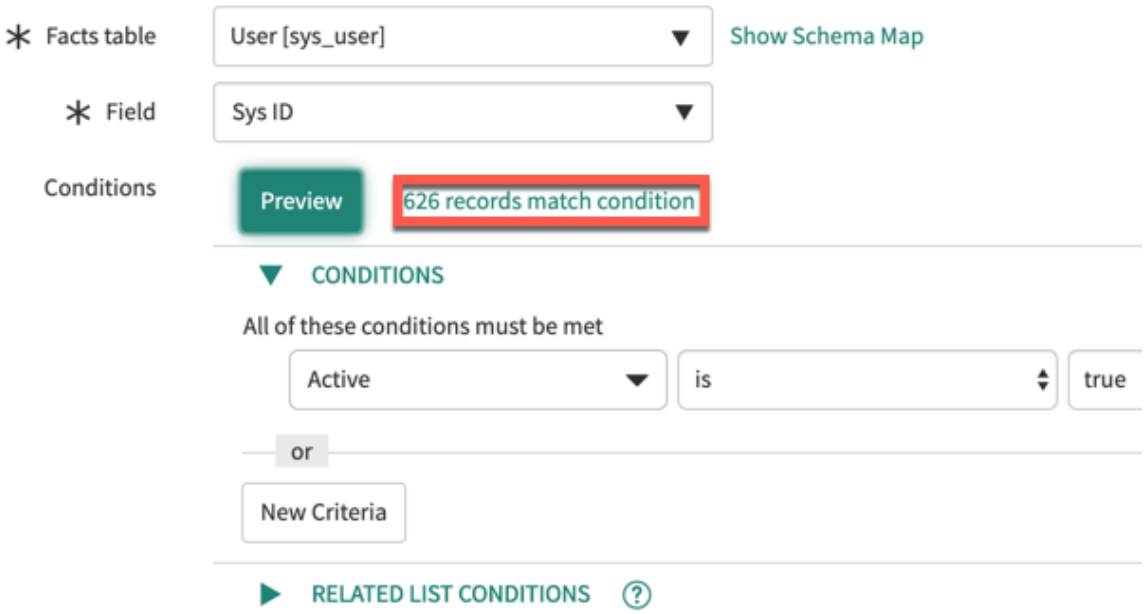
   [Inactive] [is] [false] or

   [Inactive] [is] [empty]

8. To see how many records match the selected conditions, click **Preview**.
9. **Optional:** Define **RELATED LIST CONDITIONS** to include a relationship with another table in the filter.
   For more information, see Add related list conditions.

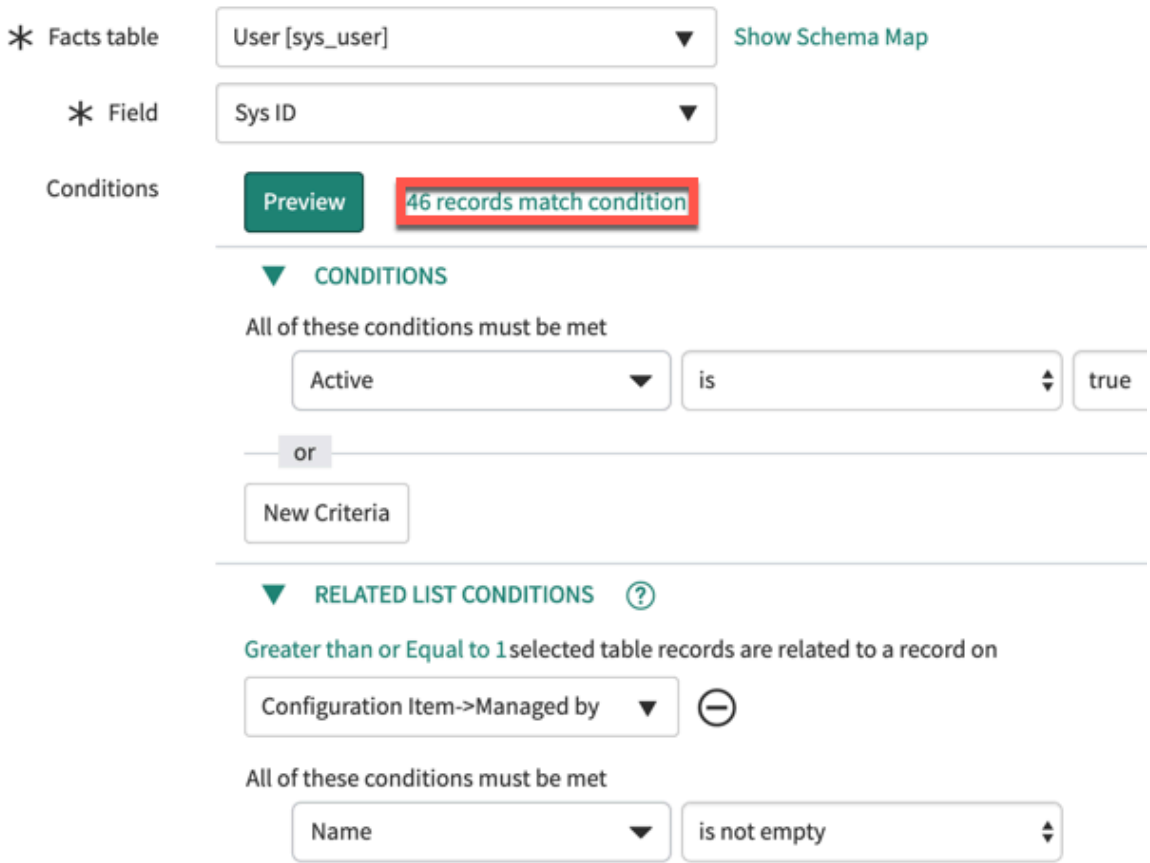
   Example
   For example, consider a breakdown source for Configuration Item (CI) Managers. The facts table is User [sys_user], but the only condition you can apply from this table is to filter for active users. No field on the table lets you select only users who are CI Managers. You get hundreds of results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



(Optional)

If you add a condition that the Name on the User record must match at least one entry in the Managed by column of the Configuration Item [cmdb_ci] table, the breakdown source only returns the users who are CI Managers.



10. **Optional:** In **Label for unmatched**, write a custom label to use when the value in a mapped field on an indicator source record does not match any elements on the breakdown source. The default label is **Unmatched**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example
The Incident.Category breakdown source references records on the Choices [sys_choices] table where the value of the Table field is incident and the value of the Element field is category. The Category breakdown includes a mapping from the Incident.Category breakdown source to the Category field on the Incidents [incident] table. If an Incident record has a null value in the Category field, the value when you apply the Category breakdown to this record is **Unmatched**, by default.

11. In the **Security** tab, set whether to exclude or include breakdown source elements by role based on element security lists.
For more information, see Define an elements security list.

What to do next
Create breakdowns that use this breakdown source. You can open the **Breakdowns** tab and click **New**. The **Breakdown** form opens, as described in Create an automated breakdown. After you create breakdowns that use this source, these breakdowns are listed in the **Breakdowns** tab.

Bucket groups for breakdown sources

Bucket groups are used to recategorize data so it can be used as a breakdown, for example by grouping a range of values into discrete buckets.

In the data architecture, bucket groups are defined in Bucket Group [pa_bucket_groups] records and buckets in Bucket [pa_buckets] records. Each Bucket [pa_buckets] record contains a Bucket Group field that is a reference to a Bucket Group [pa_bucket_groups] record.

To work with a bucket group, create a breakdown source that uses Bucket [pa_buckets] as the facts table and specifies the bucket group in a condition. If a breakdown built on this source uses a breakdown mapping with a script, the breakdown groups the values that the script returns into buckets. If the breakdown mapping specifies a field instead of using a script, the breakdown groups the values of the mapped field into buckets.

Related topics

Create a breakdown mapping on a breakdown record

Grouping field values into buckets

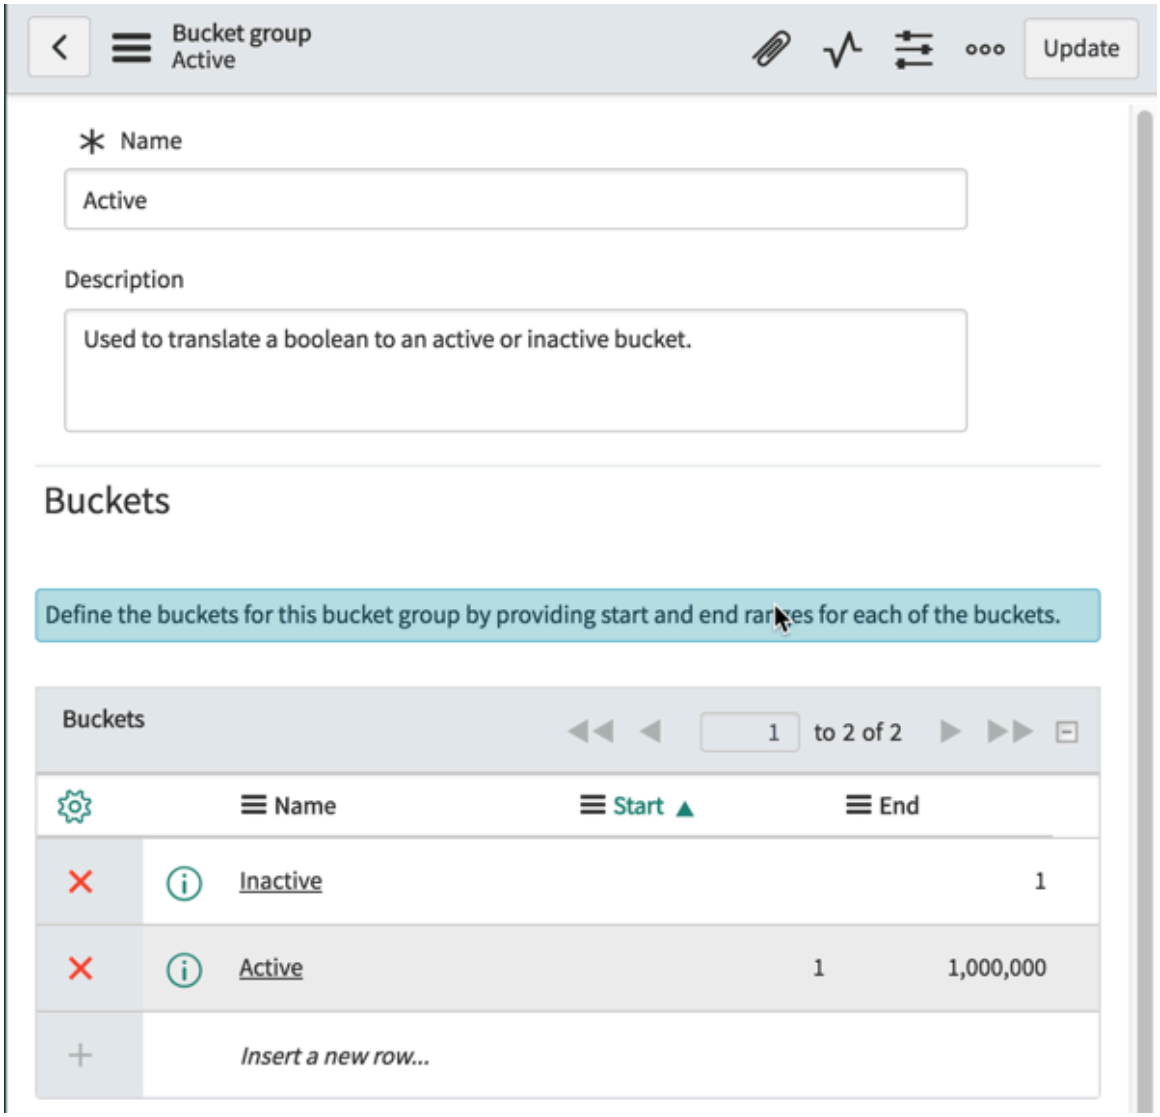
You can use a bucket group with a breakdown mapping that does not use a script, to group the values of any mapped field to buckets.

The use case can be as simple as translating the `true` and `false` values of a boolean into two buckets with meaningful labels.

Example: Sorting boolean values into buckets

A base Performance Analytics installation includes the Active breakdown as part of the Analytics Usage Overview. This breakdown uses a mapping to the job.active boolean field from the Job Log [pa_jobs_logs] table. The breakdown source uses a bucket group where `true` values for job.active are sorted into the Active bucket, while `false` values are sorted into the Inactive bucket. Note that `false` values are numerically considered to be a value less than one, while `true` values are numerically one and above.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Grouping script results into buckets

When you have a breakdown mapping script that collects a range of values, you can define a bucket group to divide those values into discrete buckets.

After you create the bucket group, you create a breakdown source based on the bucket group. Then you create a breakdown that uses that breakdown source. When you create the breakdown mapping for the breakdown, define or select a script for the mapping. The breakdown groups the results that the script returns into the buckets of the bucket group. For an example, see Example: Script mapping.

You can write a bucket group for an existing script, or you can first write the bucket group and then write the script. Both must exist before you can create the breakdown.

Note: The same script can be used with any number of bucket groups. Also, in principle any scripts that returned the same kind of data could be used with the same bucket group.

Create a bucket group

Specify a group of buckets into which you want to recategorize data.

Before you begin
Role required: pa_data_collector or higher

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Platform Analytics Administration** > **Indicators** > **Scripts**.
2. Select **New**.
3. Enter a **Name** that clearly identifies the bucket group, like `Age Ranges in Days`.
4. Double-tap **Insert a new row** to create a bucket.
5. Enter a **Name** for the first bucket, then press Enter or tap the green check icon.
6. Double-tap in the **Start** and **End** columns to enter the starting and ending values for the range. Records that match the end value are excluded from the bucket. Therefore, set the end value of one bucket and the start value of the next bucket to be the same. Records that exactly match that value are sorted into the bucket that has that value as the start value.

   ⚠ **Warning:** If the end value of one bucket does not match the start value of the next bucket, you have a 'hole' where records are not sorted into any bucket. For example, if you have a bucket that ends at 20 and the next bucket starts at 21, records for which the script returns a value between 20.0000~ and 20.9999~ do not get sorted into any buckets.

7. Press **Submit** after all the bucket ranges have been defined.

Example: Incident Age Ranges bucket group

Consider the case where you want to group incidents by age, as follows:

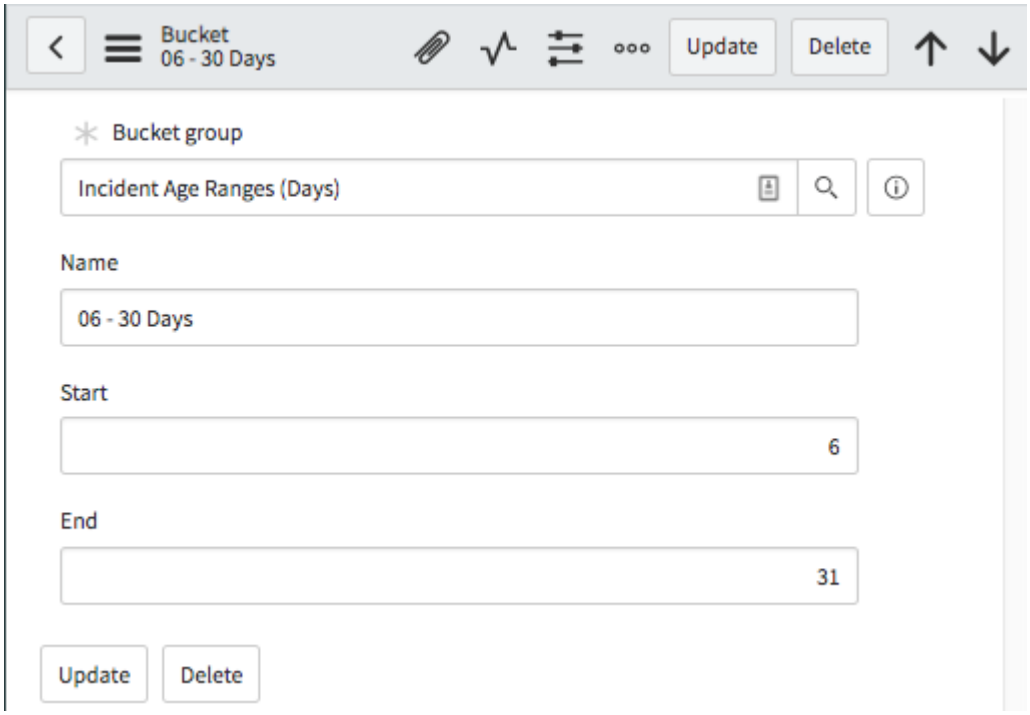
- Less than a day
- 1–5 days
- 6–30 days
- 31–90 days
- More than 90 days

In **Platform Analytics Administration** > **Indicators** > **Scripts**, you already have a script named Incident.Age.Days. This script derives the age in days of an incident from its opening date and the latest date on which a score was collected:

```
var diff=function(x,y){return y.dateNumericValue() -
 x.dateNumericValue();};
var days=function(x,y){return diff(x,y)/(24*60*60*1000);};
days(current.opened_at, score_end);
```

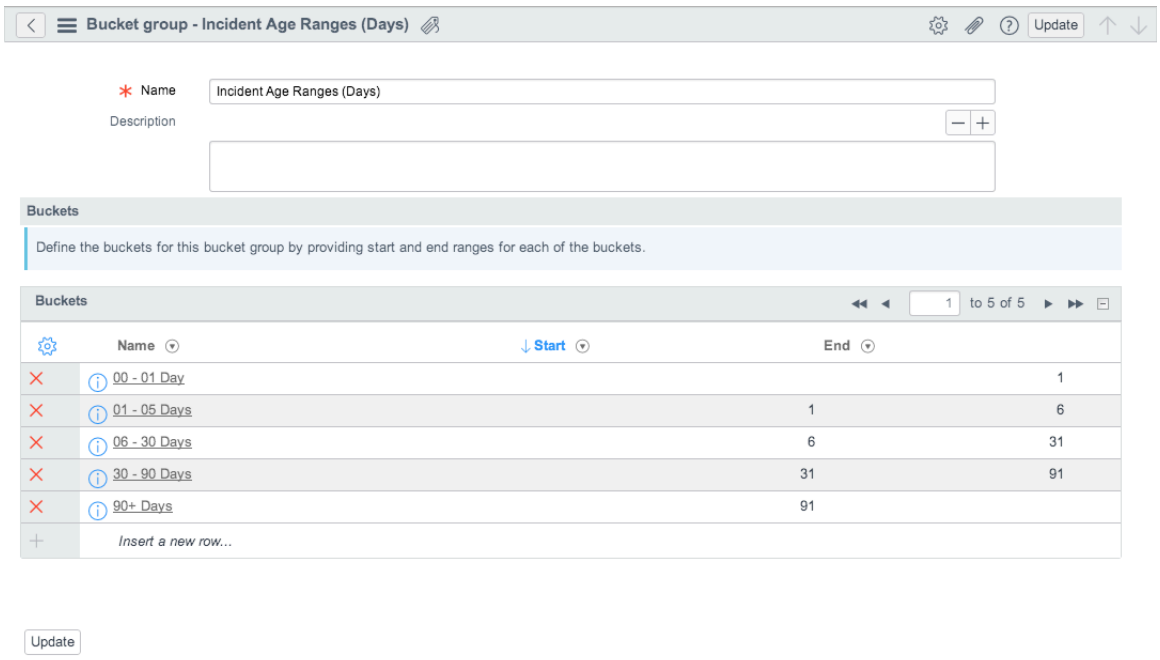
You create a bucket group named Incident Age Ranges (Days). In this bucket group, you define a set of buckets that start at the desired date and end at the beginning of the next bucket. For example, the 06–30 Days bucket starts at 6 and ends at 31:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



This bucket will contain incidents from the age of precisely 6 days to the age of 30 days, 23 hours, 59 minutes, and 59 seconds.

At the end, you have a bucket group with five buckets corresponding to the age ranges in which you want to divide incidents.



Note: The Script Mapping example shows a breakdown that uses this bucket group and script.

What to do next

Create a breakdown source that uses the Bucket [pa_buckets] facts table, the Sys ID field, and the condition [Bucket group][Is][<the name of the bucket group you created>]. Then create a

© 2026 ServiceNow, Inc. All rights reserved.

Scripting in Performance Analytics

Automated breakdowns

An automated breakdown uses a breakdown source to determine selectable elements.

Automated breakdowns are based on a breakdown source, which is a set of records from a table. The breakdown maps these records, known as breakdown elements, with fields on tables that indicators collect scores from. Scores collected from mapped tables can then be grouped and filtered based on the values in the mapped fields and the breakdown elements.

For example, the Groups breakdown source that includes records from the Groups [sys_user_groups] table is available by default. This breakdown source specifies the filter **[Active][is][true]** to include only active groups as elements. You can map this breakdown source to fields on other tables that reference the Groups table, such as the Incident **Assignment group** field. Scores collected from the mapped table are grouped based on the value of that field. You can then filter the scores on the Analytics Hub and dashboards by selecting the breakdown and an element, such as to show scores only for incidents assigned to the Hardware group.

Create an automated breakdown

To create an automated breakdown, select a breakdown source for it to use and apply access restrictions. Then map which field on the indicator source references the breakdown source. Finally, assign indicators to the breakdown.

Before you begin

Familiarize yourself with the definitions and uses of breakdowns in general and automated breakdowns in particular.

Role required: pa_data_collector, pa_power_user, pa_admin, or admin

About this task

An automated breakdown uses a breakdown source to determine selectable elements. You can use an existing breakdown source or you can define a new one.

Note: This process allows you to create a fully customized breakdown. To create a simple automated breakdown, see Create a breakdown from a wizard.

Procedure

1. Navigate to **All** > **Platform Analytics Administration** > **Breakdowns** > **Automated Breakdowns** and select **New**.
2. Specify a meaningful **Name**.
   The name of a breakdown is frequently based on the label of the field that is used in the breakdown mappings.
3. In the **Automated** tab, select the **Breakdown source**.
4. **Optional:** Select a **Default elements filter**.
   Use element filters to restrict the elements that are visible to a user. For more information, see Element filters.
5. **Optional:** In the **Access control** tab, set who can see the breakdown.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These restrictions apply in all cases: seeing the breakdown in the list of breakdowns, seeing the breakdown in an Analytics Hub or dashboard, or using the breakdown when creating a widget.

Value of Visible to	Further settings
Everyone (default)	You can restrict visibility by roles. Unselect **Visible by all roles** and select the **Roles** that are required to access the breakdown.
Groups and Users	Select the **Groups** and individual **Users** who can access this breakdown. You can select groups or users from a list, and you can select users by email address.

What to do next

Create breakdown mappings and associate indicators with the breakdown. You can do this from the indicator, using a graphical tool (see Assign and map breakdowns.

Create a breakdown mapping on a breakdown record

Specify which field on the indicator source references the breakdown source. If no appropriate field is available, specify a script to query the indicator source.

Before you begin

Assign a breakdown source to the breakdown before creating the mapping.

Role required: The same as for creating a breakdown.

About this task

You can create multiple mappings for the same breakdown, enabling you to use that breakdown for multiple indicators.

Note: The procedure on this page uses a related list on the breakdown form. You can instead use a graphical tool that you access from the indicator form. See Assign and map breakdowns.

Procedure

1. If you are adding a mapping to an existing breakdown, find that breakdown in the relevant list of breakdowns and open it.
2. In the **Breakdown Mapping** related list, click **New**.
3. Select the **Facts table**.
   This table is the indicator source that you want to break down.
4. Do one of these actions.

Option	Description
Use a field to map values to elements.	Select the **Field** in the indicator source that maps to records in the breakdown. See the use of the **Category** field in Example: Field mapping.
Use a script to map values to elements.	Select **Scripted**, then select the **Script** that defines the association between indicator records and breakdown elements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Use a script when you do not have the simple use case of a field in the indicator source that maps to a breakdown source table. A script can define a wide range of mapping relation ships. The most common use case is when the breakdown source is a bucket group and the script returns an integer to assign an indi cator score to a bucket. See Example: Script mapping. You cannot show real-time scores for an indi cator that uses a scripted breakdown. **Tip:** Try to implement scripted break down mappings so that [mapping of lev el 1 && mapping of level 2] is equal to the intersection of [mapping of level 1] and [mapping of level 2]. Otherwise, the score and the number of records may not agree for second-level breakdowns. If these values disagree, the score is cor rect. For more details and an example, see KB0748969. Now Support login is required.

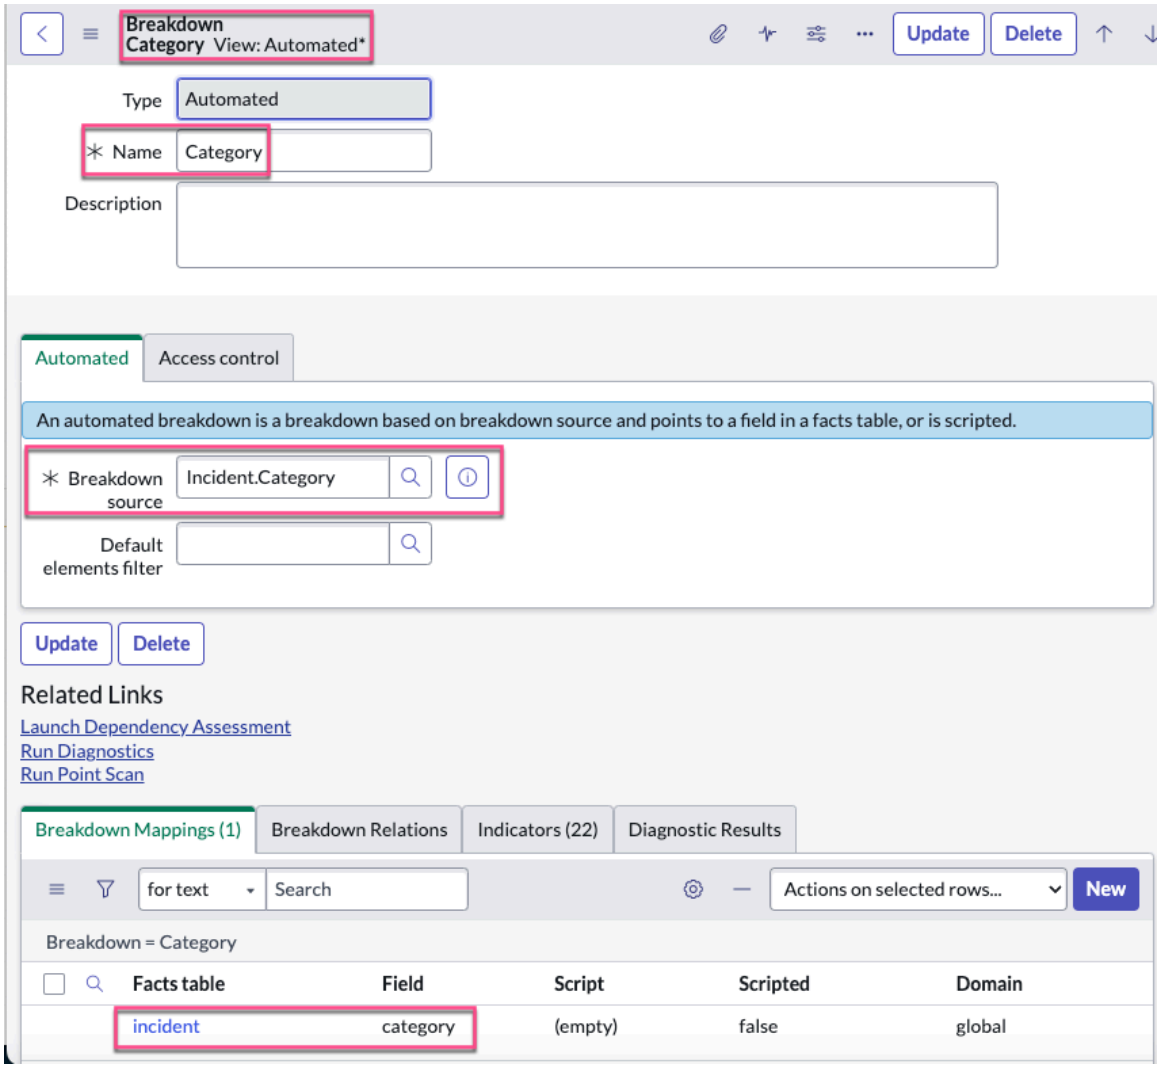
5. Click **Submit**.
6. Repeat steps 2–5 as needed, to define additional mappings.

Example: Field mapping

The Category breakdown maps the **Category** field on the incident table to the Incident.Category breakdown source, which references the Choices[sys_choice_list] table.

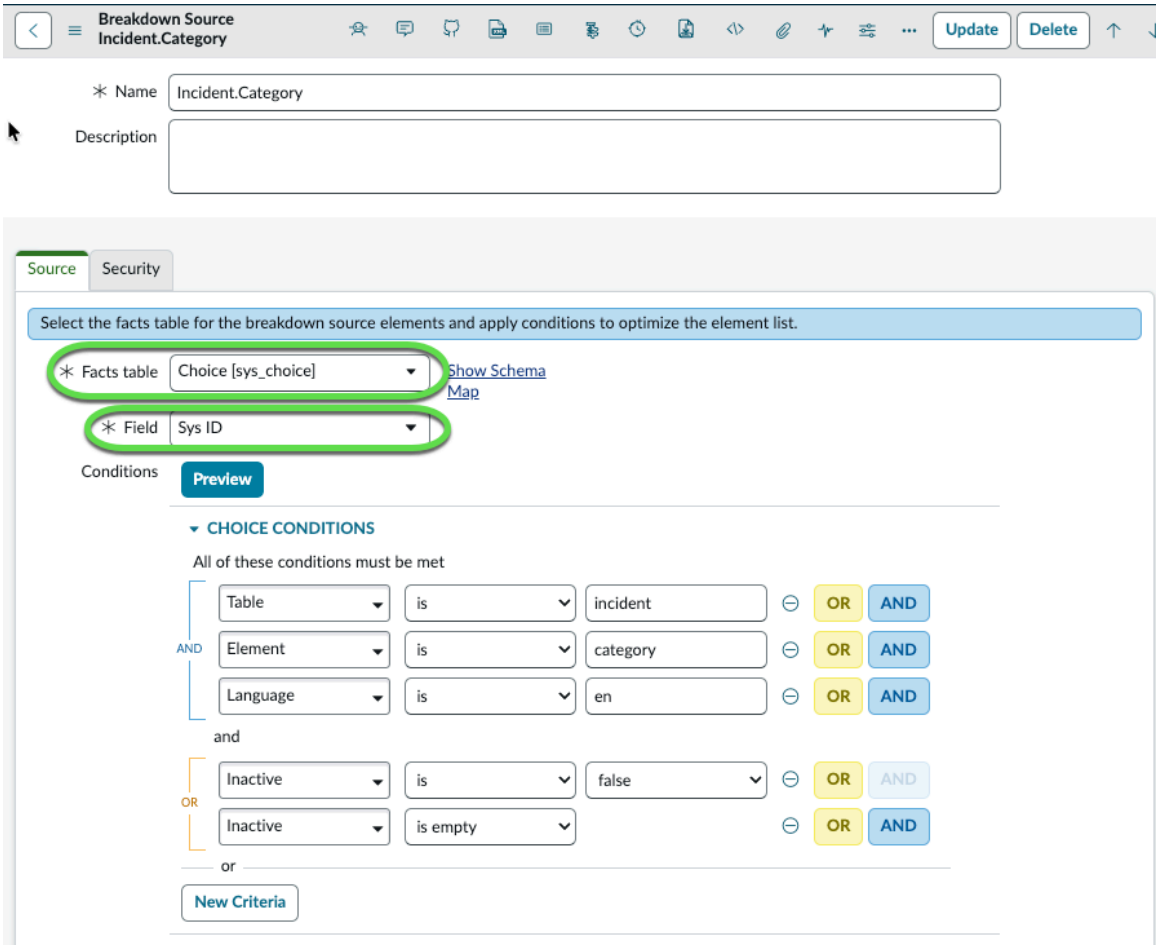
In the first image, you see the Category breakdown with the Incident.Category breakdown source. This breakdown has a breakdown mapping to the **Category** field on the incident table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

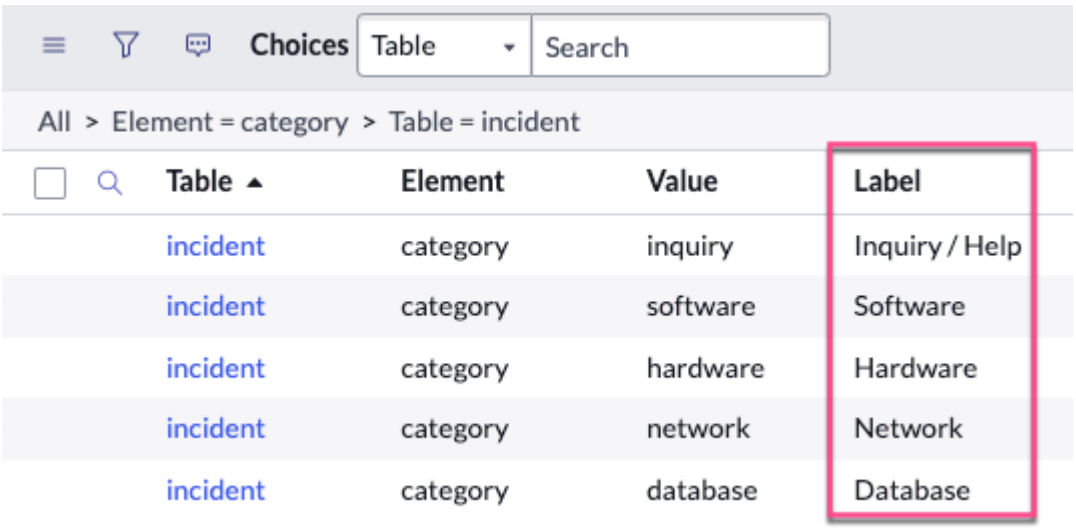


The Incident.Category breakdown source uses records in the Choices[sys_choice_list] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

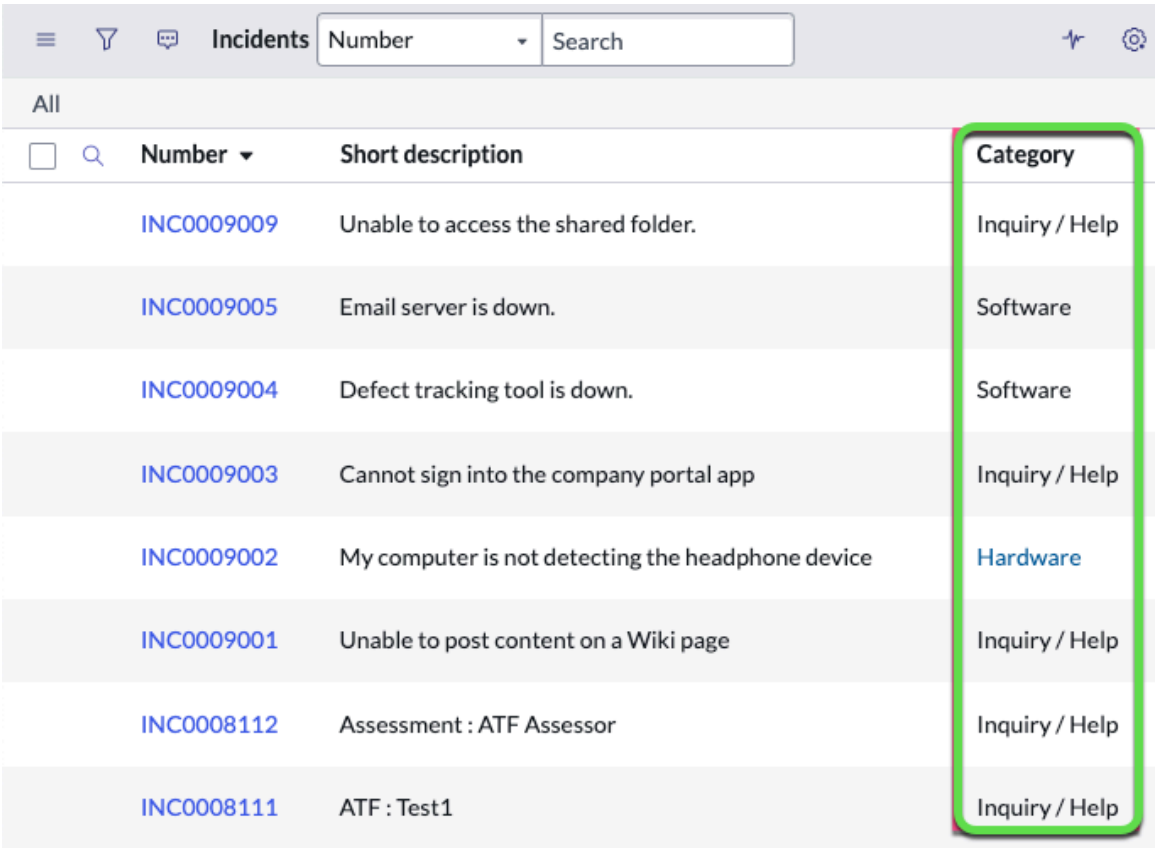


The next image shows the Choice [sys_choice] table records that meet the conditions that are specified in the Incident.Category breakdown source. Note the Label field values.



Finally, you see the Category field of some records on the Incidents table. This field is mapped to the Category breakdown. The field values match the Label fields of the records of the Choices[sys_choice_list] table that the Incident.Category breakdown source filters for.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

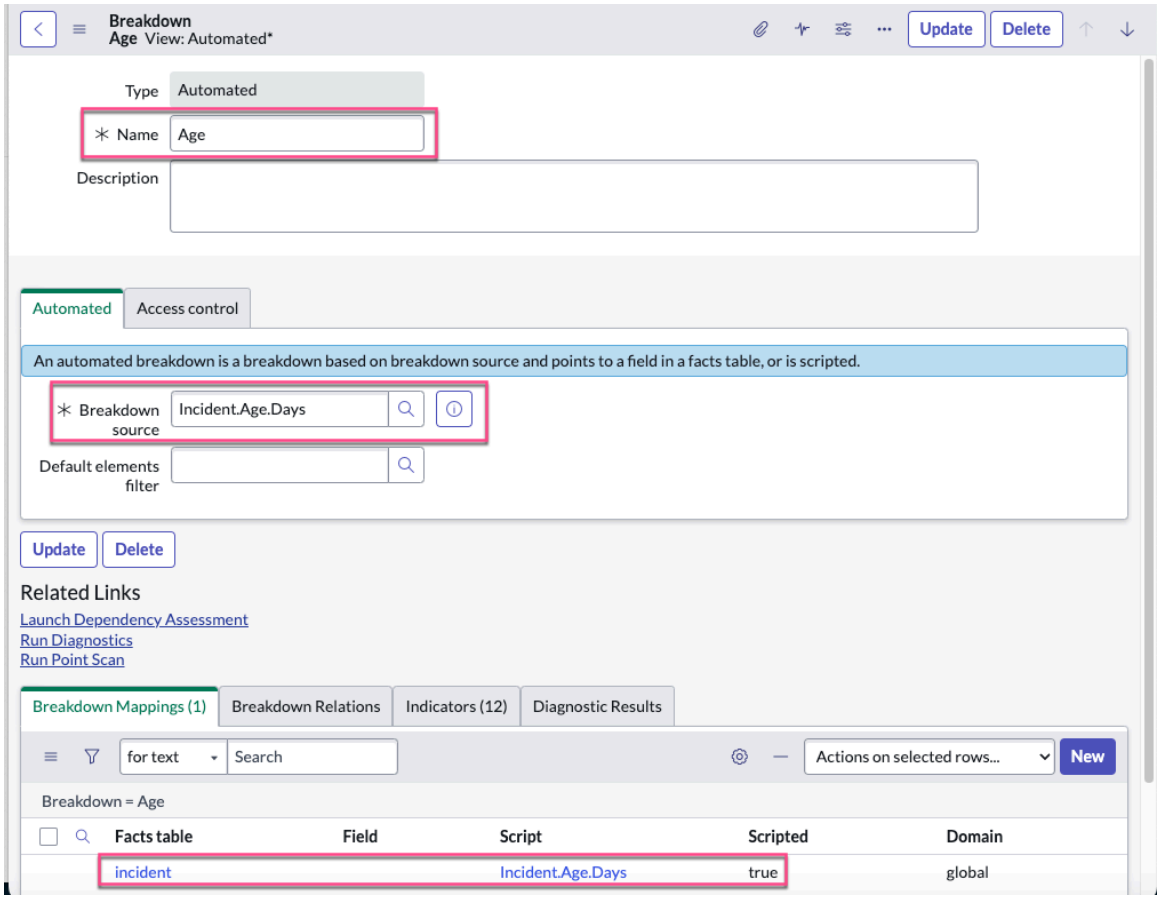


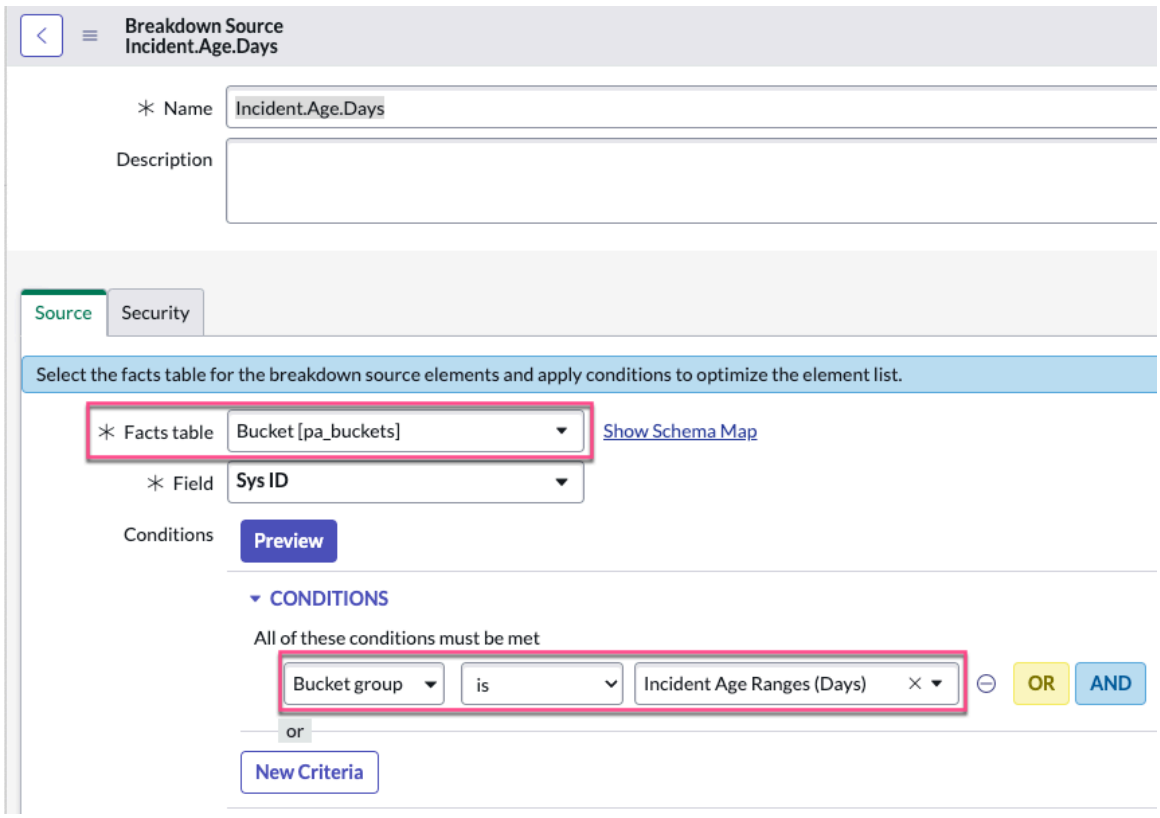
Example: Script mapping

The Age breakdown uses the Incident.Age.Days script to calculate the age of incidents in days and map the values to the Incident Age Ranges bucket group.

In the first two images, you see the Age breakdown, which uses the Incident.Age.Days breakdown source and the Incident.Age.Days script for breakdown mapping. You also see that the breakdown source refers to the Incident Age Range (Days) bucket group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



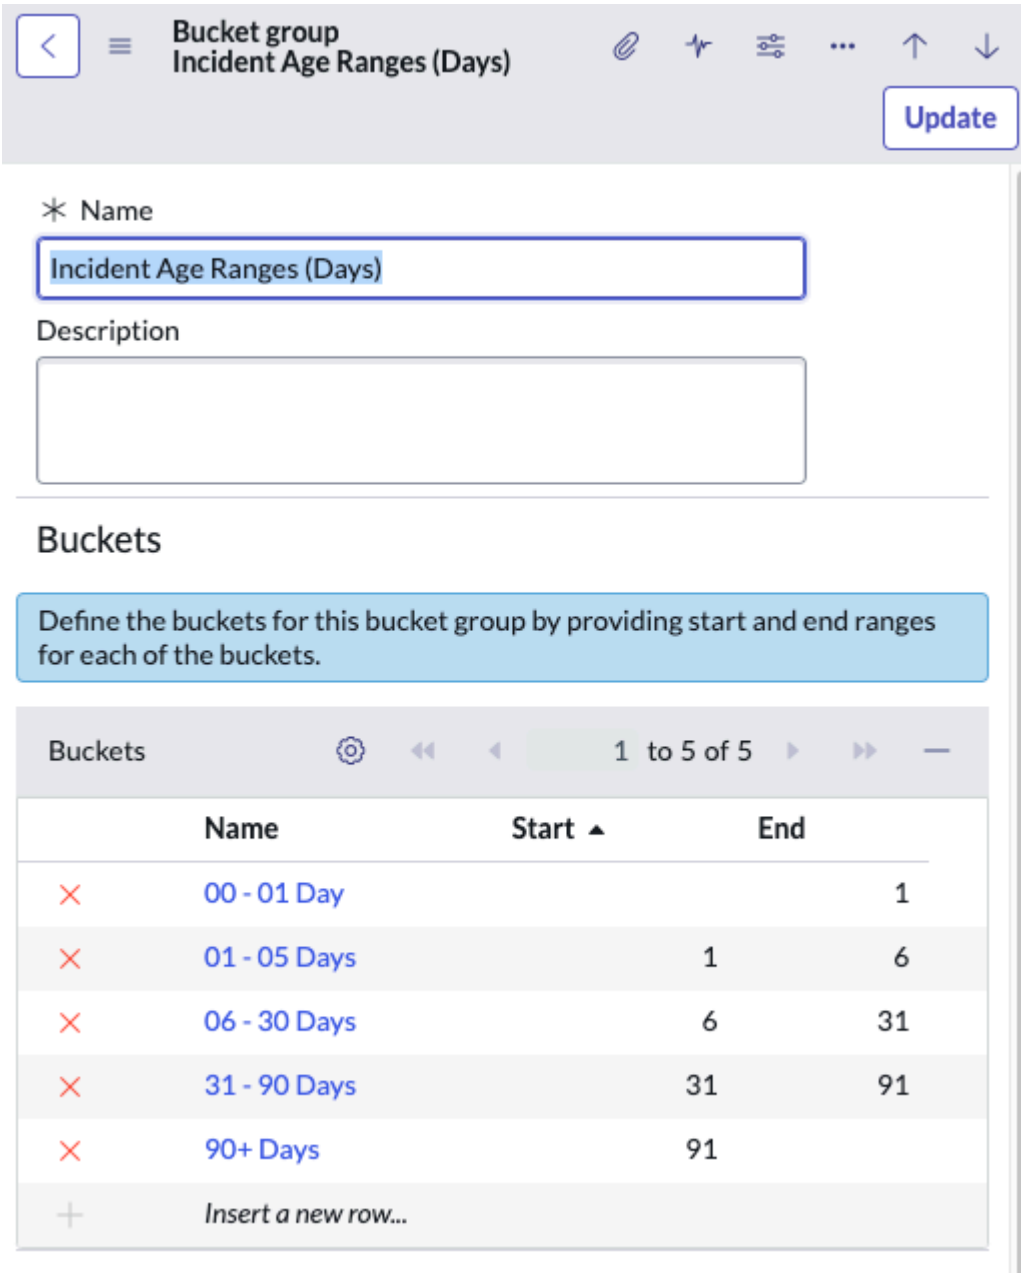


The Incident.Age.Days script takes the time stamp when the incident was opened from the incident table and subtracts this from the time stamp at the end of the collection period. The script converts this value from milliseconds to days.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var diff=function(x,y){return y.dateNumericValue() -
 x.dateNumericValue();};
var days=function(x,y){return diff(x,y)/(24*60*60*1000);};
days(current.opened_at, score_end);
```

The resulting numbers of days are sorted into the buckets of the bucket group.



Here is the result of running this script on the Number of open incidents indicator.

Scripting in Performance Analytics

Assign an indicator to an automated breakdown

Associate automated or formula indicators with a breakdown to enable the collection of broken down scores for those indicators.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
The breakdown must have a breakdown mapping for the indicator source table.

Role required: pa_data_collector, pa_power_user, pa_admin, or admin

Procedure
1. Navigate to **All** > **Platform Analytics Administration** > **Breakdowns** > **Automated Breakdowns**.
2. Select a breakdown record.
3. In the **Indicators** related list, click **Edit**.
4. Use the slushbucket to select the indicators you want to assign to this breakdown.
5. Click **Save**.
6. **Optional:** In the **Indicator Breakdowns** related list, set the **Display** value to false to hide the breakdown on the Analytics Hub and dashboard widgets.
   If the **Display** field is false, broken-down scores are still populated during data collection, but the breakdown is not selectable on the Analytics Hub or on dashboard widgets.

What to do next
Run a data collection jobs on the indicator to collect scores for the new breakdown.

Important: If you add a breakdown to an existing indicator for which you already have scores, be careful to collect scores for the new breakdown without overwriting any collected scores.

For this purpose, create a special one-off collection job. Set the job to collect data for as far back as you need. Select only the indicator or indicators to which you have added this breakdown. Configure the resulting job indicators to exclude all other breakdowns. Clear the **Collect indicator** option on the job indicators. Then run the job.

If your role does not allow you to create collection jobs, contact your Performance Analytics admin.

For more information, see Create or schedule a data collection job and Configure a job indicator.

Manual breakdowns

In a manual breakdown, you define the breakdown elements and the indicator scores for each element manually instead of using records from a breakdown source.

Unlike an automated breakdown, a manual breakdown does not map to any fields on the indicator source table. Instead, users must populate the broken-down scores manually.

Related topics
Add or edit indicator scores manually

Create a manual breakdown

Create a breakdown for an indicator where you add scores manually.

Before you begin
Roles required: pa_data_collector, pa_power_user, pa_admin, or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Platform Analytics Administration** > **Indicators** > **Manual Breakdowns**.
2. Select **New**.
   The **Type** is set to **Manual** automatically.
3. Enter a descriptive **Name**.
4. Right-click the form header and select **Save**.
5. In the **Manual** section, double-click **Insert a new row** to add a new breakdown element.
6. Press Enter or click the green check mark to save the entry.
7. **Optional:** Change the **Order** value.
   Elements with a lower **Order** value appear higher in the list of elements, such as on the Analytics Hub and dashboards.
8. Repeat steps 5-7 to add additional breakdown elements.
9. Click **Submit**.

What to do next

Associate manual indicators with this breakdown and populate scores using the scoresheet.

Assign a manual indicator to a manual breakdown

Associate a manual indicator with a manual breakdown to enable users to enter broken-down scores for the indicator.

Before you begin

Role required: pa_data_collector, pa_power_user, pa_admin, or admin

About this task

Note: You can break down manual indicator scores by only one breakdown at a time. You cannot apply a 2nd-level breakdown to a manual indicator.

Procedure

1. Navigate to **All** > **Platform Analytics Administration** > **Breakdowns** > **Manual Breakdowns**.
2. Select a breakdown record.
3. In the **Indicators** related list, click **Edit**.
4. Use the slushbucket to select the indicators you want to assign to this breakdown.
5. Click **Save**.
6. **Optional:** In the **Indicator Breakdowns** related list, set the **Display** value to false to hide the breakdown on the Analytics Hub and dashboard widgets.
   If the **Display** field is false, broken-down scores are still populated during data collection, but the breakdown is not selectable on the Analytics Hub or on dashboard widgets.

What to do next

Populate broken-down scores for the indicators using the scoresheet.

Element filters

Element filters enable you to specify or limit the displayed breakdown elements on visualizations.

An elements filter consists of a conditional filter or related list conditions and the breakdown source that the conditions apply to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip: Use an elements filter with dynamic conditions to create personalized visuals on a widget. For more information, see Personalized visuals.

Related topics

Performance Analytics widgets

Create an elements filter

Select the breakdown source and filter conditions to filter breakdown elements from that breakdown source.

Before you begin

Role required: pa_data_collector or admin

Procedure

Navigate to **All** > **Platform Analytics Administration** > **Breakdowns** > **Elements Filters** and create a new record (see table for field descriptions).

Element filter fields

Field	Description
Breakdown source	Select the breakdown source you want to create an element filter for. The element filter is available for any breakdowns based on this breakdown source.
Facts table	Read-only. Displays the breakdown source facts table.
Filter	CONDITIONS: Specify the filter conditions to limit the available elements. Only elements that meet these conditions are displayed when you apply this element filter. For example, if the breakdown source facts table is User [sys_user], you can add a filter condition to include only users in the HR department. This filter condition is [Department][is][HR]. For Personalized visuals, the operator in the filter condition must be `[is (dynamic)]`.
	RELATED LIST CONDITIONS: Include a relationship with another table in the conditions. For example, you could create an element filter on the Groups breakdown source, which uses the Group [sys_user_group] table. If you added a related list condition on Incident [incident]->Assignment group, you would get only groups that had an incident assigned to them. If this condition included [[Created][on][Last 6 Months]], you would get groups that were

Field	Description
	assigned an incident that was created within the last six months. Roles	Select any roles that a user must have to select this element filter on a widget form. A user must have at least one of the specified roles. If no roles are specified, all users who can edit a Performance Analytics widget can add this element filter.

What to do next

Use an element filter with dynamic conditions to create personalized visuals on a widget. For more information, see Personalized visuals.

All widget indicators that use this elements filter and all diagnostic results that mention this elements filter are listed at the bottom of the elements filter record.

Element filters in visualizations

Element filters can be seen in a Platform Analytics data visualization or on KPI Details. In the Core UI, they can be seen in Performance Analytics widgets or the Analytics Hub. Some restrictions apply.

You can select the element filter in the following ways on different visualizations:

- On the Core UI Analytics Hub: When you select a breakdown, if that breakdown has elements filters, you get a list of them to choose from.
- In a Core UI Performance Analytics widget: When configuring the widget, fill in the **Elements filter** field in the **Element settings** tab. Only breakdown, time series, and score widgets support elements filters. For time series and score widgets, an elements filter replaces the first-level breakdown element. For breakdown widgets, an elements filter limits the elements that are shown.
- In a Core UI widget indicator on a time series widget: Select a filter in the **Elements filter** field in the Element Settings. You must first select a breakdown with element filters on its breakdown source.

  Note: The names of all elements that get applied are appended to the name or label of the indicator.

- On KPI Details in Platform Analytics: When you select a breakdown in the **Filters** pane, if that breakdown has elements filters, you get a list of them to choose from under **Refine by**.
- In a Platform Analytics data visualization: While configuring the data visualization, select an indicator data source, a breakdown, and the [is (dynamic)] operator. Any elements filters for that breakdown are then available in the **Element** field. Only automated indicators with the Count, Minimize, or Maximize aggregate are supported.

In all of these cases, you can select an elements filter only if you first select a breakdown with at least one elements filter on its breakdown source. You may also need a certain role to select an elements filter, depending on the configuration of that filter.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Besides specifying an elements filter on a visualization, you can specify a **Default element filter** on a breakdown record. That elements filter is selected automatically for that breakdown in any visualization. Users that view the breakdown on the Analytics Hub or on KPI Details can change or clear the selected elements filter.

Note: It is not possible to change elements filters that are used to personalize visuals when simply viewing the visual on a dashboard or workspace. Only a user with the rights to edit the underlying widget or data visualization can change the elements filter. For more information, see Personalized visuals.

Navigating breakdown elements with breakdown relations

Breakdown relations open a new navigation path for viewing breakdown scores, by moving from one breakdown element to another element of the same breakdown. The elements should be in an hierarchical relationship.

Important: Platform Analytics features other than indicator scorecards do not support breakdown relations.

You can use breakdown relations to navigate between the elements of a single breakdown that are in a hierarchical relationship. For example, the Location breakdown has a hierarchy of 'parent' and 'child' elements, where a country can be the parent of cities. Breakdown relations let an Analytics Hub viewer navigate from a country down into a city, from a city to the country, or between cities in the same country.

In Platform Analytics, breakdown relations can be applied only on indicator scorecards. The latest version of the Data Visualizations application from the ServiceNow® Store is required. In the Core UI, breakdown relations affect navigation on the Analytics Hub and in breakdown widgets.

Breakdown relations on Next Experience dashboards

An indicator scorecard on a Next Experience dashboard can show hierarchical or breakdown-to-breakdown relations. You must pair the indicator scorecard with a filter on the dashboard. The filter source is the table that is the breakdown source, and the filter applies to indicators with that breakdown. The filter acts as the source, and the scorecard breakdown acts as the target. The relation record defines how these two are connected. Within that connection, the breakdown elements from the filter are mapped to fields on the target scorecard's breakdown elements. That mapping is what the breakdown relation record defines. In short: filter → breakdown relation → scorecard breakdown, with element-level field mappings in between.

For a hierarchy of elements on the same breakdown, the filter source must be the same as the breakdown source. For example, if the indicator scorecard shows indicators with the Assignment Group breakdown, the dashboard filter must filter on the Group table. It also must filter indicators with the Assignment Group breakdown.

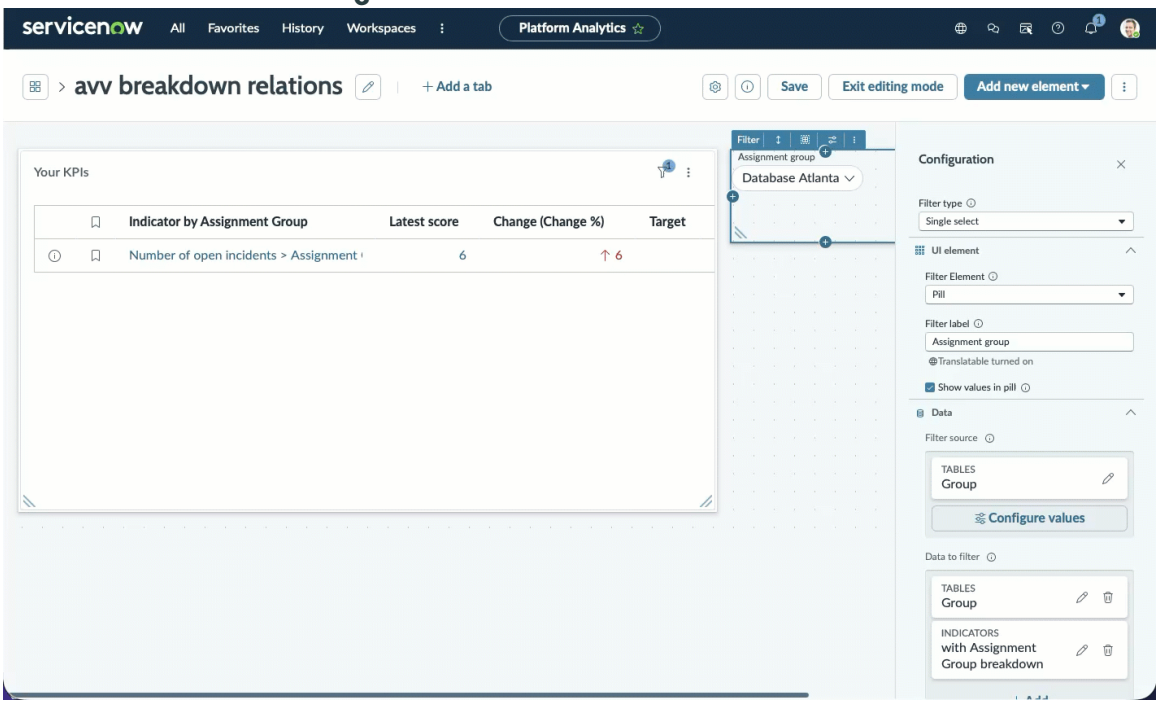
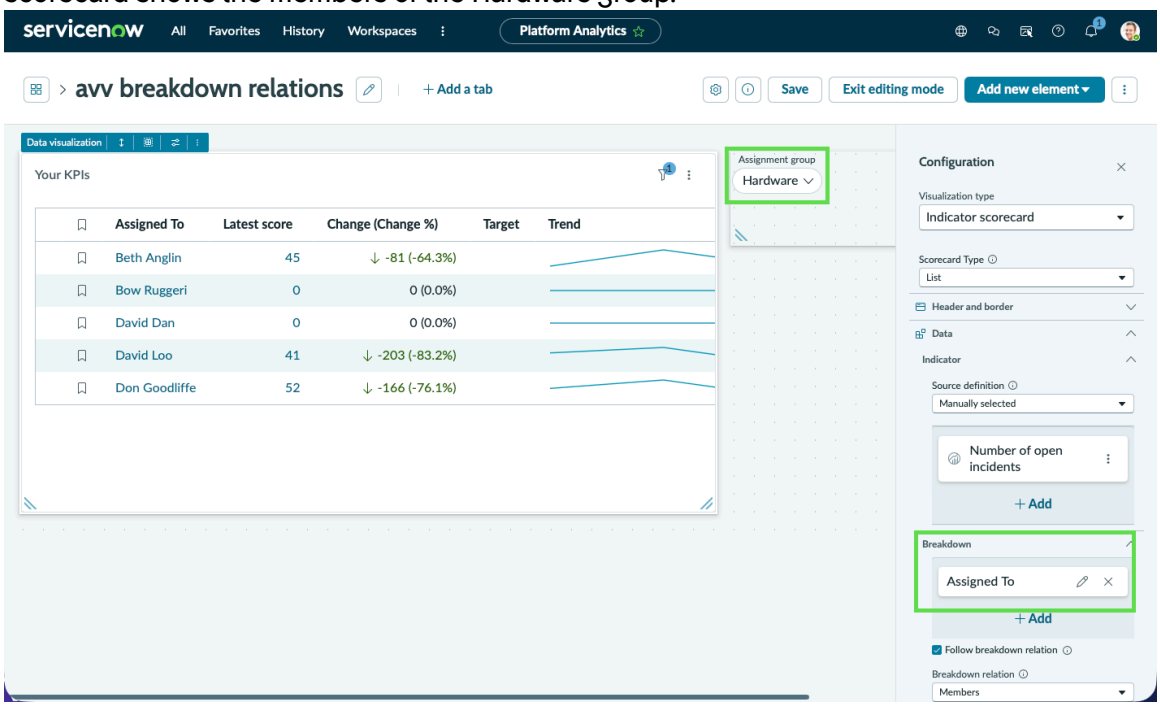
Indicator scorecard showing hierarchical relations



Breakdown-to-breakdown relations define different primary and related breakdowns. To show such a relation on a Platform Analytics dashboard, the indicator scorecard uses the related breakdown. The filter is based on the primary breakdown, so is identical to what you create for a hierarchical relation. For example, you can filter on the Hardware assignment group and configure the indicator scorecard to use the Assigned To breakdown. As a result, the indicator scorecard shows the members of the Hardware group.



Breakdown relations in Core UI breakdown widgets

A Core UI breakdown widget can show the parent, child, or sibling elements of the element that was chosen for the breakdown dashboard. For more information about using breakdown relations on breakdown dashboards, see Showing breakdown relations on dashboards.

Create relations between elements of a breakdown

Use a breakdown relation to set up navigation between a hierarchy of elements within the same breakdown. A field in the breakdown records must identify the hierarchical relationship of one record to another.

Before you begin

Review the use cases for breakdown relations in Navigating breakdown elements with breakdown relations.

Important: To show breakdown relations on Platform Analytics, you have to create a dashboard with an indicator scorecard and a filter. KPI Details does not support breakdown relations.

Role required: pa_data_collector, pa_power_user, admin

Note: While a business analyst, typically with the pa_power_user role, is most likely to know what breakdown relations to create, creating them requires the knowledge and access to tables of a technical expert with pa_data_collector. A pa_admin is likely to understand both. Consider having either a pa_admin create the relation or have a collaboration between a pa_power_user and a pa_data_collector.

About this task

You can create breakdown relations to navigate the following hierarchical relationships between elements of a breakdown:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Child relations, to navigate from a parent element to its children
- Parent relations, to navigate from a child element to its parents
- Sibling, or peer relations, to navigate between elements that share the same parent element

In a breakdown with a hierarchical relationship between elements, one field in the element record identifies the position of the element in the hierarchy. Typically this field is Parent, and identifies the parent element. Elements that are the parent of one element can themselves have a parent element.

Note: Breakdown relations are one-way relationships. Define multiple breakdown relations to create a bi-directional relationship.

Procedure

1. Navigate to **All** > **Breakdowns** > **Breakdown Relations** and click **New**.
2. In the **Breakdown** and **Related breakdown** fields, select the breakdown whose elements you want to navigate between.
   These fields have the same value when you're creating a hierarchical relation between elements of the same breakdown.
3. In the **Table** field, select the same table as the breakdown source facts table.
4. Fill in the rest of the form, depending on whether you're creating a child, a parent, or a sibling/peer relation.

Breakdown Relation form

Field	Child relation	Parent relation	Sibling/peer relation
Breakdown field	Select the field that identifies the parent element. For the Location breakdown, select **Parent**.	Select the unique identifier field for elements of this breakdown. For the Location breakdown, as for most breakdowns, select **Sys ID**	Select the unique identifier field for elements of this breakdown. For the Location breakdown, as for most breakdowns, select **Sys ID**
Related breakdown field	Select the unique identifier field for elements of this breakdown. For the Location breakdown, as for most breakdowns, select **Sys ID**	Select the field that identifies the parent element. For the Location breakdown, select **Parent**.	Select the unique identifier field for elements of this breakdown. For the Location breakdown, as for most breakdowns, select **Sys ID**
Common field	Leave empty.	Leave empty.	Select the field that identifies the parent element.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Child relation	Parent relation	Sibling/peer relation
			For the Location breakdown, select **Parent**.

5. Under **Conditions**, define any further conditions that a record must fulfill to appear as a related breakdown for this relationship.

Example: Parent group of Assignment Groups

These instructions create a parent group relation for the Assignment Group breakdown and displays the relation in a dashboard. To display the breakdown relation in a dashboard, you need two dashboard elements:

- A filter
- An indicator scorecard

The filter is the starting point. It acts as a source, and the breakdown configured for the indicator scorecard acts as a target. The breakdown relation record defines how these two elements are connected.

1. Navigate to **All** > **Breakdowns** > **Breakdown Relations** and tap **New**.
2. Name the relation Parent Group.
3. For both Breakdown and Related Breakdown, select Assignment Group.
4. For the Table, select Group [sys_user_group].
5. Select SysID for the breakdown field.
6. Select Parent for the related breakdown field.
7. Do not select a common field.
8. Define [Active][Is][True] as the condition.
9. Tap **Update**.

You now have a hierarchical breakdown relation. To display it, you need a dashboard with an indicator scorecard.

1. Navigate to **Platform Analytics** > **Library** > **Dashboards**
2. Tap **Create dashboard**.
3. Create a Next Experience dashboard in the In-line editor and name it Hierarchical relation.
4. Tap **Add new element**
5. Select **Data visualization** and create a visualization.
6. Configure the visualization as follows:

Field	Value
Visualization type	Indicator scorecard
Scorecard type	List
Data > Indicator > Source definition	Manually selected

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Tap **Indicator > Add**.
8. Select the Number of open incidents indicator.
9. Tap **Breakdown > Add**
10. Select Assignment Group.
11. Turn on **Follow breakdown relation**.
12. Select the Parent Group relation.
13. Save.

Lastly, you need a filter on the same breakdown.

1. Tap **Add new element**.
2. Select Filter > New Filter.
3. Label the filter Assignment Group.
4. Tap **Add source** and select the Group [sys_user_group] table.
5. Tap **Apply**
6. Under Data to filter, tap **Add**.
7. Select indicators with the breakdown Assignment Group.
8. Tap **Apply**.

Save the dashboard and start selecting values in the filter. When you select a child value, like Database Atlanta, you roll the result up into the parent value, like Database.

What to do next

View examples of breakdown relations that are shipped by default in every instance.

About this task

You want to be able to navigate quickly between two breakdowns at the same level that are logically related.

Note: Breakdown relations are one-way relationships. To create a bi-directional relationship, define multiple breakdown relations.

Procedure

1. Navigate to **All** > **Breakdowns** > **Breakdown Relations** and tap **New**.
2. Fill in the fields on the form, as follows.

Breakdown Relation form

Field	Description	Example
Breakdown	Select the breakdown that this relationship belongs to. You can access related breakdowns from this breakdown only.	If you want a selection of group members to appear when you select an Assignment Group, the **Breakdown** is Assignment Group.
Related breakdown	Select the breakdown you want to associate with the first breakdown.	If you want a selection of group members to appear when you select an Assignment Group, the related breakdown with the Assignment Group members is Assigned To.
Table	Select a table with fields that reference the facts table records of the sources of both breakdowns. For many-to-many relationships, select a many-to-many table. For one-to-many relationships, select a facts table.	The Assignment Group breakdown uses Group data. The Assigned To breakdown uses User data. Assignment Groups can have many members, and a user can be a member of more than one Assignment Group, so they have a many-to-many relationship. Therefore, you select the Group Member [sys_user_grmember] table, which is a many-to-many table that joins groups and users.
Breakdown field	Select the field from the specified table that identifies the breakdown element you can navigate from.	To relate Assignment Group and Assigned To, select the **Group** field. This field in the Group Member [sys_user_grmember] table identifies the element of the Assignment Group breakdown.
Related breakdown field	Select the field from the specified table that identifies the breakdown elements you can navigate to when viewing this relation.	To relate Assignment Group and Assigned To, select the **User** field. This field in the Group Member [sys_user_grmember] table identifies the element of the Assigned To breakdown.
Common field	Leave this field empty when defining a relation between breakdowns.	
Conditions	Define any further conditions that a record must fulfill to appear as a related breakdown for this relationship.	Add the condition **[User.Active] [is] [true]** to filter out inactive group members.

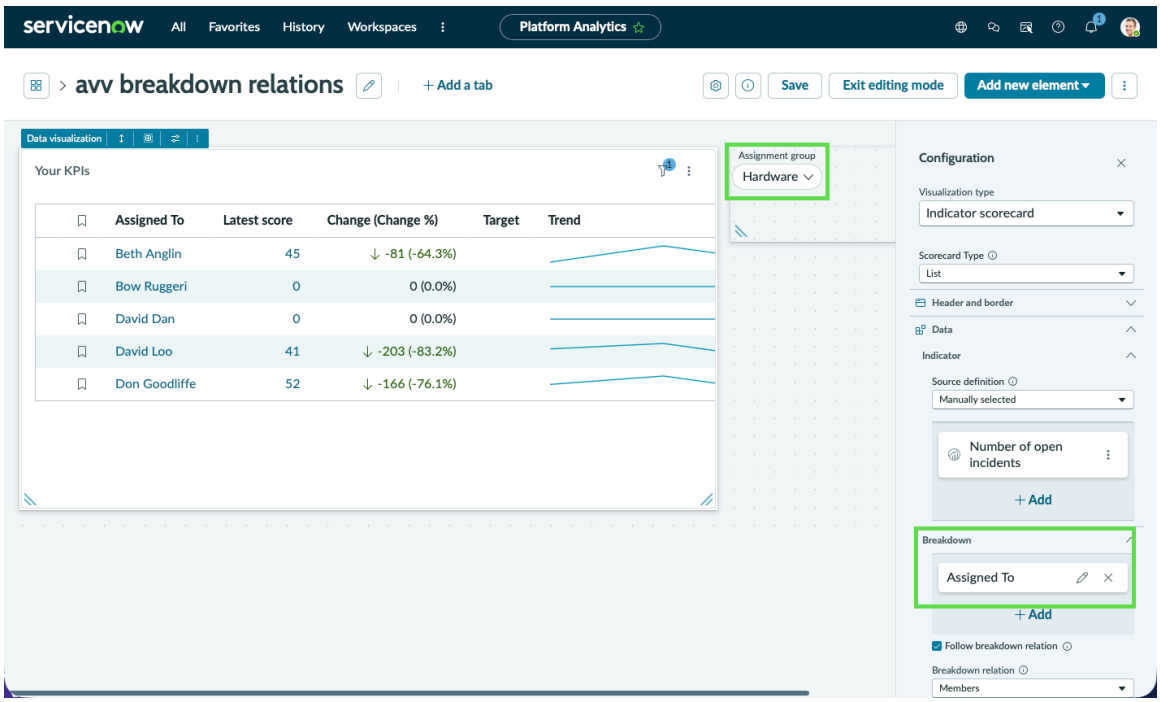
Result

After you submit the Breakdown Relation form, put a filter element and an indicator scorecard element on a Next Experience dashboard. The filter is the starting point. It acts as a source, and the breakdown configured for the indicator scorecard acts as a target. The breakdown relation record defines how these two elements are connected. The filter should use the breakdown source table from the primary breakdown as its filter source. It should filter all indicators with that breakdown. The indicator scorecard should use the related breakdown. For example, consider the following:

- A breakdown relations record named Members, where the Breakdown is Assignment Group and the related breakdown is Assigned To. The table is Group Member [sys_user_grmember], which has fields on both breakdown sources. The Breakdown Field is Group and the Related Breakdown Field is User.
- A filter on the Group [sys_user_group] table that filters indicators with the Assignment Group breakdown.
- An indicator scorecard that shows the Number of open incidents indicator. The breakdown is Assigned To, and the scorecard follows the Members breakdown relation.

When an Assignment Group is selected in the filter, the members of that assignment group are displayed in the indicator scorecard.



What to do next

View examples of breakdown relations that are shipped by default in every instance. The example shown here is the **Members** breakdown relation. The **Member of** breakdown relation provides navigation in the reverse direction, starting with an element in Assigned To and navigating to an Assignment Group. Lastly, the **Manager** breakdown relation is similar to **Members**, but because each assignment group has only one manager, it shows a many-to-one relationship. It thus uses a facts table instead of a many-to-many table.

Control ability to view breakdown elements

To limit which breakdown elements a subset of users can view on indicators, implement element security. Element security applies to widgets, workspaces, and the Analytics Hub .

Before you begin
Roles required: pa_admin or admin

About this task
There are no visibility options for breakdowns. Instead, access to breakdowns is regulated by ACLs in the breakdown sources.

Procedure
1. Navigate to **All** > **Platform Analytics Administration** > **'Data Sources** > **Breakdown Sources**.
2. Open the breakdown sources record for the breakdown you want to set access to.
3. In the **Security type** list, select from the following choices.

Security type	Description
Deny list	Exclude groups and users with the roles you specify. They cannot view the indicator scores for the breakdown elements you spec ify. Groups and users without these roles can view the scores for the elements.
Allow list	Include groups and users with the roles you specify. Only they can view the indicator scores for the breakdown elements you spec ify. Groups and users without these roles can not view the scores for the elements.

4. Define an Elements Security List record and either:
   - Select the elements for the list.
   - Set conditions to define which elements are on the list.
5. Specify the roles that the elements security list applies to.

Define an elements security list

An elements security list prevents unauthorized access to breakdown elements.

Before you begin
Role required: pa_admin

Procedure
1. Navigate to **All** > **Platform Analytics Administration** > **Data Sources** > **Breakdown Sources**.
2. Open an existing breakdown source record.
3. In the **Elements Security List** related list, select **New**.
4. Fill in the fields, as appropriate.

Name	Description
Name	Descriptive name of the elements security list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Description	A more detailed description of what the elements security list does and its purpose.
Active	Check box for making the elements security list active (selected) or inactive (cleared).
All roles	Select to indicate that the list applies to all roles. Clear the check box and click the lock icon to specify the roles belonging to this elements security list. You can use the search button to look for specific roles.
Security type	[Read-Only] Security type selected for the associated breakdown source.
Dimension	[Read-Only] Dimension selected for the associated breakdown source.
Facts table	[Read-Only] Facts table selected for the associated breakdown source.
Select elements	Select to specify explicitly the elements that this security list applies to. If this option is cleared, use **Conditions** to determine which elements to include.
All elements	Select for the security list to include all elements. Clear to specify individual elements in this security list. Default: selected
Show blank option	Select to allow a user on a breakdown dashboard to see scores without any breakdown elements specified. Clear to allow a user on a breakdown dashboard to see only scores for the breakdown elements that are visible to their role. This setting affects only widgets that follow breakdown dashboard elements. Users with the admin role can always see unfiltered scores on breakdown dashboards.
Conditions	The conditions for determining which breakdown elements the security list applies to. For example, **[User.Manager] [is (dynamic)] [Me]**. Conditions are applied on top of the breakdown source conditions. This field is available only if **Select elements** is not selected.

5. Click **Submit**.

Role restrictions with deny lists

If deny list security is specified for a breakdown source, and any of the roles of a user are on an element security list for that breakdown source, that user cannot see the elements which that security list applies to.

Visibility of breakdown element by user role with deny list security

User role on element security list?	Visibility of elements
None of the roles of the user are in an element security list.	All elements that the security list applies to are visible.
Any of the roles of the user are in an element security list.	None of the elements that the security list applies to are visible.
User has the admin role.	All elements are visible.
